in which *V* is the volume, in mL, of the *Test Solution*; *C* is the concentration, in mg per mL, of USP Flumazenil RS in the *Standard solution*; *L* is the dose, in mg, of Flumazenil per mL obtained in the *Assay*; *D* is the volume, in mL, of Injection taken to prepare the *Test solution*; *F* is the relative response factor as described in the table below;  $r_i$  is the peak response for each impurity in the *Test solution*; and  $r_s$  is the peak response of flumazenil obtained from the *Standard solution*: meets the requirements given in the table below.

Compound Name	Relative Response Factor	Limit (%)
Flumazenil related compound A	0.9	1.0
Unknown	1.0	0.5
Total unknown	—	1.0
Total	—	2.0

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay—**

*Diluent*—Prepare a mixture of water, tetrahydrofuran, and methanol (75:20:5).

*0.02 M Phosphate buffer*—Add 0.02 M phosphoric acid to 0.02 M monobasic potassium phosphate to obtain a solution having a pH of  $2.7 \pm 0.05$ .

*Mobile phase*—Prepare a filtered and degassed mixture of 0.02 M *Phosphate buffer*, tetrahydrofuran, and methanol (75:20:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability solution*—Dissolve appropriate quantities of USP Flumazenil RS, USP Flumazenil Related Compound A RS, and USP Flumazenil Related Compound B RS in *Diluent*,

and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 0.01 mg of each per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Flumazenil RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

**Assay preparation**—Dilute a volume of Injection, if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.1 mg per mL of flumazenil in a known volume, *V*.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L10. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak areas as directed for *Procedure*: the relative retention times are about 0.71 for flumazenil related compound A, about 0.85 for flumazenil related compound B, and 1.0 for flumazenil; the resolution, *R*, between flumazenil related compound B and flumazenil is not less than 1.8; and the tailing factor for flumazenil related compound A is not more than 2.0. Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of flumazenil (C<sub>15</sub>H<sub>14</sub>FN<sub>3</sub>O<sub>3</sub>) in the volume of Injection taken by the formula:

$$VC(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Flumazenil RS in the *Standard preparation*; *V* is the volume, in mL, of the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Flumethasone Pivalate

C<sub>27</sub>H<sub>36</sub>F<sub>2</sub>O<sub>6</sub> 494.57

Pregna-1,4-diene-3,20-dione, 21-(2,2-dimethyl-1-oxopropoxy)-6,9-difluoro-11,17-dihydroxy-16-methyl-, (6α,11β,16α)-, 6α,9-Difluoro-11β,17,21-trihydroxy-16α-methylpregna-1,4-diene-3,20-dione 21-pivalate [2002-29-1].

» Flumethasone Pivalate contains not less than 97.0 percent and not more than 103.0 percent of C<sub>27</sub>H<sub>36</sub>F<sub>2</sub>O<sub>6</sub>, calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** <11>—  
USP Flumethasone Pivalate RS

### Identification—

**A:** *Infrared Absorption* <197M>.

**B:** *Ultraviolet Absorption* <197U>—

*Solution:* 20 μg per mL.

*Medium:* methanol.

Absorptivities at 237 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Specific rotation** <781S>: between +71° and +82°.

*Test solution:* 10 mg per mL, in dioxane.

**Loss on drying** <731>—Dry it at 105° for 4 hours: it loses not more than 1.0% of its weight.

**Chromatographic purity**—Prepare a solution in dioxane containing 20 mg per mL. Apply 5 μL of this solution and 5 μL each of three dioxane solutions containing in each mL, respectively, 200 (1%), 400 (2%), and 600 (3%) μg of USP Flumethasone Pivalate RS to a suitable thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of toluene and ethyl acetate (7:3) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with dilute sulfuric acid (1 in 2), heating at 100° for 30 minutes, and inspecting under long-wavelength UV light: the total content of any impurities detected, when compared to the Standard solutions, does not exceed 3.0%.

### Assay—

**Standard preparation**—Dissolve a suitable quantity of USP Flumethasone Pivalate RS, accurately weighed, in alcohol, and dilute quantitatively and stepwise with alcohol to obtain a solution having a known concentration of about 20 μg per mL. Transfer 10.0 mL of this solution to a glass-stoppered, 20-mL conical flask.

**Assay preparation**—Transfer about 20 mg of Flumethasone Pivalate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with alcohol to volume, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, dilute with alcohol to volume, and mix. Transfer 10.0 mL of this solution to a glass-stoppered, 20-mL conical flask.

**Procedure**—To each of the flasks containing the *Standard preparation* and the *Assay preparation*, and to a similar flask containing 10.0 mL of alcohol to provide the blank, add 1.0 mL of tetramethylammonium hydroxide TS. Mix, allow to stand for 20 minutes, accurately timed, add 1.0 mL of blue tetrazolium TS to each flask, and mix. Allow to stand for 40 minutes, add 1.0 mL of glacial acetic acid to each flask, mix, and concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 520 nm, with a suitable spectrophotometer, against the blank. Calculate the quantity, in mg, of C<sub>27</sub>H<sub>36</sub>F<sub>2</sub>O<sub>6</sub> in the portion of Flumethasone Pivalate taken by the formula:

$$C(A_U / A_S)$$

in which *C* is the concentration, in μg per mL, of USP Flumethasone Pivalate RS in the *Standard preparation*; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Flumethasone Pivalate Cream

» Flumethasone Pivalate Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flumethasone pivalate ( $C_{27}H_{36}F_2O_6$ ) in a suitable cream base.

**Packaging and storage**—Preserve in collapsible tubes.

**USP Reference standards** (11)—

USP Flumethasone Pivalate RS

**Identification**—Place a quantity of Cream, equivalent to about 400  $\mu$ g of flumethasone pivalate, in a 50-mL centrifuge tube, and treat as directed in the Assay, collecting the extracts in a 50-mL centrifuge tube. Evaporate the acetonitrile on a water bath (about 75°) with the aid of a stream of nitrogen. Dissolve the residue in 2.0 mL of acetonitrile with the aid of heat, allow to cool, and centrifuge. Apply 50  $\mu$ L of this solution and 50  $\mu$ L of a solution of chloroform and methanol (1:1) of USP Flumethasone Pivalate RS containing 200  $\mu$ g per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in toluene until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Redevelop the plate in the same manner in a solvent system consisting of toluene and ethyl acetate (7:3), remove the plate from the developing chamber, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** (755): meets the requirements.

**Assay**—

*Solvent acetonitrile*—Saturate acetonitrile with isooctane.

*Solvent isooctane*—Saturate isooctane with acetonitrile.

*4-Aminoantipyrine solution*—Dissolve about 200 mg of 4-aminoantipyrine in a 1 in 100 solution of hydrochloric acid in methanol to make 50 mL of solution, and mix. Prepare this solution on the day of use.

*Standard preparation*—Dissolve a suitable quantity of USP Flumethasone Pivalate RS, accurately weighed, in *Solvent acetonitrile*, and dilute quantitatively and stepwise with *Solvent acetonitrile* to obtain a solution having a known concentration of about 40  $\mu$ g per mL.

*Assay preparation*—Transfer an accurately weighed portion of Cream, equivalent to about 400  $\mu$ g of flumethasone pivalate, to a tared glass-stoppered, 50-mL centrifuge tube. Place the tube in a vacuum desiccator, and dry the specimen in vacuum over silica gel until about 70% loss in weight is obtained.

*Procedure*—[NOTE—Perform the extractions in glass-stoppered, 50-mL centrifuge tubes with separation being effected by centrifugation, the portion to be retained being withdrawn into a hypodermic syringe fitted with a blunt-end, 14-gauge, 15-cm needle.] Add 10.0 mL of *Solvent acetonitrile* to the Assay preparation, and transfer 10.0 mL of the Standard preparation to a separate, glass-stoppered, 50-mL centrifuge tube. Add 25 mL of *Solvent isooctane* to each tube, shake by mechanical means until the cream is dispersed, and then shake both mixtures for 5 minutes. Separate and withdraw each acetonitrile layer, and filter through cotton pledgets, previously saturated with *Solvent acetonitrile*, into separate 25-mL volumetric flasks. Repeat the extraction, using a 10-mL portion of *Solvent acetonitrile* for

each tube. Separate, withdraw, and filter each acetonitrile layer through the same respective filter, and combine the extracts with the main extracts. Dilute each with *Solvent acetonitrile* to volume, and mix. Transfer 10.0 mL of each solution to separate, glass-stoppered, 20-mL tubes, and to a third tube transfer 10.0 mL of *Solvent acetonitrile* to provide the blank. Evaporate the solvent on a water bath (about 75°) with the aid of a stream of nitrogen. Add 5.0 mL of *4-Aminoantipyrine solution* to each tube, insert the stopper, shake by mechanical means until the residue dissolves, and allow to stand for 1 hour. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 390 nm, with a suitable spectrophotometer, against the blank. Calculate the quantity, in mg, of flumethasone pivalate ( $C_{27}H_{36}F_2O_6$ ) in the portion of Cream taken by the formula:

$$0.01C(A_U / A_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Flumethasone Pivalate RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the Assay preparation and the Standard preparation, respectively.

## Flunisolide

$C_{24}H_{31}FO_6 \cdot 1/2H_2O$  443.51

Pregna-1,4-diene-3,20-dione, 6-fluoro-11,21-dihydroxy-16,17-[(1-methylethylidene)bis(oxy)]-, hemihydrate, (6 $\alpha$ , 11 $\beta$ , 16 $\alpha$ )-.

6 $\alpha$ -Fluoro-11 $\beta$ , 16 $\alpha$ , 17, 21-tetrahydroxypregna-1,4-diene-3,20-dione cyclic 16,17-acetal with acetone, hemihydrate [77326-96-6].

Anhydrous 434.51 [3385-03-3].

» Flunisolide contains not less than 97.0 percent and not more than 102.0 percent of  $C_{24}H_{31}FO_6$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Flunisolide RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 10  $\mu$ g per mL.

*Medium:* methanol.

**Specific rotation** (781S): between +103° and +111°.

*Test solution:* 10 mg per mL, in chloroform.

**Loss on drying** (731)—Dry it in vacuum at 60° for 3 hours: it loses not more than 1.0% of its weight.

**Water, Method I** (921)—The anhydrous form contains not more than 1.0%. The hemihydrate form contains between 1.8% and 2.5% (determined on a dried specimen).

**Residue on ignition** (281): not more than 0.1% from 250 mg.

**Chromatographic purity**—

*Standard solutions*—Prepare a solution of USP Flunisolide RS in acetone to contain 10 mg per mL (*Standard solution*

A). Dilute 1 mL of *Standard solution A* with acetone to 100 mL (*Standard solution B*).

**Test preparation**—Prepare a solution of Flunisolide in acetone to contain 10 mg per mL.

**Procedure**—Apply 10- $\mu$ L volumes of *Standard solution A*, *Standard solution B*, and the *Test preparation* to a suitable thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Place the plate in a suitable chromatographic chamber previously equilibrated with a mixture of toluene and alcohol (90:10), seal the chamber, and develop the chromatogram until the solvent front has moved three-fourths of the length of the plate. Remove the plate, allow the solvent to evaporate, and examine the plate under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the *Test preparation* corresponds to that obtained from *Standard solution A*. No secondary spot exhibits an intensity greater than that of the principal spot from *Standard solution B*.

#### Assay—

**Mobile phase**—Prepare a suitable degassed solution of water and acetonitrile (3:2) such that at an approximate flow rate of 1.6 mL per minute, the retention time of Flunisolide is about 6 minutes.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Flunisolide RS in *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL.

**Assay preparation**—Using 20 mg of Flunisolide, accurately weighed, proceed as directed for *Standard preparation*.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  25-cm column that contains 5- to 10- $\mu$ m packing L7. The flow rate is about 1.6 mL per minute. Chromatograph the *Standard preparation*, and record the peak response as directed for *Procedure*: the column efficiency is not less than 2700 theoretical plates; the tailing factor for the flunisolide peak is not more than 1.7; and the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (between 15  $\mu$ L and 30  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{24}H_{31}FO_6$  in the portion of Flunisolide taken by the formula:

$$(434.51 / 443.51)100C(r_U / r_S)$$

in which 434.51 and 443.51 are the molecular weights of  $C_{24}H_{31}FO_6$  and  $C_{24}H_{31}FO_6 \cdot \frac{1}{2}H_2O$ , respectively; C is the concentration, in mg per mL, of USP Flunisolide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Flunisolide Nasal Solution

» Flunisolide Nasal Solution is an aqueous, buffered solution of Flunisolide. It is supplied in a form suitable for nasal administration. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{24}H_{31}FO_6$ .

**Packaging and storage**—Preserve in tight containers, protected from light, and store at controlled room temperature.

#### USP Reference standards <11>—

USP Flunisolide RS

**Identification**—Proceed as directed in the *Assay*, except to inject 50  $\mu$ L to 200  $\mu$ L of a mixture of the *Assay preparation* and the *Standard preparation* (1:1) onto the column, adjusting the response to obtain a response that is between 50% and 90% full scale: a single peak is observed in the chromatogram for the mixed solution.

**pH** <791>: between 4.5 and 6.0, a silver-silver chloride (internal element) electrode being used in conjunction with a fiber junction calomel electrode.

**Quantity delivered per spray**—Prime the spray pump by delivering 10 sprays into a fume hood. Accurately weigh the entire assembly, record the weight, and deliver 8 more sprays into the hood. Again weigh the assembly, and record the weight. Calculate the quantity, in  $\mu$ g, of  $C_{24}H_{31}FO_6$  delivered per spray taken by the formula:

$$[(W_1 - W_2) / 8][A / D]$$

in which  $W_1$  and  $W_2$  are the first and second weights, respectively, in g; A is the quantity, in  $\mu$ g per mL, of  $C_{24}H_{31}FO_6$  found in the *Assay*; and D is the density of Nasal Solution, in g per mL. The quantity delivered is between 17  $\mu$ g and 33  $\mu$ g per spray.

#### Assay—

**Mobile phase**—Prepare a suitable degassed solution of water, acetonitrile, and glacial acetic acid (69:30:1 to 64:35:1). Adjust the ratio as necessary to obtain suitable chromatographic performance.

**Internal standard solution**—Dissolve norethindrone in acetonitrile to obtain a solution containing about 300  $\mu$ g per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Flunisolide RS in a mixture of acetonitrile and *Mobile phase* (1:1) to obtain a solution having a known concentration of about 250  $\mu$ g per mL. Transfer 1.0 mL of this solution, and 1.0 mL of *Internal standard solution*, by means of "to contain" pipets, to a 50-mL volumetric flask. Rinse the pipets with *Mobile phase*, adding the rinsings to the flask, dilute with *Mobile phase* to volume, and mix. The final concentration of USP Flunisolide RS is about 5  $\mu$ g per mL.

**Assay preparation**—Transfer an accurately measured volume of Nasal Solution, equivalent to about 250  $\mu$ g of flunisolide, to a 50-mL volumetric flask, and add 1.0 mL of *Internal standard solution* by means of "to contain" pipets. Rinse the pipets with *Mobile phase*, adding the rinsing to the flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  25-cm column that contains 5- to 10- $\mu$ m packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the analyte and the internal standard is not less than 5.0; and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.6 for flunisolide and 1.0 for norethindrone. Calculate the quantity, in mg, of  $C_{24}H_{31}FO_6$  in each mL of the Nasal Solution taken by the formula:

$$(434.51 / 443.51)(50C / V)(R_U / R_S)$$

in which 434.51 and 443.51 are the molecular weights of  $C_{24}H_{31}FO_6$  and  $C_{24}H_{31}FO_6 \cdot \frac{1}{2}H_2O$ , respectively; C is the concentration, in mg per mL, of USP Flunisolide RS in the *Standard preparation*; V is the volume, in mL, of Nasal Solution taken; and  $R_U$  and  $R_S$  are the peak response ratios of the

flunisolide peak and the norethindrone peak obtained from the Assay preparation and the Standard preparation, respectively.

## Flunixin Meglumine

$C_{14}H_{11}F_3N_2O_2 \cdot C_7H_{17}NO_5$  491.46

3-Pyridinecarboxylic acid, 2-[[2-methyl-3-(trifluoromethyl)phenyl]amino]-, compd. with 1-deoxy-1-(methylamino)-D-glucitol (1:1)

2-( $\alpha^3, \alpha^3, \alpha^3$ -Trifluoro-2,3-xylydino)nicotinic acid compound with 1-deoxy-1-(methylamino)-D-glucitol (1:1) [42461-84-7].

» Flunixin Meglumine contains not less than 99.0 percent and not more than 101.0 percent of  $C_{14}H_{11}F_3N_2O_2 \cdot C_7H_{17}NO_5$ .

**Packaging and storage**—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** (11)—  
USP Flunixin Meglumine RS

**Labeling**—Label it to indicate that it is for veterinary use only.

### Identification—

**A:** Infrared Absorption (197M).

**B:** Ultraviolet Absorption (197U)—

Solution: 1 in 30,000.

Medium: 0.1 N sodium hydroxide.

**Melting range** (741): between 137° and 140°.

**pH** (791): between 7.0 and 9.0, in a solution (1 in 20).

**Loss on drying** (731)—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

**Specific rotation** (781S): between −9° and −12°.

Test solution: 120 mg per mL.

**Residue on ignition** (281): not more than 0.2%.

### Chromatographic purity—

**Test solution**—Prepare a solution of Flunixin Meglumine in methanol containing 40 mg per mL.

**Standard stock solution**—Prepare a solution of USP Flunixin Meglumine RS in methanol containing 40 mg per mL.

**Standard solution 1**—Transfer 50  $\mu$ L of the Standard stock solution to a 10-mL volumetric flask, dilute with methanol to volume, and mix.

**Standard solution 2**—Dilute 20  $\mu$ L of the Standard stock solution with 10 mL of methanol, and mix.

**Procedure**—Separately apply 10- $\mu$ L portions of the Test solution, the Stock standard solution, Standard solution 1, and Standard solution 2 to a thin-layer chromatographic plate (see Chromatography (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and in a paper-lined chamber develop the chromatogram in a solvent system consisting of a mixture of toluene, ethyl acetate, glacial acetic acid, and water (65:30:10:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and air-dry the plate. Examine the plate under short-wavelength UV light. Compare the intensities of any secondary spots in the chromatogram obtained from the Test solution with the intensity of the principal spot

in the chromatograms obtained from Standard solution 1 and from Standard solution 2: no individual secondary spot in the chromatogram obtained from the Test solution is more intense than the principal spot in the chromatogram obtained from Standard solution 2 (0.2%), and the sum of the intensities of all the secondary spots in the chromatogram obtained from the Test solution does not exceed the intensity of the principal spot in the chromatogram obtained from Standard solution 1 (0.5%).

**Assay**—Dissolve about 175 mg of Flunixin Meglumine, accurately weighed, in 50 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically (see Titrimetry (541)). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 24.573 mg of  $C_{14}H_{11}F_3N_2O_2 \cdot C_7H_{17}NO_5$ .

## Flunixin Meglumine Granules

» Flunixin Meglumine Granules contain an amount of flunixin meglumine ( $C_{14}H_{11}F_3N_2O_2 \cdot C_7H_{17}NO_5$ ) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flunixin ( $C_{14}H_{11}F_3N_2O_2$ ).

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Granules to indicate that they are for veterinary use only.

**USP Reference standards** (11)—  
USP Flunixin Meglumine RS

### Identification—

**A:** The UV absorption spectrum of the solution employed for measurement of absorbance in the Assay exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Flunixin Meglumine RS, concomitantly measured.

**B:** Grind a quantity of Granules, equivalent to about 25 mg of flunixin, and transfer the powder to a 50-mL centrifuge tube. Add 20 mL of acetate buffer, prepared by dissolving 4.1 g of anhydrous sodium acetate in 500 mL of water, adding 2.9 mL of glacial acetic acid, and diluting with water to 1000 mL. Rotate the tube for 10 minutes. Extract with 25 mL of ethyl acetate, and use the upper phase as the test solution. Separately apply 10  $\mu$ L of the test solution and 10  $\mu$ L of a Standard solution of USP Flunixin Meglumine RS in methanol containing 1.5 mg per mL to a thin-layer chromatographic plate (see Chromatography (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatograms in a solvent system consisting of a mixture of toluene, ethyl acetate, glacial acetic acid, and water (65:30:10:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the spots to air-dry. Examine the plate under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

### Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

**Procedure**—Transfer a quantity of Granules, equivalent to about 12.5 mg of flunixin, to the dissolution flask. Determine the amount of flunixin ( $C_{14}H_{11}F_3N_2O_2$ ) dissolved from UV absorbances at the wavelength of maximum absorbance at about 252 nm on filtered portions of solution under test

in comparison with a Standard solution having a known concentration of about 23.6 µg per mL of USP Flunixin Meglumine RS in the same *Medium*. Each µg of flunixin meglumine is equivalent to 0.6028 µg of flunixin.

**Tolerances**—Not less than 75% (Q) of the labeled amount of flunixin ( $C_{14}H_{11}F_3N_2O_2$ ) is dissolved in 30 minutes.

**Uniformity of dosage units** (905)—meet the requirements.

#### Assay—

**Standard preparation**—Dissolve an accurately weighed quantity of USP Flunixin Meglumine RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.82 mg per mL. Transfer 4.0 mL of this solution to a 100-mL volumetric flask, dilute with 0.1 N sodium hydroxide to volume, and mix.

**Assay preparation**—Dissolve an accurately weighed quantity of Granules in water by shaking for 30 minutes. Quantitatively dilute with water to obtain a solution containing about 0.5 mg of flunixin per mL, and mix. Centrifuge a portion of this solution. Transfer 4.0 mL of the supernatant layer to a 100-mL volumetric flask, dilute with 0.1 N sodium hydroxide to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* at the wavelength of maximum absorbance at about 283 nm using 0.1 N sodium hydroxide to set the instrument. Calculate the quantity, in mg, of flunixin ( $C_{14}H_{11}F_3N_2O_2$ ) in the portion of Granules taken by the formula:

$$(296.25 / 491.46)(12,500C)(A_U / A_S)$$

in which 296.25 and 491.46 are the molecular weights of flunixin and flunixin meglumine, respectively; C is the concentration, in mg per mL, of USP Flunixin Meglumine RS in the *Standard preparation*, and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*; respectively.

## Flunixin Meglumine Injection

» Flunixin Meglumine Injection is a sterile solution of Flunixin Meglumine in Water for Injection. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flunixin ( $C_{14}H_{11}F_3N_2O_2$ ).

**Packaging and storage**—Preserve in multiple-dose containers, and store at controlled room temperature.

#### USP Reference standards (11)—

USP Endotoxin RS

USP Flunixin Meglumine RS

**Labeling**—Label Injection to indicate that it is for veterinary use only.

**Bacterial endotoxins** (85)—It contains not more than 4.54 USP Endotoxin Units per mg of flunixin.

#### Identification—

**A:** The UV absorption spectrum of the *Assay preparation* obtained in the *Assay* exhibits maxima and minima at the same wavelengths as that of the *Standard preparation*, concomitantly measured.

**B:** Transfer a quantity of Injection, equivalent to about 50 mg of flunixin, to a 50-mL centrifuge tube. Add 10 mL of *Acetate buffer*, prepared as directed in the *Assay*, and extract with 25 mL of ethyl acetate. Use the upper phase as the test solution. Separately apply 10 µL of the test solution and 10 µL of a Standard solution of USP Flunixin Meglumine RS in methanol containing 3 mg per mL to a thin-layer chro-

matographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatograms in a solvent system consisting of a mixture of toluene, ethyl acetate, glacial acetic acid, and water (75:25:10:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the spots to air-dry. Examine the plate under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 7.8 and 9.0.

#### Assay—

**Acetate buffer**—Dissolve 4.1 g of anhydrous sodium acetate in 500 mL of water. Add 2.9 mL of glacial acetic acid, dilute with water to 1000 mL, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Flunixin Meglumine RS in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with 0.1 N sodium hydroxide to obtain a solution having a known concentration of about 1.65 mg per mL. Transfer 4.0 mL of this solution to a 100-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of flunixin, to a 50-mL centrifuge tube. Add 20 mL of *Acetate buffer*, and extract with three 25-mL portions of ethyl acetate. Combine the extracts, filter, and evaporate to dryness on a steam bath under a stream of nitrogen. Dissolve the residue in 0.1 N sodium hydroxide, and transfer to a 100-mL volumetric flask with the aid of 0.1 N sodium hydroxide. Dilute with 0.1 N sodium hydroxide to volume, and mix. Transfer 4.0 mL of this solution to a second 100-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* at the wavelength of maximum absorbance at about 327 nm. Calculate the quantity, in mg, of flunixin ( $C_{14}H_{11}F_3N_2O_2$ ) in each mL of Injection taken by the formula:

$$(296.25 / 491.46)(2500C / V)(A_U / A_S)$$

in which 296.25 and 491.46 are the molecular weights of flunixin and flunixin meglumine, respectively; C is the concentration, in mg per mL, of USP Flunixin Meglumine RS in the *Standard preparation*; V is the volume, in mL, of Injection taken to prepare the *Assay preparation*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Flunixin Meglumine Paste

» Flunixin Meglumine Paste contains an amount of flunixin meglumine ( $C_{14}H_{11}F_3N_2O_2 \cdot C_7H_7NO_5$ ) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flunixin ( $C_{14}H_{11}F_3N_2O_2$ ).

**Packaging and storage**—Preserve in a well-closed container.

#### USP Reference standards (11)—

USP Flunixin Meglumine RS

**Labeling**—Label the Paste to indicate that it is for veterinary use only.

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Escherichia coli*, and *Salmonella* species.

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol, water, and glacial acetic acid (70:30:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Dissolve a quantity of sodium benzoate in water to obtain a solution containing 33 mg per mL.

**Diluent**—Prepare a mixture of methanol and water (7:3).

**Standard preparation**—Transfer about 83 mg of USP Flunixin Meglumine RS, accurately weighed, to a 50-mL centrifuge tube. Add 5.0 mL of *Internal standard solution*, 20.0 mL of water, and 10.0 mL of methanol to the tube, and mix to dissolve. Transfer 10.0 mL of this solution to a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**Assay preparation**—Transfer an accurately weighed quantity of Paste, equivalent to about 50 mg of flunixin, to a 50-mL centrifuge tube. Add 5.0 mL of *Internal standard solution* and 20.0 mL of water to the tube, and rotate for 20 minutes. Add 10.0 mL of methanol, and mix. Heat the tube in a water bath at 60° for 5 minutes, with occasional shaking. Continue rotating the tube until cool, and centrifuge. Transfer 10.0 mL of the clear supernatant to a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for sodium benzoate and 1.0 for flunixin meglumine; the resolution, *R*, between sodium benzoate and flunixin meglumine is not less than 1.9; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of flunixin (C<sub>14</sub>H<sub>11</sub>F<sub>3</sub>N<sub>2</sub>O<sub>2</sub>) in the portion of Paste taken by the formula:

$$(296.25 / 491.46)(87.5C)(R_U / R_S)$$

in which 296.25 and 491.46 are the molecular weights of flunixin and flunixin meglumine, respectively; C is the concentration, in mg per mL, of USP Flunixin Meglumine RS in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the ratios of the peak responses for flunixin and sodium benzoate obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluocinolone Acetonide

C<sub>24</sub>H<sub>30</sub>F<sub>2</sub>O<sub>6</sub> (anhydrous) 452.49

Pregna-1,4-diene-3,20-dione, 6,9-difluoro-11,21-dihydroxy-16,17-[(1-methylethylidene)bis(oxy)]-, (6α,11β,16α)-, 6α,9-Difluoro-11β,16α,17,21-tetrahydroxypregna-1,4-diene-3,20-dione, cyclic 16,17-acetal with acetone [67-73-2]. Dihydrate 488.53

» Fluocinolone Acetonide is anhydrous or contains two molecules of water of hydration. It contains not less than 97.0 percent and not more than 102.0 percent of C<sub>24</sub>H<sub>30</sub>F<sub>2</sub>O<sub>6</sub>, calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label it to indicate whether it is anhydrous or hydrous.

**USP Reference standards** (11)—

USP Fluocinolone Acetonide RS

**Identification**—

**A: Infrared Absorption** (197K)—If a difference appears, dissolve portions of both the test specimen and the USP Reference Standard in ethyl acetate, evaporate to dryness, and repeat the test on the residues.

**B:** It responds to the *Thin-layer Chromatographic Identification Test* (201), the test solution and the Standard solution being prepared at a concentration of 5 mg per mL in acetone, chromatographic silica gel being used as the adsorbent, the solvent mixture being nitromethane, dichloromethane, and methanol (50:50:1), and UV light being used to locate the spots.

**Specific rotation** (781S): between +98° and +108°.

**Test solution:** 10 mg per mL, in methanol.

**Loss on drying** (731)—Dry it in vacuum at 105° for 3 hours: anhydrous Fluocinolone Acetonide loses not more than 1.0% of its weight, and hydrous Fluocinolone Acetonide loses not more than 8.5% of its weight.

**Assay**—

**Mobile phase**—Prepare a suitable, degassed solution of water, acetonitrile, and tetrahydrofuran (77:13:10).

**Standard preparation**—Dissolve about 20 mg of USP Fluocinolone Acetonide RS, accurately weighed, in 23 mL of a mixture of acetonitrile and tetrahydrofuran (13:10), dilute with water to 100.0 mL, and mix.

**Assay preparation**—Transfer about 20 mg of Fluocinolone Acetonide, accurately weighed, to a 100-mL volumetric flask, dissolve in 23 mL of a mixture of acetonitrile and tetrahydrofuran (13:10), dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.5-mm × 10-cm column that contains packing L1. Adjust the flow rate so that the retention time for fluocinolone acetonide is between 9 and 13 minutes. Chromatograph the *Standard preparation*, and record the peak response as directed for *Procedure*: the column efficiency is not less than 3000 theoretical plates, and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{24}H_{30}F_2O_6$  in the portion of Fluocinolone Acetonide taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Fluocinolone Acetonide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluocinolone Acetonide Cream

» Fluocinolone Acetonide Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{24}H_{30}F_2O_6$ .

**Packaging and storage**—Preserve in collapsible tubes or tight containers.

### USP Reference standards (11)—

USP Fluocinolone Acetonide RS

USP Norethindrone RS

**Identification**—Transfer a quantity of the Cream, equivalent to about 0.5 mg of fluocinolone acetonide, to a centrifuge tube, disperse it in 5 mL of water, add 10 mL of chloroform, shake, and centrifuge. Remove and discard the aqueous layer, add 10 mL of water to the tube, shake, and centrifuge. Dry about 2 mL of the chloroform extract over about 200 mg of anhydrous sodium sulfate: the dried extract responds to the *Thin-Layer Chromatographic Identification Test* (201), 50  $\mu$ L of the dried chloroform extract and 50  $\mu$ L of a Standard solution containing about 50  $\mu$ g per mL of USP Fluocinolone Acetonide RS being applied, and a mixture of chloroform and diethylamine (2:1) being used for development.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** (755): meets the requirements.

### Assay—

**Internal standard solution**—Dissolve USP Norethindrone RS in acetonitrile to obtain a solution containing about 200  $\mu$ g per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fluocinolone Acetonide RS in acetonitrile to obtain a solution having a known concentration of about 300  $\mu$ g per mL. Transfer 5.0 mL of this solution, 6.0 mL of *Internal standard solution*, and 15.0 mL of water to a 50-mL volumetric flask. Dilute with acetonitrile to volume, and mix. The *Standard preparation* contains 30  $\mu$ g of USP Fluocinolone Acetonide RS per mL.

**Mobile solvent**—Prepare a mixture of water and acetonitrile (5:3). Adjust the ratio as necessary to obtain suitable chromatographic performance.

**Assay preparation**—Dissolve an accurately weighed portion of Cream, equivalent to about 0.75 mg of fluocinolone acetonide, in about 10 mL of acetonitrile by heating on a steam bath. Transfer the mixture to a 25-mL volumetric flask with the aid of three 2-mL portions of acetonitrile. Add 3.0 mL of *Internal standard solution* and 5.0 mL of water, cool, and mix. Dilute with acetonitrile to volume, mix, and cool in an ice bath. Centrifuge or filter the mixture to obtain a clear solution.

**Apparatus**—Use a high-pressure liquid chromatograph (see *Chromatography* (621)) of the general type equipped

with a detector for monitoring UV absorbance at about 254 nm, and capable of providing a flow rate of about 2 mL per minute for the *Mobile solvent*. Use a column that contains packing L1.

**Procedure**—Chromatograph equal volumes of the *Assay preparation* and the *Standard preparation*. Three replicate injections of the *Standard preparation* show a resolution factor of not less than 2.0 between the peaks for norethindrone and fluocinolone acetonide and a relative standard deviation of not more than 1.5%. Calculate the quantity, in mg, of  $C_{24}H_{30}F_2O_6$  in the portion of Cream taken by the formula:

$$0.025C(R_U / R_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Fluocinolone Acetonide RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak areas of fluocinolone acetonide and norethindrone obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluocinolone Acetonide Ointment

» Fluocinolone Acetonide Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{24}H_{30}F_2O_6$ .

**Packaging and storage**—Preserve in collapsible tubes or tight containers.

### USP Reference standards (11)—

USP Fluocinolone Acetonide RS

USP Norethindrone RS

**Identification**—Evaporate 10.0 mL of the *Assay preparation* obtained in the *Assay* to dryness, and dissolve the residue in 1 mL of chloroform: it responds to the *Thin-layer Chromatographic Identification Test* (201), 50  $\mu$ L of the test solution and 50  $\mu$ L of the Standard solution, containing about 50  $\mu$ g per mL of USP Fluocinolone Acetonide RS, being applied and a mixture of chloroform and diethylamine (2:1) being used for development.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** (755): meets the requirements.

### Assay—

**Internal standard solution**—Dissolve a suitable quantity of USP Norethindrone RS in methanol to obtain a solution containing about 850  $\mu$ g per mL.

**Diluted internal standard solution**—Transfer 5.0 mL of *Internal standard solution* to a 250-mL flask. Dilute with methanol to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fluocinolone Acetonide RS in acetonitrile to obtain a solution having a known concentration of about 200  $\mu$ g per mL. Transfer 10.0 mL of this solution and 2.0 mL of *Internal standard solution* to a 100-mL volumetric flask. Dilute with methanol to volume, and mix. The concentration of USP Fluocinolone Acetonide RS in the *Standard preparation* is 20  $\mu$ g per mL.

**Mobile solvent**—Prepare a mixture of acetonitrile and water (1:1). Adjust the ratio as necessary to obtain suitable chromatographic performance.

**Assay preparation**—Transfer an accurately weighed portion of Ointment, equivalent to about 0.7 mg of fluocinolone acetonide, to a 50-mL, round-bottom centrifuge tube. Add 35.0 mL of *Diluted internal standard solution*, emulsify using an ultrasonic probe, and centrifuge to bring the insol-

uble matter to the bottom. The clear supernatant is the *Assay preparation*.

**Apparatus**—Use a suitable high-pressure liquid chromatograph (see *Chromatography* <621>) of the general type equipped with a detector for monitoring UV absorbance at about 254 nm, and capable of providing a flow rate of about 2 mL per minute for the *Mobile solvent*. Use a 50-cm × 4-mm column that contains packing L1 so as to provide a resolution factor, *R* (see *Chromatography* <621>), of at least 2.0 between peaks for norethindrone and fluocinolone acetonide. Three replicate injections of the *Standard preparation* show a relative standard deviation of not more than 1.5%.

**Procedure**—Chromatograph equal volumes of the *Assay preparation* and the *Standard preparation*, adjusting the system as necessary to obtain peaks of between about 50% and 90% of full-scale. Calculate the quantity, in mg, of  $C_{24}H_{30}F_2O_6$  in the portion of Ointment taken by the formula:

$$0.035C(R_U / R_S)$$

in which *C* is the concentration, in µg per mL, of USP Fluocinolone Acetonide RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak areas of fluocinolone acetonide and the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluocinolone Acetonide Topical Solution

» Fluocinolone Acetonide Topical Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{24}H_{30}F_2O_6$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Fluocinolone Acetonide RS

**Identification**—Transfer a quantity of Topical Solution, equivalent to about 0.5 mg of fluocinolone acetonide, to a separator, add 5 mL of water, and extract with 10 mL of chloroform. Withdraw the chloroform layer into a second separator, wash with 10 mL of water, and dry about 2 mL of the chloroform extract over about 200 mg of anhydrous sodium sulfate: the dried extract responds to the *Thin-Layer Chromatographic Identification Test* (201), 50 µL of the dried chloroform extract and 50 µL of the Standard solution being applied, and a mixture of chloroform and diethylamine (2:1) being used for development.

**Microbial enumeration tests** <61> and **Tests for specified microorganisms** <62>—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Assay**—

**Internal standard solution**—Dissolve norethindrone in acetonitrile to obtain a solution containing about 200 µg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fluocinolone Acetonide RS in acetonitrile to obtain a solution having a known concentration of about 200 µg per mL. Transfer 5.0 mL of this solution, 4.0 mL of *Internal standard solution*, 10 mL of propylene glycol, and about 25 mL of acetonitrile to a 50-mL volumetric flask. Mix, cool to room temperature, dilute with acetonitrile to volume, and mix. The final concentration of USP Fluocinolone Acetonide RS is 20 µg per mL.

**Mobile solvent**—Prepare a mixture of water and acetonitrile (3:2). Adjust the ratio as necessary to obtain suitable chromatographic performance.

**Assay preparation**—Transfer an accurately measured volume of Topical Solution, equivalent to about 0.5 mg of fluocinolone acetonide, to a 25-mL volumetric flask. Add 2.0 mL of *Internal standard solution* and 10 mL of acetonitrile. Mix, cool to room temperature, dilute with acetonitrile to volume, and mix.

**Apparatus**—Use a suitable high-pressure liquid chromatograph (see *Chromatography* <621>) of the general type equipped with a detector for monitoring UV absorbance at about 254 nm, and capable of providing a flow rate of about 2 mL per minute for the *Mobile solvent*. Use a column containing packing L1 so as to provide a resolution factor, *R*, of at least 2.0 between peaks for norethindrone and fluocinolone acetonide.

**Procedure**—Chromatograph equal volumes of the *Assay preparation* and the *Standard preparation*, adjusting the system as necessary to obtain peaks of between about 50% and 90% full-scale. Calculate the quantity, in mg, of  $C_{24}H_{30}F_2O_6$  in each mL of the Topical Solution taken by the formula:

$$0.025(C / V)(R_U / R_S)$$

in which *C* is the concentration, in µg per mL, of USP Fluocinolone Acetonide RS in the *Standard preparation*; *V* is the volume, in mL, of Solution taken; and  $R_U$  and  $R_S$  are the ratios of the areas of the fluocinolone acetonide peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluocinonide

$C_{26}H_{32}F_2O_7$  494.52

Pregna-1,4-diene-3,20-dione, 21-(acetyloxy)-6,9-difluoro-11-hydroxy-16,17-[(1-methylethylidene)bis(oxy)]-, (6α, 11β, 16α)-.

6α,9-Difluoro-11β,16α,17,21-tetrahydroxypregna-1,4-diene-3,20-dione, cyclic 16,17-acetal with acetone, 21-acetate [356-12-7].

» Fluocinonide contains not less than 97.0 percent and not more than 103.0 percent of  $C_{26}H_{32}F_2O_7$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—

USP Fluocinonide RS

**Identification**—

**A:** *Infrared Absorption* <197K>.

**B:** *Ultraviolet Absorption* <197U>—

*Solution:* 10 µg per mL.

*Medium:* methanol.

Absorptivities at 238 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Specific rotation** <781S>: between +81° and +89°.

*Test solution:* 10 mg per mL, in chloroform.

**Loss on drying** <731>—Dry it at 105° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): negligible, from 100 mg.  
**Chromatographic purity**—

*Mobile phase and Chromatographic system*—Proceed as directed in the Assay.

*Test preparation*—Transfer about 25 mg of fluocinonide, accurately weighed, to a 10-mL volumetric flask, add acetonitrile to volume, and mix.

*Procedure*—Inject 30  $\mu$ L of the *Test preparation* into the chromatograph, record the chromatogram, and measure the area responses of all peaks. Calculate the area percentage of each peak observed in the chromatogram. The largest secondary peak is not more than 1.0% of the total area, and no other secondary peak is more than 0.5% of the total area. The sum of the areas of all peaks, other than the main peak, does not constitute more than 2.0% of the total area.

**Assay**—

*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile and water (1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Transfer about 25 mg of USP Fluocinonide RS, accurately weighed, to a 100-mL volumetric flask, add acetonitrile to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a solution having a known concentration of about 0.025 mg of USP Fluocinonide RS per mL.

*Assay preparation*—Using about 25 mg of Fluocinonide, accurately weighed, proceed as directed for *Standard preparation*.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 30  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{26}H_{32}F_2O_7$  in the portion of Fluocinonide taken by the formula:

$$1000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Fluocinonide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses due to the fluocinonide obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluocinonide Cream

» Fluocinonide Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluocinonide ( $C_{26}H_{32}F_2O_7$ ).

**Packaging and storage**—Preserve in collapsible tubes or tight containers.

**USP Reference standards** (11)—  
 USP Fluocinonide RS

**Identification**—Weigh an amount of Cream, equivalent to about 2.5 mg of fluocinonide, into a glass-stoppered, 100-mL centrifuge tube containing 5 mL of water and 10 mL of methanol. Add 20 mL of cyclohexane, shake vigorously, centrifuge, and discard the upper phase. Add 20 mL of water and 5 mL of chloroform, shake vigorously, centrifuge until the lower phase is clear, and discard the upper

phase. The clear chloroform extract is the *Test solution*. Separately apply 10  $\mu$ L of the *Test solution* and 10  $\mu$ L of a Standard solution having a concentration of 0.5 mg per mL of USP Fluocinonide RS in chloroform to equidistant points about 2 cm from one end of a thin-layer chromatographic plate (see *Chromatography* (621)), coated with a 0.25-mm layer of chromatographic silica gel. Allow the applications to dry, and develop the chromatogram in a suitable chromatographic chamber using a mixture of chloroform and acetone (4:1). Air-dry, and view under short-wavelength UV light: the principal spot from the *Test solution* corresponds to that obtained from the Standard solution.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** (755): meets the requirements.

**Assay**—

*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile and water (1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Fluocinonide RS in acetonitrile to obtain a solution having a known concentration of about 200  $\mu$ g per mL. Transfer 10.0 mL of this solution and 10.0 mL of water to a 100-mL volumetric flask. Dilute with acetonitrile to volume, and mix. The final concentration of USP Fluocinonide RS is 20  $\mu$ g per mL.

*Assay preparation*—Transfer an accurately weighed quantity of Cream, containing about 2 mg of fluocinonide, to a 100-mL volumetric flask. Add about 60 mL of acetonitrile, and dissolve the cream by heating on a steam bath. Add 10.0 mL of water, and allow to cool. Dilute with acetonitrile to volume, and mix. Filter the mixture through a fine-sintered glass funnel, using vacuum, and use the filtrate.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 4500 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Chromatograph equal volumes (about 20  $\mu$ L) of the *Assay preparation* and the *Standard preparation*, record the chromatograms, and measure the peak responses due to fluocinonide. Calculate the quantity, in mg, of fluocinonide ( $C_{26}H_{32}F_2O_7$ ) in the portion of Cream taken by the formula:

$$0.1 C(r_U / r_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Fluocinonide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses due to fluocinonide obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluocinonide Gel

» Fluocinonide Gel contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluocinonide ( $C_{26}H_{32}F_2O_7$ ).

**Packaging and storage**—Preserve in collapsible tubes or tight containers.

**USP Reference standards** (11)—  
 USP Fluocinonide RS

**Identification**—Weigh an amount of Gel, equivalent to about 2.5 mg of fluocinonide, into a glass-stoppered, 50-mL centrifuge tube containing 20 mL of sodium chloride solution (1 in 10). Add 5 mL of chloroform and 15 mL of methanol, and shake vigorously. Centrifuge to clarify the chloroform layer, and remove the solid material present at the interphase. Discard the upper phase. Dry a portion of the chloroform layer over anhydrous sodium sulfate. Using the dried extract as the *Test preparation*, proceed as directed in the *Identification* test under *Fluocinonide Cream*, beginning with “Apply 10  $\mu$ L of the *Test solution*.”

**Minimum fill** (755): meets the requirements.

**Assay—**

*Mobile phase*—Prepare a mixture of acetonitrile and water (1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Fluocinonide RS in acetonitrile to obtain a solution having a known concentration of about 200  $\mu$ g per mL. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with acetonitrile to volume, and mix. The final concentration is 20  $\mu$ g per mL.

*Assay preparation*—Transfer an accurately weighed quantity of Gel, containing about 2 mg of fluocinonide, to a 100-mL volumetric flask. Add about 60 mL of acetonitrile, and dissolve the gel by heating on a steam bath. Cool to room temperature, dilute with acetonitrile to volume, and mix. Centrifuge a portion at about 2500 rpm for about 5 minutes. Filter a portion of the centrifugate through an acetonitrile-insoluble membrane filter. The filtrate is the *Assay preparation*.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{26}H_{32}F_2O_7$  in the portion of Gel taken by the formula:

$$0.1C(r_U / r_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Fluocinonide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses due to fluocinonide obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluocinonide Ointment

» Fluocinonide Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluocinonide ( $C_{26}H_{32}F_2O_7$ ).

**Packaging and storage**—Preserve in collapsible tubes or tight containers.

**USP Reference standards** (11)—

USP Fluocinonide RS

**Identification**—Weigh an amount of Ointment, equivalent to about 2.5 mg of fluocinonide, into a glass-stoppered, 50-mL centrifuge tube containing 20 mL of cyclohexane. Gently disperse to form a suspension. Add 5 mL of water and 10 mL of methanol. Shake vigorously, allow the phases

to separate, and discard the upper phase. Add 20 mL of water and 5 mL of chloroform, shake vigorously, centrifuge, and transfer a portion of the chloroform layer to a small test tube containing about 200 mg of anhydrous sodium sulfate. Mix, and allow to stand until the extract is clear. Using the clear chloroform extract as the *Test preparation*, proceed as directed in the *Identification* test under *Fluocinonide Cream*, beginning with “Apply 10  $\mu$ L of the *Test solution*.”

**Minimum fill** (755): meets the requirements.

**Assay—**

*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile and water (1:1). Adjust the ratio as necessary to obtain suitable chromatographic performance.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Fluocinonide RS in acetonitrile to obtain a solution having a known concentration of about 400  $\mu$ g per mL. Transfer 10.0 mL of this solution to a 100-mL volumetric flask. Dilute with methanol to volume, and mix. The final concentration of USP Fluocinonide RS is about 40  $\mu$ g per mL.

*Assay preparation*—Transfer an accurately weighed quantity of Ointment, containing about 1.35 mg of fluocinonide, to a round-bottom, 50-mL centrifuge tube. Add 35.0 mL of methanol. Emulsify, using an ultrasonic probe, and centrifuge to bring the insoluble matter to the bottom. The clear supernatant is the *Assay preparation*.

*Chromatographic system* (see *Chromatography* (621))—Proceed as directed under *Fluocinonide Cream*, except that the flow rate for the *Mobile phase* is about 1 mL per minute.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of fluocinonide ( $C_{26}H_{32}F_2O_7$ ) in the portion of Ointment taken by the formula:

$$0.035C(r_U / r_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Fluocinonide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses due to fluocinonide obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluocinonide Topical Solution

» Fluocinonide Topical Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{26}H_{32}F_2O_7$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Fluocinonide RS

**Identification**—Transfer an amount of Topical Solution, equivalent to about 2.5 mg of fluocinonide, to a glass-stoppered, 50-mL centrifuge tube containing 5 mL of water and 10 mL of methanol, add 20 mL of cyclohexane, shake vigorously, centrifuge, and discard the upper phase. Add 20 mL of water and 5 mL of chloroform, shake vigorously, centrifuge until the lower phase is clear, and discard the upper phase. The clear chloroform extract is the *test solution*. Proceed as directed in the *Identification* test under *Fluocinonide Cream* beginning with “Apply 10  $\mu$ L of the *Test solution*.”

**Minimum fill** (755): meets the requirements.

**Alcohol content—**

*Standard solution*—Dilute 20.0 mL of USP Alcohol with methanol to volume in a 200-mL volumetric flask.

**Internal standard solution**—Dilute 20.0 mL of isopropyl alcohol with methanol to volume in a 100-mL volumetric flask.

**Test preparation**—Using a “to contain” pipet, transfer 2 mL of Topical Solution to a 100-mL volumetric flask, rinsing the pipet 3 times with methanol and collecting the rinsings in the volumetric flask. Add 5.0 mL of *Internal standard solution*, dilute with methanol to volume, and mix.

**Standard preparation**—Pipet 6 mL of the *Standard solution* and 5 mL of the *Internal standard solution* into a 100-mL volumetric flask, dilute with methanol to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 1.8-m glass column that is packed with 80- to 100-mesh packing S3. The carrier gas is nitrogen or helium, flowing at a rate of about 40 mL per minute. The injection port and detector temperatures are maintained at about 225°. The column temperature is maintained at about 130°. Chromatograph the *Standard preparation*, record the chromatogram, and determine the peak response ratio as directed for *Procedure*. Adjust the carrier gas flow rate so that the resolution,  $R$ , of alcohol and isopropyl alcohol is not less than 1.5; the tailing factor of the alcohol peak is not more than 1.25; and the relative standard deviation for peak response ratios from replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (2 µL to 3 µL) of the *Test preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage (v/v) of C<sub>2</sub>H<sub>5</sub>OH in the Topical Solution taken by the formula:

$$(0.3)(95.45)(R_U / R_S)$$

in which 95.45 is the percentage (v/v) of C<sub>2</sub>H<sub>5</sub>OH in USP Alcohol; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Test preparation* and the *Standard preparation*, respectively: between 28.4% and 39.0% of C<sub>2</sub>H<sub>5</sub>OH is present.

#### Assay—

**Mobile phase**—Use a mixture of acetonitrile and water (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fluocinonide RS in acetonitrile to obtain a solution containing about 500 µg per mL. Transfer 2.0 mL of this solution to a 25-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix to obtain a solution having a known concentration of about 40 µg of USP Fluocinonide RS per mL.

**Assay preparation**—Using a “to contain” pipet, transfer a volume of Topical Solution, equivalent to about 1 mg of fluocinonide, to a 25-mL volumetric flask, rinsing the pipet with about 5 mL of *Mobile phase*, and adding the rinsings to the volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the analyte peak is not more than 1.5; and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of C<sub>26</sub>H<sub>32</sub>F<sub>2</sub>O<sub>7</sub> in each mL of the Topical Solution taken by the formula:

$$0.025(C / V)(r_U / r_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Fluocinonide RS in the *Standard preparation*;  $V$  is the volume, in mL, of Topical Solution taken; and  $r_U$  and  $r_S$  are the peak responses due to fluocinonide obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluorescein

C<sub>20</sub>H<sub>12</sub>O<sub>5</sub> 332.31

Spiro[isobenzofuran-1(3H),9'-[9H]xanthen-3-one, 3',6'-dihydroxy-.

Fluorescein [2321-07-5].

» Fluorescein contains not less than 97.0 percent and not more than 102.0 percent of C<sub>20</sub>H<sub>12</sub>O<sub>5</sub>, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards <11>—

USP Diacetylfluorescein RS

C<sub>24</sub>H<sub>16</sub>O<sub>7</sub> 416.39

USP Fluorescein RS

**Identification, Infrared Absorption** <197K>: previously dried over silica gel for 16 hours.

**Water, Method I** <921>: not more than 1.0%.

**Zinc**—Suspend 100 mg in 10 mL of a saturated solution of sodium chloride, add 2 mL of 3 N hydrochloric acid, mix, filter, and add 1 mL of potassium ferrocyanide TS to the filtrate: no turbidity is produced.

**Acriflavine**—Suspend 10 mg in 5 mL of water, swirl the mixture, and filter. To the filtrate add a few drops of sodium salicylate solution (1 in 10): no precipitate is formed.

#### Assay—

**Standard preparation**—Dissolve about 110 mg of USP Diacetylfluorescein RS, accurately weighed, in 10 mL of alcohol contained in a 100-mL volumetric flask. Add 2 mL of 2.5 N sodium hydroxide, and heat on a steam bath at about the boiling temperature for 20 minutes, with frequent swirling. Cool, dilute with water to volume, and mix. Dilute quantitatively and stepwise with water to obtain a solution having a known concentration of about 1.1 µg of diacetylfluorescein per mL. Transfer 3.0 mL of this solution to a 100-mL volumetric flask containing 20 mL of pH 9.0 alkaline borate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), dilute with water to volume, and mix.

**Assay preparation**—Dissolve about 90 mg of Fluorescein, accurately weighed, in 10 mL of alcohol contained in a 100-mL volumetric flask. Add 2 mL of 2.5 N sodium hydroxide, and heat on a steam bath at about the boiling temperature for 20 minutes, with frequent swirling. Cool, dilute with water to volume, and mix. Dilute quantitatively and stepwise with water to obtain a solution having a concentration of 0.9 µg per mL. Transfer 3.0 mL of this solution to a 100-mL volumetric flask containing 20 mL of pH 9.0 alkaline borate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the fluorescence intensities,  $I$ , of the *Standard preparation* and the *Assay preparation* in a fluorometer at an excitation wavelength of 485 nm and an emission wavelength of 515 nm. Calculate the quantity, in mg, of  $C_{20}H_{12}O_5$  in the Fluorescein taken by the formula:

$$(332.31 / 416.39)(3333C)(I_U / I_S)$$

in which 332.31 and 416.39 are the molecular weights of fluorescein and diacetylfluorescein, respectively;  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Diacetylfluorescein RS in the *Standard preparation*; and  $I_U$  and  $I_S$  are the fluorescence values observed for the *Assay preparation* and the *Standard preparation*, respectively.

## Fluorescein Sodium

$C_{20}H_{10}Na_2O_5$  376.27

Spiro[isobenzofuran-1(3H),9'-[9H]xanthene]-3-one, 3',6'-dihydroxy, disodium salt.

Fluorescein disodium salt [518-47-8].

» Fluorescein Sodium contains not less than 90.0 percent and not more than 102.0 percent of  $C_{20}H_{10}Na_2O_5$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Diacetylfluorescein RS

$C_{24}H_{16}O_7$  416.39

**Identification**—

**A:** A solution of it is strongly fluorescent, even in extreme dilution. The fluorescence disappears when the solution is made acid, and reappears when the solution is again made alkaline.

**B:** The residue remaining after the incineration of it responds to the tests for *Sodium* (191).

**C:** Place 1 drop of a solution (1 in 2000) upon a piece of filter paper: a yellow spot is produced and, when exposed while moist to the vapor of bromine for 1 minute and then to ammonia vapor, it becomes deep pink in color.

**Water**, *Method I* (921): not more than 17.0%.

**Zinc**—Dissolve 100 mg in 10 mL of a saturated solution of sodium chloride, add 2 mL of 3 N hydrochloric acid, shake well, filter, and add 1 mL of potassium ferrocyanide TS to the filtrate: no turbidity is produced.

**Acriflavine**—Dissolve 10 mg in 5 mL of water, and add a few drops of sodium salicylate solution (1 in 10): no precipitate is formed.

**Assay**—

**Standard preparation**—Dissolve an accurately weighed quantity of USP Diacetylfluorescein RS in 10 mL of alcohol contained in a 100-mL volumetric flask. [NOTE—110.7 mg of anhydrous USP Diacetylfluorescein RS is equivalent to 100.0 mg of fluorescein sodium.] Add 2 mL of 2.5 N sodium hydroxide, and heat on a steam bath at about the boiling temperature for 20 minutes, with frequent swirling. Cool, dilute with water to volume, and mix. Transfer a suitable aliquot to a volumetric flask, and dilute with water to volume

to obtain a solution having a concentration of 1  $\mu\text{g}$  of fluorescein sodium per mL. Transfer a 3-mL aliquot to a 100-mL volumetric flask containing 20 mL of pH 9.0 alkaline borate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), dilute with water to volume, and mix. The concentration of fluorescein sodium in the *Standard preparation* is 0.03  $\mu\text{g}$  per mL.

**Assay preparation**—Dissolve about 100 mg of Fluorescein Sodium, accurately weighed, in water, and dilute quantitatively and stepwise with water to obtain a solution having a concentration of 1  $\mu\text{g}$  per mL. Transfer 3.0 mL of this solution to a 100-mL volumetric flask containing 20 mL of pH 9.0 alkaline borate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the fluorescence intensities,  $I$ , of the *Standard preparation* and the *Assay preparation* in a fluorometer at an excitation wavelength of 485 nm and an emission wavelength at 515 nm. Calculate the quantity, in mg, of  $C_{20}H_{10}Na_2O_5$  in the Fluorescein Sodium taken by the formula:

$$3333C(I_U / I_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of fluorescein sodium in the *Standard preparation*; and  $I_U$  and  $I_S$  are the fluorescence values observed for the *Assay preparation* and the *Standard preparation*, respectively.

## Fluorescein Injection

» Fluorescein Injection is a sterile solution, in Water for Injection, of Fluorescein prepared with the aid of Sodium Hydroxide. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluorescein sodium ( $C_{20}H_{10}Na_2O_5$ ). It may contain Sodium Bicarbonate.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP Diacetylfluorescein RS

$C_{24}H_{16}O_7$  416.39

**Identification**—It responds to *Identification tests A and C* under *Fluorescein Sodium*.

**Pyrogen**—It meets the requirements of the *Pyrogen Test* (151), the test dose being the equivalent of 250 mg of fluorescein sodium per kg.

**pH** (791): between 8.0 and 9.8.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

**Standard preparation**—Prepare as directed in the *Assay* under *Fluorescein Sodium*.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of fluorescein sodium, and dilute quantitatively and stepwise with water to obtain a solution having a concentration of 1  $\mu\text{g}$  per mL. Transfer 3.0 mL of this solution to a 100-mL volumetric flask containing 20 mL of pH 9.0 alkaline borate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), dilute with water to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Fluorescein Sodium*. Calculate the quantity, in mg, of

fluorescein sodium ( $C_{20}H_{10}Na_2O_5$ ) equivalent in the Injection taken by the formula:

$$3333C(I_U / I_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of fluorescein sodium in the *Standard preparation*; and  $I_U$  and  $I_S$  are the fluorescence values observed for the *Assay preparation* and the *Standard preparation*, respectively.

## Fluorescein Sodium Ophthalmic Strips

» Fluorescein Sodium Ophthalmic Strips contain not less than 100.0 percent and not more than 160.0 percent of the labeled amount of fluorescein sodium ( $C_{20}H_{10}Na_2O_5$ ).

**Packaging and storage**—Package not more than 2 Strips in a single-unit container in such manner as to maintain sterility until the package is opened. Package individual packages in a second protective container.

**Labeling**—The label of the second protective container bears a statement that the contents may not be sterile if the individual package has been damaged or previously opened. The label states the amount of fluorescein sodium in each Strip.

### USP Reference standards (11)—

USP Diacetylfluorescein RS

**Identification**—Cut the colored tip from 1 Strip, place it in a small test tube containing 1 mL of water, and agitate for 1 minute: the resulting solution of fluorescein sodium responds to *Identification* tests A and C under *Fluorescein Sodium*.

**Sterility** (71): meets the requirements.

**Content uniformity**—The content of  $C_{20}H_{10}Na_2O_5$  in each of not less than 10 Strips, determined as directed in the *Assay*, is not less than 85.0% and not more than 175.0% of the labeled amount.

### Assay—

*Standard preparation*—Prepare as directed in the *Assay* under *Fluorescein Sodium*.

*Assay preparation*—Remove 1 Strip from its package, taking care not to allow any portion of the tip to adhere to the packaging material, transfer to a 100-mL volumetric flask, add 50 mL of water, shake the flask vigorously, and dilute with water to volume. Shake occasionally, and, after 1 hour, mix the contents of the flask. Transfer an aliquot ( $V$ ) of this solution, equivalent to about 100  $\mu\text{g}$  of fluorescein sodium, to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 3 mL of the resulting solution to a 100-mL volumetric flask containing 20 mL of pH 9.0 alkaline borate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), dilute with water to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Fluorescein Sodium*. Calculate the quantity, in mg, of fluorescein sodium ( $C_{20}H_{10}Na_2O_5$ ) in the Strip taken by the formula:

$$(333)(C/V)(I_U / I_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of fluorescein sodium in the *Standard preparation*;  $V$  is the volume of the aliquot of solution taken for the *Assay preparation*; and  $I_U$  and  $I_S$  are the fluorescence intensities observed for the *Assay preparation* and the *Standard preparation*, respectively. Calculate the average content from the individual assays of not less than 10 Strips.

## Fluorescein Sodium and Benoxinate Hydrochloride Ophthalmic Solution

» Fluorescein Sodium and Benoxinate Hydrochloride Ophthalmic Solution is a sterile aqueous solution of Fluorescein Sodium and Benoxinate Hydrochloride. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amounts of fluorescein sodium ( $C_{20}H_{10}Na_2O_5$ ) and benoxinate hydrochloride ( $C_{17}H_{28}N_2O_3 \cdot \text{HCl}$ ). It contains a suitable preservative.

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Benoxinate Hydrochloride RS

USP Diacetylfluorescein RS

### Identification—

**A:** It responds to *Identification* test A under *Fluorescein Sodium*.

**B:** The relative retention times of the major peaks in the chromatogram of the *Assay* correspond to those in the chromatograms of the *Standard fluorescein sodium preparation* and the *Standard benoxinate hydrochloride preparation* as obtained in the *Assay*.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 4.3 and 5.3.

### Assay—

*Mobile phase*—Dissolve 100 mg of sodium 1-pentanesulfonate in 40 mL of glacial acetic acid in a 2000-mL volumetric flask. Add 600 mL of acetonitrile and 10 mL of triethanolamine, dilute with water to volume, and mix. Adjust with phosphoric acid to a pH of 3, and pass through a filter having a 0.5- $\mu\text{m}$  or finer porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard fluorescein sodium preparation*—Transfer about 55 mg of USP Diacetylfluorescein RS, accurately weighed, to a 50-mL volumetric flask containing 5 mL of alcohol. Add 1 mL of 2.5 N sodium hydroxide, and heat on a steam bath at about the boiling temperature for 20 minutes, with frequent swirling. Cool, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains the equivalent of about 0.1 mg of fluorescein sodium per mL.

*Standard benoxinate hydrochloride preparation*—Quantitatively dissolve an accurately weighed quantity of USP Benoxinate Hydrochloride RS in *Mobile phase*, and if necessary dilute quantitatively and stepwise with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL,  $J$  being the ratio of the labeled amount, in mg, of benoxinate hydrochloride to the labeled amount, in mg, of fluorescein sodium in each mL of Ophthalmic Solution.

*Assay preparation*—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 5 mg of fluorescein sodium, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard fluorescein sodium preparation* and the *Standard benoxinate hydrochloride preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for each

analyte peak is not more than 2.0, and the relative standard deviation for replicate injections of each *Standard preparation* is not more than 2.0%.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 25  $\mu$ L) of the *Standard fluorescein sodium preparation*, the *Standard benoxinate hydrochloride preparation*, and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of fluorescein sodium ( $C_{20}H_{10}Na_2O_5$ ) in each mL of Ophthalmic Solution taken by the formula:

$$(376.28 / 416.39)(W / 10V)(r_U / r_S)$$

in which 376.28 and 416.39 are the molecular weights of fluorescein sodium and diacetylfluorescein, respectively; *W* is the quantity, in mg, of USP Diacetylfluorescein RS taken to prepare the *Standard fluorescein sodium preparation*; *V* is the volume, in mL, of Ophthalmic Solution taken; and  $r_U$  and  $r_S$  are the fluorescein peak responses obtained from the *Assay preparation* and the *Standard fluorescein sodium preparation*, respectively. Calculate the quantity, in mg, of benoxinate hydrochloride ( $C_{17}H_{28}N_2O_3 \cdot HCl$ ) in each mL of Ophthalmic Solution taken by the formula:

$$50(C / V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Benoxinate Hydrochloride RS in the *Standard benoxinate hydrochloride preparation*; *V* is the volume, in mL, of Ophthalmic Solution taken; and  $r_U$  and  $r_S$  are the benoxinate peak responses obtained from the *Assay preparation* and the *Standard benoxinate hydrochloride preparation*, respectively.

## Fluorescein Sodium and Proparacaine Hydrochloride Ophthalmic Solution

» Fluorescein Sodium and Proparacaine Hydrochloride Ophthalmic Solution is a sterile aqueous solution of Fluorescein Sodium and Proparacaine Hydrochloride. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of fluorescein sodium ( $C_{20}H_{10}Na_2O_5$ ) and proparacaine hydrochloride ( $C_{16}H_{26}N_2O_3 \cdot HCl$ ). It contains a suitable preservative.

**Packaging and storage**—Preserve in tight, light-resistant containers, preferably of Type I amber glass, and store in a refrigerator.

**Labeling**—Label it to state that it is to be stored in a refrigerator before and after the container is opened.

**USP Reference standards** (11)—

USP Diacetylfluorescein RS

$C_{24}H_{16}O_7$  416.39

USP Proparacaine Hydrochloride RS

**Identification**—

**A:** It responds to *Identification test A* under *Fluorescein Sodium*.

**B:** It responds to the *Identification test* under *Proparacaine Hydrochloride Ophthalmic Solution*.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 4.0 and 5.2.

**Assay for fluorescein sodium**—

**Standard preparation**—Prepare as directed in the *Assay* under *Fluorescein Sodium*.

**Assay preparation**—Using Ophthalmic Solution, prepare as directed in the *Assay* under *Fluorescein Sodium*.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Fluorescein Sodium*. Calculate the quantity, in mg, of fluorescein sodium ( $C_{20}H_{10}Na_2O_5$ ) in the volume of Ophthalmic Solution taken by the formula:

$$3333C(I_U / I_S)$$

in which the terms are as defined therein.

**Assay for proparacaine hydrochloride**—

**Standard preparation**—Prepare as directed for *Standard preparation* in the *Assay* under *Proparacaine Hydrochloride Ophthalmic Solution*.

**Assay preparation**—Using Ophthalmic Solution, prepare as directed for *Assay preparation* under *Proparacaine Hydrochloride Ophthalmic Solution*.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Proparacaine Hydrochloride Ophthalmic Solution*. Calculate the quantity, in mg, of proparacaine hydrochloride ( $C_{16}H_{26}N_2O_3 \cdot HCl$ ) in each mL of Ophthalmic Solution taken by the formula:

$$100(C / V)(r_U / r_S)$$

in which the terms are as defined therein.

## Fludeoxyglucose F 18 Injection

» Fludeoxyglucose F 18 Injection is a sterile, aqueous solution, suitable for intravenous administration, of 2-deoxy-2-[ $^{18}F$ ]fluoro-D-glucose in which a portion of the molecules are labeled with radioactive  $^{18}F$  (see *Positron Emission Tomography Drugs for Compounding, Investigational, and Research Uses* (823)). It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{18}F$  expressed in MBq (mCi) per mL at the time indicated in the labeling. It may contain suitable preservatives and/or stabilizing agents.

**Specific activity:** no carrier added.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers that are adequately shielded.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injection* (1): the time and date of calibration; the amount of  $^{18}F$  as fludeoxyglucose expressed as total MBq (mCi) per mL, at time of calibration; the expiration time and date; the name and quantity of any added preservative or stabilizer; and the statement "Caution—Radioactive Material." The labeling indicates, that in making dosage calculations, correction is to be made for radioactive decay. The radioactive half-life of  $^{18}F$  is 109.7 minutes. The label indicates "Do not use if cloudy or if it contains particulate matter."

**USP Reference standards** (11)—

USP Endotoxin RS

USP Fludeoxyglucose RS

USP Fludeoxyglucose Related Compound A RS  
4,7,13,16,21,24-Hexaoxa-1,10-diazabicyclo[8.8.8.]hex-  
acosane.  
 $C_{18}H_{36}N_2O_6$   
USP Fludeoxyglucose Related Compound B RS  
 $C_6H_{11}ClO_5$  198.60

### Identification—

**A: Radionuclidic identity**—Its half-life, determined using a suitable detector system (see *Radioactivity* (821)), is between 105 and 115 minutes.

**B: Radiochemical identity**—The  $R_f$  value of Fludeoxyglucose F 18 in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution*, as obtained in the *Radiochemical purity* test.

**Bacterial endotoxins** (85) (see *Sterilization and Sterility Assurance* under *Positron Emission Tomography Drugs for Compounding, Investigational, and Research Uses* (823))—It contains not more than 175/V USP Endotoxin Unit per mL of the Injection, in which V is the maximum administered total dose, in mL, at the expiration time.

**pH** (791): between 4.5 and 7.5.

### Radiochemical purity—

**Standard solution**—Dissolve 10 mg of USP Fludeoxyglucose RS in 100 mL of acetonitrile and water (95:5). (The USP Fludeoxyglucose RS that is specified in this test is nonradioactive 2-deoxy-2-fluoro-D-glucose [molecular weight 182.15].)

**Test solution**—Use the Injection.

**Procedure**—Apply a volume of Injection, appropriately diluted such that it provides a count rate suitable for the radioactivity detection system being utilized, to an activated silica gel thin-layer chromatographic plate (see *Chromatography* (621)). Apply about 10  $\mu$ L of the *Standard solution* to the same chromatographic plate. Develop the chromatogram in a solvent system consisting of a mixture of acetonitrile and water (95:5) until the solvent has moved about three-fourths of the length of the plate. Remove the plate, and allow the chromatogram to dry. Determine the radioactivity distribution by scanning the chromatogram with a suitable collimated radiation detector. Determine the location of the Fludeoxyglucose by spraying the developed chromatographic plate with 2 N sulfuric acid and heating the plate at 110° for 10 minutes: the  $R_f$  value of Fludeoxyglucose F 18 (determined by radiochromatogram scanning) corresponds to that of the *Standard solution* (about 0.4); the radioactivity of Fludeoxyglucose F 18 is not less than 90% of the total radioactivity.

**Radionuclidic purity**—Using a suitable gamma-ray spectrometer (see *Selection of a Counting Assembly* under *Radioactivity* (821)), count an appropriate aliquot of the Injection for a period of time sufficient to collect a gamma spectrum. The resultant gamma spectrum should be analyzed for the presence of identifiable photopeaks which are not characteristic of  $^{18}F$  emissions. Not less than 99.5% of the observed gamma emissions should correspond to the 0.511 MeV, 1.022 MeV, or Compton scatter peaks of  $^{18}F$ .

**Chemical purity**—[NOTE—The methods and limits described in this section relate to potential impurities associated with the acid-hydrolysis method of synthesis for the Injection. Specific examples include aminopolyether (Kryptofix®) and 2-chloro-2-deoxy-D-glucose. If methods of synthesis that may result in different impurities are used, the presence of unlabeled ingredients, reagents, and by-products specific to the process must be controlled, and their potential for physiological or pharmacological effects must be considered (see *Positron Emission Tomography Drugs for Compounding, Investigational, and Research Uses* (823)). Any ingredients with toxic potential must be within appropriate limits, and conformance with these limits is to be demonstrated by the use of one or more validated limit tests.]

**LIMIT OF AMINOPOLYETHER**—[NOTE—This test must be performed for Fludeoxyglucose F 18 produced by any route of synthesis that uses this reagent.]

**Absorbent:** 0.25-mm layer of chromatographic silica gel.<sup>1</sup>

**Test solution**—Use the Injection.

**Standard solution**—Dissolve an accurately weighed quantity of USP Fludeoxyglucose Related Compound A RS in saline TS to obtain a solution having a known concentration of 50  $\mu$ g per mL.

**Application volume:** about 1  $\mu$ L.

**Developing solvent system:** a mixture of methanol and 30% ammonium hydroxide (9:1).

**Procedure**—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). Place the plate in a chamber containing iodine crystals. Develop the plate until a spot is visible on the chromatogram of the *Standard solution*: the size and intensity of the spot obtained from the *Test solution* does not exceed that obtained from the *Standard solution*.

**LIMIT OF 2-CHLORO-2-DEOXY-D-GLUCOSE**—[NOTE—This test is performed when the nucleophilic synthesis includes hydrolysis with hydrochloric acid or the use of anionic exchange resins in the chloride form to trap fluoride  $^{18}F$  released from the target prior to its use in the synthesis of Fludeoxyglucose F 18.]

**Mobile phase**—Dissolve about 16 g of 50% sodium hydroxide solution in 1000 mL of water, filter, and degas by sparging with helium.

**System suitability solution**—Dissolve accurately weighed quantities of USP Fludeoxyglucose RS and USP Fludeoxyglucose Related Compound B RS in *Mobile phase* to obtain a solution having known concentrations of 1.0 mg per mL and 0.1 mg per mL, respectively.

**Standard solution**—Dissolve an accurately weighed quantity of USP Fludeoxyglucose Related Compound B RS in water to obtain a solution having a known concentration of 0.1 mg per mL.

**Test solution**—Use the Injection.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a pulsed amperometric detector and a 4.0-mm  $\times$  25-cm column that contains 10- $\mu$ m packing L46. The flow rate is adjusted to about 0.5 mL per minute. Chromatograph the *Standard solution* and the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between fludeoxyglucose and fludeoxyglucose related compound B is not less than 1.5; and the relative standard deviation for replicate injections is not more than 5%.

**Procedure**—Separately inject equal volumes (about 100  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of 2-chloro-2-deoxy-D-glucose in each mL of the Injection taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Fludeoxyglucose Related Compound B RS in the *Standard solution*; and  $r_U$  and  $r_S$  are the 2-chloro-2-deoxy-D-glucose peak areas obtained from the *Test solution* and the *Standard solution*, respectively: not more than 1 mg per dose is found.

### Residual solvents—

**Standard solutions**—Prepare separate aqueous solutions of ether, acetonitrile, and dehydrated alcohol having known concentrations of 0.1%, 0.01%, and 0.1%, respectively.

<sup>1</sup> Available from Alltech Associates, Inc., 2051 Waukegan Rd., Deerfield, IL 60015 as Machery Nagel SILG/UV 254 4  $\times$  8 cm, Alltech catalog No. 805021.

**Test solutions**—Use the Injection.

**Chromatographic system** (see *Chromatography* <621>)—The gas chromatograph is equipped with a flame-ionization detector, a splitless injector system, and a 0.53-mm × 30-m fused-silica column coated with a 0.25-μm, chemically cross-linked G16 stationary phase. The carrier gas is helium, flowing at a rate of 10 mL per minute. (Nitrogen may be used as a makeup gas.) The chromatograph is programmed as follows. Initially the temperature is maintained at 40° for 2 minutes, then the temperature is increased at a rate of 20° per minute to 130°, and maintained at 130° for 5.5 minutes. The injection port and detector temperatures are maintained at 250° and 300°, respectively. Inject the *Standard solutions*, and record the identity peak responses as directed for *Procedure*: the resolution,  $R$ , between any two components is not less than 1.0; and the relative standard deviation for replicate injections is not more than 5%.

**Procedure**—Separately inject equal volumes (about 1 μL) of the *Standard solutions* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of acetonitrile, ether, and alcohol in the Injection by the formula:

$$C(r_i / r_s)$$

in which  $C$  is the percentage of the relevant analyte in the *Standard solution*; and  $r_i$  and  $r_s$  are the peak responses of the relevant analyte obtained from the *Test solution*, if any, and the *Standard solution*, respectively: not more than 0.04% of acetonitrile is found; not more than 0.5% of ether is found; and not more than 0.5% of alcohol is found.

**Other requirements**—It meets the requirements under *Injections* <1>, except that the Injection may be distributed or dispensed prior to completion of the test for *Sterility* <71>, the latter test being started within 24 hours of final manufacture, and except that it is not subject to the recommendation of *Container Content*.

**Assay for radioactivity**—Using a suitable calibrated system as directed under *Radioactivity* <821>, determine the radioactivity in MBq (or mCi) per mL, of the Injection.

## Fluorodopa F 18 Injection

» Fluorodopa F 18 Injection is a sterile aqueous solution, suitable for intravenous administration of 6-[<sup>18</sup>F]fluorodopa in which a portion of the molecules are labeled with radioactive <sup>18</sup>F (see *Positron Emission Tomography Drugs for Compounding, Investigational, and Research Uses* <823>). It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of <sup>18</sup>F expressed in MBq (or mCi) per mL at the time indicated in the labeling. It may contain suitable preservatives and/or stabilizing agents.

### Specific activity—

**Mobile phase, Standard solution, Test solution, and Chromatographic system**—Proceed as directed in the test for *Radiochemical purity*.

**Procedure**—Separately inject equal volumes (about 50 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the concentration of

L-fluorodopa found, in mg per mL, in the Injection by the formula:

$$C(r_u / r_s)$$

in which  $C$  is the concentration of the *Standard solution*; and  $r_u$  and  $r_s$  are the peak responses of the *Test solution* and the *Standard solution*, respectively. Determine the concentration of fluorodopa F 18, in mCi per mL, as directed in the *Assay for radioactivity*. Calculate the *Specific activity* by dividing the result from the *Assay* (in mCi per mL) by the concentration (in mg per mL): it is not less than 0.463 mCi per mg of L-fluorodopa ( $3.7 \times 10^3$  MBq [100 mCi] per mmol).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers that are adequately shielded.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* <1>: the time and date of calibration; the amount of <sup>18</sup>F as fluorodopa expressed as total MBq (or mCi) per mL, at time of calibration; the expiration time and date; the name and quantity of any added preservative or stabilizer; and the statement "Caution—Radioactive Material". The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay. The radioactive half-life of <sup>18</sup>F is 109.7 minutes. The label also includes the statement "Do not use if cloudy or if it contains particulate matter."

### USP Reference standards <11>—

USP Endotoxin RS

USP L-Fluorodopa RS

### Radionuclidic identification (see *Radioactivity* <821>)—

**A:** Its half-life, determined using a suitable detector system, is between 105 and 115 minutes.

**B:** *Radiochemical identity*—The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution*, as obtained in the test for *Radiochemical purity*.

**Bacterial endotoxins** <85>: not more than 175/V USP Endotoxin Unit per mL of Injection, in which  $V$  is the maximum administered total dose, in mL, at the expiration time.

**pH** <791>: between 4.0 and 5.5.

### Radiochemical purity—

**Mobile phase**—Prepare a filtered and degassed mixture of 0.1% acetic acid and methanol (97:3).

**Standard solution**—Dissolve an accurately weighed quantity of USP L-Fluorodopa RS in 10 mmol of pH 4.5 sodium acetate buffer, and dilute quantitatively, and stepwise if necessary, with the same buffer to obtain a solution having a known concentration of about 0.1 mg per mL.

**Test solution**—Use the Injection diluted with water such that it provides a count rate of about  $5 \times 10^5$  counts per minute.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 4.6-mm × 30-cm column that contains packing L1, a radioactivity detector, and a variable wavelength UV detector operating in the range of 260 to 290 nm. The flow rate is about 0.8 mL per minute. Chromatograph the *Test solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Prepare a mixture of the *Test solution* and the *Standard solution* and inject about 50 μL into the chromatograph, record the chromatograms, and measure the areas for both the radioactive and nonradioactive peaks. The ratio and injected volume may be adjusted to obtain suitable detection system sensitivity. The radioactivity of the major peak is not less than 90% of the total radioactivity measured, and no individual radiochemical impurity is more than 2%. The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution*. [NOTE—The typical re-

tention time for fluorodopa is about 6 minutes. Retention times are very sensitive to the pH of the solvent.]

**Radionuclidic purity**—Using a suitable gamma-ray spectrometer (see *Selection of a Counting Assembly* under *Radioactivity* (821)), count an appropriate aliquot of Injection for a period of time sufficient to obtain a gamma spectrum. The resultant gamma spectrum should be analyzed for the presence of identifiable photopeaks which are not characteristic of F 18 emissions. Not less than 99.5% of the gamma emissions should correspond to the 0.511 MeV, 1.022 MeV, or Compton scatter peaks of F 18, with no individual impurity peaks present above 0.1%.

**Chemical purity**—The methods and limits described in this section relate to potential impurities associated with commonly used methods of synthesis for Fluorodopa F 18 Injection. If methods of synthesis are used that may result in different impurities, the presence of unlabeled ingredients, reagents, and by-products specific to the process must be controlled and then potential for physiological or pharmacological effects must be considered.

**LIMIT OF ORGANOTIN** (to be determined if tin-containing starting materials or reagents are used in the synthesis)—

**Mobile phase**—Prepare a filtered and degassed 5  $\mu$ mol solution of morin in a mixture of toluene, acetic acid, methanol, and acetonitrile (91:5:2:2).

**Standard solution**—Prepare a mixture of 10 mmol each of dimethyltin dibromide and trimethyltin bromide in alcohol.

**Test solution**—Use the Injection.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a fluorescence detector (excitation at 420 nm and detection at 500 nm) and a 4.6-mm  $\times$  25-cm column that contains packing L32. The flow rate is about 1 mL per minute.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. The volume of Injection in the *Standard solution* and the *Test solution* may be adjusted to obtain suitable detection system sensitivity. Calculate the concentration, in  $\mu$ g per mL, of dimethyltin and trimethyltin in the portion of Injection taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in  $\mu$ g per mL, of the relevant organotin compound in the *Standard solution*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.5  $\mu$ g per mL of dimethyltin and trimethyltin is found.

**LIMIT OF MERCURY** (to be determined if mercury-containing starting materials or reagents are used in the synthesis)—  
[Caution—Because of the toxic nature of mercury vapor, great care must be taken to avoid inhaling it. A bypass has been included in the system, therefore, either to vent the mercury vapor into an exhaust hood or to pass the vapor through some absorbing media such as a solution containing equal volumes of 0.1 M potassium permanganate and dilute sulfuric acid (1 in 10).]

**Apparatus**—Use a flameless atomic absorption spectrophotometer for measuring radiation at 253.7 nm emitted by mercury vapor.

**Stannous chloride suspension**—Add 25 g of stannous chloride to 250 mL of 0.5 N sulfuric acid. This mixture is a suspension and is to be stirred continuously during use.

**Sodium chloride-hydroxylamine hydrochloride solution**—Dissolve 12 g of sodium chloride and 12 g of hydroxylamine hydrochloride in water, dilute with water to 100 mL, and mix.

**Mercury stock solution**—Dissolve 135.4 mg of mercuric chloride, accurately weighed, in 75 mL of water. Add 10 mL

of nitric acid, dilute with water to 100.0 mL, and mix. Each mL of this solution contains 1 mg of mercury.

**Mercury standard solution**—Before using, make successive dilutions of the *Mercury stock solution* with water to obtain a *Mercury standard solution* containing 0.1  $\mu$ g per mL.

**Calibration**—To six 300-mL glass-stoppered bottles, transfer, respectively, 0-, 0.5-, 1.0-, 2.0-, 5.0-, and 10.0-mL aliquots of the *Mercury standard solution* containing 0  $\mu$ g to 1.0  $\mu$ g of mercury. To each bottle add water to make 100 mL, mix, and add 5 mL of sulfuric acid and 2.5 mL of nitric acid. Add 15 mL of potassium permanganate solution (1 in 20). Allow to stand for 15 minutes. Add 8 mL of potassium persulfate solution (1 in 20), and heat in a water bath at 95° for 2 hours. Cool, and add 6 mL of *Sodium chloride-hydroxylamine hydrochloride solution* to reduce the excess permanganate. When the solution has been decolorized, wait for 30 seconds and add 5 mL of *Stannous chloride suspension*. Immediately attach the flask to the aeration apparatus to form a closed system. Allow the sample to stand without manual agitation. The circulating pump, previously adjusted to a rate of 1 L per minute, is allowed to run continuously. The absorbance will increase and reach a maximum within 30 seconds. As soon as the recorder pen levels off, in about 1 minute, open the bypass valve and continue the aeration until the absorbance returns to its minimum value. Close the bypass valve, remove the stopper and frit from the bottle, and continue the aeration. Plot a standard curve of the peak height versus micrograms of mercury.

**Test preparation**—Transfer 1.0 mL of Injection to a 300-mL glass-stoppered bottle, and proceed as directed under *Calibration*, beginning with "To each bottle add water". Measure the absorbance of the solution, and determine the quantity, in  $\mu$ g, of mercury in the *Test preparation* from the standard curve: not more than 0.5  $\mu$ g is found.

#### Enantiomeric purity—

**Mobile phase**—Prepare a filtered and degassed mixture of 100 mmol of monobasic potassium phosphate and 2 mmol of cupric sulfate (1:1). Adjust to a pH of 4.6. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Use the *Standard solution* as directed under *Radiochemical purity*.

**Test solution**—Use the Injection.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph as directed under *Radiochemical purity* is equipped with a 4.6-mm  $\times$  25-cm column that contains packing L32. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the capacity factors,  $k'$ , for the D- and L-isomers are not less than 2.1 and 7.3, respectively.

**Procedure**—Prepare a mixture of the *Test solution* and the *Standard solution*, and inject about 50  $\mu$ L into the chromatograph, record the chromatograms, and measure the areas for both the radioactive and nonradioactive peaks. The ratio and injected volume may be adjusted to obtain suitable detection system sensitivity. The radioactivity of the L-isomer is not less than 95%.

**Other requirements**—It meets the requirements under *Injections* (1), except that the Injection may be distributed or dispensed prior to completion of the test for *Sterility* (71); the latter being started within 24 hours of final manufacture, and except that it is not subject to the recommendation on *Container Content*.

**Assay for radioactivity**—Using a suitable calibrated system as directed under *Radioactivity* (821), determine the radioactivity, in MBq (or mCi) per mL, of Injection.

## Sodium Fluoride F 18 Injection

» Sodium Fluoride F 18 Injection is a sterile solution, suitable for intravenous administration, of sodium fluoride in Sodium Chloride Injection in which a portion of the molecules are labeled with radioactive  $^{18}\text{F}$  (see *Positron Emission Tomography Drugs for Compounding, Investigational, and Research Uses* (823)). It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{18}\text{F}$  expressed in megabecquerels (or in millicuries) per mL at the time indicated in the labeling.

**Specific activity:** no carrier added.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers that are adequately shielded.

**Labeling**—Label container to include the following, in addition to the information specified for *Labeling* under *Injections* (1): the time and date of calibration; the amount of  $^{18}\text{F}$  as fluoride anion expressed as MBq (or mCi) per mL, at time of calibration; total activity at time of calibration; the expiration time and date; and the statements "Caution—Radioactive Material" and "Do not use if cloudy or if it contains particulate matter." Label it to indicate that the radioactive half-life of  $^{18}\text{F}$  is 109.7 minutes, and that in making dosage calculations, correction is to be made for radioactive decay.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Sodium Fluoride RS

**Radionuclide identification** (see *Radioactivity* (821))—

**A:** Its half-life, determined using a suitable detector system, is between 105 and 115 minutes.

**B:** *Radiochemical identity*—The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution*, as obtained in the test for *Radiochemical purity*.

**Bacterial endotoxins** (85)—It contains not more than 175/V USP Endotoxin Unit per mL of the Injection, in which V is the maximum administered total dose, in mL, at the expiration time. It also meets the requirements of *Quality Control under Positron Emission Tomography Drugs for Compounding, Investigational, and Research Uses* (823).

**Sterility** (71): meets the requirements.

**pH** (791): between 4.5 and 8.0.

**Chemical purity**—This article may be synthesized by different methods and processes and may, therefore, may contain different impurities. The presence of unlabeled ingredients, reagents, and by-products specific to the process must be controlled, and their potential for physiological or pharmacological effects must be considered.

**Radiochemical purity**—

*Mobile phase*—Prepare a filtered and degassed solution of 0.003 N sulfuric acid in water.

*Standard solution*—Dissolve an accurately weighed quantity of USP Sodium Fluoride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.1 mg per mL.

*Test solution*—Use the Injection.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a flow-through gamma ray detector, a conductivity detector, and a 10-mm  $\times$  25-cm column that contains 10- $\mu\text{m}$  packing L31. The flow rate is about 0.8 mL per minute. Chromatograph the *Test solution*, and record the peak responses as directed for *Pro-*

*cedure*: the relative standard deviation for replicate injections is not more than 5%.

*Procedure*—Prepare a solution of the *Test solution* and the *Standard solution*, inject about 50  $\mu\text{L}$  of the combined solution into the chromatograph, record the chromatograms, and measure the areas for both the radioactive and nonradioactive peaks (the injection volume may be adjusted to obtain suitable detection system sensitivity): the radioactivity of the major peak is not less than 95% of the total radioactivity measured; and the retention time of the *Test solution* corresponds to the retention time (about 8 minutes) of the *Standard solution*.

**Radionuclide purity**—Using a suitable gamma-ray spectrometer (see *Selection of a Counting Assembly under Radioactivity* (821)), count an appropriate aliquot of Injection for a period of time sufficient to obtain a gamma spectrum. The resultant gamma spectrum should be analyzed for the presence of identifiable photopeaks which are not characteristic of  $^{18}\text{F}$  emission: not less than 99.5% of the gamma emissions correspond to the 0.511 MeV, 1.022 MeV, or Compton scatter peaks of  $^{18}\text{F}$ .

**Other requirements**—It meets the requirements under *Injections* (1), except that the Injection may be distributed or dispensed prior to completion of the test for *Sterility* (71), the latter test started within 24 hours of final manufacture, and except that it is not subject to the recommendation on *Container Content*.

**Assay for radioactivity**—Using a suitable calibrated system as directed under *Radioactivity* (821), determine the radioactivity, in MBq (or MCi) per mL, of Injection.

## Fluorometholone

$\text{C}_{22}\text{H}_{29}\text{FO}_4$  376.46

Pregna-1,4-diene-3,20-dione, 9-fluoro-11,17-dihydroxy-6-methyl-, (6 $\alpha$ ,11 $\beta$ )-.

9-Fluoro-11 $\beta$ ,17-dihydroxy-6 $\alpha$ -methylpregna-1,4-diene-3,20-dione [426-13-1].

» Fluorometholone contains not less than 97.0 percent and not more than 103.0 percent of  $\text{C}_{22}\text{H}_{29}\text{FO}_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Fluorometholone RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 10  $\mu\text{g}$  per mL.

*Medium:* methanol.

Absorptivities at 239 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** Prepare a solution in methanol containing 500  $\mu\text{g}$  per mL. Apply 100  $\mu\text{L}$  of this solution and 100  $\mu\text{L}$  of a methanol solution of USP Fluorometholone RS containing 500  $\mu\text{g}$  per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 250- $\mu\text{m}$  layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a

mixture of methylene chloride and acetone (4:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the specimen solution corresponds to that obtained from the Standard solution.

**Specific rotation** (781S): between +52° and +60°.

*Test solution:* 10 mg per mL, in pyridine.

**Loss on drying** (731)—Dry it in vacuum at 60° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

#### Assay—

*Mobile phase*—Prepare a suitable filtered solution of methanol and water (60:40) such that the retention time of fluorometholone is about 3 minutes.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Fluorometholone RS in *Mobile phase* to obtain a solution having a known concentration of about 100 µg per mL.

*Assay preparation*—Transfer about 20 mg of Fluorometholone, accurately weighed, to a 200-mL volumetric flask, add *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph six replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, using a suitable microsyringe or sampling valve, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{22}H_{29}FO_4$  in the portion of Fluorometholone taken by the formula:

$$0.2C(r_U / r_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Fluorometholone RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluorometholone Acetate

$C_{24}H_{31}FO_5$  418.50

Pregna-1,4-diene-3,20-dione, 17-(acetyloxy)-9-fluoro-11-hydroxy-6-methyl-, (6 $\alpha$ ,11 $\beta$ )-.

9-Fluoro-11 $\beta$ ,17-dihydroxy-6 $\alpha$ -methylpregna-1,4-diene-3,20-dione, 17 acetate [3801-06-7].

» Fluorometholone Acetate contains not less than 98.0 percent and not more than 101.0 percent of  $C_{24}H_{31}FO_5$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Fluorometholone RS

USP Fluorometholone Acetate RS

#### Identification—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U).

*Solution:* 10 µg per mL.

*Medium:* methanol.

**Specific rotation** (781S): between +25.0° and +31.0°.

*Test solution:* 20 mg per mL, in chloroform.

**Loss on drying** (731)—Dry in vacuum at 60° for 3 hours: it loses not more than 1.0% of its weight.

#### Related compounds—

*Mobile phase*, *System suitability solution*, and *Chromatographic system*—Prepare as directed in the *Assay*.

*Standard solution*—Dissolve an accurately weighed quantity of USP Fluorometholone RS in methanol, and dilute quantitatively and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.03 mg per mL.

*Test solution*—Use the *Assay preparation*.

*Blank*—Use acetonitrile.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Blank*, the *Standard solution*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. [NOTE—Allow the elution to continue for about two and a half times the elution time of the fluorometholone acetate peak before making the next injection.]

Calculate the percentage of fluorometholone or fluorometholone diacetate in the portion of Fluorometholone Acetate taken by the formula:

$$100 \times 50 \times (1/F)(C/W)(r_U / r_S)$$

in which  $F$  is the relative response factor (see values in the accompanying *Table*);  $C$  is the concentration, in mg per mL, of USP Fluorometholone RS in the *Standard solution*;  $W$  is the weight, in mg, taken to prepare the *Test solution*;  $r_U$  is the fluorometholone or fluorometholone diacetate peak height response obtained from the *Test solution*; and  $r_S$  is the fluorometholone peak height response obtained from the *Standard solution*.

Calculate the percentage of all other fluorometholone acetate impurities in the portion of Fluorometholone Acetate taken by the formula:

$$100(1/F)(r_i / r_T)$$

in which  $F$  is the relative response factor (see values in the accompanying *Table*);  $r_i$  is the peak area for each impurity (except fluorometholone and fluorometholone diacetate) obtained from the *Test solution*; and  $r_T$  is the sum of the peak areas of all impurity peaks plus the fluorometholone acetate peak obtained from the *Test solution*.

Impurity	Relative Retention Time	Relative Response Factor	Limit (%)
Fluorometholone	0.6	1.0 <sup>a</sup>	1.0
Compound SOX <sup>1</sup>	0.89	1.0	0.5
Fluorometholone Acetate	1.0	—	—
Fluorometholone Diacetate	1.39	0.45 <sup>a</sup>	1.0

<sup>3</sup>17a-Acetoxy-6a-methylpregna-1,4,9(11)-trien-3,20-dione.

<sup>4</sup>17a-Acetoxy-6a-methylpregna-1,4,7,9(11)-tetraen-3,20-dione.

<sup>a</sup>Relative to fluorometholone.

### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of water and acetonitrile (60:40). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fluorometholone Acetate RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 1.0 mg per mL.

**System suitability solution**—Prepare a solution of USP Fluorometholone RS by dissolving a quantity in methanol and diluting in acetonitrile to a final concentration of about 1 mg per mL. Mix equal volumes of this solution and the *Standard preparation*, and dilute with acetonitrile to a final concentration of about 0.03 mg per mL each for fluorometholone and fluorometholone acetate.

**Assay preparation**—Transfer about 50 mg of Fluorometholone Acetate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between fluorometholone and fluorometholone acetate is not less than 10. The column efficiency for fluorometholone acetate is not less than 10,000 theoretical plates, and the tailing factor for fluorometholone acetate is not more than 2.0. Chromatograph the *Standard preparation* and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>24</sub>H<sub>31</sub>FO<sub>5</sub> in the portion of Fluorometholone Acetate taken by the formula:

$$50C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Fluorometholone Acetate RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluorometholone Cream

» Fluorometholone Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluorometholone (C<sub>22</sub>H<sub>29</sub>FO<sub>4</sub>).

**Packaging and storage**—Preserve in collapsible tubes.

**USP Reference standards** (11)—

USP Fluorometholone RS

**Identification**—The retention ratios of the main peak to the internal standard peak obtained with the *Standard preparation* and the *Assay preparation* as directed in the *Assay* do not differ by more than 2.0%.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** (755): meets the requirements.

### Assay—

**Internal standard solution**—Dissolve fluoxymesterone in acetonitrile to obtain a solution containing about 100 μg per mL.

**Mobile solvent**—Prepare a solution containing butyl chloride, water-saturated butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (95:95:14:7:6).

**Standard preparation**—Dissolve a suitable quantity of USP Fluorometholone RS, accurately weighed, in *Internal standard solution* to obtain a solution having a known concentration of about 50 μg per mL.

**Assay preparation**—Transfer an accurately weighed quantity of Cream, equivalent to about 1 mg of fluorometholone, into a suitable container, add 20.0 mL of *Internal standard solution*, and mix.

**Procedure**—Treat 20.0 mL each of the *Standard preparation* and the *Assay preparation* in the following manner. To each add 10.0 mL of hexane, and shake for about 15 minutes, then allow the layers to separate, and centrifuge, if necessary. Using a suitable microsyringe or sampling valve, inject equal volumes of lower (acetonitrile) layers obtained from the *Standard preparation* and the *Assay preparation* into a suitable high-pressure liquid chromatograph (see *Chromatography* (621)) of the general type equipped with a detector for monitoring UV light absorption at about 254 nm, equipped with a suitable recorder, capable of providing column pressure up to about 1000 psi. The instrument contains a 4-mm × 30-cm stainless steel column that contains packing L3. In a suitable chromatogram, the resolution factor, *R* (see *Chromatography* (621)), is not less than 2.4 be-

tween peaks for fluorometholone and the internal standard, and the lowest and highest peak area ratios ( $R_S$ ) of three replicate injections of the *Standard preparation* agree within 2.0%. Calculate the quantity, in mg, of fluorometholone ( $C_{22}H_{29}FO_4$ ) in the portion of Cream taken by the formula:

$$20C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Fluorometholone RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak area ratios of the fluorometholone peak and the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluorometholone Ophthalmic Suspension

» Fluorometholone Ophthalmic Suspension is a sterile suspension of Fluorometholone in a suitable aqueous medium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluorometholone ( $C_{22}H_{29}FO_4$ ). It may contain suitable stabilizers, buffers, and antimicrobial agents.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—  
USP Fluorometholone RS

**Identification**—Mix 1 mL of the well-shaken Ophthalmic Suspension with 2 mL of a mixture of methanol and water (3:2) until a solution is obtained. Apply 20- $\mu$ L portions of this solution and of a Standard solution of USP Fluorometholone RS in the same solvent containing 500  $\mu$ g per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)), coated with a 0.25-mm layer of chromatographic silica gel mixture and previously activated by heating at 80° for 5 minutes. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of methylene chloride and acetone (4:1) until the solvent front has moved not less than 15 cm. Remove the plate from the developing chamber, mark the solvent front, and allow to air-dry. Examine the plate under short-wavelength UV light: the  $R_f$  value and intensity of the principal spot obtained from the test solution correspond to those obtained from the Standard solution.

**Sterility** (71): meets the requirements.

**pH** (791): between 6.0 and 7.5.

**Assay**—

*Mobile phase*—Prepare a suitable filtered solution of methanol and water (60:40) such that the retention time of fluorometholone is about 3 minutes.

*Standard preparation*—Using a suitable quantity of USP Fluorometholone RS, accurately weighed, prepare a solution in methanol containing 0.5 mg per mL. Pipet 10 mL of this solution and 5 mL of water into a 50-mL volumetric flask. Dilute with methanol to volume, and mix to obtain a *Standard preparation* having a known concentration of about 100  $\mu$ g per mL.

*Assay preparation*—Pipet a volume of well-shaken Ophthalmic Suspension, equivalent to about 5 mg of fluorometholone, into a 50-mL volumetric flask, dilute with methanol to volume, and mix. Pass through a 5- $\mu$ m membrane filter, and use the clear filtrate.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph six replicate injections of the *Standard preparation*, and record

the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, using a suitable microsyringe or sampling valve, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of fluorometholone ( $C_{22}H_{29}FO_4$ ) in the portion of Ophthalmic Suspension taken by the formula:

$$0.05C(R_U / r_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Fluorometholone RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluorouracil

$C_4H_3FN_2O_2$  130.08  
2,4(1*H*,3*H*)-Pyrimidinedione, 5-fluoro-.  
5-Fluorouracil [51-21-8].

» Fluorouracil contains not less than 98.0 percent and not more than 102.0 percent of  $C_4H_3FN_2O_2$ , calculated on the dried basis. [Caution—Great care should be taken to prevent inhaling particles of Fluorouracil and exposing the skin to it.]

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Fluorouracil RS

**Identification**—

**A:** Infrared Absorption (197M).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 10  $\mu$ g per mL.

*Medium:* pH 4.7 acetate buffer (prepared from 8.4 g of sodium acetate and 3.35 mL of glacial acetic acid mixed with water to make 1000 mL).

Absorptivities at 266 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** To 5 mL of a solution (1 in 100) add 1 mL of bromine water TS: the bromine color is discharged.

**Loss on drying** (731)—Dry it in vacuum over phosphorus pentoxide at 80° for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.002%.

**Content of fluorine**—[NOTE—All laboratory utensils used in this procedure should be scrupulously clean and free from even trace amounts of fluoride. The use of plasticware, wherever possible, in the preparation and storage of solutions and for measurement of potentials is recommended.]

*Isopropyl alcohol solution*—Dilute 295 mL of isopropyl alcohol with water to 500 mL.

*Buffer solution*—To 55 g of sodium chloride in a 1-L volumetric flask add 500 mg of sodium citrate, 255 g of sodium acetate, and 300 mL of water. Shake to dissolve, and add 115 mL of glacial acetic acid. Cool to room temperature, add 300 mL of isopropyl alcohol, dilute with water to vol-

ume, and mix. The pH of the resulting solution is between 5.0 and 5.5.

**Reagent blank**—Pipet 15 mL of 1,2-dimethoxyethane into a flat-bottom, glass-joint, 500-mL flask, and proceed as directed for *Test stock solution*, beginning with “add the contents of a 15-mL vial of sodium biphenyl solution.”

**Modified calomel reference electrode**—Mix 70 mL of a freshly prepared saturated potassium chloride solution with 30 mL of isopropyl alcohol, fill the electrode with the clear supernatant, and allow the electrode to soak in the remainder of the solution for a minimum of 2 hours before using. Store the electrode immersed in the potassium chloride-isopropyl alcohol solution when not in use.

**Standard stock solution**—Accurately weigh 2.211 g of sodium fluoride, previously dried at 150° for 4 hours, transfer to a 1-L volumetric flask, and dissolve in about 200 mL of water. Add 1 mL of sodium hydroxide solution (1 in 25), dilute with water to volume, and mix. Store this solution in plastic containers. One mL is equivalent to 1 mg of fluoride.

**Standard curve**—Dilute 10.0 mL of *Standard stock solution* with water to 100 mL. Into each of four 100-mL volumetric flasks, pipet 0.8, 1.0, 1.2, and 1.6 mL, respectively, of the resulting solution. To each flask add 15 mL of *Reagent blank*, dilute with *Buffer solution* to volume, and mix. Use these dilutions, containing, respectively, 0.8, 1.0, 1.2, and 1.6 µg per mL, to construct the standard curve as follows. Determine the potentials of each solution as directed for *Procedure*. Plot the results of fluorine concentration, as the abscissa, in mg per 100 mL versus the potential, as the ordinate, on semilogarithmic graph paper, for each of the standards. Draw the best straight line through the plotted points.

**Test stock solution**—Place 200 mg of Fluorouracil, accurately weighed, in a 250-mL volumetric flask, add about 150 mL of 1,2-dimethoxyethane, shake by mechanical means to dissolve, dilute with the same solvent to volume, and mix. Pipet 15 mL of this solution into a flat-bottom, glass-joint, 500-mL flask, add the contents of a 15-mL vial of sodium biphenyl solution through a long-stem funnel to prevent splattering, swirl the flask gently, and cover with a watch crystal. Allow to stand at room temperature for 20 minutes, then cautiously add 50.0 mL of isopropyl alcohol while swirling the flask. Add 10.0 mL of 30 percent hydrogen peroxide and 4.0 mL of 1 N sodium hydroxide, and connect the flask to a water-cooled reflux condenser that has previously been cleaned with water and isopropyl alcohol and dried. Place the flask on a hot plate, set at about 245°, and reflux for 1 hour. Cool to room temperature, rinse the condenser with 15 mL of *Isopropyl alcohol solution*, transfer the contents of the flask to a 250-mL volumetric flask using *Isopropyl alcohol solution* as a rinse, dilute with the same solvent to volume, and mix.

**Test solution**—Pipet 15 mL of the *Test stock solution* into a 100-mL volumetric flask, and dilute with *Buffer solution* to volume.

**Procedure**—Measure the potential, in mV, of the *Test solution*, with a suitable pH meter having a minimum reproducibility of ±0.2 mV, and equipped with a fluoride-specific ion electrode and a glass-sleeved *Modified calomel reference electrode*. When taking a measurement, immerse the electrodes into the solution, which has been transferred to a 150-mL plastic beaker, insert a suitable plastic-coated stirring bar, place the beaker on a magnetic stirrer, taking adequate precautions to prevent heat transfer, and stir for 2 minutes before reading. Dry the electrodes between measurements, taking care not to scratch the crystal surface of the specific ion electrode. Determine the quantity of fluorine, in mg per 100 mL of the *Test solution*, from the *Standard curve*. Multiply the quantity by the factor 138.9 to express the result as a percentage: not less than 13.9% and not more than 15.0% of fluorine, calculated on the dried basis, is found.

#### Assay—

**Mobile phase**—Use degassed and filtered water.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fluorouracil RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 10 µg per mL.

**Assay preparation**—Transfer an accurately weighed quantity of about 20 mg of Fluorouracil to a 200-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Quantitatively dilute a known volume of this solution with water to obtain a solution having a concentration of about 10 µg per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column containing packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 2500 theoretical plates, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>4</sub>H<sub>3</sub>FN<sub>2</sub>O<sub>2</sub> in the portion of Fluorouracil taken by the formula:

$$2C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Fluorouracil RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the fluorouracil peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluorouracil Cream

» Fluorouracil Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluorouracil (C<sub>4</sub>H<sub>3</sub>FN<sub>2</sub>O<sub>2</sub>). It may contain Sodium Hydroxide to adjust the pH.

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

#### USP Reference standards <11>—

USP Fluorouracil RS

**Identification**—Prepare a test solution by placing a quantity of Cream, equivalent to about 5 mg of fluorouracil, in a glass-stoppered conical flask, add 50 mL of alcohol, and shake until dissolved. Dissolve 5 mg of USP Fluorouracil RS in 50 mL of alcohol to obtain a Standard solution. In 20-µL increments, apply 100 µL each of the Standard solution and the test solution to a line about 3 cm from the bottom edge of a thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture, which previously has been dried and activated at 105° for 5 minutes. Develop the chromatogram in a solvent system consisting of a mixture of ethyl acetate, methanol, and ammonium hydroxide (75:25:1), allowing the solvent front to move about 15 cm beyond the initial spotting line. Remove the plate, air-dry for 15 minutes, and examine under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**Microbial enumeration tests <61> and Tests for specified microorganisms <62>**—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** (755): meets the requirements.

**Assay—**

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under *Fluorouracil*.

*Assay preparation*—Transfer an accurately weighed portion of Cream, equivalent to about 10 mg of fluorouracil, to a 100-mL volumetric flask, add 20 mL of methanol, and mix on a vortex mixer to dissolve. Dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, dilute with water to volume, mix, and filter.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of fluorouracil ( $C_4H_3FN_2O_2$ ) in the portion of Cream taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Fluorouracil RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the fluorouracil peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluorouracil Injection

» Fluorouracil Injection is a sterile solution of Fluorouracil in Water for Injection, prepared with the aid of Sodium Hydroxide. It contains, in each mL, not less than 45 mg and not more than 55 mg of fluorouracil ( $C_4H_3FN_2O_2$ ).

**NOTE**—If a precipitate is formed as a result of exposure to low temperatures, redissolve it by heating to 60° with vigorous shaking, and allow to cool to body temperature prior to use.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass, and store at controlled room temperature. Avoid freezing and exposure to light.

**Labeling**—Label it to indicate the expiration date, which is not more than 24 months after date of manufacture.

**USP Reference standards** (11)—

USP Fluorouracil RS

USP Endotoxin RS

**Identification—**

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the Assay.

**B:** Carefully acidify a portion of Injection, equivalent to about 100 mg of fluorouracil, with glacial acetic acid. Stir and slightly chill the solution to precipitate the fluorouracil, collect the precipitate, wash with 1 mL of water, and then dry in vacuum over phosphorus pentoxide at 80° for 4 hours: the residue so obtained responds to *Identification test A* under *Fluorouracil*.

**C:** It responds to *Identification test C* under *Fluorouracil*.

**Bacterial endotoxins** (85)—It contains not more than 0.33 USP Endotoxin Unit per mg of fluorouracil.

**pH** (791): between 8.6 and 9.4.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay—**

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under *Fluorouracil*.

*Assay preparation*—Transfer a suitable volume of the Injection, equivalent to 50 mg of fluorouracil, to a 100-mL volumetric flask, dilute with water to volume, and mix. Dilute quantitatively a known volume of this solution with water to obtain a solution having a concentration of 10  $\mu$ g per mL.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the major peaks. Calculate the quantity, in mg, of  $C_4H_3FN_2O_2$  in the volume of Injection taken by the formula:

$$5(C / V)(r_U / r_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Fluorouracil RS in the *Standard preparation*; V is the volume, in mL, of the Injection taken for the *Assay preparation*; and  $r_U$  and  $r_S$  are the fluorouracil peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluorouracil Topical Solution

» Fluorouracil Topical Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_4H_3FN_2O_2$ .

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Fluorouracil RS

**Identification**—It responds to the *Identification test* under *Fluorouracil Cream*.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Assay—**

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under *Fluorouracil*.

*Assay preparation*—Transfer an accurately weighed portion of Solution, equivalent to about 20 mg of fluorouracil, to a 100-mL volumetric flask, dilute with water to volume, and mix. Quantitatively dilute a volume of this solution with water to obtain a concentration of 10  $\mu$ g per mL.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the major peaks. Calculate the quantity, in mg, of fluorouracil ( $C_4H_3FN_2O_2$ ) in the portion of Solution taken by the formula:

$$2C(r_U / r_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Fluorouracil RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the fluorouracil responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluoxetine Hydrochloride

$C_{17}H_{18}F_3NO \cdot HCl$  345.79

Benzenepropanamine, *N*-methyl- $\gamma$ -[4-(trifluoromethyl)phenoxy]-, hydrochloride, ( $\pm$ ).  
( $\pm$ )-*N*-Methyl-3-phenyl-3-[( $\alpha,\alpha,\alpha$ -trifluoro-*p*-tolyl)oxy]propylamine, hydrochloride [59333-67-4].

» Fluoxetine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $C_{17}H_{18}F_3NO \cdot HCl$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Fluoxetine Hydrochloride RS

USP Fluoxetine Related Compound A RS

*N*-Methyl-3-phenyl-3-[( $\alpha,\alpha,\alpha$ -trifluoro-*m*-tolyl)oxy]propylamine hydrochloride.

$C_{17}H_{18}F_3NO \cdot HCl$  345.79

USP Fluoxetine Related Compound B RS

*N*-Methyl-3-phenylpropylamine.

$C_{10}H_{15}N$  149.24

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** A solution meets the requirements of the tests for *Chloride* (191).

**Water**, *Method I* (921): not more than 0.5%.

**Heavy metals**, *Method II* (231): 0.003%.

**Related compounds**—

**Mobile phase**—Proceed as directed in the *Assay*.

**Test solution 1**—Transfer about 56 mg of Fluoxetine Hydrochloride, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Test solution 2**—Transfer 2 mL of *Test solution 1*, accurately measured, to a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**System suitability solution**—Dissolve about 22 mg of USP Fluoxetine Hydrochloride RS in 10 mL of 1 N sulfuric acid, and heat to 85° for 3 hours. Cool, transfer 0.4 mL of this solution to a 25-mL volumetric flask, and add about 28 mg of USP Fluoxetine Hydrochloride RS, 1 mg of USP Fluoxetine Related Compound A RS, and 1 mg of USP Fluoxetine Related Compound B RS. Dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m base-deactivated packing L7. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.24 for  $\alpha$ -[2-(methylamino)ethyl]benzenemethanol (if present), 0.27 for fluoxetine related compound B, 0.94 for fluoxetine related compound A, 1.0 for fluoxetine, and 2.17 for 4-trifluoromethylphenol; and the ratio of the height of the fluoxetine related compound A peak to the depth of the valley between the fluoxetine and fluoxetine related compound A peaks (measured from the fluoxetine related compound A peak height) is not more than 1.1.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of *Test solution 1* and *Test solution 2* into the chromatograph, record the chromatograms for not less than twice the elution time for fluoxetine, and measure the peak responses. Calculate the percentage of fluoxetine related compound A in the portion of Fluoxetine Hydrochloride taken by the formula:

$$100r_A / (r_A + r_U)$$

in which  $r_A$  is the peak response of fluoxetine related compound A obtained from *Test solution 2*; and  $r_U$  is the peak response of fluoxetine obtained from *Test solution 2*.

Calculate the percentage of each of the other impurities in the portion of Fluoxetine Hydrochloride taken by the formula:

$$100r_i / (r_s + 5r_U)$$

in which  $r_i$  is the peak response for each impurity obtained from *Test solution 1*;  $r_s$  is the sum of the responses of all the peaks, excluding fluoxetine, obtained from *Test solution 1*; and  $r_U$  is as defined above: not more than 0.15% of fluoxetine related compound A is found; not more than 0.25% of  $\alpha$ -[2-(methylamino)ethyl]benzenemethanol is found; not more than 0.25% of fluoxetine related compound B is found; and not more than 0.1% of any other individual impurity is found. The sum of all impurities found is not more than 0.5%.

**Assay**—

**Triethylamine buffer**—Transfer about 10 mL of triethylamine, accurately measured, to a suitable container, add about 980 mL of water, and adjust with phosphoric acid to a pH of 6.0.

**Mobile phase**—Prepare a filtered and degassed mixture of *Triethylamine buffer*, stabilizer-free tetrahydrofuran, and methanol (6:3:1). Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fluoxetine Hydrochloride RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.11 mg per mL.

**Assay preparation**—Transfer about 11 mg of Fluoxetine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 227-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m base-deactivated packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{17}H_{18}F_3NO \cdot HCl$  in the portion of Fluoxetine Hydrochloride taken by the formula:

$$100C(r_U / r_s)$$

in which  $C$  is the concentration, in mg per mL, of USP Fluoxetine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluoxetine Capsules

» Fluoxetine Capsules contain an amount of Fluoxetine Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluoxetine ( $C_{17}H_{18}F_3NO$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Fluoxetine Hydrochloride RS

### Identification—

**A: Infrared Absorption** (197K)—

**Test specimen**—Transfer a quantity of Capsule contents, equivalent to about 10 mg of fluoxetine, to a suitable container, dissolve in 10 mL of methanol, and filter. Rinse the container and filter with 5 mL of methanol, and evaporate with the aid of a current of air and mild heat to dryness.

### Dissolution (711)—

**Medium:** water; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes.

Determine the amount of  $C_{17}H_{18}F_3NO$  dissolved by employing the following method.

**Diethylamine phosphate suspension**—Transfer 250 mL of acetonitrile to a suitable container, add 1.0 mL of diethylamine, mix, and adjust with phosphoric acid to a pH of 3.5. [NOTE—Diethylamine phosphate will precipitate; therefore, keep well-mixed.]

**Mobile phase**—Prepare a filtered and degassed mixture of water, acetonitrile, and diethylamine (600:400:4), and adjust with phosphoric acid to a pH of 3.5. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Prepare a solution of USP Fluoxetine Hydrochloride RS having a concentration similar to that of the *Test solution*, and filter. Transfer 5.0 mL of this solution to a suitable container, add 2.0 mL of *Diethylamine phosphate suspension*, and mix.

**Test solution**—Filter 20 mL of the solution under test. Transfer 5.0 mL of this solution to a suitable container, add 2.0 mL of *Diethylamine phosphate suspension*, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 226-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L10. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of fluoxetine ( $C_{17}H_{18}F_3NO$ ) dissolved by the formula:

$$(309.33/345.79)900C(r_U / r_S)$$

in which 309.33 and 345.79 are the molecular weights of fluoxetine and fluoxetine hydrochloride, respectively; C is the concentration, in  $\mu$ g per mL, of USP Fluoxetine Hydrochloride RS in the *Standard solution*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{17}H_{18}F_3NO$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Chromatographic purity—

**Triethylamine buffer**—Proceed as directed in the *Assay* under *Fluoxetine Hydrochloride*.

**Mobile phase**—Prepare a filtered and degassed mixture of *Triethylamine buffer* and acetonitrile (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Dissolve an accurately weighed quantity of USP Fluoxetine Hydrochloride RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.01 mg per mL.

**Test solution**—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and mix. Transfer an accurately weighed portion of the combined contents, equivalent to about 20 mg of fluoxetine, to a 10-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L10. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution* for at least 22 minutes, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 1100 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Inject a volume (about 10  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Capsules taken by the formula:

$$100(r_i / r_S)$$

in which  $r_i$  is the peak response for each impurity; and  $r_S$  is the sum of the responses of all the peaks: not more than 0.25% of any individual impurity is found, and not more than 0.80% of total impurities is found.

### Assay—

**Triethylamine buffer, Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay* under *Fluoxetine Hydrochloride*.

**Assay preparation**—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and mix. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg of fluoxetine, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, mix, and filter.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of fluoxetine ( $C_{17}H_{18}F_3NO$ ) in the portion of Capsules taken by the formula:

$$(309.33 / 345.79)100C(r_U / r_S)$$

in which 309.33 and 345.79 are the molecular weights of fluoxetine and fluoxetine hydrochloride, respectively; C is the concentration, in mg per mL, of USP Fluoxetine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluoxetine Delayed-Release Capsules

» Fluoxetine Delayed-Release Capsules contain an amount of Fluoxetine Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluoxetine ( $C_{17}H_{18}F_3NO$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

### USP Reference standards (11)—

USP Fluoxetine Hydrochloride RS

USP Fluoxetine Related Compound C RS

*N*-Methyl-*N*-[3-phenyl-3-(4-trifluoromethyl-phenoxy)-propyl]-succinamic acid.

$C_{21}H_{22}F_3NO_4$  409.40

### Identification, Infrared Absorption (197F)—

**Test specimen**—Transfer the contents of 3 Capsules to a suitable container, and grind to a fine powder. Transfer a portion of the powder, equivalent to about 40 mg of fluoxetine, to a suitable container, and dissolve in 25 mL of 0.1 N hydrochloric acid. Filter, and transfer 10 mL of the solution so obtained to a separatory funnel, add 20 mL of methylene chloride, and mix. Allow the phases to separate, and transfer the organic layer to a small glass container. Evaporate to dryness with the aid of a current of air and mild heat. Redissolve the residue with a few drops of methylene chloride, and transfer to a potassium bromide plate. Dry or evaporate to a thin film with the aid of a stream of nitrogen.

### Drug release (711)—

**Apparatus 3:** 12 dips per minute (dpm), using a polypropylene 40-mesh screen on the top and bottom of the reciprocating cylinder.

#### ACID STAGE—

**Medium:** 0.1 N hydrochloric acid; 250 mL, deaerated. Operate the apparatus for 2 hours at 12 dpm, withdraw an aliquot of the *Medium*, and allow the apparatus to proceed to the *Buffer stage*.

**Standard solution**—Prepare a solution of USP Fluoxetine Hydrochloride RS in *Acid stage Medium* having a known concentration of about 0.036 mg per mL.

**Test solution**—Use portions of the solution under test passed through a filter having a 0.45- $\mu$ m porosity.

**Procedure**—Determine the amount of  $C_{17}H_{18}F_3NO$  dissolved from the minimum (most negative) of the first derivative of UV absorbances at about 278 nm in comparison with the *Standard solution*.

**Tolerances**—Not more than 10% of the labeled amount of  $C_{17}H_{18}F_3NO$  is dissolved in 2 hours.

#### BUFFER STAGE—

**Medium:** pH 6.8 phosphate buffer (prepared by mixing 3 L of 0.1 N hydrochloric acid and 1 L of 0.2 M tribasic sodium phosphate, and adjusting, if necessary, with 1 N hydrochloric acid or 1 N sodium hydroxide to a pH of  $6.8 \pm 0.05$ ); 250 mL, deaerated. Operate the apparatus for 45 minutes at 12 dpm, and withdraw an aliquot of the *Medium*.

**Standard solution**—Prepare a solution of USP Fluoxetine Hydrochloride RS in *Buffer stage Medium*, having a known concentration of about 0.36 mg per mL.

**Test solution**—Use portions of the solution under test passed through a filter having a 0.45- $\mu$ m porosity.

**Procedure**—Determine the amount of  $C_{17}H_{18}F_3NO$  dissolved from the difference between the maximum UV absorbance at about 264 nm and the absorbance at 290 nm in comparison with the *Standard solution*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{17}H_{18}F_3NO$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Chromatographic purity—

**Ion-pair solution**—Dissolve about 6.5 g of sodium 1-octanesulfonate and 2.9 g of anhydrous sodium acetate in 1 L of water, and adjust with glacial acetic acid to a pH of 5.0.

**Mobile phase**—Prepare a filtered and degassed mixture of *Ion-pair solution* and acetonitrile (58:42). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Degraded fluoxetine solution**—Dissolve a quantity of USP Fluoxetine Hydrochloride RS in 1.0 N sulfuric acid to obtain a solution containing about 2.2 mg per mL. Heat to 85° for 3 hours, and cool to room temperature.

**Fluoxetine related compound solution**—Dissolve a quantity of USP Fluoxetine Related Compound C RS in *Mobile phase* to obtain a solution containing about 0.5 mg per mL.

**System suitability solution**—Transfer about 13.5 mg of USP Fluoxetine Hydrochloride RS to a 100-mL volumetric flask, add 2 mL of *Degraded fluoxetine solution* and 2 mL of *Fluoxetine related compound solution*, and dissolve in and dilute with *Mobile phase* to volume. Transfer 10.0 mL of this solution to a 250-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Detector sensitivity solution**—Transfer 2 mL of the *System suitability solution* to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Test solution**—Weigh and finely powder not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of fluoxetine, to a 250-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Filter before injection.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm  $\times$  15-cm column that contains 3.5- $\mu$ m packing L7. The column temperature is maintained at 30°. The flow rate is about 1 mL per minute. Inject the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.49 for  $\alpha, \alpha, \alpha$ -trifluoro-*p*-cresol, 0.70 for fluoxetine related compound C, and 1.0 for fluoxetine; the resolution,  $R$ , between  $\alpha, \alpha, \alpha$ -trifluoro-*p*-cresol and fluoxetine related compound C is not less than 2.0; and the resolution,  $R$ , between fluoxetine related compound C and fluoxetine is not less than 6.0. Chromatograph the *Detector sensitivity solution*, and record the peak responses as directed for *Procedure*: the signal-to-noise ratio for the fluoxetine peak is not less than 10.

**Procedure**—Inject a volume (about 50  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram for at least three times the retention time of the fluoxetine peak, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Capsules taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity, and  $r_s$  is the sum of the responses of all the peaks: not more than 0.2% of any individual impurity is found, and not more than 0.7% of total impurities is found.

### Assay—

**Ion-pair solution**—Dissolve about 2.9 mL of glacial acetic acid and about 7.1 g of sodium 1-pentanesulfonate in 1 L of water. Adjust with 5 N sodium hydroxide to a pH of 5.0.

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and *Ion-pair solution* (67:33). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Dissolve suitable quantities of USP Fluoxetine Hydrochloride RS and  $\alpha, \alpha, \alpha$ -trifluoro-*p*-cresol in *Mobile phase* to obtain a solution containing about 110  $\mu$ g per mL and 20  $\mu$ g per mL, respectively.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fluoxetine Hydrochloride RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.11 mg per mL.

**Assay preparation**—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and mix. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of fluoxetine, to a 500-mL volumetric flask, shake by mechanical means for about 10 minutes, and then sonicate for about 5 minutes. Cool the solution to room temperature, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 10.0-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix. Filter the solution before injection.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 227-nm detector and a 4.6-mm × 7.5-cm column that contains 3.5-μm packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at 38°. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for α,α,α-trifluoro-*p*-cresol and 1.0 for fluoxetine; the resolution, *R*, between α,α,α-trifluoro-*p*-cresol and fluoxetine is not less than 4.0; the tailing factor for the fluoxetine peak is not more than 1.7; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of fluoxetine (C<sub>17</sub>H<sub>18</sub>F<sub>3</sub>NO) in the portion of Capsules taken by the formula:

$$1000(309.33/345.79)C(r_U / r_S)$$

in which 309.33 and 345.79 are the molecular weights of fluoxetine and fluoxetine hydrochloride, respectively; *C* is the concentration, in mg per mL, of USP Fluoxetine Hydrochloride RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluoxetine Oral Solution

» Fluoxetine Oral Solution contains an amount of Fluoxetine Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluoxetine (C<sub>17</sub>H<sub>18</sub>F<sub>3</sub>NO). It may contain one or more preservatives.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** <11>—

USP Fluoxetine Hydrochloride RS

**Identification, Infrared Absorption** <197S>—

**Solution**—Transfer a volume of Oral Solution, equivalent to about 20 mg of fluoxetine, to a separatory funnel, add 5.0 mL of water and 0.5 mL of 1 N sodium hydroxide, extract with 5 mL of chloroform, and discard the aqueous layer. Evaporate the remaining layer to dryness, and dissolve the residue in 0.4 mL of chloroform.

**Uniformity of dosage units** <905>—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** <698>—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** <791>: between 2.5 and 4.5.

**Chromatographic purity**—

**Ion-pair solution**—Transfer about 4.3 g of sodium 1-octanesulfonate and 13.8 g of monobasic sodium phosphate to a suitable container, dissolve in 1 L of water, and adjust with phosphoric acid to a pH of 3.0.

**Diluent**—Prepare a mixture of *Ion-pair solution*, methanol, and acetonitrile (6:3:1).

**Solution A**—Prepare a filtered and degassed mixture of *Ion-pair solution*, methanol, and acetonitrile (53:26:21).

**Solution B**—Prepare a filtered and degassed mixture of *Ion-pair solution*, acetonitrile, and methanol (43:35:22).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability solution**—Dissolve a quantity of USP Fluoxetine Hydrochloride RS in 1 N sulfuric acid to obtain a solution having a known concentration of about 2.0 mg per mL, and heat at 85° for 1 hour. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, add about 10 mg of USP Fluoxetine Hydrochloride RS, dissolve in and dilute with *Diluent* to volume, and mix.

**Test solution**—Transfer an accurately measured volume of Oral Solution, equivalent to about 19 mg of fluoxetine, to a 10-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**Diluted test solution**—Transfer 1.0 mL of the *Test solution* to a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	100	0	equilibration
0–13	100	0	isocratic
13–15	100→0	0→100	linear gradient
15–29	0	100	isocratic
29–30	0→100	100→0	linear gradient
30–end	100	0	isocratic

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the retention time of any peak, except the peak for fluoxetine, is less than 13 minutes.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Diluted test solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the volume of Oral Solution taken by the formula:

$$100r_i / (\Sigma r_i + 25r_s)$$

in which *r<sub>i</sub>* is the peak response for each impurity obtained from the *Test solution*; and *r<sub>s</sub>* is the peak response for fluoxetine obtained from the *Diluted test solution*: not more than 0.4% of any individual impurity is found; and not more than 0.8% of total impurities is found.

**Assay**—

**Triethylamine buffer**—Transfer about 10 mL of triethylamine, accurately measured, to a suitable container, add about 980 mL of water, and adjust with phosphoric acid to a pH of 6.0.

**Mobile phase**—Prepare a filtered and degassed mixture of Triethylamine buffer and acetonitrile (1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fluoxetine Hydrochloride RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 45 µg per mL.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 4.0 mg of fluoxetine, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the fluoxetine peak. Calculate the quantity, in mg, of fluoxetine ( $C_{17}H_{18}F_3NO$ ) in the volume of Oral Solution taken by the formula:

$$(309.33/345.79)(0.1C)(r_U / r_S)$$

in which 309.33 and 345.79 are the molecular weights for fluoxetine and fluoxetine hydrochloride, respectively; C is the concentration, in µg per mL, of USP Fluoxetine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluoxetine Tablets

» Fluoxetine Tablets contain an amount of Fluoxetine Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluoxetine ( $C_{17}H_{18}F_3NO$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** <11>—

USP Fluoxetine Hydrochloride RS  
USP Fluoxetine Related Compound B RS  
N-Methyl-3-phenylpropylamine.  
 $C_{10}H_{15}N$  149.24

**Identification, Infrared Absorption** <197K>—

**Test specimen**—Transfer 1 Tablet to a suitable container, dissolve in 10 mL of chloroform, and filter. Rinse the container with 5 mL of chloroform, and filter. Evaporate the combined filtrate in a hood with the aid of a current of air and mild heat to dryness.

**Dissolution** <711>—

**Medium:** 0.1 N hydrochloric acid; 1000 mL.

**Apparatus 1:** 100 rpm.

**Time:** 15 minutes.

Determine the amount of  $C_{17}H_{18}F_3NO$  dissolved by employing the following method.

**Ion-pair solution, Mobile phase, and System suitability solution**—Prepare as directed in the Assay.

**Standard solution**—Prepare a solution of USP Fluoxetine Hydrochloride RS in *Medium* having a known concentration similar to that of the solution under test.

**Test solution**—Filter 20 mL of the solution under test.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 227-nm detector and a 4.6-mm × 7.5-cm column that contains 3.5-µm packing L7. The column temperature is maintained at 38°. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between fluoxetine and  $\alpha, \alpha$ ,  $\alpha$ -trifluoro-*p*-cresol is not less than 2.0; the tailing factor for the fluoxetine peak is not more than 1.7; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of  $C_{17}H_{18}F_3NO$  dissolved by the formula:

$$(309.33/345.79)1000C(r_U / r_S)$$

in which 309.33 and 345.79 are the molecular weights of fluoxetine and fluoxetine hydrochloride, respectively; C is the concentration, in mg per mL, of USP Fluoxetine Hydrochloride RS in the *Standard solution*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{17}H_{18}F_3NO$  is dissolved in 15 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Chromatographic purity**—

**Ion-pair solution**—Dissolve 6.5 g of sodium 1-octanesulfonate in 1000 mL of water, add 2.9 mL of phosphoric acid, and adjust with a sodium hydroxide solution (1 in 5) to a pH of 3.0.

**Mobile phase**—Prepare a filtered and degassed mixture of *Ion-pair solution* and acetonitrile (57:43). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Resolution solution**—Transfer 1 mg of USP Fluoxetine Related Compound B RS and about 13.5 mg of USP Fluoxetine Hydrochloride RS to a 100-mL volumetric flask. Add 2 mL of a solution prepared by dissolving about 22 mg of USP Fluoxetine Hydrochloride RS in 10 mL of 1 N sulfuric acid, heating at about 85° for 3 hours, and cooling to room temperature. Dilute with *Mobile phase* to volume, and mix. Pipet 10.0 mL of this solution into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Detector sensitivity solution**—Prepare a solution of *Resolution solution* in *Mobile phase* (1 in 100).

**Standard solution**—Dissolve an accurately weighed quantity of USP Fluoxetine Hydrochloride RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.0135 mg per mL.

**Test solution**—Place 10 Tablets in a volumetric flask of suitable size. Dissolve in and dilute with *Mobile phase* to volume to obtain a solution having a concentration of about 2 mg of fluoxetine per mL. Pass a portion of the solution through a suitable filter, and use the filtrate.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 15-cm column that contains 3.5-µm packing L7. The column temperature is maintained at 30°. The flow rate is about 1.0 mL per minute. Chromatograph in the following order the *Mobile phase*, the *Detector sensitivity solution*, and the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.19 for  $\alpha$ -[2-(methylamino)ethyl]benzenemethanol, 0.26 for fluoxetine related compound B, and 1.0 for fluoxetine; the resolution,  $R$ , between  $\alpha$ -[2-(methylamino)ethyl]benzenemethanol and fluoxetine related com-

pound B is not less than 4.5; and the signal-to-noise ratio for the *Detector sensitivity solution* is not less than 10.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for a period of time equal to three times the retention time of the main peak, and measure the areas for all the peaks. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(309.33/345.79)(C_S / C_U)(r_i / r_S)$$

in which 309.33 and 345.79 are the molecular weights of fluoxetine and fluoxetine hydrochloride, respectively;  $C_S$  is the concentration, in mg per mL, of USP Fluoxetine Hydrochloride RS in the *Standard solution*;  $C_U$  is the concentration, in mg per mL, of fluoxetine in the *Test solution*;  $r_i$  is the peak response for each impurity obtained from the *Test solution*; and  $r_S$  is the peak response for fluoxetine obtained from the *Standard solution*: not more than 0.25% of any individual impurity is found; and not more than 0.80% of total impurities is found.

#### Assay—

**Ion-pair solution**—Dissolve 7.1 g of sodium 1-pentane-sulfonate in 1000 mL of water, add 2.9 mL of glacial acetic acid, and adjust with a sodium hydroxide solution (1 in 5) to a pH of 5.0.

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and *Ion-pair solution* (67:33). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability solution**—Transfer about 10 mg of  $\alpha, \alpha$ ,  $\alpha$ -trifluoro-*p*-cresol, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 10 mL of this solution into a 100-mL volumetric flask containing about 11 mg of USP Fluoxetine Hydrochloride RS, dilute with *Mobile phase* to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fluoxetine Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

**Assay preparation**—Transfer 10 Tablets to a 1000-mL volumetric flask. Add about 500 mL of *Mobile phase*, and shake to disintegrate the Tablets. Dilute with *Mobile phase* to volume, and sonicate for 10 minutes. Transfer a portion of this solution to a volumetric flask of suitable size, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of about 0.1 mg of fluoxetine per mL. Pass through a suitable filter, and use the filtrate.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 227-nm detector and a 4.6-mm  $\times$  7.5-cm column that contains 3.5- $\mu$ m packing L7. The column temperature is maintained at 38°. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between fluoxetine and  $\alpha, \alpha, \alpha$ -trifluoro-*p*-cresol is not less than 4.0; the tailing factor for the fluoxetine peak is not more than 1.7; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of fluoxetine ( $C_{17}H_{18}F_3NO$ ) in the portion of Tablets taken by the formula:

$$(309.33/345.79)(1000CD)(r_U / r_S)$$

in which 309.33 and 345.79 are the molecular weights of fluoxetine and fluoxetine hydrochloride, respectively;  $C$  is

the concentration, in mg per mL, of USP Fluoxetine Hydrochloride RS in the *Standard preparation*;  $D$  is the dilution factor, if performed, used in preparing the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluoxymesterone

$C_{20}H_{29}FO_3$  336.44

Androst-4-en-3-one, 9-fluoro-11,17-dihydroxy-17-methyl-, (11 $\beta$ ,17 $\beta$ )-.  
9-Fluoro-11 $\beta$ ,17 $\beta$ -dihydroxy-17-methylandrost-4-en-3-one [76-43-7].

» Fluoxymesterone contains not less than 97.0 percent and not more than 102.0 percent of  $C_{20}H_{29}FO_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers, protected from light.

#### USP Reference standards <11>—

USP Fluoxymesterone RS

#### Identification—

**A: Infrared Absorption** <197K>—If a difference appears, dissolve portions of both the test specimen and the USP Reference Standard in dehydrated alcohol, evaporate the solutions to dryness, and repeat the test on the residues.

**B: Ultraviolet Absorption** <197U>—

**Solution:** 10  $\mu$ g per mL.

**Medium:** alcohol.

Absorptivities at 242 nm do not differ by more than 2.5%.

**Specific rotation** <781S>: between +104° and +112°.

**Test solution:** 10 mg per mL, in alcohol.

**Loss on drying** <731>—Dry it at 105° for 3 hours: it loses not more than 1.0% of its weight.

#### Chromatographic purity—

**Solution A**—Prepare a filtered and degassed mixture of methanol and water (55:45).

**Solution B**—Use filtered and degassed methanol.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*.

**Blank solution**—Use *Solution B*.

**System suitability solution**—Dilute a volume of the *Test solution* quantitatively, and stepwise if necessary, with methanol to obtain a solution having a concentration of about 5  $\mu$ g of fluoxymesterone per mL.

**Test solution**—Prepare a solution of Fluoxymesterone in *Solution B* containing about 0.5 mg per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The column temperature is maintained at 40°. The flow rate is 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	100	0	equilibration
0–20	100→60	0→40	linear gradient
20–40	60→0	40→100	linear gradient
40–45.0	0	100	isocratic
45.0–45.1	0→100	100→0	linear gradient
45.1–60	100	0	isocratic

Chromatograph the *Test solution*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 15,000 theoretical plates. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the signal-to-noise ratio for the fluoxymesterone peak is not less than 100.

**Procedure**—Separately inject equal volumes (about 5  $\mu$ L) of the *Blank solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for any peaks that do not appear in the *Blank solution* that have an area equal to or greater than 0.1% of the fluoxymesterone peak. Calculate the percentage of each impurity in the portion of Fluoxymesterone taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses of all the peaks: not more than 1.0% of any individual impurity is found; and not more than 2.0% of total impurities is found.

#### Assay—

**Internal standard solution**—Dissolve methylprednisolone in a mixture of chloroform and methanol (95:5) to obtain a solution containing about 200  $\mu$ g per mL.

**Mobile phase**—Prepare a solution containing butyl chloride, water-saturated butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (475:475:70:35:30).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fluoxymesterone RS in *Internal standard solution* to obtain a solution having a known concentration of about 0.25 mg per mL.

**Assay preparation**—Dissolve about 25 mg of Fluoxymesterone, accurately weighed, in 100.0 mL of *Internal standard solution* to obtain a solution having a concentration of about 0.25 mg per mL.

**Procedure**—Inject equal volumes of the *Assay preparation* and the *Standard preparation* into a suitable high-pressure liquid chromatograph (see *Chromatography* <621>) of the general type equipped with a detector for monitoring UV light at 254 nm, equipped with a suitable recorder, and capable of providing column pressure up to about 2000 psi. The instrument contains a 4-mm  $\times$  30-cm stainless steel column that contains packing L3. In a suitable chromatogram, the resolution,  $R$ , between fluoxymesterone and the internal standard is not less than 3.0; and the relative standard deviation of the peak response ratios of four replicate injections of the *Standard preparation* is not more than 2.0%. Calculate the quantity, in mg, of  $C_{20}H_{29}FO_3$  in the portion of Fluoxymesterone taken by the formula:

$$100C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Fluoxymesterone RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of fluoxymesterone to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluoxymesterone Tablets

» Fluoxymesterone Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluoxymesterone ( $C_{20}H_{29}FO_3$ ).

**Packaging and storage**—Preserve in well-closed containers, protected from light.

#### USP Reference standards <11>—

USP Fluoxymesterone RS

USP Norethindrone RS

**Identification**—Triturate a quantity of powdered Tablets, equivalent to about 20 mg of fluoxymesterone, with 20 mL of hot chloroform, and decant the supernatant through a filter. Repeat the extraction with two 20-mL portions of hot chloroform. Evaporate the combined chloroform solutions on a water bath to dryness, digest the residue with 5 mL of acetone, decant the supernatant, add to it 20 mL of water, and filter off the precipitate. Dissolve the precipitate in 5 mL of acetone, add 20 mL of water, and filter: the precipitate, after being dried at 105° for 3 hours, meets the requirements for *Identification test A* under *Fluoxymesterone*.

#### Dissolution <711>—

**Medium**: 0.01 N hydrochloric acid; 900 mL.

**Apparatus 2**: 75 rpm.

**Time**: 60 minutes.

Determine the amount of  $C_{20}H_{29}FO_3$  dissolved by employing the following method.

**Mobile phase**—Prepare a degassed and filtered solution of water and acetonitrile (58:42). Make adjustments if necessary (see *Chromatography* <621>).

**Internal standard solution**—Dissolve a quantity of USP Norethindrone RS in alcohol to obtain a solution having a final concentration of about 46  $\mu$ g per mL.

**Standard solution**—Transfer about 28 mg of USP Fluoxymesterone RS, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with alcohol to volume, and mix.

Pipet 5 mL of the resulting solution into a 250-mL volumetric flask, dilute with *Dissolution Medium* to volume, and mix. Pipet 5 mL of this solution and 2 mL of *Internal standard solution* into a 25-mL volumetric flask, dilute with *Dissolution Medium* to volume, and mix.

**Test solution**—Pipet a filtered 20-mL aliquot of the solution under test and 2 mL of *Internal standard solution* into a 25-mL volumetric flask, dilute with *Dissolution Medium* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 3 mL per minute. Chromatograph replicate injections of the *Standard solution*, and measure the peak responses as directed for *Procedure*: the relative retention times are 0.5 for fluoxymesterone and 1.0 for norethindrone; the resolution,  $R$ , between fluoxymesterone and norethindrone is not less than 2; and the relative standard deviation is not more than 2.0%.

**Procedure**—Inject a volume (about 20  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the responses for the major peaks. Calculate the amount of  $C_{20}H_{29}FO_3$  dissolved by comparison with the *Standard solution*, similarly chromatographed.

**Tolerances**—Not less than 70% (Q) of the labeled amount of  $C_{20}H_{29}FO_3$  is dissolved in 60 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

## PROCEDURE FOR CONTENT UNIFORMITY—

*Internal standard solution, Mobile phase, and Standard preparation*—Prepare as directed in the Assay under Fluoxymesterone.

*Test preparation*—Transfer 1 Tablet to a suitable container, add 2 mL of water, and sonicate for 30 minutes or until the Tablet completely disintegrates. Add an accurately measured volume of *Internal standard solution* (5.0 mL for each mg of fluoxymesterone in the Tablet), and shake the mixture for 15 minutes. Filter a portion of the chloroform layer, and use the clear filtrate.

*Procedure*—Proceed as directed in the Assay under Fluoxymesterone, using the *Test preparation* in place of the Assay preparation. Calculate the quantity, in mg, of fluoxymesterone ( $C_{20}H_{29}FO_3$ ) in the Tablet taken by the formula:

$$(TC/D)(R_U / R_S)$$

in which  $T$  is the labeled quantity, in mg, of fluoxymesterone in the Tablet;  $D$  is the concentration, in mg per mL, of fluoxymesterone in the *Test preparation*, based on the labeled quantity per Tablet and the extent of dilution; and the other terms are as defined therein.

**Assay—**

*Internal standard solution, Mobile phase, and Standard preparation*—Prepare as directed in the Assay under Fluoxymesterone.

*Assay preparation*—Accurately weigh 20 Tablets, and grind to a fine powder in a mortar and pestle. Accurately weigh a portion of the powder, equivalent to about 5 mg of fluoxymesterone, and transfer to a suitable container. Add 20.0 mL of *Internal standard solution*, sonicate for 10 minutes, and shake for 15 minutes. Filter a portion of the liquid, and analyze the clear filtrate as directed for *Procedure*.

*Procedure*—Proceed as directed in the Assay under Fluoxymesterone. Calculate the quantity, in mg, of fluoxymesterone ( $C_{20}H_{29}FO_3$ ) in the portion of Tablets taken by the formula:

$$20C(R_U / R_S)$$

in which the terms are as defined therein.

## Fluphenazine Decanoate

» Fluphenazine Decanoate contains not less than 98.0 percent and not more than 102.0 percent of  $C_{32}H_{44}F_3N_3O_2S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Fluphenazine Decanoate Dihydrochloride RS

[NOTE—Throughout the following procedures, protect test or assay specimens, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

**Identification—**

**A:** Place about 50 mg of Fluphenazine Decanoate and about 50 mg of USP Fluphenazine Decanoate Dihydrochloride RS in separate, glass-stoppered, small centrifuge tubes, and treat each tube as follows. Add 1.5 mL of sodium hydroxide solution (1 in 250), and mix. Add 2 mL of carbon disulfide, shake vigorously for 2 minutes, and centrifuge. Dry the lower, clear layer by filtering through 2 g of anhydrous sodium sulfate: the IR absorption spectrum of the test preparation, determined in a 0.1-mm cell, exhibits maxima only

at the same wavelengths as that of the Standard preparation, similarly measured.

**B:** Use a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Impregnate the plate with a 1 in 20 solution of tetradecane in hexane, and allow to air-dry. Prepare a test solution in alcohol containing 20 mg per mL. Apply 1  $\mu$ L each of the test solution and of a Standard solution of USP Fluphenazine Decanoate Dihydrochloride RS in alcohol, similarly prepared. Allow the spots to dry. Apply to the spot from the Standard solution, 1.0  $\mu$ L of 0.1 N sodium hydroxide and allow it to dry. Develop the plate in an equilibrated chamber using a mixture of methanol and water (9:1) as the mobile phase. Examine the plate under short-wavelength UV light at 254 nm: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**Loss on drying** (731)—Dry it in vacuum at 60° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Ordinary impurities** (466)—

*Test solution:* methanol.

*Standard solution:* methanol.

*Eluant:* a mixture of acetone, cyclohexane, and ammonium hydroxide (16:6:1).

*Visualization:* 1; then spray the plate with 50% sulfuric acid.

*Interpretation:* no individual ordinary impurity observed exceeds 1.0% and the total of any ordinary impurities observed does not exceed 2.0%.

**Assay**—Dissolve about 500 mg of Fluphenazine Decanoate, accurately weighed, in 50 mL of glacial acetic acid, add one drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 29.59 mg of  $C_{32}H_{44}F_3N_3O_2S$ .

## Fluphenazine Decanoate Injection

» Fluphenazine Decanoate Injection is a sterile solution of Fluphenazine Decanoate in a suitable vegetable oil. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of fluphenazine decanoate ( $C_{32}H_{44}F_3N_3O_2S$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, of Type I glass, protected from light.

**USP Reference standards** (11)—

USP Fluphenazine Decanoate Dihydrochloride RS

USP Fluphenazine Hydrochloride RS

[NOTE—Throughout the following procedures, protect test or assay specimens, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

**Identification—**

**A:** To a volume of Injection, equivalent to about 50 mg of fluphenazine decanoate, add 2 mL of methanol and 3 mL of palladium chloride solution (1 in 1000): a rust-red color is produced. Add an excess of the palladium chloride solution: the color is intensified to a brownish red.

**B:** The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

**Chromatographic purity**—From the chromatograms obtained in the *Assay*, calculate the percentage of fluphenazine in the portion of *Injection* taken by the formula:

$$3.43(W/V)(r_U/r_S)$$

in which *W* is the weight, in mg, of USP Fluphenazine Hydrochloride RS used to prepare the *Standard preparation*; *V* is the amount, in mg, of fluphenazine decanoate in the portion of *Injection* taken to prepare the *Assay preparation*, based on the labeled concentration; and *r<sub>U</sub>* and *r<sub>S</sub>* are the fluphenazine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. The fluphenazine content is not more than 4% of the labeled amount of fluphenazine decanoate. [NOTE—Use peak heights where peak responses are indicated.] Calculate the percentage of each impurity eluting after fluphenazine decanoate in the portion of *Injection* taken by the formula:

$$100(r_i/r_S)$$

in which *r<sub>i</sub>* is the peak response for each peak eluting after fluphenazine decanoate; and *r<sub>S</sub>* is the sum of the responses for fluphenazine decanoate and all of the peaks eluting after fluphenazine decanoate: the sum of the responses for all of the peaks eluting after fluphenazine decanoate is not more than 2%.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol, acetonitrile, and 0.05 M ammonium acetate (2:2:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Accurately weigh about 25 mg of USP Fluphenazine Hydrochloride RS, and transfer it to a 250-mL volumetric flask. Dissolve in isopropyl alcohol, dilute with isopropyl alcohol to volume, and mix (*Solution A*). Accurately weigh about 25 mg of Fluphenazine Decanoate Dihydrochloride RS. Transfer it to a 50-mL volumetric flask, and add 10 mL of *Solution A*, quantitatively measured. Add 20 mL of isopropyl alcohol and dissolve sonicating, if necessary. Dilute with isopropyl alcohol to volume, and mix. Quantitatively dilute the resulting solution with acetonitrile (1:5) to obtain a solution having a known concentration of about 0.1 mg of fluphenazine decanoate per mL.

**Assay preparation**—Transfer an accurately measured quantity of the *Injection*, equivalent to about 25 mg of fluphenazine decanoate, to a glass-stoppered, 50-mL volumetric flask. Add about 20 mL of isopropyl alcohol, insert the stopper, and shake vigorously for at least 1 minute. Add 20 mL more of isopropyl alcohol, and repeat the vigorous shaking. Dilute with isopropyl alcohol to volume, and mix. Quantitatively dilute the resulting solution with acetonitrile (1:5) to obtain a solution having a concentration of fluphenazine decanoate of about 0.1 mg per mL.

**System suitability preparation**—Weigh suitable quantities of USP Fluphenazine Decanoate Dihydrochloride RS and USP Fluphenazine Hydrochloride RS (5:4), and dissolve in a mixture of methanol and acetonitrile (1:1). Dilute the solution quantitatively and stepwise with the same solvent mixture to obtain a solution having a concentration of anhydrous USP Fluphenazine Decanoate Dihydrochloride RS of about 0.1 mg per mL.

**Chromatographic system** (see *Chromatography* (621))—The chromatograph is equipped with a 254-nm detector and a

4.6-mm × 25-cm column containing 10-μm packing L1 preceded by a 4.6-mm × 5-cm pre-column containing similar packing of larger particle size (30–40 μm). The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation* and the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between fluphenazine and fluphenazine decanoate in the *System suitability preparation* is not less than 3.0; and the relative standard deviation of the fluphenazine decanoate peak for replicate injections of the *Standard preparation* does not exceed 2.0. The relative retention times for fluphenazine and fluphenazine decanoate are 0.6 and 1, respectively.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, continuing the chromatography, in each case, for a time equal to 2.5 times the elution time of fluphenazine decanoate. Record the chromatograms, and measure responses for the major peaks and for the peaks from all substances eluting after fluphenazine decanoate. Calculate the quantity, in mg, of fluphenazine decanoate (C<sub>32</sub>H<sub>44</sub>F<sub>3</sub>N<sub>3</sub>O<sub>2</sub>S) in each mL of the *Injection* taken by the formula:

$$0.890(W_S/W_U)(r_U/r_S)$$

in which *W<sub>S</sub>* is the weight, in mg, of USP Fluphenazine Decanoate Dihydrochloride RS corrected for its moisture content, used to prepare the *Standard preparation*; *W<sub>U</sub>* is the volume, in mL, of *Injection* taken, and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses of fluphenazine decanoate obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluphenazine Enanthate

C<sub>29</sub>H<sub>38</sub>F<sub>3</sub>N<sub>3</sub>O<sub>2</sub>S 549.69

Heptanoic acid, 2-[4-[3-[2-(trifluoromethyl)-10H-phenothiazin-10-yl]propyl]-1-piperazinyl]ethyl ester.

2-[4-[3-[2-(Trifluoromethyl)phenothiazin-10-yl]propyl]-1-piperazinyl]ethyl heptanoate [2746-81-8].

» Fluphenazine Enanthate contains not less than 97.0 percent and not more than 103.0 percent of C<sub>29</sub>H<sub>38</sub>F<sub>3</sub>N<sub>3</sub>O<sub>2</sub>S, calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards (11)—

USP Fluphenazine Enanthate Dihydrochloride RS

C<sub>29</sub>H<sub>38</sub>F<sub>3</sub>N<sub>3</sub>O<sub>2</sub>S · 2HCl 622.63

NOTE—Throughout the following procedures, protect test or assay specimens, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

**Identification—**

**A:** Place about 50 mg of Fluphenazine Enanthate and about 50 mg of USP Fluphenazine Enanthate Dihydrochloride RS in separate, glass-stoppered, small centrifuge tubes, and treat each tube as follows. Add 1.5 mL of sodium hydroxide solution (1 in 250), and mix. Add 2 mL of carbon disulfide, shake vigorously for 2 minutes, and centrifuge. Dry the lower, clear layer by filtering it through 2 g of anhydrous sodium sulfate: the IR absorption spectrum of the test preparation, determined in a 0.1-mm cell, exhibits maxima only at the same wavelengths as that of the Standard preparation, similarly measured.

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 10 µg per mL.

*Medium:* methanolic hydrochloric acid (8.5 in 1000).

Absorptivities at 258 nm, calculated on the dried basis, do not differ by more than 2.5%.

**Loss on drying** (731)—Dry it in vacuum at 60° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Heavy metals, Method II** (231): 0.003%.

**Ordinary impurities** (466)—

*Test solution:* alcohol.

*Standard solution:* alcohol.

*Eluant:* a mixture of alcohol, glacial acetic acid, and water (3:1:1).

*Visualization:* 1.

**Assay**—Dissolve about 500 mg of Fluphenazine Enanthate, accurately weighed, in 50 mL of glacial acetic acid, add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 27.49 mg of  $C_{29}H_{38}F_3N_3O_2S$ .

## Fluphenazine Enanthate Injection

» Fluphenazine Enanthate Injection is a sterile solution of Fluphenazine Enanthate in a suitable vegetable oil. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluphenazine enanthate ( $C_{29}H_{38}F_3N_3O_2S$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I or Type III glass, protected from light.

**NOTE**—Throughout the following procedures, protect test or assay specimens, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

**Identification**—To a volume of Injection, equivalent to about 50 mg of fluphenazine enanthate, add 2 mL of methanol and 3 mL of palladium chloride solution (1 in 1000): a rust-red color is produced. Add an excess of the palladium chloride solution: the color is intensified to a brownish red.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Dissolve an accurately measured volume of Injection, equivalent to about 150 mg of fluphenazine enanthate, in 75 mL of glacial acetic acid, add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 27.49 mg of fluphenazine enanthate ( $C_{29}H_{38}F_3N_3O_2S$ ).

## Fluphenazine Hydrochloride

$C_{22}H_{26}F_3N_3OS \cdot 2HCl$  510.44

1-Piperazineethanol, 4-[3-[2-(trifluoromethyl)-10H-phenothiazin-10-yl]propyl]-, dihydrochloride.

4-[3-[2-(Trifluoromethyl)phenothiazin-10-yl]propyl]-1-piperazineethanol dihydrochloride [146-56-5].

» Fluphenazine Hydrochloride contains not less than 97.0 percent and not more than 103.0 percent of  $C_{22}H_{26}F_3N_3OS \cdot 2HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Fluphenazine Hydrochloride RS

**NOTE**—Throughout the following procedures, protect test or assay specimens, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

**Identification—**

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 10 µg per mL.

*Medium:* methanol.

Absorptivities at 259 nm, calculated on the dried basis, do not differ by more than 2.5%.

**C:** A solution of Fluphenazine Hydrochloride responds to the tests for *Chloride* (191).

**Loss on drying** (731)—Dry it at 65° for 3 hours: it loses not more than 1% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Heavy metals, Method II** (231): 0.003%.

**Ordinary impurities** (466)—

*Test solution:* 0.1 M methanolic sodium hydroxide.

*Standard solution:* 0.1 M methanolic sodium hydroxide.

*Eluant:* a mixture of acetone, cyclohexane, and diethylamine (40:15:1).

*Visualization:* 1.

**Assay—**

*Diluent solution*—Prepare a filtered and degassed mixture of 0.05 M monobasic potassium phosphate (adjusted with phosphoric acid to a pH of 2.5), acetonitrile, and methanol (40:30:30). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Mobile phase*—Prepare a mixture containing 0.2% triethylamine in *Diluent solution*.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Fluphenazine Hydrochloride RS in *Diluent solution*, and dilute quantitatively, and stepwise if necessary, with *Diluent solution* to obtain a solution having a known concentration of about 0.06 mg per mL.

*Assay preparation*—Transfer about 120 mg of Fluphenazine Hydrochloride, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with *Diluent solution* to volume, and mix. Pipet 5.0 mL of this solution into a 100-mL volumetric flask, dilute with *Diluent solution* to volume, and mix. Filter, discarding the first 5 mL of the filtrate.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 12.5-cm column that contains packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{22}H_{26}F_3N_3OS \cdot 2HCl$  in the portion of Fluphenazine Hydrochloride taken by the formula:

$$2000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Fluphenazine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluphenazine Hydrochloride Elixir

» Fluphenazine Hydrochloride Elixir contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluphenazine hydrochloride ( $C_{22}H_{26}F_3N_3OS \cdot 2HCl$ ).

**Packaging and storage**—Preserve in tight containers, protected from light.

**USP Reference standards** <11>—  
USP Fluphenazine Hydrochloride RS

**NOTE**—Throughout the following procedures, protect test or assay specimens, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

**Identification**—Transfer a volume of Elixir, equivalent to about 10 mg of fluphenazine hydrochloride, to a separator, and to a second separator transfer 10 mg of USP Fluphenazine Hydrochloride RS. To each separator add 20 mL of 6 N sodium hydroxide, and extract each mixture with 20 mL of isoctane. Evaporate the isoctane solutions to dryness, and proceed as directed in the *Identification* test under *Fluphenazine Hydrochloride Tablets*, beginning with “dissolve the residues in 0.5-mL portions.”

**Uniformity of dosage units** <905>—

FOR ELIXIR PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** <698>—

FOR ELIXIR PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** <791>: between 5.3 and 5.8.

**Alcohol content** <611>: not less than 90.0% and not more than 110.0% of the labeled amount, the labeled amount being not more than 15.0% of  $C_2H_5OH$ .

**Assay**—

*Diluent solution, Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Fluphenazine Hydrochloride*.

*Assay preparation*—Using a “to contain” pipet transfer a volume of Elixir, equivalent to about 6 mg of fluphenazine hydrochloride, to a 100-mL volumetric flask. Rinse the pipet with *Diluent solution* to complete the transfer, dilute with

*Diluent solution* to volume, and mix. Filter, discarding the first 5 mL of the filtrate.

**Procedure**—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of fluphenazine hydrochloride ( $C_{22}H_{26}F_3N_3OS \cdot 2HCl$ ) in each mL of the Elixir taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Fluphenazine Hydrochloride RS in the *Standard preparation*; V is the volume, in mL, of Elixir taken; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluphenazine Hydrochloride Injection

» Fluphenazine Hydrochloride Injection is a sterile solution of Fluphenazine Hydrochloride in Water for Injection. It contains not less than 95.0 percent and not more than 110.0 percent of the labeled amount of fluphenazine hydrochloride ( $C_{22}H_{26}F_3N_3OS \cdot 2HCl$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.

**USP Reference standards** <11>—

USP Endotoxin RS

USP Fluphenazine Hydrochloride RS

**NOTE**—Throughout the following procedures, protect test or assay specimens, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

**Identification**—Transfer a volume of Injection, equivalent to about 10 mg of fluphenazine hydrochloride, to a separator, and to a second separator transfer 10 mg of USP Fluphenazine Hydrochloride RS. To each separator add 20 mL of 6 N sodium hydroxide, and extract each mixture with 20 mL of isoctane. Evaporate the isoctane solutions to dryness, and proceed as directed in the *Identification* test under *Fluphenazine Hydrochloride Tablets*, beginning with “dissolve the residues in 0.5-mL portions.”

**Bacterial endotoxins** <85>—It contains not more than 166.7 USP Endotoxin Units per mg of fluphenazine hydrochloride.

**pH** <791>: between 4.8 and 5.2.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay**—Proceed with Injection as directed in the *Assay* under *Fluphenazine Hydrochloride Elixir*.

## Fluphenazine Hydrochloride Oral Solution

» Fluphenazine Hydrochloride Oral Solution is an aqueous solution of Fluphenazine Hydrochloride. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluphenazine hydrochloride ( $C_{22}H_{26}F_3N_3OS \cdot 2HCl$ ).

**Packaging and storage**—Preserve in tight containers, protected from light.

**Labeling**—Label it to indicate that it is to be diluted to appropriate strength with water or other suitable fluid prior to administration.

**USP Reference standards** (11)—  
USP Fluphenazine Hydrochloride RS

NOTE—Throughout the following procedures, protect test or assay specimens, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

**Identification**—Transfer a volume of Oral Solution, equivalent to about 10 mg of fluphenazine hydrochloride, to a separator, and to a second separator transfer 10 mg of USP Fluphenazine Hydrochloride RS. To each separator add 20 mL of sodium hydroxide solution (1 in 4), and extract each mixture with 20 mL of isooctane. Evaporate the isooctane solutions to dryness, and proceed as directed in the *Identification* test under *Fluphenazine Hydrochloride Tablets*, beginning with “dissolve the residues in 0.5-mL portions.”

**pH** (791): between 4.0 and 5.0.

**Alcohol content** (611): not less than 90.0% and not more than 110.0% of the labeled amount, the labeled amount being not more than 15.0% of  $C_2H_5OH$ .

**Assay**—Proceed with Oral Solution as directed in the *Assay* under *Fluphenazine Hydrochloride Elixir*.

## Fluphenazine Hydrochloride Tablets

» Fluphenazine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluphenazine hydrochloride ( $C_{22}H_{26}F_3N_3OS \cdot 2HCl$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Fluphenazine Hydrochloride RS

NOTE—Throughout the following procedures, protect test or assay specimens, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

**Identification**—Transfer a portion of finely powdered Tablets, equivalent to about 10 mg of fluphenazine hydrochloride, to a separator, and to a second separator transfer 10 mg of USP Fluphenazine Hydrochloride RS. Add 5 mL of water and 20 mL of dilute hydrochloric acid (1 in 120) to each separator, shake for 10 minutes, and to each mixture add 20 mL of chloroform-saturated sodium carbonate solution (1 in 10). Extract each mixture with five 20-mL portions of chloroform, shaking gently to avoid emulsion formation, and pass the extracts through separate chloroform-washed cotton filters into separate 150-mL beakers. Evaporate the extracts on a steam bath to dryness, and dissolve the residues in 0.5-mL portions of a mixture of 4 volumes of methanol and 1 volume of water. Apply 10  $\mu$ L of each solution to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of acetone, cyclohexane, and diethylamine (40:15:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by

lightly spraying with a solution of sulfuric acid in methanol (2 in 5): the  $R_f$  value and color of the principal spot obtained from the test solution correspond to those obtained from the Standard solution.

**Dissolution** (711)—

*Medium*: 0.01 N hydrochloric acid; 900 mL.

*Apparatus 1*: 100 rpm.

*Time*: 45 minutes.

*Procedure*—Determine the amount of  $C_{22}H_{26}F_3N_3OS \cdot 2HCl$  dissolved by employing the procedure set forth in the *Assay*, with the following differences: in the *Mobile phase*, use 0.3% triethylamine; in the *Assay preparation*, dilute the amount of sample to be withdrawn with an equal volume of *Mobile phase*; in the *Standard preparation*, use a concentration and composition similar to that of the *Assay preparation*; in the *Chromatographic system*, use a flow rate of about 2.0 mL per minute; in the *Procedure*, inject a volume of about 100  $\mu$ L.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{22}H_{26}F_3N_3OS \cdot 2HCl$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

*Diluent solution, Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Fluphenazine Hydrochloride*.

*Assay preparation*—Transfer 6 Tablets to a suitable volumetric flask, add *Diluent solution*, shake for 1 hour, and sonicate for 10 minutes or until a fine suspension is obtained. Dilute quantitatively, and stepwise if necessary, with *Diluent solution* to obtain a final concentration of 0.06 mg of fluphenazine hydrochloride per mL. Filter, discarding the first 5 mL of the filtrate.

*Procedure*—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of fluphenazine hydrochloride ( $C_{22}H_{26}F_3N_3OS \cdot 2HCl$ ) in the portion of Tablets taken by the formula:

$$100CT(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Fluphenazine Hydrochloride RS in the *Standard preparation*; T is the labeled quantity, in mg, of fluphenazine hydrochloride in the Tablet; and  $r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Flurandrenolide

$C_{24}H_{33}FO_6$  436.51

Pregn-4-ene-3,20-dione, 6-fluoro-11,21-dihydroxy-16,17-[(1-methylethylidene)bis(oxy)]-,  $6\alpha,11\beta,16\alpha$ -.

6 $\alpha$ -Fluoro-11 $\beta$ ,16 $\alpha$ ,17,21-tetrahydroxypregn-4-ene-3,20-dione, cyclic 16,17-acetal with acetone [1524-88-5].

» Flurandrenolide contains not less than 97.0 percent and not more than 102.0 percent of  $C_{24}H_{33}FO_6$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers in a cold place, protected from light.

**USP Reference standards** (11)—  
USP Flurandrenolide RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 20 µg per mL.

*Medium:* methanol.

Absorptivities at 237 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Specific rotation** (781S): between +145° and +153°.

*Test solution:* 10 mg per mL, in chloroform.

**Loss on drying** (731)—Dry it in vacuum at 105° for 4 hours: it loses not more than 1.0% of its weight.

**Ordinary impurities** (466)—

*Test solution:* methanol.

*Standard solution:* methanol.

*Application volume:* 10 µL.

*Eluent:* a mixture of toluene and isopropyl alcohol (90:10), in a nonequilibrated chamber.

*Visualization:* 1.

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and water (60:40). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Dissolve Prednisone in *Mobile phase*, with the aid of sonication, to obtain a solution containing about 1 mg per mL.

**Standard preparation**—Transfer about 5 mg of USP Flurandrenolide RS, accurately weighed, to a 10-mL volumetric flask, add 2.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, sonicate to aid solution, and mix to obtain a solution having a known concentration of about 0.5 mg of USP Flurandrenolide RS per mL.

**Assay preparation**—Transfer about 5 mg of Flurandrenolide, accurately weighed, to a 10-mL volumetric flask, add 2.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, sonicate to aid solution, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 240-nm detector and a 4-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the order of elution is prednisone followed by flurandrenolide, the resolution; *R*<sub>1</sub> between the analyte and internal standard is not less than 2.0; and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.5 for prednisone and 1.0 for flurandrenolide. Calculate the quantity, in mg, of C<sub>24</sub>H<sub>33</sub>FO<sub>6</sub> in the portion of Flurandrenolide taken by the formula:

$$10C(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Flurandrenolide RS in the *Standard preparation*; and *R*<sub>U</sub> and *R*<sub>S</sub> are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Flurandrenolide Cream

» Flurandrenolide Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flurandrenolide (C<sub>24</sub>H<sub>33</sub>FO<sub>6</sub>).

**Packaging and storage**—Preserve in tight containers, protected from light.

**USP Reference standards** (11)—  
USP Flurandrenolide RS

**Thin-layer chromatographic identification test** (201)—

**Test solution**—Extract a quantity of weighed Cream, equivalent to about 500 µg of flurandrenolide, as directed for the *Assay preparation*. Omit the addition of the internal standard, and evaporate the chloroform extracts on a steam bath under a stream of nitrogen to about 3 mL. Transfer the chloroform solution to a 10-mL flask, and evaporate with the aid of a stream of nitrogen to dryness. Dissolve the residue in 2 mL of chloroform.

*Application volume:* 4.0 µL.

**Developing solvent system:** a mixture of ethyl acetate and ethyl ether (70:30).

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** (755): meets the requirements.

**Assay**—

**Methanolic sodium chloride**—Transfer 100 mL of sodium chloride solution (1 in 10) to a 500-mL volumetric flask. Dilute with methanol to volume, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and water (70:30). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Transfer about 10 mg of testosterone to a 100-mL volumetric flask, add methanol to volume, and mix.

**Standard preparation**—Transfer about 16 mg of USP Flurandrenolide RS, accurately weighed, to a 100-mL volumetric flask, add methanol to volume, and mix. Transfer 3.0 mL of this solution to a 10-mL volumetric flask, add 4.0 mL of *Internal standard solution*, dilute with water to volume, and mix to obtain a solution having a known concentration of about 48 µg of USP Flurandrenolide RS per mL.

**Assay preparation**—Transfer an accurately weighed quantity of Cream, equivalent to about 500 µg of flurandrenolide, to a 125-mL separator. Add 50 mL of hexanes and 25 mL of *Methanolic sodium chloride*, and shake until the Cream is thoroughly dispersed. Allow the phases to separate, and drain the lower aqueous phase into a second 125-mL separator containing 15 mL of hexanes. Shake vigorously, allow the phases to separate, and drain the lower aqueous phase into a 250-mL separator containing 75 mL of water. Serially extract the hexane phases remaining in the two 125-mL separators with two additional 25-mL portions of *Methanolic sodium chloride*, adding each aqueous phase to the 250-mL separator. Discard the hexane phases. Extract the combined aqueous phases with four 25-mL portions of chloroform. Filter each chloroform extract through 10 g of anhydrous sodium sulfate into a 125-mL conical beaker. Rinse the sodium sulfate with water-washed chloroform, and add the wash to the beaker. Add 4.0 mL of *Internal standard solution* to the beaker containing the chloroform extract. Evaporate the solution on a steam bath under a stream of nitrogen nearly to dryness. Remove the beaker from the steam bath, and evaporate the remaining solution with the aid of nitrogen to dryness. Add 10 mL of *Mobile phase* to

the beaker, and place it in an ultrasonic bath to dissolve the residue. Pass the solution through a suitable filter having a 0.5- $\mu$ m porosity and a prefilter above the membrane filter to prevent clogging.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 2 for testosterone and 1.0 for flurandrenolide; the resolution,  $R$ , between the analyte and internal standard is not less than 2.0; and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of flurandrenolide ( $C_{24}H_{33}FO_6$ ) in the portion of Cream taken by the formula:

$$10C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Flurandrenolide RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Flurandrenolide Lotion

» Flurandrenolide Lotion contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flurandrenolide ( $C_{24}H_{33}FO_6$ ).

**Packaging and storage**—Preserve in tight containers, protected from heat, light, and freezing.

**USP Reference standards** <11>—  
USP Flurandrenolide RS

**Identification**—It responds to the *Identification* test under *Flurandrenolide Cream*.

**Microbial enumeration tests** <61> and **Tests for specified microorganisms** <62>—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** <755>: meets the requirements.

**pH** <791>: between 3.5 and 6.0, determined in a 1 in 10 dilution of the Lotion in water containing 0.30 mL of saturated potassium chloride solution per 100 mL.

**Assay**—

*Methanolic sodium chloride, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Flurandrenolide Cream*.

*Assay preparation*—Transfer an accurately weighed portion of Lotion, calculated from the density to contain about 500  $\mu$ g of flurandrenolide, to a separator. (Determine the density by taring a 100-mL volumetric flask containing 50.0 mL of water, adding approximately 25 g of well-shaken Lotion, and again weighing, then carefully adjusting the contents of the volumetric flask with water from a buret to volume, and finally calculating the density taken by the formula:

$$A / B$$

in which  $A$  is the weight, in g, of the Lotion taken; and  $B$  is 50.0 mL minus the volume, in mL, of water necessary to

adjust the contents of the volumetric flask to volume.) Proceed as directed for *Assay preparation* in the *Assay* under *Flurandrenolide Cream*, beginning with "Add 50 mL of hexane and 25 mL of *Methanolic sodium chloride*."

**Procedure**—Proceed as directed in the *Assay* under *Flurandrenolide Cream*. Calculate the quantity, in mg, of flurandrenolide ( $C_{24}H_{33}FO_6$ ) in each mL of the Lotion taken by the formula:

$$10C(D / W)(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Flurandrenolide RS in the *Standard preparation*;  $D$  is the density of the Lotion;  $W$  is the weight, in g, of Lotion taken; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Flurandrenolide Ointment

» Flurandrenolide Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flurandrenolide ( $C_{24}H_{33}FO_6$ ).

**Packaging and storage**—Preserve in tight containers, protected from light.

**USP Reference standards** <11>—  
USP Flurandrenolide RS

**Identification**—It meets the requirements for *Thin-layer chromatographic identification test* under *Flurandrenolide Cream*.

**Microbial enumeration tests** <61> and **Tests for specified microorganisms** <62>—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** <755>: meets the requirements.

**Assay**—Proceed as directed in the *Assay* under *Flurandrenolide Cream*, using Ointment in place of Cream.

## Flurandrenolide Tape

» Flurandrenolide Tape is a nonporous, pliable, adhesive-type tape having Flurandrenolide impregnated in the adhesive material, the adhesive material on one side being transported on a removable, protective slit-paper liner. Flurandrenolide Tape contains not less than 80.0 percent and not more than 125.0 percent of the labeled amount of  $C_{24}H_{33}FO_6$ .

**Packaging and storage**—Preserve at controlled room temperature.

**USP Reference standards** <11>—  
USP Flurandrenolide RS

**Identification**—Extract a portion of Tape, equivalent to about 200  $\mu$ g of flurandrenolide, as directed for the *Assay preparation* in the *Assay*. Omit the addition of the internal standard, and evaporate the chloroform extracts on a steam bath under a stream of nitrogen to about 3 mL. Transfer the chloroform solution to a 10-mL flask, and evaporate with the aid of a stream of nitrogen to dryness. Dissolve the residue in 1.0 mL of a mixture of equal volumes of chloroform and methanol, warming gently to effect solution: it meets

the requirements of the *Thin-Layer Chromatographic Identification Test* (201), 5  $\mu$ L each of the test solution and Standard solution being applied, and the solvent mixture consisting of ethyl acetate and ether (70:30).

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

#### Assay—

*Methanolic sodium chloride, Mobile phase, and Chromatographic system*—Prepare as directed in the Assay under *Flurandrenolide Cream*.

*Flurandrenolide standard solution*—Dissolve about 7 mg of USP Flurandrenolide RS, accurately weighed, in 50 mL of methanol in a 100-mL volumetric flask. Dilute with methanol to volume, and mix.

*Internal standard solution*—Dissolve about 4 mg of Testosterone in 50 mL of methanol in a 100-mL volumetric flask. Dilute with methanol to volume, and mix.

*Standard preparation*—Pipet 3.0 mL of *Flurandrenolide standard solution* and 4.0 mL of *Internal standard solution* into a 10-mL volumetric flask. Dilute with water to volume, and mix.

*Assay preparation*—Accurately measure and cut a portion of Tape, equivalent to about 200  $\mu$ g of flurandrenolide. Remove and discard the paper liner from the portion of Tape. Touch the flattened end of a glass rod to the adhesive side of the Tape, and carefully transfer the tape to the bottom of a 600-mL beaker containing 15 mL of anhydrous methanol, taking care that the adhesive side of the tape does not adhere to the wall of the beaker. Remove the glass rod from the tape, and wash it with 5 mL of anhydrous methanol, adding the wash to the beaker. Place the beaker containing the Tape and the methanol in an ultrasonic bath for 3 minutes, rotating the beaker in such manner that the methanol is in contact with all portions of the Tape. Transfer the methanol to a 250-mL separator. Extract the Tape, using sonication, with two additional 20-mL portions of anhydrous methanol, adding each portion to the separator. To the combined methanol extract add 15 mL of sodium chloride solution (1 in 10) and 50 mL of hexane, and shake vigorously. Allow the phases to separate, and drain the lower aqueous phase into a second separator containing 15 mL of hexane. Shake vigorously, allow the phases to separate, and drain the lower phase into a third 250-mL separator containing 100 mL of water. Serially extract the hexane phases remaining in the two separators with one 25-mL portion of *Methanolic sodium chloride*, adding the extract to the third separator. Discard the hexane phases. Extract the combined aqueous phases with four 25-mL portions of chloroform. Filter each chloroform extract through 10 g of anhydrous sodium sulfate into a 125-mL conical beaker. Rinse the sodium sulfate with water-washed chloroform, and add the wash to the beaker. Add 4.0 mL of *Internal standard solution* to the beaker. Evaporate the solution on a steam bath under a stream of nitrogen to near dryness. Remove the beaker from the steam bath and evaporate the remaining solution with the aid of nitrogen to dryness. Add 10 mL of *Mobile solvent* to the beaker, and place it in an ultrasonic bath to dissolve the residue. Pass the solution through a suitable porosity filter having a 0.5- $\mu$ m filter with a prefilter above the membrane filter to prevent clogging.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 2 for testosterone and 1.0 for flurandrenolide.

Calculate the quantity, in  $\mu$ g, of  $C_{24}H_{33}FO_6$  in the portion of Tape taken by the formula:

$$10C(R_U / R_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Flurandrenolide RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the Assay preparation and the *Standard preparation*, respectively.

## Flurazepam Hydrochloride

$C_{21}H_{23}ClFN_3O \cdot 2HCl$  460.80

2H-1,4-Benzodiazepin-2-one, 7-chloro-1-[2-(diethylamino)ethyl]-5-(2-fluorophenyl)-1,3-dihydro-, dihydrochloride.

7-Chloro-1-[2-(diethylamino)ethyl]-5-(o-fluorophenyl)-1,3-dihydro-2H-1,4-benzodiazepin-2-one dihydrochloride [1172-18-5].

» Flurazepam Hydrochloride contains not less than 99.0 percent and not more than 101.0 percent of  $C_{21}H_{23}ClFN_3O \cdot 2HCl$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards (11)—

USP Flurazepam Hydrochloride RS

USP Flurazepam Related Compound C RS

5-Chloro-2-(2-diethylaminoethyl(amino)-2'-fluorobenzophenone hydrochloride.

$C_{19}H_{22}ClFN_2O \cdot HCl$  385.31

USP Flurazepam Related Compound F RS

7-Chloro-5-(2-fluorophenyl)-1,3-dihydro-2H-1,4-benzodiazepin-2-one.

$C_{15}H_{10}ClFN_2O$  288.71

#### Identification—

**A: Infrared Absorption** (197K). [NOTE—Do not grind excessively, as decomposition may occur.]

**B: Ultraviolet Absorption** (197U)—

*Solution:* 10  $\mu$ g per mL.

*Medium:* sulfuric acid in methanol (1 in 36).

Absorptivities at 239 nm, calculated on the anhydrous basis, do not differ by more than 3.0%.

**C:** Prepare a solution of it in methanol containing 3 mg per mL. Apply 10  $\mu$ L of this solution and 10  $\mu$ L of a methanol solution of USP Flurazepam Hydrochloride RS containing 3 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of ethyl acetate and ammonium hydroxide (200:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by viewing under short-wavelength UV light: the  $R_f$  value of the principal spot in the chromatogram of the test solution corresponds to that obtained from the solution of the Reference Standard.

**D:** To 2 mL of a solution (1 in 20) add 1 mL of 2 N nitric acid: the solution responds to the tests for *Chloride* (191), 5 drops of silver nitrate TS being used.

**Water, Method Ia** (921): not more than 0.5%.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.002%.

**Limit of fluoride ion**—[NOTE—Use plasticware throughout the procedure.]

**pH 5.25 Buffer**—Dissolve 110 g of sodium chloride and 1 g of sodium citrate in 700 mL of water in a 2000-mL volumetric flask. Cautiously add 150 g of sodium hydroxide, and dissolve with shaking. Cool to room temperature, and, while stirring, cautiously add 450 mL of glacial acetic acid to the cooled solution. Cool, add 600 mL of isopropyl alcohol, dilute with water to volume, and mix: the pH of this solution is between 5.0 and 5.5.

**Standard stock solution**—Transfer 221 mg of sodium fluoride to a 100-mL volumetric flask, add about 20 mL of water, and mix to dissolve. Add 1.0 mL of sodium hydroxide solution (1 in 2500), dilute with water to volume, and mix. Each mL of this solution contains 1 mg of fluoride ions. Store in a tightly closed, plastic container.

**Standard preparations**—Dilute portions of the *Standard stock solution* quantitatively and stepwise with *pH 5.25 Buffer* to obtain 100-mL solutions having concentrations of 1, 3, 5, and 10 µg per mL.

**Test preparation**—Transfer 1.0 g of Flurazepam Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *pH 5.25 Buffer* to volume, and mix.

**Procedure**—Concomitantly measure the potential (see *Titrimetry* (541)), in mV, of the *Standard preparations* and of the *Test preparation*, with a pH meter capable of a minimum reproducibility of ±0.2 mV, equipped with a glass-sleeved calomel-fluoride specific-ion electrode system. [NOTE—When taking measurements, immerse the electrodes in the solution, which has been transferred to a 150-mL beaker containing a polytetrafluoroethylene-coated stirring bar. Allow to stir on a magnetic stirrer having an insulated top until equilibrium is attained (1 to 2 minutes), and record the potential. Rinse and dry the electrodes between measurements, being careful to avoid damaging the crystal of the specific-ion electrode.] Plot the logarithm of the fluoride-ion concentrations, in µg per mL, of the *Standard preparations* versus the potential in mV. From the measured potential of the *Test preparation* and the standard curve determine the concentration, in µg per mL, of fluoride ion in the *Test preparation*: not more than 0.05% is found.

#### Related compounds—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and 1% ammonium acetate (80:20). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Dissolve accurately weighed quantities of USP Flurazepam Related Compound C RS and USP Flurazepam Related Compound F RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 2 µg per mL for each component. [NOTE—Prepare fresh daily.]

**Test solution**—Transfer about 50 mg of Flurazepam Hydrochloride, accurately weighed, to a 25-mL volumetric flask, add methanol to volume, and mix. [NOTE—Prepare this solution just prior to use.]

**System suitability solution**—Dissolve accurately weighed quantities of USP Flurazepam Hydrochloride RS and 2-amino-5-chlorobenzophenone in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration in each mL of about 150 µg of USP Flurazepam Hydrochloride RS and about 60 µg of 2-amino-5-chlorobenzophenone.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 239-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between 2-amino-5-chlorobenzophenone and flurazepam is not less than 2. Chromatograph replicate injections of the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in percentage, of flurazepam related compound C and flurazepam related compound F in the portion of Flurazepam Hydrochloride taken by the formula:

$$2.5(C/W)(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of USP Flurazepam Related Compound C RS or USP Flurazepam Related Compound F RS in the *Standard solution*; *W* is the weight, in mg, of Flurazepam Hydrochloride taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses for the related compounds obtained from the *Test solution* and the *Standard solution*, respectively. The limit is not more than 0.1% of flurazepam related compound C and not more than 0.1% of flurazepam related compound F.

**Assay**—Transfer about 600 mg of Flurazepam Hydrochloride, accurately weighed, to a 250-mL beaker, dissolve in 80 mL of glacial acetic acid, and add 20 mL of mercuric acetate TS. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using a calomel-glass electrode system. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 23.04 mg of C<sub>21</sub>H<sub>23</sub>ClFN<sub>3</sub>O · 2HCl.

## Flurazepam Hydrochloride Capsules

» Flurazepam Hydrochloride Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flurazepam hydrochloride (C<sub>21</sub>H<sub>23</sub>ClFN<sub>3</sub>O · 2HCl).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Flurazepam Hydrochloride RS

#### Identification—

**A:** Dissolve a portion of Capsules, equivalent to about 30 mg of flurazepam hydrochloride, in 10 mL of methanol, filter, and proceed as directed for *Identification* test C under *Flurazepam Hydrochloride*.

**B:** The retention time of the major peak for flurazepam hydrochloride in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**C:** Capsules meet the requirements under *Identification—Organic Nitrogenous Bases* (181).

#### Dissolution (711)—

**Medium:** 0.01 N hydrochloric acid; 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 20 minutes.

**Standard solution**—Prepare a solution of USP Flurazepam Hydrochloride RS having an accurately known concentration similar to the concentration of the solution under test. Pipet

5 mL of this solution to a 10-mL volumetric flask, and dilute with 1% ammonium acetate to volume.

**Test solution**—Pipet 5 mL of a filtered portion of the solution under test into a 10-mL volumetric flask, and dilute with 1% ammonium acetate to volume.

**Procedure**—Determine the amount of  $C_{21}H_{23}ClFN_3O \cdot 2HCl$  dissolved, using the *Chromatographic system* as set forth in the *Related compounds* test under *Flurazepam Hydrochloride*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{21}H_{23}ClFN_3O \cdot 2HCl$  is dissolved in 20 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

**Mobile phase, System suitability solution, and Chromatographic system**—Prepare as directed for *Related compounds* under *Flurazepam Hydrochloride*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Flurazepam Hydrochloride RS in methanol, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.15 mg per mL. Prepare fresh daily.

**Assay preparation**—[NOTE—Prepare fresh daily.] Weigh and mix the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the Capsule contents, equivalent to about 30 mg of flurazepam hydrochloride, to a 200-mL volumetric flask. Add 40 mL of methanol, and shake by mechanical means for 10 minutes. Add 10 mL of 1% ammonium acetate, and shake by mechanical means for 5 minutes. Dilute with *Mobile phase* to volume, mix and sonicate for 2 minutes, and filter.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of flurazepam hydrochloride ( $C_{21}H_{23}ClFN_3O \cdot 2HCl$ ) in the portion of Capsules taken by the formula:

$$200C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Flurazepam Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Flurbiprofen

$C_{15}H_{13}FO_2$  244.26  
[1,1'-Biphenyl]-4-acetic acid, 2-fluoro- $\alpha$ -methyl-, ( $\pm$ )-.  
( $\pm$ )-2-(2-Fluoro-4-biphenyl)propionic acid [5104-49-4].

» Flurbiprofen contains not less than 99.0 percent and not more than 100.5 percent of  $C_{15}H_{13}FO_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards (11)—

USP Flurbiprofen RS  
USP Flurbiprofen Related Compound A RS  
2-(4-Biphenyl)propionic acid.  
 $C_{15}H_{14}O_2$  226.28

#### Identification—

**A: Infrared Absorption** (197K).

**B: Ultraviolet Absorption** (197U)—

**Solution:** 10  $\mu$ g per mL.

**Medium:** 0.1 N sodium hydroxide.

Absorbance maximum at 247 nm is about 0.8.

**Melting range** (741): between 114° and 117°.

**Loss on drying** (731)—Dry it in vacuum at 60° to constant weight: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.001%.

#### Related compounds—

**Diluent**—Prepare a mixture of water and acetonitrile (11:9).

**Mobile phase**—Prepare a filtered and degassed mixture of water, acetonitrile, and glacial acetic acid (12:7:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard stock solution**—Dissolve an accurately weighed quantity of USP Flurbiprofen Related Compound A RS in *Diluent* to obtain a solution having a concentration of about 50  $\mu$ g per mL.

**System suitability solution**—Pipet 2.0 mL of *Standard stock solution* into a 10-mL volumetric flask, add about 20 mg of USP Flurbiprofen RS, dilute with *Diluent* to volume, and mix.

**Standard solution**—Transfer 2.0 mL of *Standard stock solution* to a 10.0-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**Test solution**—Prepare a solution of Flurbiprofen in *Diluent* containing 2.0 mg per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  15-cm column that contains 4- $\mu$ m packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.9 for flurbiprofen related compound A and 1.0 for flurbiprofen; and the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of flurbiprofen related compound A in the portion of Flurbiprofen taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in  $\mu$ g per mL, of USP Flurbiprofen Related Compound A RS in the *Standard solution*;  $C_U$  is the concentration, in  $\mu$ g per mL, of Flurbiprofen in the *Test solution*; and  $r_U$  and  $r_S$  are the peak responses for flurbiprofen related compound A obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.5% of flurbiprofen related compound A is found. Calculate the percentage of each impurity in the portion of Flurbiprofen taken by the formula:

$$100(r_i / r_S)$$

in which  $r_i$  is the peak response for each impurity obtained from the *Test solution*; and  $r_S$  is the sum of the responses of all the peaks obtained from the *Test solution*: the sum of all impurities is not more than 1.0%.

**Assay**—Dissolve about 0.5 g of Flurbiprofen, accurately weighed, in 100 mL of alcohol, previously neutralized with 0.1 N sodium hydroxide VS to the phenolphthalein endpoint, add phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS to the first appearance of a faint pink color that persists for not less than 30 seconds. Each mL of 0.1 N sodium hydroxide is equivalent to 24.43 mg of  $C_{15}H_{13}FO_2$ .

## Flurbiprofen Tablets

» Flurbiprofen Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flurbiprofen ( $C_{15}H_{13}FO_2$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Flurbiprofen RS

**Identification**—

**A:** Place a number of Tablets, equivalent to about 100 mg of flurbiprofen, in a flask, add 10 mL of 0.1 N hydrochloric acid, and sonicate until the Tablets disintegrate. Extract with two 15-mL portions of ether, combining the ether extracts in a flask containing about 1 g of anhydrous sodium sulfate. Decant the ether, and evaporate to dryness: the IR absorption spectrum of a mineral oil dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Flurbiprofen RS.

**B:** The retention time of the flurbiprofen peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

**pH 7.2 Phosphate buffer**—Dissolve 245 g of monobasic potassium phosphate and 50 g of sodium hydroxide in water to make 2000 mL of solution. Dilute 333 mL of this stock solution to 6000 mL with water. If necessary, adjust with 5 N sodium hydroxide or with phosphoric acid to a pH of  $7.20 \pm 0.05$ .

**Medium:** pH 7.2 phosphate buffer; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 45 minutes.

**Procedure**—Determine the amount of  $C_{15}H_{13}FO_2$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 247 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, in comparison with a Standard solution having a known concentration of USP Flurbiprofen RS in the same *Medium*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{15}H_{13}FO_2$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements, the following procedure being used where the test for *Content Uniformity* is required.

**Procedure for content uniformity**—Proceed as directed in the *Assay*, except in preparing the *Assay preparation* to use 1 Tablet and to use 10.0 mL of *Internal standard solution* for each 25 mg of flurbiprofen in the Tablet, based on the labeled amount.

**Assay**—

**Mobile phase**—Dissolve 1.4 g of monobasic sodium phosphate in 570 mL of water, add 430 mL of acetonitrile, and adjust with phosphoric acid to a pH of 3.0. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Dissolve acetophenone in *Mobile phase* to obtain a solution having a concentration of about 0.8  $\mu$ L per mL.

**Standard preparation**—Accurately weigh about 30 mg of USP Flurbiprofen RS. Add 10.0 mL of *Internal standard solution*, and swirl to dissolve. This stock solution contains about 3 mg of USP Flurbiprofen RS per mL. Dilute a portion of this stock solution with 20 volumes of *Mobile phase*, and mix.

**Assay preparation**—Place 3 Tablets in a stoppered container. Based on the labeled amount, in mg, of flurbiprofen in each Tablet, add 25.0 mL of *Internal standard solution* for each 75 mg of flurbiprofen in the 3 Tablets. Shake by mechanical means for about 15 minutes, and centrifuge. Dilute a portion of this solution with 20 volumes of *Mobile phase*, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  25-cm column containing packing L7. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the relative retention times are about 0.4 for acetophenone and 1.0 for flurbiprofen; the resolution, *R*, between the acetophenone and flurbiprofen is not less than 8; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of flurbiprofen ( $C_{15}H_{13}FO_2$ ) in the portion of Tablets taken by the formula:

$$(WV / 10)(R_U / R_S)$$

in which *W* is the quantity, in mg, of USP Flurbiprofen RS used to prepare the *Standard preparation*; *V* is the volume, in mL, of *Internal standard solution* used to prepare the *Assay preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the ratios of the flurbiprofen peak response to the acetophenone peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Flurbiprofen Sodium

$C_{15}H_{12}FNaO_2 \cdot 2H_2O$  302.27

[1,1'-Biphenyl]-4-acetic acid, 2-fluoro- $\alpha$ -methyl, sodium salt dihydrate, ( $\pm$ )-.

Sodium ( $\pm$ )-2-(2-fluoro-4-biphenyl)propionate dihydrate. Anhydrous 266.25

» Flurbiprofen Sodium contains not less than 97.0 percent and not more than 103.0 percent of  $C_{15}H_{12}FNaO_2 \cdot 2H_2O$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Flurbiprofen RS

USP Flurbiprofen Sodium RS

USP Flurbiprofen Related Compound A RS  
2-(4-Biphenyl)propionic acid.

$C_{15}H_{14}O_2$  226.28

**Identification—****A:** Infrared Absorption (197M)—

Test specimen: previously dried.

**B:** Ultraviolet Absorption (197U)—

Solution: 10 µg per mL.

Medium: pH 6.0 buffer consisting of 2.42 g of monobasic sodium phosphate and 0.66 g of dibasic sodium phosphate dissolved in water to make 1000 mL.

Absorptivities at 246 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** The residue obtained by igniting it meets the requirements of the tests for Sodium (191).**Specific rotation** (781S): between  $-0.45^\circ$  and  $+0.45^\circ$ .

Test solution: 50 mg per mL, in methanol.

**Loss on drying** (731)—Dry about 0.3 g of it in vacuum at a pressure not exceeding 1 mm of mercury over phosphorus pentoxide in a suitable drying tube at  $60^\circ$  for 18 hours: it loses not less than 11.3% and not more than 12.5% of its weight.**Heavy metals, Method II** (231): 0.001%.**Limit of flurbiprofen related compound A—***Diluent, Mobile phase, and System suitability preparation—*Proceed as directed in the Assay.*Standard solution—*Use *Standard flurbiprofen related compound A preparation*, prepared as directed in the Assay.*Test solution—*Use the *Assay preparation*.*Chromatographic system—*Proceed as directed in the Assay, except to chromatograph the *Standard solution* instead of the *Standard preparation*.*Procedure—*Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of flurbiprofen related compound A in the portion of Flurbiprofen Sodium taken by the formula:

$$200(C/W)(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Flurbiprofen Related Compound A RS in the *Standard solution*; W is the weight, in mg, of the portion of Flurbiprofen Sodium taken to prepare the *Test solution*; and  $r_U$  and  $r_S$  are the peak areas for flurbiprofen related compound A obtained from the *Test solution* and the *Standard solution*, respectively: not more than 1.5% is found.**Assay—***Diluent—*Mix 500 mL of methanol and 250 mL of water.*Mobile phase—*Prepare a filtered and degassed mixture of acetonitrile, water, and glacial acetic acid (50:49:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).*Standard flurbiprofen related compound A preparation—*Dissolve an accurately weighed quantity of USP Flurbiprofen Related Compound A RS in methanol to obtain a stock solution having a known concentration of about 150 µg per mL. Transfer 1.0 mL of this solution to a 200-mL volumetric flask, dilute with *Diluent* to volume, and mix.*Standard preparation—*Dissolve an accurately weighed quantity of USP Flurbiprofen RS in methanol to obtain a stock solution having a known concentration of about 1 mg per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.*System suitability preparation—*Transfer 5 mL of the stock solution used to prepare the *Standard preparation* and 2 mL of the stock solution used to prepare the *Standard flurbiprofen related compound A preparation* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.*Assay preparation—*Transfer about 100 mg of Flurbiprofen Sodium, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.Transfer 5.0 mL of this solution to a second 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.0-mm × 25-cm column that contains 10-µm packing L7. The flow rate is about 2 mL per minute. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between flurbiprofen related compound A and flurbiprofen is not less than 1.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 1.0%.*Procedure—*Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of  $C_{15}H_{12}FNaO_2 \cdot 2H_2O$  in the portion of Flurbiprofen Sodium taken by the formula:

$$200(302.27/244.27)(C/W)(r_U / r_S)$$

in which 302.27 and 244.27 are the molecular weights of flurbiprofen sodium dihydrate and anhydrous flurbiprofen, respectively; C is the concentration, in µg per mL, of USP Flurbiprofen RS in the *Standard preparation*; W is the weight, in mg, of the portion of Flurbiprofen Sodium taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the flurbiprofen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

---

**Flurbiprofen Sodium Ophthalmic Solution**

---

» Flurbiprofen Sodium Ophthalmic Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flurbiprofen sodium ( $C_{15}H_{12}FNaO_2 \cdot 2H_2O$ ).**Packaging and storage—**Preserve in tight containers.**USP Reference standards** (11)—

USP Flurbiprofen RS

USP Flurbiprofen Related Compound A RS

2-(4-Biphenyl)propionic acid.

 $C_{15}H_{14}O_2$  226.28**Identification—**The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the Assay.**pH** (791): between 6.0 and 7.0.**Antimicrobial effectiveness** (51): meets the requirements.**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.**Assay—***Diluent, Mobile phase, Standard flurbiprofen related compound A preparation, Standard preparation, and System suitability preparation—*Proceed as directed in the Assay under *Flurbiprofen Sodium*.*Assay preparation—*Use the undiluted Ophthalmic Solution.*Chromatographic system—*Proceed as directed in the Assay under *Flurbiprofen Sodium*, using a 4.0-mm × 5-cm guard column that contains 5-µm packing L1.*Procedure—*Separately inject equal volumes (about 15 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and meas-

ure the areas for the major peaks. Calculate the quantity of flurbiprofen sodium ( $C_{15}H_{12}FNaO_2 \cdot 2H_2O$ ) in each mL of the Ophthalmic Solution taken by the formula:

$$(302.27 / 244.27)C(r_U / r_S)$$

in which 302.27 and 244.27 are the molecular weights of flurbiprofen sodium dihydrate and anhydrous flurbiprofen, respectively;  $C$  is the concentration, in mg per mL, of USP Flurbiprofen RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Flutamide

$C_{11}H_{11}F_3N_2O_3$  276.21

Propanamide, 2-methyl-N-[4-nitro-3-(trifluoromethyl)-phenyl]-.

$\alpha, \alpha, \alpha$ -Trifluoro-2-methyl-4'-nitro-*m*-propionotoluidide [13311-84-7].

» Flutamide contains not less than 98.0 percent and not more than 101.0 percent of  $C_{11}H_{11}F_3N_2O_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Flutamide RS

USP *o*-Flutamide RS

2-Methyl-N-[6-nitro-3-(trifluoromethyl)phenyl]propanamide

$C_{11}H_{11}F_3N_2O_3$  276.22

### Identification—

**A:** *Infrared Absorption* (197M).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Melting range** (741): between 110° and 114°, but the range between beginning and end of melting does not exceed 2°.

**Loss on drying** (731)—Dry it in vacuum at 60° for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): not more than 10 ppm.

### Related compounds—

*Mobile phase* and *System suitability solution*—Prepare as directed in the *Assay*.

*Standard solution*—Use the *Standard preparation*, prepared as directed in the *Assay*.

*Test solution*—Use the *Assay preparation*, prepared as directed in the *Assay*.

*Detector sensitivity solution*—Transfer 1.0 mL of the *Standard solution* into a 100-mL volumetric flask, dilute with a mixture of water and acetonitrile (4:1) to volume, and mix. Dilute quantitatively, and stepwise if necessary, with a mixture of water and acetonitrile (4:1) to obtain a solution having a known concentration of about 0.1 µg per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The column temperature is maintained at 25 ± 5°. The flow rate is about 1.0 mL per minute. Chromatograph the *System*

*suitability solution*, and record the peak area responses as directed for *Procedure*: the relative retention times are about 1.4 for *o*-flutamide and 1.0 for flutamide; and the resolution,  $R$ , between flutamide and *o*-flutamide is not less than 6.0. Chromatograph the *Detector sensitivity solution*, and record the peak area responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 10.0% for flutamide.

*Procedure*—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak area responses. Calculate the percentage of each impurity in the portion of Flutamide taken by the formula:

$$100(1/F)(r_i / r_s)$$

in which  $F$  is the relative response factor of the impurities according to the table below;  $r_i$  is the peak area response for each impurity; and  $r_s$  is the sum of the responses of all the peaks: the impurities meet the requirements tabulated below.

Compound name	Relative Retention Time	Relative Response Factor (F)	Limit (%)
4-Nitro-3-trifluoromethyl-acetanilide	0.42	1.06	0.2
4-Nitro-3-trifluoromethyl-aniline	0.45	1.10	0.15
3-trifluoromethylaniline	0.63	1.10	0.2
4-Nitro-3-trifluoromethyl-propionanilide	0.66	1.02	0.3
3-trifluoromethyl-isobutyranilide	0.80	1.95	0.2
<i>o</i> -Flutamide	1.40	1.78	0.2
Flutamide	1.0	1.0	—
Unknown	—	1.0	0.05
Total unknown	—	—	0.1
Total impurities	—	—	0.4

### Assay—

*Mobile phase*—Prepare a filtered and degassed mixture of water and acetonitrile (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Flutamide RS in 50 mL of acetonitrile, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.2 mg per mL.

*System suitability solution*—Transfer about 50 mg of USP *o*-Flutamide RS, accurately weighed, to a 50-mL volumetric flask, dissolve in 10 mL of acetonitrile, dilute with water to volume, and mix. Transfer 1.0 mL of this solution and 5.0 mL of the *Standard preparation* into a 100-mL volumetric flask, dilute with a mixture of water and acetonitrile (4:1) to volume, and mix.

*Assay preparation*—Transfer about 50 mg of Flutamide, previously dried and accurately weighed, to a 250-mL volumetric flask. Add 50 mL of acetonitrile, and sonicate until the Flutamide dissolves. Add 150 mL of water, mix, and allow to warm to room temperature. Dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The column temperature is maintained at 25 ± 5°. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak area responses as directed for *Procedure*: the relative retention times are about 1.4 for *o*-flutamide and 1.0 for flutamide; and the resolution,  $R$ , between flutamide and *o*-flutamide is not less than

6.0. Chromatograph the *Standard preparation*, and record the peak area responses as directed for *Procedure*: the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{11}H_{11}F_3N_2O_3$  in the portion of Flutamide taken by the formula:

$$250C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Flutamide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Flutamide Capsules

» Flutamide Capsules contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of flutamide ( $C_{11}H_{11}F_3N_2O_3$ ).

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—  
USP Flutamide RS

### Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

B: Remove the contents of 20 Capsules, and grind the contents to a fine powder. Dissolve a portion of the powder in a mixture of chloroform and methanol (5:1) to obtain a solution containing 3 mg of flutamide per mL. The test solution so obtained responds to the *Thin-Layer Chromatographic Identification Test* (201), a mixture of chloroform and ethyl acetate (3:1) being used as the developing solvent and 20  $\mu$ L each of the test solution and the Standard solution being applied to the thin-layer chromatographic plate.

### Dissolution (711)—

*Medium*: 2% sodium lauryl sulfate solution; 1000 mL.

*Apparatus 2*: 75 rpm.

*Time*: 60 minutes.

*Procedure*—Determine the amount of  $C_{11}H_{11}F_3N_2O_3$  dissolved from UV absorbances at the wavelength of maximum absorbances at the wavelength of maximum absorbance at about 306 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, in comparison with a Standard solution having a known concentration of USP Flutamide RS in the same *Medium*.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{11}H_{11}F_3N_2O_3$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Chromatographic purity—

*Mobile phase*—Prepare as directed in the *Assay*.

*Standard solution*—Prepare as directed in the *Assay* for *Standard preparation*.

*Test solution*—Use the *Assay preparation*.

*Detector sensitivity solution*—Transfer an accurately measured volume of the *Standard solution* into a volumetric flask, and dilute quantitatively, and stepwise if necessary, with a mixture of water and acetonitrile (4:1) to obtain a solution having a known concentration of about 0.2 mg per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The column temperature is maintained at  $25 \pm 5^\circ$ . The flow rate is about 1.0 mL per minute. Chromatograph the *Detector sensitivity solution*, and record the peak area responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 10% for flutamide.

*Procedure*—Inject a volume (about 20  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak area responses. Calculate the percentage of each impurity in the portion of Capsules taken by the formula:

$$100(r_i / r_S)$$

in which  $r_i$  is the peak area response for each impurity, excluding those where peak area responses are less than those obtained from the *Detector sensitivity solution*; and  $r_S$  is the sum of the responses of all the peaks: not more than 0.2% for any impurity having a relative retention time of about 0.45 is found; not more than 0.1% of any other impurity is found; and not more than 0.3% of total impurities is found.

### Assay—

*Diluent*—Prepare a mixture of acetonitrile and water (1:1).

*Mobile phase*—Prepare a filtered and degassed mixture of water and acetonitrile (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Flutamide RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.5 mg per mL. Transfer 20.0 mL of this solution into a 50-mL volumetric flask, and dilute with water to volume to obtain a final concentration of 0.2 mg per mL.

*Assay preparation*—Remove the contents of not fewer than 20 Capsules, and mix. Transfer an accurately weighed portion of the powder, equivalent to 125 mg of flutamide, into a 250-mL volumetric flask. Add 180 mL of *Diluent*. Shake the flask for 15 minutes. Dilute with *Diluent* to volume, and mix. Allow the insoluble material to settle. Transfer 20.0 mL of supernatant into a 50-mL volumetric flask, dilute with water to volume, mix, and pass through a polytetrafluoroethylene membrane filter having a 0.45- $\mu$ m porosity.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The column temperature is maintained at  $25 \pm 5^\circ$ . The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak area response as directed for *Procedure*: the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak area response for the flutamide peak. Calculate the quantity, in mg, of flutamide ( $C_{11}H_{11}F_3N_2O_3$ ) in the portion of Capsules taken by the formula:

$$625C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Flutamide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluticasone Propionate

$C_{25}H_{31}F_3O_5S$  500.57  
 Androsta-1,4-diene-17-carbothioic acid, 6,9-difluoro-11-hydroxy-16-methyl-3-oxo-17-(1-oxopropoxy)-, (6 $\alpha$ ,11 $\beta$ ,16 $\alpha$ ,17 $\alpha$ )-S-(fluoromethyl) ester;  
 S-Fluoromethyl 6 $\alpha$ ,9 $\alpha$ -difluoro-11 $\beta$ -hydroxy-16 $\alpha$ -methyl-3-oxo-17 $\alpha$ -propionyloxyandrosta-1,4-diene-17 $\beta$ -carbothioate [80474-14-2].

### DEFINITION

Fluticasone Propionate contains NLT 98.0% and NMT 101.0% of  $C_{25}H_{31}F_3O_5S$ , calculated on the anhydrous, solvent-free basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** (197M)
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** 1.15 g/L of monobasic ammonium phosphate, adjusted with phosphoric acid to a pH of  $3.5 \pm 0.05$

**Mobile phase:** Methanol, acetonitrile, and *Buffer* (50:15:35)

**System suitability solution:** 0.05 mg/mL of USP Fluticasone Propionate Resolution Mixture RS in *Mobile phase*

**Standard solution:** 0.04 mg/mL of USP Fluticasone Propionate RS in *Mobile phase*

**Sample solution:** 0.04 mg/mL of Fluticasone Propionate in *Mobile phase*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 239 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for fluticasone propionate and fluticasone propionate related compound D are about 1.0 and 1.10, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.5 between fluticasone propionate and fluticasone propionate related compound D, *System suitability solution*

**Relative standard deviation:** NMT 2%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of fluticasone propionate ( $C_{25}H_{31}F_3O_5S$ ) in the portion of Fluticasone Propionate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of fluticasone propionate from the *Sample solution*

$r_S$  = peak response of fluticasone propionate from the *Standard solution*

$C_S$  = concentration of USP Fluticasone Propionate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Fluticasone Propionate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–101.0% on the anhydrous, solvent-free basis

### IMPURITIES

#### ORGANIC IMPURITIES

**Solution A:** 0.5 mL of phosphoric acid in 1000 mL of acetonitrile

**Solution B:** 0.5 mL of phosphoric acid in 1000 mL of methanol

**Solution C:** 0.5 mL of phosphoric acid in 1000 mL of water

**Mobile phase:** See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)	Solution C (%)
0	42	3	55
40	53	3	44
60	87	3	10
70	87	3	10
75	42	3	55

**System suitability solution:** Dissolve 2.0 mg of USP Fluticasone Propionate System Suitability Mixture RS in 5 mL of *Solution A* using sonication. Add 5 mL of *Solution C*.

**Sample solution:** 2.0 mg/mL prepared as follows: Dissolve 2.0 mg of Fluticasone Propionate in 5 mL of *Solution A* using sonication. Add 5 mL of *Solution C*.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 239 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Column temperature:** 40°

**Flow rate:** 1 mL/min

**Injection size:** 50  $\mu$ L

#### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 0.6 between fluticasone propionate related compound B and fluticasone propionate related compound C; NLT 1.5 between fluticasone propionate related compound D and fluticasone propionate

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Fluticasone Propionate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each impurity

$r_T$  = sum of the responses of all the peaks

Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Fluticasone propionate related compound A	0.5	0.2
Fluticasone propionate related compound B	0.75	0.1
Fluticasone propionate related compound C	0.8	0.1
Fluticasone propionate related compound D	0.95	0.3
Fluticasone propionate	1.0	—
Fluticasone propionate related compound E	1.3	0.3
Any individual unspecified impurity	—	0.1
Total impurities*	—	1.0

\* Include all impurity peaks greater than or equal to 0.05%.

#### • LIMIT OF ACETONE

**Internal standard solution:** 0.05% (v/v) solution of tetrahydrofuran in dimethylformamide

**Standard solution:** 0.05% (v/v) of acetone in *Internal standard solution*

**Sample solution:** 50 mg/mL of Fluticasone Propionate in the *Internal standard solution*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.53-mm × 25-m; 2-μm film of phase G16

**Carrier gas:** Nitrogen or helium

**Temperature**

**Detector:** 250°

**Splitless injector:** 150°

**Column:** See Table 3.

Table 3

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
60	0	60	3.5
60	30	180	3.0

**Flow rate:** 5.5 mL/min

**Injection size:** 0.1 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 5.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of acetone (w/w) in the portion of Fluticasone Propionate taken:

$$\text{Result} = (R_U/R_S) \times D \times (C_S/C_U)$$

$R_U$  = peak response ratio of acetone to tetrahydrofuran from the *Sample solution*

$R_S$  = peak response ratio of acetone to tetrahydrofuran from the *Standard solution*

$D$  = density of acetone at 20° (g/mL)

$C_S$  = concentration of acetone in the *Standard solution* (%v/v)

$C_U$  = concentration of Fluticasone Propionate in the *Sample solution* (g/mL)

Acceptance criteria: NMT 1.0% (w/w)

#### SPECIFIC TESTS

- **OPTICAL ROTATION**, *Specific Rotation* (781S): +32° to +36° at 20°, calculated on the anhydrous, solvent-free basis  
**Sample solution:** 0.5% (w/v) of Fluticasone Propionate in dichloromethane (0.5 g in 100 mL)

- **WATER DETERMINATION**, *Method I* (921): NMT 0.2% (w/w)

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at a temperature not exceeding 30°.

- **LABELING:** Fluticasone Propionate in the form of microcrystals is so labeled.

- **USP REFERENCE STANDARDS** (11)

USP Fluticasone Propionate RS

USP Fluticasone Propionate Resolution Mixture RS

USP Fluticasone Propionate System Suitability Mixture RS

It is a mixture of USP Fluticasone Propionate RS and fluticasone propionate related compounds B, C, and D.

*Fluticasone propionate related compound A:* 6α,9α-Difluoro-11β-hydroxy-16α-methyl-3-oxo-17α-propionyloxyandrost-1,4-diene-17β-carbonylsulfenic acid.

*Fluticasone propionate related compound B:* 6α,9α-Difluoro-11β-hydroxy-16α-methyl-2',3,4'-trioxo-17α-spiro(androst-1,4-diene-17,5'-(1,3)oxathiolane).

*Fluticasone propionate related compound C:* S-Fluoromethyl 17α-acetyloxy-6α,9α-difluoro-11β-hydroxy-16α-methyl-3-oxo-androst-1,4-diene-17β-carbothioate.

*Fluticasone propionate related compound D:* S-Methyl 6α,9α-difluoro-11β-hydroxy-16α-methyl-3-oxo-17α-propionyloxy-androst-1,4-diene-17β-carbothioate.

*Fluticasone propionate related compound E:* 6α,9α-Difluoro-11β,17α-dihydroxy-16α-methyl-3-oxo-androst-1,4-diene-17β-carboxylic acid 6α,9α-difluoro-17β-(fluoromethylthio) carbonyl-11β-hydroxy-16α-methyl-3-oxo-androst-1,4-dien-17α-yl ester.

## Fluticasone Propionate Cream

#### DEFINITION

Fluticasone Propionate Cream contains NLT 90.0% and NMT 110.0% of the labeled amount of fluticasone propionate (C<sub>25</sub>H<sub>31</sub>F<sub>3</sub>O<sub>5</sub>S).

#### IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)

**Standard solution:** 0.4 mg/mL of USP Fluticasone Propionate RS in acetonitrile

**Test solution:** Transfer a quantity of Cream, equivalent to 1000 μg of fluticasone propionate, to a 125-mL separatory funnel. Add 25 mL of acetonitrile and 25 mL of hexane to the separatory funnel. Stopper and shake the funnel until the Cream is completely dispersed. Shake the separatory funnel for an additional 3 min, and allow the phases to separate. Filter the lower layer through a 20-mL syringe containing a cotton plug into a 50-mL volumetric flask. Repeat the extraction with one 7-mL aliquot of acetonitrile, and filter the lower layer into the volumetric flask. Wash the cotton plug with 2 mL of acetonitrile, and collect the washings into the volumetric flask. Dilute the sample extract with acetonitrile to volume. Transfer 12 mL of the sample extract to a glass tube suitable for evaporation, and evaporate to dryness at about 40°. Dissolve the residue in 0.6 mL of acetonitrile. [NOTE—The *Test solution* may be cloudy because of the presence of undissolved excipients.]

**Chromatographic system**(See *Chromatography* <621>, *Thin-Layer Chromatography*.)**Adsorbent:** 0.2-mm layer of chromatographic silica gel mixture on a high-performance thin-layer chromatographic plate, 5- $\mu$ m particle size**Application volume:** 40  $\mu$ L**Developing solvent system:** Dichloromethane, ethyl acetate, and glacial acetic acid (30:8:1)**Analysis****Samples:** *Standard solution* and *Test solution*

Separately apply the *Standard solution* and the *Test solution* to the plate. On the same plate, apply 20  $\mu$ L of the *Standard solution*, allow the application to dry, and apply 20  $\mu$ L of the *Test solution* on top of the dried 20- $\mu$ L *Standard solution* spot. Allow each of the applications to dry thoroughly. Place the plate in a tank equilibrated with the developing solvent, and allow the developing solvent to travel about 8 cm from the point of application. Remove the plate and allow to air-dry. Examine the plate under ultraviolet light at 254 nm.

**Acceptance criteria:** The  $R_f$  value of the principal spot from the *Test solution* corresponds to that of the *Standard solution*. [NOTE—If the excipients in the Cream interfere with the appearance of the principal spot obtained for the *Test solution*, use the *Standard solution* and the *Test solution* overspot to confirm identity.]

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY****• PROCEDURE**

[NOTE—Protect the *Standard solution* and the *Sample solution* from direct light by using a light-protective volumetric flask and autosampler vials.]

**Buffer:** 1.2 g/L of monobasic ammonium phosphate. Adjust with phosphoric acid to a pH of  $3.50 \pm 0.03$ .

**Mobile phase:** Methanol, acetonitrile, and *Buffer* (46:14:40)

**Diluent:** Alcohol and water (65:35)

**System suitability stock solution:** 0.5 mg/mL of USP Fluticasone Propionate Nasal Spray Resolution Mixture RS in methanol. [NOTE—USP Fluticasone Propionate Nasal Spray Resolution Mixture RS is a mixture of fluticasone propionate and fluticasone propionate related compound D.]

**System suitability solution:** 10  $\mu$ g/mL of USP Fluticasone Propionate Nasal Spray Resolution Mixture RS in *Diluent* from *System suitability stock solution*

**Standard stock solution:** 0.5 mg/mL USP Fluticasone Propionate RS. Dissolve the standard first in a volume of methanol, equivalent to 80% of the final volume, and dilute with water to volume.

**Standard solution:** 20  $\mu$ g/mL USP Fluticasone Propionate RS in *Diluent*, from *Standard stock solution*

**Sample solution:** Equivalent to 20  $\mu$ g/mL of fluticasone propionate. Transfer a quantity of Cream, equivalent to 1000  $\mu$ g of fluticasone propionate, to a 125-mL separatory funnel. Add to the separatory funnel 25 mL of *Diluent*. Stopper and shake vigorously until the Cream is completely dispersed. Add 25 mL of hexane, shake for an additional 3 min, and allow the phases to separate. Filter the lower layer through a 20-mL syringe containing a cotton plug into a 50-mL volumetric flask. Repeat the extraction with one 5-mL and one 2-mL aliquot of *Diluent*, filtering the lower layers into the volumetric flask. Wash the cotton plug with 1 mL of *Diluent*, and collect the washings into the volumetric flask. Dilute the sample with *Diluent* to volume.

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** 240 nm**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1**Column temperature:** 50°**Flow rate:** 1.5 mL/min**Injection size:** 20  $\mu$ L**System suitability****Samples:** *System suitability solution* and *Standard solution***Suitability requirements**

**Resolution:** NLT 1.4 between fluticasone propionate and fluticasone propionate related compound D, *System suitability solution*

**Tailing factor:** NMT 1.4, *Standard solution* (calculated using the width of the peak at 10% of the height)

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of fluticasone propionate ( $C_{25}H_{31}F_3O_5$ ) in the portion of Cream taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of fluticasone propionate from the *Sample solution*

$r_S$  = peak response of fluticasone propionate from the *Standard solution*

$C_S$  = concentration of USP Fluticasone Propionate RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of fluticasone propionate in the *Sample solution* ( $\mu$ g/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

- **MINIMUM FILL** <755>: Meets the requirements

**SPECIFIC TESTS**

- **pH** <791>: 4.5–6.5

- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: Meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*. The total aerobic microbial count is NMT 100 cfu/g, and the total combined molds and yeasts count is NMT 10 cfu/g.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in collapsible tubes or tight containers, protected from light. Store between 2° and 30°.

- **USP REFERENCE STANDARDS** <11>

USP Fluticasone Propionate RS

USP Fluticasone Propionate Nasal Spray Resolution Mixture RS

This Reference Standard is a mixture of fluticasone propionate and fluticasone propionate related compound D, and the chemical names for both are given below:  
*Fluticasone propionate:* 5-Fluoromethyl 6 $\alpha$ ,9 $\alpha$ -difluoro-11 $\beta$ -hydroxy-16 $\alpha$ -methyl-3-oxo-17 $\alpha$ -propionyloxyandrosta-1,4-diene-17 $\beta$ -carbothioate.

*Fluticasone propionate related compound D:* 5-Methyl-6 $\alpha$ ,9 $\alpha$ -difluoro-11 $\beta$ -hydroxy-16 $\alpha$ -methyl-3-oxo-17 $\alpha$ -propionyloxyandrosta-1,4-diene-17 $\beta$ -carbothioate.

**Fluticasone Propionate Nasal Spray****DEFINITION**

Fluticasone Propionate Nasal Spray is a white, opaque suspension of Fluticasone Propionate in water. It is supplied in a form suitable for nasal administration. It contains NLT 95.0% and NMT 115.0% of the labeled amount of fluticasone propionate ( $C_{25}H_{31}F_3O_5$ ).

**IDENTIFICATION****A. INFRARED ABSORPTION** (197M)

**Sample:** Transfer 30 g of Nasal Spray equally into two 50-mL centrifuge tubes. Add 10 mL of water to each tube, insert the stopper, and shake vigorously for 2 min. Centrifuge at 3500 rpm for 10 min, and discard the supernatant. Add 10 mL of water to each tube, insert the stopper, and shake vigorously for 2 min. Centrifuge at 3500 rpm for 10 min, and discard the supernatant. Add 10 mL of water to each tube, insert the stopper, and shake vigorously for 2 min. Centrifuge at 3500 rpm for 10 min, and discard the supernatant. To one tube add 10 mL of methanol. Shake to disperse the residue, and transfer to the other tube. Shake the other tube for 1 min. Centrifuge at 3500 rpm for 10 min. Decant the supernatant into an agate mortar. Evaporate the methanol either by carefully blowing dry with compressed air or nitrogen, or by allowing the methanol to evaporate naturally. If using an air or nitrogen line, use a suitable in-line filter to avoid contamination. Allow the residue to dry overnight in a desiccator over silica gel.

**Acceptance criteria:** Meets the requirements

- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****PROCEDURE**

**Diluent:** Acetonitrile and 0.001 M hydrochloric acid (60:40)

**Buffer:** 1.2 g/L of monobasic ammonium phosphate. Adjust with phosphoric acid to a pH of  $3.5 \pm 0.05$ .

**Mobile phase:** Methanol, acetonitrile, and *Buffer* (50:15:35)

**System suitability solution:** 50 µg/mL of USP Phenylethyl Alcohol RS and 10 µg/mL of USP Fluticasone Propionate Nasal Spray Resolution Mixture RS in *Diluent*

**Standard solution:** 10 µg/mL of USP Fluticasone Propionate RS in *Diluent*

**Sample solution:** Nominally 10 µg/mL prepared as follows: Transfer an amount of the Nasal Spray containing 0.5 mg of fluticasone propionate to a 50-mL volumetric flask. Add about 40 mL of *Diluent*, and sonicate the flask for 10 min. Dilute with *Diluent* to volume, and shake. Allow to stand for 10 min until the supernatant is a clear solution. Inject the clear supernatant into the chromatograph.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 and 239 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 20 µL

**System suitability**

[NOTE—Record the peak areas at 210 nm for 5 min, then change the wavelength to 239 nm and record the peak areas.]

**Samples:** *System suitability solution* and *Standard solution*

Record the chromatogram at 210 nm for 5 min and then change the wavelength to 239 nm.

[NOTE—The relative retention times for phenylethyl alcohol, fluticasone propionate, and fluticasone propionate related compound D are about 0.42, 1.0, and 1.10, respectively.]

**Suitability requirements**

**Resolution:** NLT 1.5 between fluticasone propionate and fluticasone propionate related compound D, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the label claim of fluticasone propionate ( $C_{25}H_{31}F_3O_5S$ ) in the portion of Nasal Spray taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Fluticasone Propionate RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of Fluticasone Propionate in the *Sample solution* (µg/mL)

**Acceptance criteria:** 95.0%–115.0%

**OTHER COMPONENTS****CONTENT OF PHENYLETHYL ALCOHOL**

**Diluent, Mobile phase, System suitability solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Standard solution:** 0.05 mg/mL of USP Phenylethyl Alcohol RS in *Diluent*

**Sample solution:** Transfer 1.0 g of the Nasal Spray to a 50-mL volumetric flask. Add about 40 mL of *Diluent*, and sonicate for 10 min until supernatant is clear. Use the clear supernatant for analysis.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the quantity, in mg/g, of phenylethyl alcohol in the portion of Nasal Spray taken:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/W)$$

$r_U$  = peak response of phenylethyl alcohol from the *Sample solution*

$r_S$  = peak response of phenylethyl alcohol from the *Standard solution*

$C_S$  = concentration of USP Phenylethyl Alcohol RS in the *Standard solution* (mg/mL)

$V$  = volume of the *Sample solution*, 50 mL

$W$  = weight of the Nasal Spray in the *Sample solution* (g)

**Acceptance criteria**

For 50 sprays: 1.75–2.63 mg/g

For 120 sprays: 1.88–2.63 mg/g

**CONTENT OF BENZALKONIUM CHLORIDE**

**Buffer:** 250 mg/mL of citric acid. Adjust the solution with 2 N sodium hydroxide to a pH of  $3.5 \pm 0.05$ .

**Standard solution:** 200 µg/mL [0.02% (w/w)] of USP Benzalkonium Chloride RS in water

**Docusate sodium titrant:** Dissolve 0.22 g of USP Docusate Sodium RS in 100 mL of warm water. Dilute with water to make 1000 mL.

**Eosin Y indicator:** Dissolve 25 mg of eosin Y in 50 mL of acetone. Add 450 mL of chloroform and  $5.0 \pm 0.5$  g of citric acid. Shake thoroughly until no discoloration occurs. Filter the mixture to remove any undissolved citric acid. Store in an amber bottle.

**Titer value of docusate sodium:** Pipet 10 mL of the *Standard solution* into a 250-mL glass-stoppered flask containing 40 mL of water, 5 mL of *Eosin Y indicator*, and 2 mL of *Buffer*. Insert the stopper into the flask, and shake, releasing any build-up of pressure. Titrate with *Docusate sodium titrant* with vigorous shaking to a point when pink coloration is discharged from the chloroform layer. Perform a blank determination, substituting 10 mL of water for the *Standard solution*, and make any necessary correction (see *Titrimetry* (541)).

Calculate the titer value ( $T$ ) of the *Docusate sodium titrant*, in µg/mL, of benzalkonium chloride:

$$\text{Result} = C_S \times (V_S/V_0)$$

$C_S$  = concentration of USP Benzalkonium Chloride RS in the *Standard solution* (µg/mL)

$V_s$  = volume of the *Standard solution*, 10 mL  
 $V_D$  = volume of the *Docusate sodium titrant* used in the titration of the *Standard solution* (mL)

**Analysis**

**Sample:** 10 g of Nasal Spray

Transfer the *Sample* into a 250-mL glass-stoppered flask containing 40 mL of water, 5 mL of *Eosin Y indicator*, and 2 mL of *Buffer*. Repeat the procedure as given above for the *Standard solution*. To clarify the endpoint, place the flask in an ultrasonic bath for 1–2 min to separate the chloroform layer from the aqueous phase. Perform a blank determination.

Calculate the concentration of benzalkonium chloride, in  $\mu\text{g/g}$ , in the portion of Nasal Spray taken:

$$\text{Result} = TV/W$$

$T$  = titer value of the *Docusate sodium titrant*  
 $V$  = volume of the *Docusate sodium titrant* used in the titration of the Nasal Spray (mL)  
 $W$  = weight of the portion of Nasal Spray taken (g)

**Acceptance criteria:** 140–220  $\mu\text{g/g}$

**PERFORMANCE TESTS**

• **DELIVERED DOSE UNIFORMITY** (within container)

**Diluent:** Acetonitrile and 0.001 M hydrochloric acid (60:40)

**Buffer:** 1.2 g/L of monobasic ammonium phosphate. Adjust with phosphoric acid to a pH of  $3.5 \pm 0.05$ .

**Mobile phase:** Methanol, acetonitrile, and *Buffer* (50:15:35)

**System suitability solution:** 5  $\mu\text{g/mL}$  of USP Fluticasone Propionate Nasal Spray Resolution Mixture RS in *Diluent*

**Standard solution:** 4  $\mu\text{g/mL}$  of USP Fluticasone Propionate RS in *Diluent*

**Sample solution:** Wipe the pump clean. Shake the bottle for 30 s, and mechanically prime the bottle. Hold a 25-mL volumetric flask in an inverted position, and discharge the first two actuations (1 dose) into the flask. Turn the flask to the upright position immediately after each actuation. Insert the stopper into the flask after collecting two actuations. Discharge actuations 3–48 (50-spray pack) or 3–118 (120-spray pack) to waste. Wipe the bottle clean, and collect the last two actuations (49 and 50 or 119 and 120) in a second 25-mL volumetric flask. Turn the flask to the upright position immediately after each actuation, and insert the stopper into the flask. Add 20 mL of *Diluent* to each flask, and shake well for 10 min to disperse the suspension. Dilute with *Diluent* to volume, and mix thoroughly. Allow the flask to stand until the excipients have settled. Inject the clear supernatant. Repeat this procedure with 4 additional bottles.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 239 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu\text{m}$  packing L1

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 50  $\mu\text{L}$

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for fluticasone propionate and fluticasone propionate related compound D are about 1.0 and 1.10, respectively.]

**Suitability requirements**

**Resolution:** NLT 1.5 between fluticasone propionate and fluticasone propionate related compound D, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of the label claim of fluticasone propionate ( $\text{C}_{25}\text{H}_{31}\text{F}_3\text{O}_5\text{S}$ ) in each dose:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Fluticasone Propionate RS in the *Standard solution* ( $\mu\text{g/mL}$ )

$C_U$  = nominal concentration of the *Sample solution* ( $\mu\text{g/mL}$ )

**Acceptance criteria:** The mean dose delivered from 10 doses is within 85%–115% of the label claim. NMT 1 dose is outside 80%–120% of the label claim. No doses are outside 75%–125% of the label claim. If 2 or 3 doses are outside 80%–120% of the label claim, test an additional 10 bottles. The mean dose delivered from 30 doses is within 85%–115% of the label claim. NMT 3 doses are outside 80%–120% of the label claim. No doses are outside 75%–125% of the label claim.

• **DELIVERED DOSE UNIFORMITY** (within batch)

**Diluent, Buffer, Mobile phase, System suitability solution, Standard solution, Chromatographic system, and System suitability:** Prepare as directed in the test for *Delivered Dose Uniformity* (within container).

**Sample solution:** Wipe the pump clean. Shake the bottle for 30 s, and mechanically prime the bottle. Hold a 25-mL volumetric flask in an inverted position, and discharge the first two actuations into the flask. Turn the flask to the upright position immediately after each actuation. Insert the stopper into the flask after collecting two actuations (1 dose). Repeat this procedure with 9 additional bottles.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of the label claim of fluticasone propionate ( $\text{C}_{25}\text{H}_{31}\text{F}_3\text{O}_5\text{S}$ ) in each dose:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Fluticasone Propionate RS in the *Standard solution* ( $\mu\text{g/mL}$ )

$C_U$  = nominal concentration of the *Sample solution* ( $\mu\text{g/mL}$ )

**Acceptance criteria:** The mean dose delivered from 10 doses is within 85%–115% of the label claim. NMT 1 dose is outside 80%–120% of the label claim. No doses are outside 75%–125% of the label claim. If 2 or 3 doses are outside 80%–120% of the label claim, test an additional 20 bottles. The mean dose delivered from 2 actuations in the beginning of the 30 bottles (30 doses) is within 85%–115% of the label claim. NMT 3 doses are outside 80%–120% of the label claim. No doses are outside 75%–125% of the label claim.

**IMPURITIES**

• **ORGANIC IMPURITIES**

**Diluent:** Acetonitrile and 0.001 M hydrochloric acid (60:40)

**Solution A:** Methanol and acetonitrile (77:23)

**Buffer:** 1.2 g/L of monobasic ammonium phosphate. Adjust with phosphoric acid to a pH of  $3.4 \pm 0.1$ .

**Mobile phase:** *Solution A* and *Buffer* (60:40)

**System suitability solution:** 0.1 mg/mL of USP Fluticasone Propionate Related Compounds Mixture RS and 0.5 mg/mL of USP Phenylethyl Alcohol RS in *Diluent*

**Control solution:** 0.5 mg/mL of USP Phenylethyl Alcohol RS and 0.08 mg/mL of USP Benzalkonium Chloride RS in a mixture of *Diluent* and water (4:1)

**Sample solution:** 0.2 g/mL of Nasal Spray in *Diluent*. Shake the flask vigorously to dissolve. Pass through a filter of 0.5- $\mu$ m pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 239 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 50  $\mu$ L

#### System suitability

**Sample:** *System suitability solution*

[NOTE—See *Table 1* for the relative retention times.]

#### Suitability requirements

**Resolution:** NLT 1.5 between fluticasone propionate related compound F and phenylethyl alcohol. NLT 2 between fluticasone propionate related compound D and fluticasone propionate

#### Analysis

**Samples:** *System suitability solution*, *Control solution*, and *Sample solution*

Calculate the percentage of each impurity in the portion of Nasal Spray taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_T$  = sum of all the peak responses from the *Sample solution*, excluding the peaks from the *Control solution*

**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
S-Fluoromethyl 17 $\alpha$ -acetyloxy-6 $\alpha$ ,9 $\alpha$ -difluoro-11 $\beta$ -hydroxy-16 $\alpha$ -methyl-3-oxoandrosta-1,4-diene-17 $\beta$ -carbothioate; S-Fluoromethyl 9 $\alpha$ -fluoro-11 $\beta$ -hydroxy-16 $\alpha$ -methyl-3,6-dioxo-17 $\alpha$ -propionyloxyandrosta-1,4-diene-17 $\beta$ -carbothioate	0.7	0.3
Fluticasone propionate related compound D	1.1	0.3
6 $\alpha$ ,9 $\alpha$ -Difluoro-11 $\beta$ ,17 $\alpha$ -dihydroxy-16 $\alpha$ -methyl-3-oxoandrosta-1,4-diene-17 $\beta$ -carboxylic acid-6 $\alpha$ ,9 $\alpha$ -difluoro-17 $\beta$ -(fluoromethylthio)carbonyl-11 $\beta$ -hydroxy-16 $\alpha$ -methyl-3-oxoandrosta-1,4-dien-17 $\alpha$ -yl ester	2.1	0.3
Any unspecified related impurities	—	0.2
Total impurities	—	1.5

#### SPECIFIC TESTS

- MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: Meets the requirements of the tests for absence of *Staphylococcus aureus*, *Escherichia coli*, *Salmonella* species, and *Pseudomonas aeruginosa*. The total aerobic microbial count does not exceed 25 cfu/mL, and the total combined molds and yeasts count does not exceed 25 cfu/mL.

- pH** <791>: 5.0–7.0

#### PARTICLE SIZE

**Analysis:** Remove the pump system after shaking the test bottle to ensure product uniformity. Transfer 1 drop of the Nasal Spray onto a clean microscope slide. Examine 10 random fields of view on the slide using 400 $\times$  magnification. Drug substance particles are irregular in

shape, whereas the excipient particles are elongated and angular. Record the number of individual drug substance particles that are less than 5  $\mu$ m in diameter, greater than 5  $\mu$ m but less than 15  $\mu$ m in diameter, and greater than 15  $\mu$ m in diameter. Calculate the percentage of each category by number.

**Acceptance criteria:** See *Table 2*.

**Table 2**

Particle Size	Acceptance Criteria
<5 $\mu$ m	NLT 98%
>5 $\mu$ m – <15 $\mu$ m	NMT 1.8%
>15 $\mu$ m	NMT 0.2%

#### FOREIGN PARTICULATES

**Analysis:** Shake the required number of bottles to ensure uniformity. Remove the pump system carefully to minimize contamination of the sample. Collect about 100 g of Nasal Spray, and pass it through a wetted 250- $\mu$ m screen. Rinse each bottle with a portion of water equal to twice the volume of each bottle. Pass the rinse through the 250- $\mu$ m screen. Visually observe the screen and filtrate for any foreign particulates. Also examine the screen under a microscope using transmitted light.

**Acceptance criteria:** No foreign particulates greater than 250  $\mu$ m are visible.

- DROPLET SIZE DISTRIBUTION:** Determine using a validated laser diffraction technique and method that measures the volume diameters of droplets. In preparation shake the bottle to ensure product uniformity. Prime the pump by discharging a predetermined (refer to the product label) number of actuations to waste, at which time a fine mist should appear. Measure and record the average of three sprays per bottle, and report the mean diameter defining the population of particles, by volume, below 10% ( $D_{10}$ ), 50% ( $D_{50}$ ), and 90% ( $D_{90}$ ) of five bottles.
- SPRAY PATTERN:** Determine the spray pattern using a validated method that measures the size of the pattern. Gently shake the bottle to ensure product uniformity. Prime the pump by discharging a predetermined number (refer to the product label) of actuations to waste, at which time a fine mist should appear. Measure and record the average of two sprays per bottle and report the longest axis (x axis), and the ratio of longest to shortest axes (x/y ratio) of two bottles.

#### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store between 4° and 30°.

#### USP REFERENCE STANDARDS <11>

USP Benzalkonium Chloride RS

USP Docusate Sodium RS

USP Fluticasone Propionate RS

USP Fluticasone Propionate Nasal Spray Resolution Mixture RS

This Reference Standard is a mixture of fluticasone propionate and fluticasone propionate related compound D, and the chemical names for both are given below:

*Fluticasone propionate:* S-Fluoromethyl 6 $\alpha$ ,9 $\alpha$ -difluoro-11 $\beta$ -hydroxy-16 $\alpha$ -methyl-3-oxo-17 $\alpha$ -propionyloxyandrosta-1,4-diene-17 $\beta$ -carbothioate.

*Fluticasone propionate related compound D:* S-Methyl-6 $\alpha$ ,9 $\alpha$ -difluoro-11 $\beta$ -hydroxy-16 $\alpha$ -methyl-3-oxo-17 $\alpha$ -propionyloxyandrosta-1,4-diene-17 $\beta$ -carbothioate.

USP Fluticasone Propionate Related Compounds Mixture RS

This Reference Standard is a mixture of fluticasone propionate and fluticasone propionate related compounds D and F, and the chemical names for all are given below:

*Fluticasone propionate:* S-Fluoromethyl 6 $\alpha$ ,9 $\alpha$ -difluoro-11 $\beta$ -hydroxy-16 $\alpha$ -methyl-3-oxo-17 $\alpha$ -propionyloxyandrosta-1,4-diene-17 $\beta$ -carbothioate.

Fluticasone propionate related compound D: *S*-Methyl-6 $\alpha$ ,9 $\alpha$ -difluoro-11 $\beta$ -hydroxy-16 $\alpha$ -methyl-3-oxo-17 $\alpha$ -propionyloxy-androsta-1,4-diene-17 $\beta$ -carbothioate.  
 Fluticasone propionate related compound F: 6 $\alpha$ ,9 $\alpha$ -Difluoro-11 $\beta$ ,17 $\alpha$ -dihydroxy-16 $\alpha$ -methyl-3-oxoandrosta-1,4-diene-17 $\beta$ -carboxylic acid.

USP Phenylethyl Alcohol RS

## Fluticasone Propionate Ointment

### DEFINITION

Fluticasone Propionate Ointment contains NLT 90.0% and NMT 110.0% of the labeled amount of fluticasone propionate (C<sub>25</sub>H<sub>31</sub>F<sub>3</sub>O<sub>5</sub>S).

### IDENTIFICATION

#### • A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

**Standard solution:** 0.17 mg/mL of USP Fluticasone Propionate RS in acetonitrile

**Test solution:** Transfer a quantity of Ointment, equivalent to 100  $\mu$ g of fluticasone propionate, to a 125-mL separatory funnel. Add 50 mL of hexane and 10 mL of acetonitrile to the separatory funnel. Stopper and shake the funnel until the Ointment is completely dispersed. Shake the separatory funnel for an additional min, and allow the phases to separate. Filter the lower layer through a 10-mL syringe containing a cotton plug into a 25-mL volumetric flask. Repeat the extraction with one 10-mL aliquot of acetonitrile, and filter the lower layer into the volumetric flask. Wash the cotton plug with 2 mL of acetonitrile, and collect the washings into the volumetric flask. Dilute the sample extract with acetonitrile to volume. Transfer one-half of the sample extract to a glass tube suitable for evaporation, and evaporate to dryness at about 40°. Transfer the remainder of the sample extract into the same tube, and continue evaporating to dryness. Dissolve the residue in 0.6 mL of acetonitrile. [NOTE—The *Test solution* may be cloudy because of the presence of undissolved excipients.]

#### Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Adsorbent:** 0.2-mm layer of chromatographic silica gel mixture on a high-performance thin-layer chromatographic plate, 5- $\mu$ m particle size

**Application volume:** 40  $\mu$ L

**Developing solvent system:** Dichloromethane, ethyl acetate, and glacial acetic acid (30:8:1)

#### Analysis

**Samples:** *Standard solution* and *Test solution*  
 Separately apply the *Standard solution* and the *Test solution* to the plate. On the same plate, apply 20  $\mu$ L of the *Standard solution*, allow the application to dry, and apply 20  $\mu$ L of the *Test solution* on top of the dried 20- $\mu$ L *Standard solution* spot. Allow each of the applications to dry thoroughly. Place the plate in a tank equilibrated with the developing solvent, and allow the developing solvent to travel 8 cm from the point of application. Remove the plate and allow to air-dry. Examine the plate under ultraviolet light at 254 nm.

**Acceptance criteria:** The *R<sub>F</sub>* value of the principal spot from the *Test solution* corresponds to that of the *Standard solution*. [NOTE—If the excipients in the Ointment interfere with the appearance of the principal spot obtained for the *Test solution*, use the *Standard solution* and the *Test solution* overspot to confirm identity.]

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

[NOTE—Protect the *Standard solution* and the *Sample solution* from direct light by using a light-protective volumetric flask and autosampler vials.]

**Buffer:** 1.20 g/L of monobasic ammonium phosphate. Adjust with phosphoric acid to a pH of 3.50  $\pm$  0.03.

**Mobile phase:** Methanol, acetonitrile, and *Buffer* (46:14:40)

**Diluent:** Methanol and water (80:20)

**System suitability stock solution:** 0.5 mg/mL of USP Fluticasone Propionate Nasal Spray Resolution Mixture RS in methanol. [NOTE—USP Fluticasone Propionate Nasal Spray Resolution Mixture RS is a mixture of fluticasone propionate and fluticasone propionate related compound D.]

**System suitability solution:** 5  $\mu$ g/mL of USP Fluticasone Propionate Nasal Spray Resolution Mixture RS in *Diluent* from *System suitability stock solution*

**Standard stock solution:** 0.25 mg/mL USP Fluticasone Propionate RS. Dissolve the standard first in a volume of methanol, equivalent to 80% of the final volume, and dilute with water to volume.

**Standard solution:** 4  $\mu$ g/mL USP Fluticasone Propionate RS in *Diluent*, from *Standard stock solution*

**Sample solution:** Equivalent to 4  $\mu$ g/mL of fluticasone propionate. Transfer a quantity of Ointment, equivalent to about 100  $\mu$ g of fluticasone propionate, to a 125-mL separatory funnel. Add to the separatory funnel 45 mL of hexane previously heated to about 60° in a water bath. [NOTE—Hexane is highly flammable.] Stopper and shake vigorously until the Ointment is completely dispersed. Wash the stopper and neck of the separatory funnel with 5 mL of hexane heated to 60°, and allow the funnel to cool to room temperature. Transfer 10 mL of *Diluent* into the separatory funnel, and shake the contents for 1 min. Allow the phases to separate, and filter the lower aqueous layer via a cotton wool plug, previously washed with *Diluent*, into a 25-mL volumetric flask. Repeat the extraction with two 5-mL aliquots of *Diluent*, filtering the lower layers into the volumetric flask. Wash the cotton plug with 2 mL of *Diluent*, and collect the washings into the volumetric flask. Dilute the sample with *Diluent* to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** 240 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Column temperature:** 50°

**Flow rate:** 1.5 mL/min

**Injection size:** 50  $\mu$ L

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.4 between fluticasone propionate and fluticasone propionate related compound D, *System suitability solution*

**Tailing factor:** NMT 1.4, *Standard solution* (calculated using the width of the peak at 10% of the height)

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of fluticasone propionate (C<sub>25</sub>H<sub>31</sub>F<sub>3</sub>O<sub>5</sub>S) in the portion of Ointment taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

*r<sub>U</sub>* = peak response of fluticasone propionate from the *Sample solution*

*r<sub>S</sub>* = peak response of fluticasone propionate from the *Standard solution*

- $C_S$  = concentration of USP Fluticasone Propionate RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = nominal concentration of fluticasone propionate in the *Sample solution* ( $\mu\text{g/mL}$ )  
**Acceptance criteria:** 90.0%–110.0%

**SPECIFIC TESTS**

- MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): Meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*. The total aerobic microbial count is NMT 100 cfu/g, and the total combined molds and yeasts count is NMT 10 cfu/g.

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in collapsible tubes or tight containers, protected from light. Store between 2° and 30°.
- USP REFERENCE STANDARDS** (11)  
 USP Fluticasone Propionate RS  
 USP Fluticasone Propionate Nasal Spray Resolution Mixture RS  
 This Reference Standard is a mixture of fluticasone propionate and fluticasone propionate related compound D, and the chemical names for both are given below:  
*Fluticasone propionate:* 5-Fluoromethyl 6 $\alpha$ ,9 $\alpha$ -difluoro-11 $\beta$ -hydroxy-16 $\alpha$ -methyl-3-oxo-17 $\alpha$ -propionyloxyandrosta-1,4-diene-17 $\beta$ -carbothioate.  
*Fluticasone propionate related compound D:* 5-Methyl-6 $\alpha$ ,9 $\alpha$ -difluoro-11 $\beta$ -hydroxy-16 $\alpha$ -methyl-3-oxo-17 $\alpha$ -propionyloxy-androsta-1,4-diene-17 $\beta$ -carbothioate.

## Fluvastatin Sodium

$\text{C}_{24}\text{H}_{25}\text{FNNaO}_4$  433.45  
 6-Heptenoic acid, 7-[3-(4-fluorophenyl)-1-(1-methylethyl)-1H-indol-2-yl]-3,5-dihydroxy-, monosodium salt,  $[R^*, S^*-(E)]-(\pm)-$ ;  
 Sodium  $(\pm)-(3R^*, 5S^*, 6E)$ -7-[3-(p-fluorophenyl)-1-isopropylindol-2-yl]-3,5-dihydroxy-6-heptenoate [93957-55-2].

**DEFINITION**

Fluvastatin Sodium contains NLT 98.0% and NMT 102.0% of  $\text{C}_{24}\text{H}_{25}\text{FNNaO}_4$ , calculated on the anhydrous basis.

**IDENTIFICATION**

- A. INFRARED ABSORPTION** (197K)  
 [NOTE—If a difference appears in the IR spectra of the analyte and the Standard, dissolve equal portions of the sample specimen and the USP Reference Standard in equal volumes of methanol. Evaporate the solutions to dryness on a steam bath, protecting the solutions from light, and dry at 105° for 30 min. Repeat the test on the residues.]
- B. IDENTIFICATION TESTS—GENERAL, Sodium** (191): Meets the requirements for the pyroantimonate precipitation test

**ASSAY****• PROCEDURE**

**Solution A:** Add 20 mL of 25% aqueous tetramethylammonium hydroxide solution to 880 mL of water. Adjust with about 2.3 mL of phosphoric acid to a pH of  $7.2 \pm 0.2$ . Add 100 mL of a mixture of methanol and acetonitrile (3:2).

**Solution B:** Add 20 mL of 25% aqueous tetramethylammonium hydroxide solution and 80 mL of water to 900 mL of a mixture of methanol and acetonitrile (3:2). Adjust with about 2.3 mL of phosphoric acid to a pH of  $7.2 \pm 0.2$ .

**Mobile phase:** See the gradient table.

Time (min)	Solution A (%)	Solution B (%)
0	60	40
6	60	40
20	18	82
20.1	60	40
25.1	60	40

**System suitability solution:** 0.5 mg/mL of fluvastatin sodium from USP Fluvastatin for System Suitability RS, dissolved first in *Solution B*, using 40% of the final volume, then diluted with *Solution A* to volume

**Standard solution:** 0.5 mg/mL of USP Fluvastatin Sodium RS, dissolved first in *Solution B*, using 40% of the final volume, then diluted with *Solution A* to volume

**Sample solution:** 0.5 mg/mL of Fluvastatin Sodium, dissolved first in *Solution B*, using 40% of the final volume, then diluted with *Solution A* to volume

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 305 nm

**Column:** 4.6-mm  $\times$  5-cm; 5- $\mu\text{m}$  packing L1

**Column temperature:** 35°

**Flow rate:** 3 mL/min

**Injection size:** 20  $\mu\text{L}$

[NOTE—Adjust the start time of the gradient step and the equilibration time for each instrument.]

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for fluvastatin and fluvastatin *anti*-isomer are about 1.0 and 1.2, respectively.]

**Suitability requirements**

**Resolution:** NLT 1.6 between fluvastatin *anti*-isomer and fluvastatin, *System suitability solution*

**Column efficiency:** NLT 700 theoretical plates for the fluvastatin peak, *System suitability solution*

**Tailing factor:** NMT 3.0 for the fluvastatin peak, *System suitability solution*

**Relative standard deviation:** NMT 1.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $\text{C}_{24}\text{H}_{25}\text{FNNaO}_4$  in the portion of Fluvastatin Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Fluvastatin Sodium RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Fluvastatin Sodium in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

**IMPURITIES****Inorganic Impurities**

- **HEAVY METALS**, *Method II* (231): 20 ppm

**Organic Impurities****PROCEDURE**

[NOTE— Protect all solutions from light, and use amber autosampler vials and low-actinic glassware.]

**Solution A, Solution B, Mobile phase, Standard solution, and Sample solution:** Proceed as directed in the *Assay*.

**System suitability solution A:** Prepare as directed for the *System suitability solution* in the *Assay*.

**System suitability solution B:** 0.1 mg/mL of USP Fluvastatin Related Compound B RS in a mixture of methanol and acetonitrile (3:2). Transfer about 0.5 mL of this solution to a 10-mL volumetric flask, and dilute with *System suitability solution A* to volume. [NOTE—*System suitability solution B* is stable for up to 6 months if stored in a refrigerator.]

**Chromatographic system:** Proceed as directed in the *Assay*, except to use a liquid chromatograph equipped with either a programmable variable-wavelength detector or two separate detectors capable of monitoring at 305 and 365 nm.

**System suitability**

**Samples:** *Standard solution* and *System suitability solution B*

[NOTE— Record the peak responses at 305 nm as directed for *Analysis*. Identify the peaks corresponding to fluvastatin, fluvastatin *anti*-isomer, and fluvastatin *t*-butyl ester.]

**Suitability requirements**

**Resolution:** NLT 1.6 between fluvastatin *anti*-isomer and fluvastatin, *System suitability solution B*

**Column efficiency:** NLT 700 theoretical plates for the fluvastatin peak, *System suitability solution B*

**Tailing factor:** NMT 3.0 for the fluvastatin peak, *System suitability solution B*

**Relative standard deviation:** NMT 1.0% at 305 nm, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Record the chromatograms at 305 and 365 nm, identify the impurities listed in *Impurity Table 1*, and measure the peak responses. [NOTE— 3-Hydroxy-5-keto fluvastatin is monitored using a wavelength of 365 nm, and all other compounds are monitored at 305 nm.]

Calculate the percentage of each impurity, except for 3-hydroxy-5-keto fluvastatin, in the portion of Fluvastatin Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response at 305 nm of each impurity from the *Sample solution*

$r_S$  = peak response at 305 nm of fluvastatin from the *Standard solution*

$C_S$  = concentration of USP Fluvastatin Sodium RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Fluvastatin Sodium in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Impurity Table 1*)

Calculate the percentage of 3-hydroxy-5-keto fluvastatin in the portion of Fluvastatin Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response at 365 nm of 3-hydroxy-5-keto fluvastatin from the *Sample solution*

$r_S$  = peak response at 365 nm of fluvastatin from the *Standard solution*

$C_S$  = concentration of USP Fluvastatin Sodium RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Fluvastatin Sodium in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Impurity Table 1*)

**Acceptance criteria**

**Individual Impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 1.0%

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Fluvastatin <i>N</i> -ethyl analog <sup>a</sup>	0.7	1.2	0.1
Fluvastatin <i>anti</i> -isomer <sup>b</sup>	1.2	1.0	0.8
3-Hydroxy-5-keto fluvastatin <sup>c</sup>	1.5	27.0 <sup>d</sup>	0.1

<sup>d</sup> At 365 nm.

<sup>e</sup> [*E*,*E*]-(+)-7-[3-(4-Fluorophenyl)-1-(methylethyl)-1*H*-indol-2-yl]-3-hydroxy-4,6-heptadienoic acid monosodium salt.

<sup>f</sup> 3-(4-Fluorophenyl)-1-(methylethyl)-1*H*-indole-2-carboxaldehyde.

<sup>g</sup> [*R*\*, *S*\*-*E*]-(+)-7-[3-(4-Fluorophenyl)-1-methylethyl-1*H*-indol-2-yl]-3,5-dihydroxy-6-heptenoic acid 1,1-dimethylethyl ester.

**SPECIFIC TESTS**

- **pH** (791): 8.0–10.0, in a 10-mg/mL solution. Perform the test immediately after preparation.
- **WATER DETERMINATION**, *Method I* (921): NMT 4.0%; if labeled as a hydrated form, NMT 12.0%. [NOTE—For this monograph, the term “hydrated form” refers to several known forms of fluvastatin sodium that are not stoichiometric hydrates.]

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, protected from moisture. Store at a temperature not exceeding 40°.
- **LABELING:** Where it is a hydrated form, the label so indicates.
- **USP REFERENCE STANDARDS** (11)
  - USP Fluvastatin Sodium RS
  - USP Fluvastatin Related Compound B RS
  - Fluvastatin *t*-butyl ester.
  - USP Fluvastatin for System Suitability RS
  - Fluvastatin sodium, containing 1% to 2% of the fluvastatin sodium *anti*-isomer.

## Fluvastatin Capsules

» Fluvastatin Capsules contain an amount of Fluvastatin Sodium equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluvastatin ( $C_{24}H_{26}FNO_4$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, protected from moisture and from light. Store in a cool place or at controlled room temperature.

### USP Reference standards (11)—

USP Fluvastatin Sodium RS

USP Fluvastatin for System Suitability RS

Fluvastatin sodium and fluvastatin sodium anti-isomer.

[NOTE—USP Fluvastatin for System Suitability RS contains 1% to 2% of the fluvastatin sodium anti-isomer.]

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Dissolution (711)—

*Medium*: water; 500 mL.

*Apparatus 2*: 50 rpm, sinkers not used.

*Time*: 30 minutes.

Determine the amount of  $C_{24}H_{26}FNO_4$  dissolved by employing the following method.

**Buffer solution**—Dissolve about 1.534 g of monobasic ammonium phosphate in about 800 mL of water, and adjust with phosphoric acid or ammonium hydroxide to a pH of 3.5.

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and *Buffer solution* (7:3).

**Standard solution**—[NOTE—A volume of methanol, not exceeding 2% of the final volume of solution, may be used to aid in dissolving the USP Reference Standard.] Dissolve an accurately weighed quantity of USP Fluvastatin Sodium RS in *Medium* to obtain a solution having a known concentration of fluvastatin corresponding to that obtained when 1 Capsule is dissolved in 500 mL of solvent.

**Test solution**—Withdraw 20-mL portions of liquid under test from each vessel, and pass through a suitable filter, discarding the first 2 mL of the filtrate.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 235-nm detector, a suitable 7- $\mu$ m guard column that contains packing L1, and a 4.6-mm  $\times$  10-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the fluvastatin peaks. From the measured peak areas, calculate the quantity of  $C_{24}H_{26}FNO_4$  dissolved.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{24}H_{26}FNO_4$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements, the *Chromatographic system* being prepared as directed for the *Dissolution* test.

**Chromatographic purity**—[NOTE—Protect all solutions from light, and use amber autosampler vials and low-actinic glassware.]

**pH 7.2 Buffer, Methanol-acetonitrile mixture, Solution A, Solution B, Mobile phase, and Diluent**—Proceed as directed in the *Assay*.

**System suitability solution**—Use the *System suitability preparation*, prepared as directed in the *Assay*.

**Standard solution**—Use the *Standard preparation*, prepared as directed in the *Assay*.

**Test solution**—Use the *Assay preparation*, prepared as directed in the *Assay*.

**Chromatographic system**—Proceed as directed in the *Assay*, except use the liquid chromatograph equipped with either a programmable variable wavelength detector or two separate detectors capable of monitoring at 305 nm and at 365 nm. Chromatograph the *System suitability solution*, and record the peak responses at 305 nm as directed for *Procedure*. Identify the peaks corresponding to fluvastatin and fluvastatin anti-isomer. The resolution, *R*, between fluvastatin anti-isomer and fluvastatin is not less than 1.4; and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms at 305 nm and 365 nm, identify the impurities listed in *Table 1*, and measure the peak responses. [NOTE—3-Hydroxy-5-keto fluvastatin is monitored using a wavelength of Fosinopril Sodium and 365 nm, and all other compounds are monitored at 305 nm.] Calculate the percentage of each impurity, except for 3-hydroxy-5-keto fluvastatin, in the portion of Capsules taken by the formula:

$$100(1/F)(411.48/433.45)(C_S / C_T)(r_{i(305)} / r_{S(305)})$$

in which *F* is the relative response factor as listed in *Table 1* [NOTE—Use *F* equal to 1.0 for unknown impurities]; 411.48 and 433.45 are the molecular weights of fluvastatin and fluvastatin sodium, respectively; *C<sub>S</sub>* is the concentration, in mg per mL, of USP Fluvastatin Sodium RS in the *Standard solution*; *C<sub>T</sub>* is the concentration, in mg per mL, of fluvastatin in the *Test solution*, based on the label claim; *r<sub>i(305)</sub>* is the peak response at 305 nm for each impurity obtained from the *Test solution*; and *r<sub>S(305)</sub>* is the peak response at 305 nm for the fluvastatin peak, obtained from the *Standard solution*.

Calculate the percentage of 3-hydroxy-5-keto fluvastatin in the portion of Capsules taken by the formula:

$$100(1/F)(411.48/433.45)(C_S / C_T)(r_{i(365)} / r_{S(365)})$$

in which *F*, *C<sub>S</sub>*, and *C<sub>T</sub>* are as defined above; *r<sub>i(365)</sub>* is the peak response at 365 nm for 3-hydroxy-5-keto fluvastatin, obtained from the *Test solution*; and *r<sub>S(365)</sub>* is the peak response at 365 nm for the fluvastatin peak, obtained from the *Standard solution*. In addition to not exceeding the limits for each impurity in *Table 1*, not more than 0.5% of any unknown impurity is found; not more than 1.5% of total unknown impurities is found; and not more than 4.0% of total impurities is found.

Table 1

Name	Relative Retention Time	Relative Response Factor (F)	Limit (%)
Fluvastatin anti-isomer	1.2	1.0	1.5
3-Hydroxy-5-keto fluvastatin	1.6	27.0*	1.0
Fluvastatin hydroxydiene	2.2	0.92	1.0
Fluvastatin short-chain aldehyde	3.2	1.4	0.5

\*At 365 nm

### Assay—

**pH 7.2 Buffer**—Prepare a solution containing 40 mL of 25% aqueous tetramethylammonium hydroxide in 1 L of water, and adjust with approximately 4.5 mL of phosphoric acid to a pH of  $7.2 \pm 0.2$ .

**Methanol–acetonitrile mixture**—Prepare a mixture of methanol and acetonitrile (3:2).

**Solution A**—Prepare a filtered and degassed mixture of pH 7.2 Buffer and Methanol–acetonitrile mixture (87.5:12.5).

**Solution B**—Prepare a filtered and degassed mixture of Methanol–acetonitrile mixture and pH 7.2 Buffer (87.5:12.5).

**Mobile phase**—Use variable mixtures of Solution A and Solution B as directed for Chromatographic system.

**Diluent**—Prepare a mixture of pH 7.2 Buffer and Methanol–acetonitrile mixture (54:46).

**System suitability preparation**—Dissolve an accurately weighed quantity of USP Fluvastatin for System Suitability RS in Diluent to obtain a solution having a known concentration of about 0.42 mg of fluvastatin sodium per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fluvastatin Sodium RS in Diluent to obtain a solution having a known concentration of about 0.42 mg of fluvastatin sodium per mL.

**Assay stock preparation**—Transfer the contents and the empty shells of 10 Capsules to a 200-mL glass-stoppered flask. Add 100.0 mL of methanol, and stir with a magnetic or mechanical stirrer for 45 minutes. Centrifuge a portion of this solution at 4000 rpm for 20 minutes.

**Assay preparation**—Quantitatively transfer an amount of the Assay stock preparation, containing 20.0 mg of fluvastatin based on the label claim, to a 50-mL volumetric flask, and dilute with Diluent to volume.

**Chromatographic system** (see Chromatography <621>)—The liquid chromatograph is equipped with a 305-nm detector and a 4.6-mm × 5-cm column that contains 5-μm packing L1. The flow rate is about 2.0 mL per minute. The chromatograph is programmed as follows. [NOTE—Adjust the start time of the gradient step and the equilibration time for each instrument.]

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–6	54	46	isocratic
6–17	54→17	46→83	linear gradient
17–20	17	83	isocratic
20–20.1	17→54	83→46	linear gradient
20.1–26.1	54	46	equilibration

Chromatograph the System suitability preparation, and record the peak responses as directed for Procedure: the retention time of the fluvastatin peak is about 5.4 minutes; the relative retention times are about 1.0 for fluvastatin and 1.2 for fluvastatin anti-isomer; the resolution,  $R_s$ , between fluvastatin anti-isomer and fluvastatin is not less than 1.4; and the relative standard deviation for replicate injections is not more than 1.5%. [NOTE—If the retention time of the fluvastatin peak exceeds 5.7 minutes, adjust the isocratic step accordingly, so that both the fluvastatin peak and the anti-isomer peak elute within the isocratic region.]

**Procedure**—Separately inject equal volumes (about 25 μL) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the fluvastatin peaks. Calculate the quantity, in mg, of fluvastatin ( $C_{24}H_{26}FNO_4$ ) in the portion of Capsules taken by the formula:

$$5000(411.48/433.45)(C/V)(r_U/r_S)$$

in which 411.48 and 433.45 are the molecular weights of fluvastatin and fluvastatin sodium, respectively;  $V$  is the volume, in mL, of the Assay stock preparation taken to prepare the Assay preparation;  $C$  is the concentration, in mg per mL, of USP Fluvastatin Sodium RS in the Standard preparation; and  $r_U$  and  $r_S$  are the fluvastatin peak responses obtained

from the Assay preparation and the Standard preparation, respectively.

## Fluvoxamine Maleate

$C_{15}H_{21}F_3N_2O_2 \cdot C_4H_4O_4$  434.41

1-Pentanone, 5-methoxy-1-[4-(trifluoromethyl)phenyl]-, O-(2-aminoethyl)oxime, (E)-, (Z)-2-butenedioate (1:1).

5-Methoxy-4'-(trifluoromethyl)valerophenone (E)-O-(2-aminoethyl)oxime, maleate (1:1) [61718-82-9].

» Fluvoxamine Maleate contains not less than 98.0 percent and not more than 102.0 percent of  $C_{15}H_{21}F_3N_2O_2 \cdot C_4H_4O_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers. Store at controlled room temperature.

**USP Reference standards** <11>—

USP Fluvoxamine Maleate RS

**Identification**—

**A: Infrared Absorption** <197K>.

**B:** The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

**Melting temperature** <741>: between 121° and 123°.

**Loss on drying** <731>—Dry it in vacuum at 80° for 2 hours; it loses not more than 0.5% of its weight.

**Residue on ignition** <281>: not more than 0.1%.

**Heavy metals, Method II** <231>: 0.001%.

**Related compounds**—

**Buffer solution, Mobile phase, Resolution solution, and Chromatographic system**—Proceed as directed in the Assay.

**Identification solution**—Dissolve a quantity of maleic acid in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.35 mg per mL.

**Standard solution**—Use the Standard preparation, prepared as directed in the Assay.

**Test solution**—Use the Assay stock preparation, prepared as directed in the Assay.

**Procedure**—Separately inject equal volumes (about 20 μL) of the Standard solution, the Test solution, and the Identification solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of impurities in the portion of Fluvoxamine Maleate taken by the formula:

$$5000(C/W)F(r_i/r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Fluvoxamine Maleate RS in the Standard solution;  $W$  is the weight, in mg, of Fluvoxamine Maleate used to prepare the Test solution;  $F$  is the response factor of each impurity as given in Table 1;  $r_i$  is the individual peak area of each impurity in the Test solution; and  $r_S$  is the peak area of fluvoxamine maleate in the Standard solution. The limits of impurities are specified in Table 1. [NOTE—Disregard any peak due to maleic acid or the reagent blank.]

Table 1

Compound Name	Relative Retention Time	Response Factor	Limit (%)
Maleic acid	about 0.19	—	—
5-Methoxy-1-[4-(trifluoromethyl)phenyl]-1-pentanone-(E)-O-[2-[(2-succinyl)amino]ethyl]oxime	about 0.50	1.0	0.3
5-Methoxy-4'-(trifluoromethyl)valerophenone(E)-O-(2-aminoethyl)aminoethyl oxime maleate	about 0.67	1.4	0.2
Z-isomer	about 0.79	1.0	0.5
Fluvoxamine	1.0	—	—
4'-(Trifluoromethyl)valerophenone(E)-O-2-(2-aminoethyl)aminoethyl oxime maleate	about 1.18	1.0	0.2
(E)-O-2-(2-Aminoethyl)-4-(trifluoromethyl)- $\alpha$ -phenyl-acetophenone oxime maleate	about 1.74	1.0	0.2
4'-(Trifluoromethyl)valerophenone(E)-O-(2-aminoethyl) oxime maleate	about 2.00	1.0	0.2
5-Methoxy-4'-(trifluoromethyl)valerophenone oxime	about 3.45	0.6	0.2
5-Methoxy-4'-(trifluoromethyl)valerophenone ketone	about 4.2	0.3	0.2
Unknown impurities	—	1.0	0.1
Total	—	—	1.5

**Assay—**

**Buffer solution**—Dissolve about 5 g of 1-pentanesulfonic acid sodium salt and 0.7 g of monobasic potassium phosphate in 620 mL of water. Adjust with phosphoric acid to a pH of  $3.00 \pm 0.05$ .

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (62:38). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Resolution solution**—Transfer about 6 mg of Fluvoxamine Maleate to a 50-mL volumetric flask. Heat the sample at 120° for 10 minutes. Cool down to room temperature, and add 3.0 mL of 0.1 N hydrochloric acid. Heat the solution in a water bath for 10 minutes. Cool down to room temperature, add 50 mg of Fluvoxamine Maleate, and dissolve in 25 mL of *Mobile phase*. Dilute with *Mobile phase* to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fluvoxamine Maleate RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

**Assay stock preparation**—Transfer an accurately weighed quantity of about 50 mg of Fluvoxamine Maleate to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Transfer 5.0 mL of the *Assay stock preparation* to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 234-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L7. The flow rate is about 1.7 mL per minute. The column temperature is maintained at 40°. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between the Z-isomer and fluvoxamine maleate is not less than 3.0 and not less than 5.0 between 5-methoxy-1-[4-(trifluoromethyl)phenyl]-1-pentanone-(E)-O-[2-[(2-succinyl)amino]ethyl]oxime and the Z-isomer. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 5000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%. [NOTE—For the purpose of peak identification, the approximate relative retention times are given in *Table 1*.]

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the fluvoxamine maleate peaks. Calculate the quantity, in mg, of  $C_{15}H_{21}F_3N_2O_2 \cdot C_4H_4O_4$  in the

portion of Fluvoxamine Maleate taken by the formula:

$$1000C(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Fluvoxamine Maleate RS in the *Standard preparation*; and *r<sub>u</sub>* and *r<sub>s</sub>* are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fluvoxamine Maleate Tablets

**DEFINITION**

Fluvoxamine Maleate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of fluvoxamine maleate ( $C_{15}H_{21}F_3N_2O_2 \cdot C_4H_4O_4$ ).

**IDENTIFICATION**

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****• PROCEDURE**

**Buffer:** 5 g of 1-pentanesulfonic acid sodium salt and 0.7 g of monobasic potassium phosphate in 620 mL of water. Adjust with phosphoric acid to a pH of  $3.00 \pm 0.05$ .

**Mobile phase:** Acetonitrile and *Buffer* (19:31)

**System suitability solution:** 6 mg of fluvoxamine maleate to a 50-mL volumetric flask. Heat the sample at 120° for 10 min. Cool down to room temperature, and add 3.0 mL of 0.1 N hydrochloric acid. Heat the solution in a water bath for 10 min. Cool down to room temperature, add 50 mg of fluvoxamine maleate, and dissolve in 25 mL of *Mobile phase*. Dilute with *Mobile phase* to volume.

**Standard solution:** 0.05 mg/mL of USP Fluvoxamine Maleate RS in *Mobile phase*

**Sample stock solution:** Transfer a weighed quantity of finely powdered Tablets from NLT 20 Tablets to a suitable volumetric flask to obtain a nominal concentration of 1 mg/mL of fluvoxamine maleate. Add 50% of flask volume of *Mobile phase*. Sonicate for 15 min followed by mechanical shaking for 15 min. Dilute with *Mobile phase* to volume. Centrifuge a portion of this solution for 10 min.

**Sample solution:** 0.05 mg/mL from *Sample stock solution* diluted with *Mobile phase*. [NOTE—Pass a portion of this solution through a filter with a 0.45- $\mu$ m or finer pore size, and use the filtrate.]

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 234 nm**Column:** 4.6-mm × 25-cm; packing L7**Column temperature:** 40°**Flow rate:** 1.7 mL/min**Injection size:** 20 µL**System suitability****Samples:** *System suitability solution* and *Standard solution*[NOTE—The relative retention times for maleic acid, 5-methoxy-1-[4-(trifluoromethyl)phenyl]-1-pentanone-(*E*)-O-[2-[(2-succinyl)amino]ethyl]oxime, *Z*-isomer, and fluvoxamine maleate are 0.19, 0.5, 0.79, 1.0, respectively, *System suitability solution*.]**Suitability requirements****Resolution:** NLT 2.0 between the *Z*-isomer and fluvoxamine maleate; NLT 5.0 between 5-methoxy-1-[4-(trifluoromethyl)phenyl]-1-pentanone-(*E*)-O-[2-[(2-succinyl)amino]ethyl]oxime and the *Z*-isomer, *System suitability solution***Column efficiency:** NLT 5000 theoretical plates, *Standard solution***Tailing factor:** NMT 2.0, *Standard solution***Relative standard deviation:** NMT 2.0%, *Standard solution***Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of  $C_{15}H_{21}F_3N_2O_2 \cdot C_4H_4O_4$  in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak area from the *Sample solution* $r_S$  = peak area from the *Standard solution* $C_S$  = concentration of USP Fluvoxamine Maleate RS in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of fluvoxamine maleate in the *Sample solution* (mg/mL)**Acceptance criteria:** 90.0%–110.0%**PERFORMANCE TESTS**• **DISSOLUTION** <711>**Medium:** Water; 900 mL, degassed**Apparatus 2:** 50 rpm**Time:** 30 min**Standard solution:** USP Fluvoxamine Maleate RS at a known concentration in *Medium***Sample solution:** Centrifuge portions of the solution under test at 2000 rpm for 10 min, and dilute with *Medium*, if necessary.**Spectrometric conditions**(See *Spectrophotometry and Light-Scattering* <851>.)**Mode:** UV**Analytical wavelength:** 246 nm**Analysis****Samples:** *Standard solution* and *Sample solution*

When there are known interferences due to excipients, excipient interference corrections may be applied, as necessary.

**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_{15}H_{21}F_3N_2O_2 \cdot C_4H_4O_4$  is dissolved.• **UNIFORMITY OF DOSAGE UNITS** <905>: Meet the requirements**IMPURITIES****Organic Impurities**• **PROCEDURE**[NOTE— If (*E*)-5-methoxy-4'-difluoromethylvalerophenone-O-2-aminoethyl oxime is a known impurity, *Test 2* is recommended.]**Test 1****Buffer, Mobile phase, System suitability solution, Standard solution, and Chromatographic system:** Proceed as directed in the *Assay*.**Identification solution:** 0.35 mg/mL of maleic acid in *Mobile phase***Sample solution:** Use the *Sample stock solution*, prepared as directed in the *Assay*.**Analysis****Samples:** *Identification solution*, *Standard solution*, and *Sample solution*

[NOTE— Disregard any peak due to maleic acid or the reagent blank.]

Calculate the percentage of impurities in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

 $r_U$  = individual peak area of each impurity from the *Sample solution* $r_S$  = peak area of fluvoxamine maleate from the *Standard solution* $C_S$  = concentration of USP Fluvoxamine Maleate RS in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of fluvoxamine maleate from the *Sample solution* (mg/mL) $F$  = response factor of each impurity as given in *Impurity Table 1***Acceptance criteria****Individual impurities:** See *Impurity Table 1*.**Total impurities:** NMT 1.8%**Impurity Table 1**

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in tight containers. Store at room temperature.
- LABELING:** If a test in *Procedure* under *Organic Impurities* other than *Test 1* is used, then the labeling states with which test the article complies.
- USP REFERENCE STANDARDS (11)**  
USP Fluvoxamine Maleate RS

**Folic Acid**

$C_{19}H_{19}N_7O_6$  441.40  
 L-Glutamic acid, N-[4-[[[(2-amino-1,4-dihydro-4-oxo-6-pteridiny]methyl]amino]benzoyl]]-;

*N*-[*p*-[[*(2-Amino-4-hydroxy-6-pteridiny)*methyl]amino]benzoyl]-*L*-glutamic acid [59-30-3].

### DEFINITION

Folic Acid contains NLT 97.0% and NMT 102.0% of folic acid ( $C_{19}H_{19}N_7O_6$ ), calculated on the anhydrous basis.

### IDENTIFICATION

#### • A. ULTRAVIOLET ABSORPTION (197U)

**Sample solution:** 10 µg/mL in 0.1 N sodium hydroxide solution

**Acceptance criteria:** Meets the requirements. The ratio  $A_{256}/A_{365}$  is 2.80–3.00.

### ASSAY

#### • PROCEDURE

[NOTE—Use low-actinic glassware throughout the following procedure.]

**3 N phosphoric acid:** 98 g/L of phosphoric acid in water  
**6 N ammonium hydroxide:** Dilute 40 mL of ammonium hydroxide with water to 100 mL.

**Mobile phase:** Transfer 2.0 g of monobasic potassium phosphate into a 1000-mL volumetric flask, and dissolve in 650 mL of water. Add 15.0 mL of a solution of 0.5 M tetrabutylammonium hydroxide in methanol, 7.0 mL of 3 N phosphoric acid, and 270 mL of methanol. Cool to room temperature, adjust with 3 N phosphoric acid or 6 N ammonium hydroxide to a pH of 5.0, and dilute with water to volume. Recheck the pH before use.

**Internal standard solution:** 2 mg/mL of methylparaben in *Mobile phase*. Dissolve the methylparaben first with methanol (about 4% of the final volume), and dilute with *Mobile phase* to volume.

**Standard stock solution:** 1 mg/mL of USP Folic Acid RS in *Mobile phase*. Dissolve the folic acid with the aid of 10% ammonium hydroxide (about 1% of the final volume), and dilute with *Mobile phase* to volume.

**Standard solution:** Transfer 4.0 mL of *Standard stock solution* and 4.0 mL of *Internal standard solution* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Sample stock solution:** Transfer 100 mg of Folic Acid to a 100-mL volumetric flask, and dissolve in 40 mL of *Mobile phase* and 1 mL of 10% ammonium hydroxide. Dilute with *Mobile phase* to volume.

**Sample solution:** Transfer 4.0 mL of *Sample stock solution* and 4.0 mL of *Internal standard solution* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4.0-mm × 25-cm; packing L1

**Flow rate:** 1.2 mL/min

**Injection size:** 10 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 3.6 between methylparaben and folic acid

**Relative standard deviation:** NMT 2.0% for the ratios of the folic acid peak area to the internal standard peak area

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of folic acid ( $C_{19}H_{19}N_7O_6$ ) in the sample taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = internal standard ratio (peak response of folic acid/peak response of the internal standard) from the *Sample solution*

$R_S$  = internal standard ratio (peak response of folic acid/peak response of the internal standard) from the *Standard solution*

$C_S$  = concentration of USP Folic Acid RS in the *Standard stock solution* (mg/mL)

$C_U$  = concentration of Folic Acid in the *Sample stock solution* (mg/mL)

**Acceptance criteria:** 97.0%–102.0% on the anhydrous basis

### IMPURITIES

#### • RESIDUE ON IGNITION (281): NMT 0.3%

#### • RELATED COMPOUNDS

3 N phosphoric acid, 6 N ammonium hydroxide, *Internal standard solution*, *Standard stock solution*, *Standard solution*, and *Chromatographic system*: Proceed as directed in the *Assay*.

**Sample solution:** Use the *Sample stock solution*, prepared as directed in the *Assay*.

#### Analysis

**Sample:** *Sample solution*

Allow the *Sample solution* to elute for NLT 2 times the retention time of folic acid. Record the chromatogram, and measure the areas of all the peaks.

Calculate the percentage of total secondary peaks in the portion of Folic Acid taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = sum of the areas of all the peaks except that of the folic acid peak

$r_T$  = sum of the areas of all the peaks

**Acceptance criteria:** NMT 2.0%

### SPECIFIC TESTS

#### • WATER DETERMINATION, *Method I* (921)

**Analysis:** Proceed as directed in the chapter, except stir the methanol solvent before and during the addition of the test specimen and during the titration.

**Acceptance criteria:** NMT 8.5%

### ADDITIONAL REQUIREMENTS

#### • PACKAGING AND STORAGE: Preserve in well-closed, light-resistant containers.

#### • USP REFERENCE STANDARDS (11)

USP Folic Acid RS

## Folic Acid Injection

» Folic Acid Injection is a sterile solution of Folic Acid in Water for Injection prepared with the aid of Sodium Hydroxide or Sodium Carbonate. It contains not less than 95.0 percent and not more than 110.0 percent of the labeled amount of folic acid ( $C_{19}H_{19}N_7O_6$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.

#### USP Reference standards (11)—

USP Folic Acid RS

USP Endotoxin RS

**Identification**—To a volume of the Injection equivalent to about 100 mg of folic acid add water to make about 25 mL. Adjust with hydrochloric acid to a pH of 3.0, cool to 5°, then filter, and wash the precipitate of folic acid with cold water until the last washing shows an absence of chloride. Then wash with acetone, and dry at 80° for 1 hour: the UV absorption spectrum of a 1 in 100,000 solution of the folic acid so obtained in sodium hydroxide solution (1 in 250)

exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Folic Acid RS, concomitantly measured. The ratio  $A_{256}/A_{365}$  is between 2.80 and 3.00.

**Bacterial endotoxins** (85)—It contains not more than 357.1 USP Endotoxin Units per mg of folic acid.

**pH** (791): between 8.0 and 11.0.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

*Mobile phase, System suitability solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under *Folic Acid Tablets*.

*Assay preparation*—Dilute an accurately measured volume of Injection, quantitatively and stepwise, with an aqueous solvent containing 2 mL of ammonium hydroxide and 1 g of sodium perchlorate per 100 mL, to obtain a solution having a concentration close to that of the *Standard preparation* and between 0.20 and 0.80 mg per mL.

*Procedure*—Proceed as directed in the Assay under *Folic Acid Tablets*, and calculate the quantity, in mg, of folic acid ( $C_{19}H_{19}N_7O_6$ ) in each mL of the Injection.

## Folic Acid Tablets

### DEFINITION

Folic Acid Tablets contain NLT 90.0% and NMT 115.0% of the labeled amount of folic acid ( $C_{19}H_{19}N_7O_6$ ).

### IDENTIFICATION

#### • A. ULTRAVIOLET ABSORPTION

**Sample solution:** Digest the quantity of powdered Tablets, equivalent to 100 mg of folic acid, with 100 mL of 0.1 N sodium hydroxide, and filter. Adjust with hydrochloric acid to a pH of 3.0. Cool to 5°, filter, and wash the precipitate of folic acid with cold water until the last washing shows an absence of chloride. Then wash with acetone, and dry at 80° for 1 h. Dissolve the residue in 0.1 N sodium hydroxide to obtain a 10-μg/mL solution.

**Acceptance criteria:** The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Folic Acid RS, concomitantly measured. The absorbance ratio  $A_{256}/A_{365}$  is 2.80–3.00.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Transfer 35.1 g of sodium perchlorate and 1.40 g of monobasic potassium phosphate to a 1-L volumetric flask. Add 7.0 mL of 1 N potassium hydroxide and 40 mL of methanol, dilute with water to volume, and mix. Adjust with 1 N potassium hydroxide or phosphoric acid to a pH of 7.2.

**Diluent:** Aqueous solution containing 2 mL of ammonium hydroxide and 1 g of sodium perchlorate per 100 mL.

**System suitability solution:** 0.2 mg/mL each of USP Folic Acid RS and USP Folic Acid Related Compound A RS in *Diluent*. [NOTE—Before use, pass through a filter of 1-μm or finer pore size.]

**Standard solution:** 0.20 mg/mL of USP Folic Acid RS, corrected for water content in *Diluent*.

**Sample solution:** Equivalent to 0.2 mg/mL of folic acid, from NLT 20 powdered Tablets in *Diluent*; shake gently to aid dissolution, and filter, discarding the first portion.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 25 μL

### System suitability

**Samples:** *System suitability solution* and *Standard solution*

### Suitability requirements

**Resolution:** NLT 3.6 between folic acid related compound A (calcium formyltetrahydrofolate) and folic acid, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of folic acid ( $C_{19}H_{19}N_7O_6$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of folic acid from the *Sample solution*

$r_S$  = peak area of folic acid from the *Standard solution*

$C_S$  = concentration of USP Folic Acid RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of folic acid in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–115.0%

### PERFORMANCE TESTS

#### • DISSOLUTION (711)

**Medium:** Water; 500 mL

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Standard solution:** Solution having a known concentration of USP Folic Acid RS, corrected for water content, in *Medium*

**Sample solution:** Filtered portion of the solution under test, suitably diluted with the *Medium* if necessary

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Proceed as directed in the Assay, making any necessary modifications.

Calculate the percentage of the labeled amount of folic acid ( $C_{19}H_{19}N_7O_6$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S \times D \times V/L) \times 100$$

$r_U$  = peak area of folic acid from the *Sample solution*

$r_S$  = peak area of folic acid from the *Standard solution*

$C_S$  = concentration of USP Folic Acid RS in the *Standard solution* (mg/mL)

$D$  = dilution factor for the *Sample solution*

$V$  = volume of *Medium*, 500 mL

$L$  = label claim (mg/Tablet)

**Tolerances:** NLT 75% (Q) of the labeled amount of folic acid ( $C_{19}H_{19}N_7O_6$ ) is dissolved.

#### • UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

### ADDITIONAL REQUIREMENTS

#### • PACKAGING AND STORAGE:

Preserve in well-closed containers.

#### • USP REFERENCE STANDARDS (11)

USP Folic Acid RS

USP Folic Acid Related Compound A RS

Calcium formyltetrahydrofolate.

## Formaldehyde Solution

CH<sub>2</sub>O 30.03  
Formaldehyde.  
Formaldehyde [50-00-0].

» Formaldehyde Solution contains not less than 34.5 percent, by weight, of formaldehyde (CH<sub>2</sub>O), with methanol added (9.0% to 15.0%) to prevent polymerization.

**Packaging and storage**—Preserve in tight containers, and preferably store at a temperature not below 15°.

### Identification—

**A:** Dilute 2 mL with 10 mL of water in a test tube, and add 1 mL of silver-ammonia-nitrate TS: metallic silver is produced either in the form of a finely divided, gray precipitate, or as a bright, metallic mirror on the sides of the test tube.

**B:** Add 2 drops to 5 mL of sulfuric acid in which about 20 mg of salicylic acid has been dissolved, and warm the liquid very gently: a permanent, deep-red color appears.

**Acidity**—Measure 20.0 mL into a flask containing 20 mL of water, add 2 drops of bromothymol blue TS, and titrate with 0.1 N sodium hydroxide VS: not more than 10.0 mL of 0.1 N sodium hydroxide is consumed.

### Content of methanol—

**Internal standard solution**—Dilute 10 mL of dehydrated alcohol with water to 100 mL.

**Test solution**—To 10.0 mL of Solution add 10.0 mL of the Internal standard solution, and dilute with water to 100.0 mL.

**Standard solution**—To 1.0 mL of methanol add 10.0 mL of the Internal standard solution, and dilute with water to 100.0 mL.

**Chromatographic system** (see *Chromatography* <621>)—The gas chromatograph is equipped with a flame-ionization detector and a 2- to 4-mm × 1.5- to 2.0-m column containing packing S3. The carrier gas is nitrogen or helium, flowing at a rate of 30 to 40 mL per minute. The column temperature is maintained at 120°. The injection port temperature and the detector temperature are maintained at 150°. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the resolution, *R*, between the peaks corresponding to methanol and alcohol is not less than 2.0.

**Procedure**—Separately inject equal volumes (1 µL) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage (v/v) of methanol in the portion of Solution taken by the formula:

$$100 \times (V_M / V)(R_U / R_S)$$

in which *V<sub>M</sub>* is the volume, in mL, of methanol taken to prepare the Standard solution; *V* is the volume, in mL, of Solution taken to prepare the Test solution; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak response ratios of methanol to that of the internal standard obtained from the Test solution and the Standard solution, respectively: between 9.0% and 15.0% (v/v) is found.

**Assay**—Into a 100-mL volumetric flask containing 2.5 mL of water and 1 mL of sodium hydroxide TS 2, introduce 1.0 g of the Solution to be examined, shake, and dilute with water to 100.0 mL. To 10.0 mL of the solution add 30.0 mL of 0.1 N iodine VS. Mix, and add 10 mL of sodium hydroxide TS 2. After 15 minutes, add 25 mL of diluted sulfuric acid and 4 mL of starch TS. Titrate with 0.1 N sodium thi-

osulphate VS. Each 1 mL of 0.05 M iodine is equivalent to 1.501 mg of CH<sub>2</sub>O.

## Formoterol Fumarate

(C<sub>19</sub>H<sub>24</sub>N<sub>2</sub>O<sub>4</sub>)<sub>2</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub> · 2H<sub>2</sub>O 840.91  
(±)-2'-Hydroxy-5'-[(*R*\*)-1-hydroxy-2-[(*R*\*)-*p*-methoxy-α-methylphenethyl]amino]ethyl]formanilide fumarate (2:1) (salt), dihydrate [43229-80-7].

» Formoterol Fumarate contains not less than 98.5 percent and not more than 101.5 percent of (C<sub>19</sub>H<sub>24</sub>N<sub>2</sub>O<sub>4</sub>)<sub>2</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**Labeling**—The labeling states with which *Content of related compound I* the test article complies if a test other than *Content of related compound I*, *Test 1* is used.

### USP Reference standards <11>—

USP Formoterol Fumarate RS

USP Formoterol Fumarate System Suitability Mixture RS  
It is a mixture of USP Formoterol Fumarate RS and formoterol related compounds A, B, C, D, E, F, G, and H.

**Formoterol related compound A:** 1-(3-Amino-4-hydroxyphenyl)-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethanol.

**Formoterol related compound B:** *N*-[2-Hydroxy-5-[(1*RS*)-1-hydroxy-2-[[2-(4-methoxyphenyl)ethyl]amino]ethyl]phenyl]formamide.

**Formoterol related compound C:** *N*-[2-Hydroxy-5-[1-hydroxy-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]acetamide.

**Formoterol related compound D:** *N*-[2-Hydroxy-5-[1-hydroxy-2-[methyl[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide.

**Formoterol related compound E:** *N*-[2-Hydroxy-5-[1-hydroxy-2-[[2-(4-methoxy-3-methylphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide.

**Formoterol related compound F:** *N*-[2-Hydroxy-5-[1-[[2-hydroxy-5-[1-hydroxy-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]amino]-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide.

**Formoterol related compound G:** (2*RS*)-1-(4-Methoxyphenyl)propan-2-amine.

**Formoterol related compound H:** *N*-[5-[(1*RS*)-2-[Benzyl[(1*RS*)-2-(4-methoxyphenyl)-1-methylethyl]amino]-1-hydroxyethyl]-2-hydroxyphenyl]formamide (monobenzyl analogue).

USP Formoterol Resolution Mixture RS

This standard is a mixture of formoterol and formoterol fumarate impurity I.

**Impurity I:** *N*-[2-hydroxy-5-[(1*RS*)-1-hydroxy-2-[(1*SR*)-2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide fumarate salt (2:1)(diastereoisomer).

**Identification, Infrared Absorption** (197K).

**Optical rotation, Angular Rotation** (781A): between  $-0.10^\circ$  and  $+0.10^\circ$ .

**Test solution:** 10 mg per mL, in methanol.

**pH** (791): between 5.5 and 6.5, in a solution in water containing 1 mg per mL.

**Water, Method I** (921): between 4.0% and 5.0%.

**Residue on ignition** (281): not more than 0.1%, determined on 1 g.

**Heavy metals, Method II** (31): not more than 0.002%.

**Related compounds—**

**Solution A**—Dissolve 3.73 g of sodium dihydrogen phosphate monohydrate and 0.35 g of phosphoric acid in water, dilute with water to 1000 mL, and mix. The pH of this solution is  $3.1 \pm 0.1$ .

**Solution B**—Use acetonitrile.

**Mobile phase**—Use variable mixtures of **Solution A** and **Solution B** as directed for **Chromatographic system**. Make adjustments if necessary (see **System Suitability** under **Chromatography** (621)).

**Solution C**—Transfer 6.10 g of sodium dihydrogen phosphate monohydrate and 1.03 g of disodium hydrogen phosphate dihydrate to a 1000-mL volumetric flask, add 500 mL of water, and dissolve. Dilute with water to volume, and mix. The pH is  $6.0 \pm 0.1$ .

**Diluent**—Prepare a filtered and degassed mixture of **Solution C** and acetonitrile (84:16, v/v).

**System suitability solution**—Transfer about 5 mg of USP Formoterol Fumarate System Suitability Mixture RS (containing formoterol fumarate, and formoterol related compounds A, B, C, D, E, F, G, and H), accurately weighed, to a 25-mL volumetric flask, add 10 mL of **Diluent**, and sonicate to dissolve. Dilute with **Diluent** to volume, and mix.

**Test solution**—Transfer about 20.0 mg of Formoterol Fumarate, accurately weighed, to a 100-mL volumetric flask, add 50 mL of **Diluent**, and sonicate to dissolve. Dilute with **Diluent** to volume, and mix.

**Chromatographic system** (see **Chromatography** (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L7. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	84	16	equilibration
0–10	84	16	isocratic
10–37	84→30	16→70	linear gradient
37–40	30→84	70→16	linear gradient
40–55	84	16	isocratic

Chromatograph the **System suitability solution**, and record the peak responses as directed for **Procedure**: the resolution,  $R$ , between formoterol related compound G and formoterol related compound A is not less than 1.5; the peak-to-valley ratio ( $H_p / H_v$ ) of formoterol related compound C and formoterol is not less than 2.5, where  $H_p$  is the height above the baseline of the peak due to formoterol related compound C, and  $H_v$  is the height above the baseline of the lowest point of the curve separating this peak from the peak due to formoterol; and the relative retention times and limits are as provided in **Table 1**.

**Table 1**

Related Compound	Relative Retention Time	Relative Response Factor (F)	Limit (%)
G <sup>a</sup>	0.4	2.64	0.1
A <sup>b</sup>	0.5	1.75	0.3
B <sup>c</sup>	0.7	1.00	0.2
C <sup>d</sup>	1.2	1.10	0.2
D <sup>e</sup>	1.3	1.12	0.2
E <sup>f</sup>	1.8	0.67	0.1
F <sup>g</sup>	2.0	1.00	0.2
H <sup>h</sup>	2.2	1.24	0.1
Any other individual impurity			0.1
Total unspecified impurities			0.2
Total impurities			0.5

<sup>a</sup>(2RS)-1-(4-Methoxyphenyl)propan-2-amine.

<sup>b</sup>1-(3-Amino-4-hydroxyphenyl)-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethanol.

<sup>c</sup>N-[2-Hydroxy-5-[(1RS)-1-hydroxy-2-[[2-(4-methoxyphenyl)ethyl]amino]ethyl]phenyl]formamide.

<sup>d</sup>N-[2-Hydroxy-5-[1-hydroxy-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]acetamide.

<sup>e</sup>N-[2-Hydroxy-5-[1-hydroxy-2-[methyl[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide.

<sup>f</sup>N-[2-Hydroxy-5-[1-hydroxy-2-[[2-(4-methoxy-3-methylphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide.

<sup>g</sup>N-[2-Hydroxy-5-[1-[[2-hydroxy-5-[1-hydroxy-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]amino]-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide.

<sup>h</sup>N-[5-[(1RS)-2-[Benzyl[(1RS)-2-(4-methoxyphenyl)-1-methylethyl]amino]-1-hydroxyethyl]-2-hydroxyphenyl]formamide (monobenzyl analogue).

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the **System suitability solution** and the **Test solution** into the chromatograph, record the chromatograms, and measure all of the peak responses. Disregard any peak representing less than 0.05%. Calculate the percentage of each formoterol related compound in the portion of Formoterol Fumarate taken by the formula:

$$100F(r_i / r_s)$$

in which  $F$  is the relative response factor for each formoterol related compound according to **Table 1**;  $r_i$  is the peak response for each formoterol related compound; and  $r_s$  is the sum of the responses for all the peaks.

**Content of related compound I (diastereoisomer)—****TEST 1—**

**Standard solution**—Dissolve 10 mg of USP Formoterol Fumarate Resolution Mixture RS in 1 mL of dimethylformamide. Add 100  $\mu$ L of *N*-(trimethylsilyl)imidazole, and mix.

**Test solution**—Dissolve 10 mg of Formoterol Fumarate in 1 mL of dimethylformamide. Add 100  $\mu$ L of *N*-(trimethylsilyl)imidazole, and mix.

**Chromatographic system** (see **Chromatography** (621))—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm  $\times$  30-m fused-silica capillary column coated with a 0.25- $\mu$ m film of stationary phase G27, and a split injection system. The carrier gas is helium, flowing at a rate of about 2 mL per minute and a split ratio of about 75:1. The injection port and the detector temperatures are maintained at about 280° and 300°, respectively. The column temperature is programmed as follows. Initially the column temperature is equilibrated at 220° for 5 minutes, then the temperature is increased at a rate of 1° per minute to 250°, and maintained at 250° for 20 minutes. Chromatograph the **Standard solution**, and record the peak responses as directed for **Procedure**: the resolution,  $R$ , between

formoterol related compound I and formoterol is not less than 1.2.

**Procedure**—Separately inject equal volumes (about 2  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for formoterol related compound I and formoterol. Disregard all other peaks. Calculate the percentage of formoterol related compound I in the portion of Formoterol Fumarate taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for formoterol related compound I, and  $r_s$  is the sum of the responses of both formoterol and formoterol related compound I peaks: not more than 0.3% of formoterol related compound I is found.

**TEST 2—**

**Potassium phosphate solution**—Dissolve 5.3 g of tribasic potassium phosphate, trihydrate, in 1000 mL of water, and mix. Adjust the pH with potassium hydroxide or phosphoric acid to  $12.0 \pm 0.1$ .

**Mobile phase**—Prepare a filtered degassed mixture of *Potassium phosphate solution* and acetonitrile (88:12).

**Standard solution**—Dissolve 5 mg of USP Formoterol Fumarate Resolution Mixture RS in water, dilute with water to 50 mL, and mix.

**Test solution**—Dissolve 5 mg of Formoterol Fumarate in water, dilute with water to 50 mL, and mix.

**Diluted test solution**—Dilute 1 mL of the *Test solution* with water to 20 mL. Dilute 1 mL of this solution with water to 25 mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L67 (see *Chromatographic Reagents* under *Reagents, Indicators, and Solutions*). The flow rate is about 0.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for the *Procedure*: the peak-to-valley ratio ( $H_p / H_v$ ) of formoterol related compound I and formoterol is not less than 2.5, where  $H_p$  is the height above the baseline of the peak due to formoterol related compound I, and  $H_v$  is the height above the baseline of the lowest point of the curve separating this peak from the peak due to formoterol.

**Procedure**—Separately inject equal volumes (20  $\mu$ L) of the *Test solution* and the *Diluted test solution* into the chromatograph, record the chromatograms, and measure the peak responses for formoterol and formoterol related compound I. The area due to formoterol related compound I is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the *Diluted test solution*: not more than 0.3% of formoterol related compound I is found.

**Assay**—Transfer about 350 mg of Formoterol Fumarate, accurately weighed, to a titration vessel, dissolve in 50 mL of anhydrous acetic acid, and titrate with 0.1 M perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 M perchloric acid is equivalent to 40.24 mg of  $(C_{19}H_{24}N_2O_4)_2 \cdot C_4H_4O_4$ .

## Foscarnet Sodium

$CNa_3O_5P \cdot 6H_2O$  300.04

Phosphinocarboxylic acid, dihydroxy-, oxide, trisodium salt, hexahydrate.

Phosphonoformic acid, trisodium salt, hexahydrate [34156-56-4].

» Foscarnet Sodium contains not less than 98.5 percent and not more than 101.0 percent of  $CNa_3O_5P$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at room temperature.

**USP Reference standards** <11>—

USP Foscarnet Sodium RS

USP Foscarnet Related Compound B RS

Disodium (ethoxyoxido-phosphanyl)formate.

$C_3H_5Na_2O_5P$  198.02

USP Foscarnet Related Compound D RS

O,O-Diethyl ethoxycarbonylphosphonate.

$C_7H_{15}O_5P$  210.16

**Identification**—

**A: Infrared Absorption** <197K>.

**B:** It meets the requirements of the test for *Sodium* <191>.

**pH** <791>: between 9.0 and 11.0, in a carbon dioxide-free aqueous solution containing 20 mg of Foscarnet Sodium per mL.

**Loss on drying** <731>—Dry about 0.1 g at  $150^\circ$  for at least 15 minutes and weigh: it loses between 35.0% and 37.0% of its weight.

**Heavy metals**—

**Lead standard stock solution (1000 ppm)**—Dissolve 0.4 g of lead nitrate in 250 mL of water. Prepare and store this solution in glass containers free from soluble lead salts.

**Lead standard solution**—Immediately before use, dilute *Lead standard stock solution (1000 ppm)*, quantitatively and stepwise if necessary, with water to obtain a solution having a known concentration of 1 ppm of lead.

**Sodium sulfide solution**—Dissolve 12 g of disodium sulfide nonahydrate with heating in 45 mL of a mixture of 10 volumes of water and 29 volumes of 85% glycerol, allow to cool, and dilute with the same mixture of solvents to 100 mL.

**Acetate buffer**—Dissolve 25.0 g of ammonium acetate in 25 mL of water, and add 38.0 mL of 6 N hydrochloric acid. Adjust, if necessary, with 6 N ammonium hydroxide or 6 N hydrochloric acid to a pH of 3.5, dilute with water to 100 mL, and mix.

**Test solution**—Dissolve 1.25 g in 12.5 mL of 1 M hydrochloric acid. Heat on a boiling water bath for 3 minutes and cool to room temperature. Transfer to a beaker, adjust with 6 N ammonium hydroxide to a pH of about 3.5, and dilute with water to 25 mL.

**Standard solution**—Prepare a mixture of 5.0 mL of *Lead standard solution*, 5.0 mL of water, 2.0 mL of the *Test solution*, and 2.0 mL of *Acetate buffer*. Rapidly pour the solution into a test tube containing 1 drop of *Sodium sulfide solution*.

**Procedure**—To 12 mL of the *Test solution* add 2.0 mL of *Acetate buffer*. Rapidly pour the mixture into a test tube containing 1 drop of *Sodium sulfide solution*. The solution is not more intensely colored than the *Standard solution* prepared simultaneously (10 ppm).

**Limit of foscarnet related compound B, unknown impurities, and total impurities**—

**Solution A**—Dissolve 3.2 g of sodium sulfate decahydrate in water, add 3 mL of glacial acetic acid and 6 mL of 0.1 M sodium pyrophosphate, and dilute with water to 1000 mL.

**Solution B**—Dissolve 3.2 g of sodium sulfate decahydrate in water, add 6.8 g of sodium acetate and 6 mL of 0.1 M sodium pyrophosphate, and dilute with water to 1000 mL.

**Mobile phase**—Prepare a mixture of *Solution A* and *Solution B* (70:30). [NOTE—The pH of this solution is about 4.4.] To 1000 mL of this solution, add 0.25 g of tetrahexylam-

monium hydrogen sulfate and 100 mL of methanol, and mix.

**Test solution**—Dissolve an accurately weighed quantity of Fosfomycin Sodium in *Mobile phase* to obtain a solution having a known concentration of about 2.5 mg per mL.

**Standard solution**—Accurately dilute the *Test solution* in *Mobile phase*, stepwise if necessary, to obtain a solution having a known concentration of about 5.0 µg per mL.

**Resolution solution**—Transfer 2.0 mL of the *Test solution* into a 50-mL volumetric flask, add 5.0 mg of USP Fosfomycin Related Compound B RS, and dilute with *Mobile phase* to volume.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 10-cm column that contains 3-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between fosfomycin and fosfomycin related compound B is not less than 7.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, allow the chromatogram to run for 2.5 times of the retention time of fosfomycin, record the chromatograms, and measure the peak responses: the area of any peak, apart from the major peak, in the chromatogram obtained with the *Test solution* is not greater than the area of the major peak in the chromatogram obtained with the *Standard solution* (0.2%); the sum of the areas of all the peaks, apart from the major peak, is not greater than twice the area of the major peak in the chromatogram obtained with the *Standard solution* (0.4%). Disregard any peak with a relative retention time less than 0.6 and any peak with an area less than 0.2 times that of the peak in the chromatogram obtained with the *Standard solution*.

#### Limit of fosfomycin related compound D—

**Test solution**—Dissolve 0.25 g of Fosfomycin Sodium in 9 mL of 0.1 M acetic acid. Add 1 mL of alcohol, and mix.

**Standard solution**—Dissolve an accurately weighed quantity of USP Fosfomycin Related Compound D RS in alcohol, stepwise if necessary, to obtain a solution having a known concentration of about 25 µg per mL.

**Chromatographic system** (see *Chromatography* <621>)—The gas chromatograph is equipped with a flame-ionization detector and a 0.31-mm × 25-m column coated with a 0.5-µm phase G27. The carrier gas is helium, flowing at a rate of 1 mL per minute. The split ratio is 1:20. The chromatograph is programmed as follows. The temperature of the column is increased from 100° to 180° at a rate of 10° per minute. The injection port temperature is maintained at 200°, and the detector temperature is maintained at 250°.

**Procedure**—Separately inject equal volumes (about 3 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses: the area of the peak due to fosfomycin related compound D in the chromatogram obtained with the *Test solution* is not greater than the area of the peak in the chromatogram obtained with the *Standard solution* (0.1%).

#### Limit of phosphate and phosphite—

**Mobile phase**—Dissolve about 0.1 g of potassium phthalate monobasic in water, add 2.5 mL of 1 M nitric acid, and dilute with water to 1000 mL.

**Test solution**—Dissolve an accurately weighed quantity of Fosfomycin Sodium in water to obtain a solution having a known concentration of about 2.4 mg per mL.

**Standard stock solution 1**—Dissolve an accurately weighed quantity of sodium dihydrogen phosphate monohydrate in water to obtain a solution having a known concentration of about 0.28 mg per mL.

**Standard stock solution 2**—Dissolve an accurately weighed quantity of sodium phosphite pentahydrate in water to ob-

tain a solution having a known concentration of about 0.43 mg per mL.

**Standard solution**—Transfer 1 mL each of *Standard stock solution 1* and *Standard stock solution 2* to a 25-mL volumetric flask, and dilute with water to volume.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 290-nm detector and a 4.6-mm × 5-cm column that contains packing L23 (see *Chromatographic Reagents*). The flow rate is about 1.4 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between phosphate and phosphite is not less than 2.0.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses: the area of any peak due to phosphate and phosphite in the chromatogram obtained with the *Test solution* is not greater than the area of the corresponding peak in the chromatogram obtained with the *Standard solution* (0.3% of phosphate and 0.3% of phosphite).

**Assay**—Dissolve about 0.2 g of Fosfomycin Sodium, accurately weighed, in 50 mL of water. Titrate with 0.05 M sulfuric acid, determining the endpoint potentiometrically at the first inflection point. Each mL of 0.05 M sulfuric acid is equivalent to 19.20 mg of CN<sub>3</sub>O<sub>3</sub>P.

## Fosfomycin Tromethamine

$C_3H_7O_4P \cdot C_4H_{11}NO_3$  259.19  
Phosphonic acid, (3-methyloxiranyl)-, (2*R*-cis)-, compd. with 2-amino-2-(hydroxymethyl)-1,3-propanediol (1:1); (1*R*,2*S*)-(1,2-Epoxypropyl)phosphonic acid, compound with 2-amino-2-(hydroxymethyl)-1,3-propanediol (1:1) [78964-85-9].

#### DEFINITION

Fosfomycin Tromethamine contains NLT 98.0% and NMT 102.0% of  $C_3H_7O_4P \cdot C_4H_{11}NO_3$ , calculated on the anhydrous basis.

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
- **B.** The retention time of the fosfomycin peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C.** The retention time of the tromethamine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### • PROCEDURE

[NOTE—Prepare the solutions immediately before use.]

**Mobile phase:** 10.89 g/L of potassium dihydrogen phosphate in water

**Standard solution:** 120 mg/mL of USP Fosfomycin Tromethamine RS in *Mobile phase*

**Sample solution:** 120 mg/mL of Fosfomycin Tromethamine in *Mobile phase*

**Solution A:** Wet 300 mg of fosfomycin tromethamine with 60 µL of water, and heat in an oven at 60° for 24 h. Dissolve the residue, and dilute with *Mobile phase* to 20.0 mL.

**System suitability solution:** Dissolve 600 mg of fosfomycin tromethamine, and dilute with *Solution A* to 5.0 mL.

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** Differential refractometer at 35°**Column:** 4.6-mm × 25-cm; 5-μm packing L8**Flow rate:** 1 mL/min**Injection size:** 5 μL**Run time:** Twice the retention time of fosfomycin**System suitability****Sample:** *System suitability solution*[NOTE—The relative retention times are listed in *Impurity Table 1*.]**Suitability requirements****Resolution:** NLT 1.5 between fosfomycin open ring and fosfomycin**Peak-to-valley ratio:** NLT 1.5. [NOTE—Ratio is based on the height above the baseline due to the tromethamine phosphate peak and to the height above the baseline of the lowest point of the curve separating this peak from the peak due to the fosfomycin tromethamine adduct.]**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of C<sub>3</sub>H<sub>7</sub>O<sub>4</sub>P · C<sub>4</sub>H<sub>11</sub>NO<sub>3</sub> in the portion of Fosfomycin Tromethamine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response of fosfomycin from the *Sample solution* $r_S$  = peak response of fosfomycin from the *Standard solution* $C_S$  = concentration of USP Fosfomycin Tromethamine RS in the *Standard solution* (mg/mL) $C_U$  = concentration of Fosfomycin Tromethamine in the *Sample solution* (mg/mL)**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis**IMPURITIES****Inorganic Impurities**

- **HEAVY METALS, Method I** <231>: NMT 10 ppm

**Sample solution:** 100 mg/mL in water

- **LIMIT OF INORGANIC PHOSPHATES**

**Solution A:** Dissolve 4 g of finely powdered ammonium molybdate and 0.1 g of finely powdered ammonium vanadate in 70 mL of water. Add 20 mL of nitric acid, and dilute with water to 100 mL.**Standard solution:** Dissolve 7.16 mg of potassium dihydrogen phosphate in 1000 mL of water (5 ppm PO<sub>4</sub>). [NOTE—Prepare immediately before use.]**Sample solution:** Dissolve 0.1 g of Fosfomycin Tromethamine in 3 mL of 2 N nitric acid, and dilute with water to 10 mL.**Analysis:** In separate containers, transfer 5 mL of *Standard solution* and 5 mL of *Sample solution*. Add 5 mL of water and 5 mL of *Solution A* to both solutions, and shake vigorously. After 5 min, any color in the *Sample solution* is not more intense than the *Standard solution*.**Acceptance criteria:** NMT 500 ppm**Organic Impurities**

- **PROCEDURE**

[NOTE— Prepare the solutions immediately before use.]

**Mobile phase, Sample solution, Solution A, System suitability solution, and System suitability:** Proceed as directed in the *Assay*.**Standard solution:** 0.36 mg/mL of USP Fosfomycin Tromethamine RS in *Mobile phase***Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** Differential refractometer at 35°**Column:** 4.6-mm × 25-cm; 5-μm packing L8**Flow rate:** 1 mL/min**Injection size:** 10 μL**Run time:** Twice the retention time of fosfomycin**Analysis****Samples:** *Sample solution* and *Standard solution*

Calculate the percentage of impurities in the portion of Fosfomycin Tromethamine taken:

$$\text{Result} = (r_U/r_T) \times 100$$

 $r_U$  = peak response of any individual impurity in the *Sample solution* $r_T$  = peak responses of fosfomycin in the *Standard solution***Impurity Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

## Fosinopril Sodium

$C_{30}H_{45}NNaO_7P$  585.64  
 L-Proline, 4-cyclohexyl-1-[[[2-methyl-1-(1-oxopropoxy)propoxy](4-phenylbutyl)phosphinyl]acetyl]-, sodium salt, [1  $[S^*(R^*)]$ , 2 $\alpha$ , 4 $\beta$ ]-;  
 (4S)-4-Cyclohexyl-1-[(R)-[(S)-1-hydroxy-2-methylpropoxy](4-phenylbutyl)phosphinyl]acetyl-L-proline propionate (ester), sodium salt [88889-14-9].

### DEFINITION

Fosinopril Sodium contains NLT 97.5% and NMT 102.0% of  $C_{30}H_{45}NNaO_7P$ , calculated on the anhydrous basis.

### IDENTIFICATION

- **INFRARED ABSORPTION** <197M>

### ASSAY

#### • PROCEDURE

**Mobile phase:** Acetonitrile, phosphoric acid, and water (2000:1:10)

**System suitability solution:** 0.1 mg/mL of USP Fosinopril Sodium RS and 0.01 mg/mL of USP Fosinopril Related Compound B RS in *Mobile phase*

**Standard solution:** 0.10 mg/mL of USP Fosinopril Sodium RS in *Mobile phase*

**Sample solution:** 0.10 mg/mL of Fosinopril Sodium in *Mobile phase*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 3.9-mm  $\times$  15-cm; packing L3

**Temperature:** 33°

**Flow rate:** 1.2 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between fosinopril related compound B and fosinopril sodium

**Relative standard deviation:** NMT 2.0% for Fosinopril peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{30}H_{45}NNaO_7P$  in the portion of Fosinopril Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Fosinopril Sodium RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of Fosinopril Sodium in the *Sample solution* (mg/mL)

**Acceptance criteria:** 97.5%–102.0% on the anhydrous basis

### IMPURITIES

#### Inorganic Impurities

- **HEAVY METALS**, *Method II* <231>: 20 ppm

#### Organic Impurities

##### • PROCEDURE 1

**Mobile phase, Sample solution and Chromatographic system:** Proceed as directed in the *Assay*. [NOTE—Record the chromatograms for four times the retention time of the fosinopril sodium peak.]

**System suitability solution:** 0.1 mg/mL of USP Fosinopril Sodium RS and 0.01 mg/mL each of USP Fosinopril Related Compound A RS and USP Fosinopril Related Compound B RS in *Mobile phase*

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each individual related compound:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = individual peak response, other than the fosinopril sodium peak

$r_T$  = sum of all the peak responses

[NOTE— If present, two more diastereomers may not be resolved from fosinopril related compound B by this method. These peaks, appearing at a relative retention time of 0.7, should be integrated together to determine conformance with the limit in *Impurity Table 1*.]

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Impurity Table 1**

Name	Relative Retention Time	Procedure	Acceptance Criteria, NMT (%)
Fosinopril Related Compound A <sup>a</sup>	2.0	1	0.75
Fosinopril Related Compound B <sup>b</sup>	0.7	1	1.0
Fosinopril Related Compound C <sup>c</sup>	1.2	2	0.3

<sup>g</sup> (2S,4S)-4-Cyclohexyl-1-pivaloylpyrrolidine-2-carboxylic acid.

<sup>h</sup> 2-[(R)-[(S)-2-Methyl-1-(propionyloxy)propoxy](4-phenylbutyl)phosphinyl]acetic acid.

<sup>i</sup> (S)-4-cyclohexyl-1-(3-oxopentanoyl)-L-proline.

## • PROCEDURE 2

**Sample solution:** Proceed as directed in the Assay.

**Mobile phase:** Acetonitrile, phosphoric acid, and water (4000:2:15)

**System suitability solution:** 0.1 mg/mL of USP Fosinopril Sodium RS and 0.01 mg/mL each of USP Fosinopril Related Compound C RS and USP Fosinopril Related Compound D RS in the Mobile phase

### Chromatographic system

(See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 4.6-mm × 25-cm; packing L12

**Temperature:** 45°

**Flow rate:** 0.9 mL/min

**Injection size:** 20 µL

**Run time:** Twice the retention time of fosinopril sodium

### System suitability

**Sample:** System suitability solution

#### Suitability requirements

**Resolution:** NLT 1.5 between fosinopril sodium and fosinopril related compound C

### Analysis

**Sample:** Sample solution

Calculate the percentages of fosinopril related compound C and fosinopril related compound D only:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of fosinopril related compound C or fosinopril related compound D

$r_T$  = sum of all the peak responses

## • PROCEDURE 3

**Solution A:** 1-in-500 solution of phosphoric acid

**Mobile phase:** Acetonitrile and Solution A (14:11)

**System suitability solution:** 0.01 mg/mL each of USP Fosinopril Sodium RS, USP Fosinopril Related Compound E RS, and USP Fosinopril Related Compound F RS in Mobile phase

**Sample solution:** 0.2 mg/mL of Fosinopril Sodium in Mobile phase

### Chromatographic system

(See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector:** UV 205 nm

**Column:** 4.6-mm × 25-cm; packing L11

**Temperature:** 45°

**Flow rate:** 1 mL/min

**Injection size:** 20 µL

**Run time:** Four times the retention time of fosinopril sodium

### System suitability

**Sample:** System suitability solution

#### Suitability requirements

**Resolution:** NLT 1.5 between fosinopril related compound F and fosinopril sodium; NLT 1.5 between fosinopril related compound E and fosinopril related compound F

### Analysis

**Sample:** Sample solution

Measure the peak responses, carrying out the chromatography to four times the retention time of the fosinopril sodium peak.

Calculate the percentages of fosinopril related compound E and fosinopril related compound F only:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of fosinopril related compound E or fosinopril related compound F

$r_T$  = sum of all the peak responses

### Acceptance criteria

**Individual impurities:** See Impurity Table 1. In addition to not exceeding the limits for impurities in Impurity Table 1, NMT 0.1% of any other individual impurity is found (calculated as directed in Procedure 1).

**Total impurities:** NMT 1.5% for the total of Procedure 1, Procedure 2, and Procedure 3

## SPECIFIC TESTS

• **WATER DETERMINATION, Method I <921>:** NMT 0.2%

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.

• **USP REFERENCE STANDARDS <11>**

USP Fosinopril Sodium RS

$C_{29}H_{43}NNaO_7P$  571.62

## Fosinopril Sodium Tablets

» Fosinopril Sodium Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fosinopril sodium ( $C_{30}H_{45}NNaO_7P$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

### USP Reference standards (11)—

USP Fosinopril Sodium RS

USP Fosinopril Related Compound A RS

(4S)-4-Cyclohexyl-[(4-phenylbutyl)phosphinyl]acetyl-L-proline.

$C_{23}H_{34}NO_5P$  435.49

USP Fosinopril Related Compound G RS

(4-Phenylbutyl)phosphinylacetic acid, disodium salt.

$C_{12}H_{15}Na_2O_4P$  300.20

### Identification—

**A: Infrared Absorption** (197F)—

**Test specimen**—Transfer a portion of the finely powdered Tablets, equivalent to about 25 mg of fosinopril sodium, to a 100-mL beaker containing 40 mL of water. Heat at 25° for 5 minutes with stirring, and pass through a medium-porosity fritted-disc funnel. Centrifuge the filtrate at 2500 rpm for 30 minutes. Adjust the filtrate with phosphoric acid to a pH of 3 to precipitate the fosinopril, and pass through a fritted-disc funnel. Dissolve the precipitate by passing chloroform through the filter, and evaporate the chloroform solution to dryness under a current of air. Proceed as directed, using the oily residue so obtained and a similarly prepared residue from 25 mg of USP Fosinopril Sodium RS.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, as obtained in the *Assay*.

### Dissolution (711)—

**Medium:** water; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes.

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile and 0.2% phosphoric acid (64:36). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Resolution solution**—Prepare a solution in *Mobile phase* containing about 0.02 mg per mL each of USP Fosinopril Sodium RS and USP Fosinopril Related Compound G RS.

**Standard stock solution**—Accurately weigh about 20 mg of USP Fosinopril Sodium RS into a 200-mL volumetric flask, dissolve in 6-mL of methanol, sonicate briefly, and dilute with *Medium* to volume.

**Standard solution**—Dilute the *Standard stock solution* with *Medium* as directed in the following table.

Label claim	Standard stock solution (mL)	Final volume (Flask size)
5 mg	5.0	100
10 mg	10	100
20 mg	20	100
40 mg	40	100

**Test solution**—Use portions of the solution under test passed through a 1.2- $\mu$ m acrylic filter. [NOTE—Do not use glass filters.]

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm  $\times$  15-cm column, maintained at a temperature of 40°, that contains 5- $\mu$ m packing L1. The flow rate is

about 3 mL per minute. Chromatograph the *Resolution solution* and the *Standard solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between fosinopril sodium and fosinopril related compound G is not less than 1.7; and the relative standard deviation for replicate injections of the *Standard solution* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Test solution* and the *Standard solution* having a known concentration of USP Fosinopril Sodium RS in the same *Medium*, and record the chromatograms. Measure the responses for the major peaks, and calculate the amount of  $C_{30}H_{45}NNaO_7P$  dissolved.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{30}H_{45}NNaO_7P$  is dissolved in 30 minutes.

**Uniformity of dosage units:** meet the requirements.

### Limit of related compound A—

**Mobile phase, Diluent, and Chromatographic system**—Proceed as directed in the *Assay*.

**Standard solution**—Dissolve an accurately weighed quantity of USP Fosinopril Related Compound A RS in methanol to obtain a solution having a known concentration of about 0.1 mg per mL. Dilute with *Diluent* to obtain a solution having a final known concentration of 0.0025 mg per mL.

**Test solution**—Use the *Assay preparation*.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for the major peaks. Calculate the percentage of fosinopril related compound A in the portion of Tablets taken by the formula:

$$1000C(r_u / r_s)$$

in which  $C$  is the concentration, in mg per mL, of the fosinopril related compound A in the *Standard solution*; and  $r_u$  and  $r_s$  are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively. Not more than 4% is found.

### Assay—

**Mobile phase**—Prepare a degassed mixture of methanol and 0.2% phosphoric acid (78:22). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Prepare a mixture of 0.2 M urea solution and acetonitrile (80:20).

**Resolution solution**—Prepare a solution in *Diluent* containing 30  $\mu$ g of USP Fosinopril Related Compound A RS and 70  $\mu$ g of USP Fosinopril Sodium RS per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fosinopril Sodium RS to obtain a solution having a known concentration of about 0.1 mg per mL.

**Assay preparation**—Transfer not fewer than 10 Tablets to a 500-mL volumetric flask, add 400 mL of *Diluent*, and stir for 40 minutes. Dilute with *Diluent* to volume, mix, and centrifuge. Quantitatively dilute an accurately measured volume ( $V_s$  mL) of the clear supernatant with *Diluent* to obtain a solution ( $V_A$  mL) containing about 0.1 mg of fosinopril sodium per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector and a 4.0-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution* and the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention time is 0.4 for fosinopril related compound A, and 1.0 for fosinopril sodium; the resolution,  $R$ , between the fosinopril sodium and fosinopril related compound A peaks is not less than 2.0; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Continue the chromatography up to 1.5 times the retention time of the fosinopril sodium peak. Calculate the quantity, in mg, of fosinopril sodium ( $C_{30}H_{45}NNaO_7P$ ) in the portion of Tablets taken by the formula:

$$50C(V_A / V_S)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Fosinopril Sodium RS in the *Standard preparation*;  $V_A$  is the volume, in mL, of the *Assay preparation*;  $V_S$  is the volume, in mL, of supernatant taken for the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fosinopril Sodium and Hydrochlorothiazide Tablets

» Fosinopril Sodium and Hydrochlorothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fosinopril sodium ( $C_{30}H_{45}NNaO_7P$ ) and of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

### USP Reference standards (11)—

- USP Benzothiadiazine Related Compound A RS  
4-Amino-6-chloro-1,3-benzenedisulfonamide.  
 $C_6H_8ClN_3O_4S_2$  285.73
- USP Chlorothiazide RS
- USP Fosinopril Sodium RS
- USP Fosinopril Related Compound A RS  
(4S)-4-Cyclohexyl-[(4-phenylbutyl)phosphinyl]acetyl-L-proline.  
 $C_{23}H_{34}NO_5P$  435.49
- USP Fosinopril Related Compound H RS  
4-phenylbutyl phosphonic acid.  
 $C_{10}H_{15}O_3P$  214.20
- USP Hydrochlorothiazide RS

### Identification—

#### A: Infrared Absorption (197F)—

**FOSINOPRIL SODIUM**—Transfer a portion of the finely powdered Tablets, equivalent to about 25 mg of fosinopril sodium, to a 100-mL beaker containing 40 mL of water, heat at 30° for 5 minutes with stirring, and filter through a funnel having a medium-porosity fritted disk. Centrifuge the filtrate at 2500 rpm for 30 minutes. Adjust the filtrate with hydrochloric acid to a pH of 1 to precipitate the fosinopril, and filter through a fritted-disk funnel. Dissolve the precipitate by passing methyl isobutyl ketone through the filter, and evaporate the filtrate to dryness under a stream of nitrogen. Proceed as directed, using the oily residue so obtained and a similarly prepared residue from 25 mg of USP Fosinopril Sodium RS.

**HYDROCHLOROTHIAZIDE**—Transfer a portion of the finely powdered Tablets, equivalent to about 37.5 mg of hydrochlorothiazide, to a 250-mL beaker containing 120 mL of water, heat at 30° for 5 minutes with stirring, and filter through a funnel having a medium-porosity fritted disk. Wash the precipitate with 60 mL of methylene chloride and glacial acetic acid (90:10) mixture, and discard the filtrate. Dissolve the precipitate by passing 10 mL of methyl isobutyl ketone through the filter, and evaporate the filtrate to dryness under a stream of nitrogen. Proceed as directed, using

the waxy residue so obtained and a similarly prepared residue from 37 mg of USP Hydrochlorothiazide RS.

**B:** The retention times of the fosinopril sodium and hydrochlorothiazide peaks in the chromatogram of the *Assay preparation* correspond to those of the *Standard preparation*, as obtained in the *Assay*.

### Dissolution (711)—

**Medium:** water; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes.

**Mobile phase**—Prepare a filtered and degassed mixture of 0.01 M monobasic potassium phosphate (pH 3.0), methanol, and acetonitrile (45:35:20). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard stock solutions**—Separately dissolve about 20 mg of USP Fosinopril Sodium RS and USP Hydrochlorothiazide RS accurately weighed in 6 mL of methanol, and dilute with water to obtain solutions (*Standard stock solution A* and *B*) having known concentrations of about 0.1 mg per mL of USP Fosinopril Sodium RS and USP Hydrochlorothiazide RS, respectively.

**Standard solution**—Mix 25 mL of *Standard stock solution B* and x25 mL of *Standard stock solution A*, and dilute with water to 200 mL, x being the ratio of the respective labeled amounts, in mg, of fosinopril sodium to that of hydrochlorothiazide per Tablet.

**Resolution solution**—Transfer 5 mg of USP Fosinopril Related Compound H RS into a 100-mL volumetric flask, and dissolve in 5 mL of methanol. Add 2.0 mL of *Standard stock solution B*, dilute with water to volume, and mix.

**Test solution**—Use portions of the solution under test passed through a 1.2- $\mu$ m acrylic filter. [NOTE—Do not use glass filters.]

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a variable wavelength detector set at 210 nm and 272 nm and a 4.6-mm  $\times$  25-cm column, maintained at 40° that contains 5- $\mu$ m packing L10. The flow rate is about 1.3 mL per minute. With the detector set at 215 nm, chromatograph the *Resolution solution* and the *Standard solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the fosinopril related compound H peak and the hydrochlorothiazide peak is not less than 1.5; and the relative standard deviation for replicate injections of the *Standard solution* is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Test solution* and the *Standard solution*, and record the chromatograms with the detector set at 272 nm from 0 to 5 minutes and at 210 nm from 5 to 9 minutes, for hydrochlorothiazide and fosinopril sodium, respectively. Measure the responses for the major peaks, and calculate the amount of  $C_{30}H_{45}NNaO_7P$  and of  $C_7H_8ClN_3O_4S_2$  dissolved.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{30}H_{45}NNaO_7P$  and not less than 75% (Q) of the labeled amount of  $C_7H_8ClN_3O_4S_2$  are dissolved in 30 minutes.

**Uniformity of dosage units:** meet the requirements.

### Related compounds—

**Solution A, Solution B, Diluent 2, and Mobile phase**—Proceed as directed in the *Assay*.

**Standard solution**—Dissolve accurately weighed quantities of USP Fosinopril Sodium RS and USP Hydrochlorothiazide RS in a suitable volumetric flask in *Diluent 2* to obtain a solution having a known concentration of about 0.004 mg per mL of each USP Reference Standard.

**System suitability solution**—Dissolve accurately weighed quantities of USP Chlorothiazide RS, USP Hydrochlorothiazide RS, USP Fosinopril Sodium RS, USP Fosinopril Related Compound A RS, and USP Benzothiadiazine Related Compound A RS in a suitable volumetric flask in *Diluent 2*. Dilute stepwise, if necessary, to obtain a solution having a known concentration of about 0.005 mg per mL of USP Chlorothia-

zide RS, USP Fosinopril Related Compound A RS, and USP Benzothiadiazine Related Compound A RS and about 0.5 mg per mL of USP Hydrochlorothiazide RS and of USP Fosinopril Sodium RS.

**Test solution**—Use the Assay preparation.

**Chromatographic system**—Proceed as directed in the Assay. Chromatograph the Standard solution and the System suitability solution, and record the peak responses as directed for Procedure: the resolution, *R*<sub>s</sub>, between chlorothiazide and hydrochlorothiazide is not less than 1.8; and the relative standard deviation for replicate injections is not more than 10.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses eluting between 2.7 minutes and 27 minutes. Calculate the percentage of any impurity or degradation product in the portion of Tablets taken by the formula:

$$100(r_U / r_S)(C_S / C_U)(1/F)$$

in which *r*<sub>U</sub> is the individual peak response for each impurity obtained from the Test solution; *r*<sub>S</sub> is the response of the fosinopril sodium or hydrochlorothiazide in the Standard solution; *F* is the relative response factor of each impurity relative to fosinopril sodium or hydrochlorothiazide as mentioned in Table 1; and *C*<sub>S</sub> and *C*<sub>U</sub> are the concentrations, in mg per mL, of fosinopril sodium or hydrochlorothiazide in the Standard solution and the Test solution, respectively. The limits of impurities are specified in Table 1.

**Assay—**

**Solution A**—Prepare a filtered and degassed solution of 0.01 M monobasic potassium phosphate. Adjust with phosphoric acid to a pH of 2.0.

**Solution B**—Use acetonitrile.

**Mobile phase**—Use variable mixtures of Solution A and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography (621)).

**Diluent 1**—Use a mixture of water and acetonitrile (2:1).

**Diluent 2**—Use a mixture of 0.001 N hydrochloric acid and acetonitrile (2:1).

**Standard preparation**—Transfer into two separate suitable volumetric flasks accurately weighed quantities of USP Fosinopril Sodium RS and USP Hydrochlorothiazide RS. Dissolve USP Fosinopril Sodium RS in Diluent 1 and USP Hydrochlorothiazide RS in Diluent 2 respectively, to obtain stock solutions having known concentrations of about 2.0 mg per mL. Dilute quantitatively, and stepwise if necessary, portions of these two solutions with Diluent 2 to obtain a solution having a known concentration of 0.08 mg per mL of USP Fosinopril Sodium RS and of USP Hydrochlorothiazide RS.

**System suitability solution**—Dissolve accurately weighed quantities of USP Chlorothiazide RS, USP Hydrochlorothiazide RS, and USP Fosinopril Sodium RS in a suitable volumetric flask in Diluent 2 to obtain a solution having a known concentration of about 0.08 mg per mL of USP Hydrochlorothiazide RS and of USP Fosinopril Sodium RS and 0.025 mg per mL of the USP Chlorothiazide RS.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg of fosinopril and 12.5 mg of hydrochlorothiazide, to a 100-mL volumetric flask, add about 75 mL of Diluent 2, and sonicate for about 10 minutes. Shake by mechanical means for 15 minutes. Dilute with Diluent 2 to volume, and mix. Pass a portion of this solution through a filter (PTFE or PVDF) having a 0.45-µm or finer porosity, and collect the rest of the filtrate. Dilute further, stepwise if necessary, to obtain a solution having a known concentration of about 0.075 mg of fosinopril sodium.

**Chromatographic system** (see Chromatography (621))—The liquid chromatograph is equipped with a 206-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–2	88	12	isocratic
2–20	88→10	12→90	linear gradient
20–28	10	90	isocratic
28–37	10→88	90→12	linear gradient

Chromatograph the Standard preparation and the System suitability solution (about 20 µL), and record the peak responses as directed for Procedure: the resolution, *R*<sub>s</sub>, between the chlorothiazide and hydrochlorothiazide peaks is not less than 1.8; the tailing factor is less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of fosinopril sodium (*C*<sub>30</sub>H<sub>45</sub>NNaO<sub>7</sub>P) in the portion of the Tablets taken by the formula:

$$100(r_U / r_S)(C_S / C_U)$$

in which *r*<sub>U</sub> and *r*<sub>S</sub> are the peak responses of fosinopril sodium in the Assay preparation and the Standard preparation, respectively; and *C*<sub>S</sub> and *C*<sub>U</sub> are the concentrations, in mg per mL, of fosinopril sodium in the Standard preparation and the Assay preparation, respectively. Calculate the percentage

Table 1

Component	Relative Retention Time (RRT)	Relative Response Factor (RRF)	Limit (%)
Benzothiadiazine related compound A <sup>1</sup>	0.81 (relative to hydrochlorothiazide)	1.0	NMT 0.5
Fosinopril related compound A <sup>2</sup>	0.72 (relative to fosinopril)	1.2	NMT 4
Chlorothiazide <sup>3</sup>	0.90 (relative to hydrochlorothiazide)	1.7	NMT 0.3
Any other individual impurity	—	—	NMT 0.2 (relative to hydrochlorothiazide)
Total of all impurities	—	—	NMT 5.0

<sup>1</sup>4-Amino-6-chloro-1,3-benzenedisulfonamide.  
<sup>2</sup>(4S)-4-Cyclohexyl-1-[-(4-phenylbutyl)phosphinyl]acetyl-L-proline.  
<sup>3</sup>6-Chloro-2(H)-1,2,4-benzothiazine-7-sulfonamide.

of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) in the portion of the Tablets taken by the formula:

$$100(r_U / r_S)(C_S / C_U)$$

in which  $r_U$  and  $r_S$  are the peak responses of hydrochlorothiazide in the *Assay preparation* and the *Standard preparation*, respectively; and  $C_S$  and  $C_U$  are the concentrations, in mg per mL, of hydrochlorothiazide in the *Standard preparation* and the *Assay preparation*, respectively.

## Fosphenytoin Sodium

$C_{16}H_{13}N_2Na_2O_6P$  406.24

2,4-Imidazolidinedione, 5,5-diphenyl-3-[(phosphonoxy)methyl]-, disodium salt.

3-(Hydroxymethyl)-5,5-diphenylhydantoin, disodium phosphate (ester) [92134-98-0].

» Fosphenytoin Sodium contains not less than 98.0 percent and not more than 102.0 percent of  $C_{16}H_{13}N_2Na_2O_6P$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Fosphenytoin Sodium RS

USP Phenytoin RS

USP Phenytoin Related Compound A RS  
Diphenylglycine.

$C_{14}H_{15}NO_2$  227.26

USP Phenytoin Related Compound B RS

Diphenylhydantoic acid.

$C_{15}H_{14}N_2O_3$  270.29

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**C:** It meets the requirements of the tests for *Sodium* (191).

**pH** (791): between 8.5 and 9.5, in a solution containing 75 mg per mL.

**Water**, *Method I* (921): between 21.7% and 25.7%.

**Heavy metals**, *Method I* (231): 0.002%.

**Related compounds**—

*Buffer solution* and *Mobile phase*—Proceed as directed in the *Assay*.

*Standard solution*—Dissolve accurately weighed quantities of USP Phenytoin Related Compound A RS, USP Phenytoin Related Compound B RS, and USP Phenytoin RS in *Mobile phase*; and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 3.0 µg per mL, 3.0 µg per mL, and 1.5 µg per mL, respectively.

*Test solution*—Transfer about 150 mg of Fosphenytoin Sodium, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

*Chromatographic system*—Prepare as directed in the *Assay*. Chromatograph the *Standard solution*, and record the peak response as directed for *Procedure*: identify the peaks due to phenytoin related compound A, phenytoin, and phenytoin related compound B; the order of elution is phenytoin related compound A, phenytoin, followed by phenytoin related compound B; the resolution,  $R$ , between phenytoin and phenytoin related compound B is not less than 2.0; and the relative standard deviation is not more than 5.0%.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for not less than six times the retention time of the major peak, and measure all the peak responses. The order of elution is phenytoin related compound A, phenytoin, followed by phenytoin related compound B, followed by the major peak due to fosphenytoin. Calculate the percentage of phenytoin, phenytoin related compound B, and phenytoin related compound A, if present, in the portion of Fosphenytoin Sodium taken by the formula:

$$100(C_S / C_U)(r_i / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of the USP Reference Standard of the respective impurity in the *Standard solution*;  $C_U$  is the concentration, in mg per mL, of Fosphenytoin Sodium in the *Test solution*; and  $r_i$  and  $r_S$  are the peak responses for each impurity obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.1% of phenytoin is found; not more than 0.1% of any other impurity is found; and not more than 0.5% of total impurities is found. [NOTE—Use the peak area and concentration of USP Phenytoin RS in the *Standard solution* as  $r_S$  and  $C_S$ , respectively, to calculate the percentage of the unknown impurities.]

**Assay**—

*Buffer solution*—Dissolve 6.80 g of monobasic potassium phosphate and 30 mL of 0.5 M dodecyltriethylammonium phosphate in 900 mL of water, adjust with 1.5 M phosphoric acid to a pH of about 5.0, dilute with water to 1000 mL, mix, and filter.

*Mobile phase*—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (13:7). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Fosphenytoin Sodium RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.15 mg per mL.

*Assay preparation*—Transfer about 150 mg of Fosphenytoin Sodium, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a solution having a nominal concentration of about 0.15 mg per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 3.9-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from fosphenytoin sodium is not less than 5000 theoretical plates; the tailing factor for the fosphenytoin sodium peak is not more than 1.6; and the relative standard deviation for replicate injections is not more than 0.5%.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in percentage, of  $C_{16}H_{13}N_2Na_2O_6P$  in the portion of Fosphenytoin Sodium taken by the formula:

$$100(C_s / C_u)(r_u / r_s)$$

in which  $C_s$  is the concentration, in mg per mL, of USP Fosphenytoin Sodium RS in the *Standard preparation*;  $C_u$  is the nominal concentration of fosphenytoin, in mg per mL, in the *Assay preparation*; and  $r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fosphenytoin Sodium Injection

» Fosphenytoin Sodium Injection is a sterile solution of Fosphenytoin Sodium in Water for Injection. Fosphenytoin Sodium is a prodrug. Injection containing 1 mg per mL of Fosphenytoin Sodium is equivalent to 0.667 mg per mL of Phenytoin Sodium after injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fosphenytoin sodium ( $C_{16}H_{13}N_2Na_2O_6P$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass. Store between 2° and 8°. Do not store at room temperature for more than 48 hours.

**Labeling**—Both the actual content of Fosphenytoin Sodium and the content of Phenytoin Sodium, expressed in terms of phenytoin sodium equivalents, are stated prominently on the label.

### USP Reference standards (11)—

USP Fosphenytoin Sodium RS

USP Phenytoin RS

USP Phenytoin Related Compound A RS

Diphenylglycine.

$C_{14}H_{13}NO_2$  227.26

USP Phenytoin Related Compound B RS

Diphenylhydantoic acid.

$C_{15}H_{14}N_2O_3$  270.29

### Identification—

**A: Infrared Absorption** (197K)—

*Test specimen*—Transfer a 5-mL aliquot of Injection to a 100-mL beaker, add 30 mL of acetone to form a white precipitate, and stir for 20 minutes using a magnetic stirrer. Filter in vacuum, and collect the precipitate using suitable filter paper. Allow to dry in vacuum for 15 minutes.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85): not more than 14 USP Endotoxin Units per mL.

**pH** (791): between 8.3 and 9.3.

### Related compounds—

*Buffer solution*, *Mobile phase*, *Standard stock solution 1*, *Standard stock solution 2*, and *Chromatographic system*—Proceed as directed in the *Assay*.

*Standard solution*—Use the *Standard preparation*, prepared as directed in the *Assay*.

*Test solution*—Use the *Assay preparation*, prepared as directed in the *Assay*.

*Procedure*—Inject a volume (about 40  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentages of phenytoin, phenytoin related

compound A, phenytoin related compound B, and unknown impurities in each mL of Injection taken by the formula:

$$200,000(C/VL)(r_i / r_s)$$

in which  $C$  is the concentration, in mg per mL, of the respective impurity in the *Standard solution*;  $V$  is the volume, in mL, of the Injection taken to prepare the *Test solution*;  $L$  is the labeled amount, in mg per mL, of fosphenytoin sodium in the Injection; and  $r_i$  and  $r_s$  are the individual peak responses of the impurities in the chromatograms obtained from the *Test solution* and the *Standard solution*, respectively: not more than 1.5% of phenytoin related compound B is found; not more than 0.2% of phenytoin is found; not more than 0.2% of phenytoin related compound A is found; not more than 0.1% of any individual unknown impurity is found; and not more than 2.0% total impurities is found. [NOTE—Use the peak area and concentration of the USP Phenytoin RS in the *Standard solution* as  $r_s$  and  $C$ , respectively, to calculate the percentage of the unknown impurities.]

**Other requirements**—It meets the requirements under *Injections* (1).

### Assay—

*Buffer solution*—Dissolve about 8.2 g of monobasic potassium phosphate in 1 L of water. Adjust with 6 N potassium hydroxide solution to a pH of  $6.5 \pm 0.05$ .

*Mobile phase*—Prepare a filtered and degassed mixture of *Buffer solution*, methanol, and acetonitrile (73:25:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard stock solution 1*—Dissolve an accurately weighed quantity of USP Fosphenytoin Sodium RS in methanol, and dilute quantitatively, and stepwise if necessary, with *Buffer solution* to obtain a solution having a known concentration of about 0.75 mg per mL.

*Standard stock solution 2*—Dissolve an accurately weighed quantity of USP Phenytoin RS, USP Phenytoin Related Compound A RS, and USP Phenytoin Related Compound B RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.0075 mg per mL, 0.0075 mg per mL, and 0.015 mg per mL, respectively.

*Standard preparation*—Transfer 10.0 mL of *Standard stock solution 1* and 5.0 mL of *Standard stock solution 2* to a 50-mL volumetric flask. Dilute with *Buffer solution* to volume, and mix.

*Assay preparation*—Transfer an accurately measured volume of the Injection, equivalent to about 300 mg of fosphenytoin, to a 200-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask. Dilute with *Buffer solution* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L11. The flow rate is about 1.25 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.3 for phenytoin related compound B, about 0.5 for phenytoin related compound A, 1.0 for fosphenytoin, and about 3.8 for phenytoin; the resolution,  $R$ , between phenytoin related compound B and phenytoin related compound A is not less than 4.0; the column efficiency is not less than 2250 theoretical plates for the fosphenytoin peak; the tailing factor is not more than 1.8 for the fosphenytoin peak; and the relative standard deviation for replicate injections is not more than 1.0% for the fosphenytoin peak and not more than 5.0% for the phenytoin related compound B, phenytoin related compound A, and phenytoin peaks.

*Procedure*—Separately inject equal volumes (about 40  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and meas-

ure the peak areas for fosphenytoin. Calculate the quantity, in mg, of fosphenytoin sodium ( $C_{16}H_{13}N_2Na_2O_6P$ ) in each mL of the Injection taken by the formula:

$$2000(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Fosphenytoin Sodium RS in the *Standard preparation*; V is the volume, in mL, of the Injection taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the fosphenytoin peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Fructose

$C_6H_{12}O_6$  180.16  
D-Fructose [57-48-7].

### DEFINITION

Fructose, dried in vacuum at 70° for 4 h, contains NLT 98.0% and NMT 102.0% of fructose ( $C_6H_{12}O_6$ ).

(See *Optical Rotation*, *Angular Rotation* <781A>.)  
Tube length: 100 mm  
Temperature: 25°  
Analysis: Transfer the *Sample* to a 100-mL volumetric flask, and dissolve in 50 mL of water. Add 0.2 mL of 6 N ammonium hydroxide, and dilute with water to volume. After 30 min, determine the angular rotation. The observed rotation, in degrees, represents the weight, in g.  
Calculate the percentage of fructose ( $C_6H_{12}O_6$ ) in the Fructose taken.

$$\text{Result} = [(a \times F)/W] \times 100$$

$a$  = observed rotation of the sample (°)

$F$  = correction factor, -1.124

$W$  = weight of the *Sample* (g)

Acceptance criteria: 98.0%–102.0% on a previously dried basis

### IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.5%
- **CHLORIDE AND SULFATE**, *Chloride* <221>  
Sample: 2.0 g  
Control: 0.50 mL of 0.020 N hydrochloric acid  
Acceptance criteria: NMT 0.018%; the *Sample* shows no more chloride than corresponds to the *Control*.

- **CHLORIDE AND SULFATE**, *Sulfate* <221>  
Sample: 2.0 g  
Control: 0.50 mL of 0.020 N sulfuric acid  
Acceptance criteria: NMT 0.025%; the *Sample* shows no more sulfate than corresponds to the *Control*.
  - **ARSENIC**, *Method II* <211>  
Test preparation: Prepare by heating the acidified mixture nearly to dryness. Cool, and add 30% hydrogen peroxide.  
Acceptance criteria: NMT 1 µg/g
  - **CALCIUM AND MAGNESIUM (AS CALCIUM)**  
Sample: 20 g  
Titrimetric system  
Mode: Direct titration  
Titrant: 0.005 M edetate disodium VS  
Endpoint detection: Visual  
Analysis: Dissolve the *Sample* in 200 mL of water. Add 2 drops of hydrochloric acid, 5 mL of ammonia–ammonium chloride buffer TS, and 8 drops of eriochrome black TS, and mix. Titrate with *Titrant* to a blue endpoint. Each mL of *Titrant* is equivalent to 200.4 µg of Ca.  
Acceptance criteria: 0.005% of Ca; NMT 5.0 mL of *Titrant* is consumed.
  - **HEAVY METALS**, *Method I* <231>  
Test preparation: 4 g of Fructose in 23 mL of water. Add 2 mL of 1 N acetic acid.  
Acceptance criteria: NMT 5 µg/g
  - **LIMIT OF HYDROXYMETHYLFURFURAL**  
Resorcinol solution: 10 mg/mL of resorcinol in hydrochloric acid  
Sample solution: 100 mg/mL  
Analysis: To 10 mL of *Sample solution* add 5 mL of ether, and shake vigorously. Transfer 2 mL of the ether layer to a test tube, and add 1 mL of *Resorcinol solution*.  
Acceptance criteria: A slight pink color may develop, but no cherry-red color appears immediately.
- ### SPECIFIC TESTS
- **COLOR OF SOLUTION**  
Sample solution: 25 g of Fructose in water to make 50 mL  
Comparison solution: Mix 1.0 mL of cobaltous chloride CS, 3.0 mL of ferric chloride CS, and 2.0 mL of cupric sulfate CS with water to make 10 mL, and dilute 3 mL of this solution with water to make 50 mL.  
Analysis: View the *Sample solution* and *Comparison solution* downward in matched color-comparison tubes against a white surface.  
Acceptance criteria: The *Sample solution* has no more color than the *Comparison solution*.
  - **ACIDITY**  
Sample: 5.0 g  
Titrimetric system  
Mode: Direct titration  
Titrant: 0.02 N sodium hydroxide VS  
Endpoint detection: Visual  
Analysis: Dissolve the *Sample* in 50 mL of carbon dioxide-free water. Add phenolphthalein TS, and titrate with *Titrant* to a distinct pink color.  
Acceptance criteria: NMT 0.50 mL of *Titrant* is needed for neutralization.

• **Loss on Drying** (731)

Analysis: Dry under vacuum at 70° for 4 h.

Acceptance criteria: NMT 0.5%

**ADDITIONAL REQUIREMENTS**

• **Packaging and Storage:** Preserve in well-closed containers.

• **USP Reference Standards** (11)  
USP Fructose RS

## Fructose Injection

» Fructose Injection is a sterile solution of Fructose in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of fructose ( $C_6H_{12}O_6$ ). Fructose Injection contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I or Type II glass.

**Labeling**—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Fructose RS

**Identification**—

*Silver nitrate solution*—Dissolve 0.6 g of silver nitrate in 2.0 mL of water in a 100-mL volumetric flask, dilute with acetone to volume, and mix.

*Sodium hydroxide solution*—Dissolve 2.0 g of sodium hydroxide in 5.0 mL of water in a 100-mL volumetric flask, dilute with alcohol to volume, and mix.

*Alcoholic monobasic sodium phosphate*—Dissolve 4.0 g of monobasic sodium phosphate in 150 mL of water, and add, with mixing, 500 mL of alcohol. Use the entire mixture, even if there are two phases. Prepare the solution fresh daily.

*Standard preparation*—Prepare an aqueous solution containing 2.5 mg of USP Fructose RS per mL.

*Test preparation*—Dilute an accurately measured volume of Injection with water to obtain a solution having a known concentration of about 2.5 mg of fructose per mL.

*Procedure*—Immerse a suitable thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel, coated side down, in *Alcoholic monobasic sodium biphosphate* for 2.0 minutes. Remove the plate from the solution, place it, coated side up, on a clean, absorbent towel, dry it in a current of warm air, and activate it at 105° for 30 minutes. Cool to room temperature, and apply 5  $\mu$ L each of the *Standard preparation* and the *Test preparation*. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of acetone, *n*-butyl alcohol, and water (50:40:10). Remove the plate, allow the solvent to evaporate, and spray the plate with *Silver nitrate solution*. Allow the plate to dry for 30 seconds, then spray with *Sodium hydroxide solution*: the  $R_f$  value of the spot appearing within 3 minutes from the *Test preparation* corresponds to that obtained from the *Standard preparation*.

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mL.

**pH** (791): between 3.0 and 6.0, determined on a portion to which 0.30 mL of a saturated potassium chloride solution

has been added for each 100 mL and which previously has been diluted with water, if necessary, to a concentration of not more than 5% of fructose.

**Heavy metals, Method I** (231)—Place a volume of Injection, equivalent to 4 g of fructose, in a porcelain dish, and evaporate to a volume of about 10 mL. Cool, and dilute with water to 25 mL: the limit is 5 ppm.

**Limit of hydroxymethylfurfural**—It meets the requirements of the test for *Hydroxymethylfurfural* under *Fructose*.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Transfer an accurately measured volume of Injection, equivalent to 5 g of fructose, to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide, dilute with water to volume, and mix. After 30 minutes determine the angular rotation (see *Optical Rotation* (781)), and record the observed rotation,  $a$ , as an absolute number. Calculate the quantity, in mg, of fructose ( $C_6H_{12}O_6$ ) in each mL of the Injection taken by the formula:

$$1124a / lV$$

in which  $l$  is the length, in dm, of the polarimeter tube; and  $V$  is the volume, in mL, of Injection taken.

## Fructose and Sodium Chloride Injection

» Fructose and Sodium Chloride Injection is a sterile solution of Fructose and Sodium Chloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amounts of  $C_6H_{12}O_6$  (fructose) and of NaCl (sodium chloride). Fructose and Sodium Chloride Injection contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I or Type II glass.

**Labeling**—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Fructose RS

**Identification**—It responds to the *Identification* tests under *Fructose Injection* and to the tests for *Sodium* (191) and for *Chloride* (191).

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mL.

**pH** (791): between 3.0 and 6.0.

**Heavy metals, Method I** (231)—Proceed as directed in the test for *Heavy metals* under *Fructose Injection*: the limit is 5 ppm.

**Limit of hydroxymethylfurfural**—It meets the requirements of the test for *Hydroxymethylfurfural* under *Fructose*.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay for fructose**—Transfer an accurately measured volume of Injection, containing about 5 g of fructose, to a 100-mL volumetric flask, add 0.2 mL of 6 N ammonium hydroxide, dilute with water to volume, and mix. After 30 minutes determine the angular rotation (see *Optical Rotation* (781)), and record the observed rotation,  $a$ , as an abso-

lute number. Calculate the quantity, in mg, of fructose ( $C_6H_{12}O_6$ ) in each mL of the Injection taken by the formula:

$$1124a / IV$$

in which  $l$  is the length, in dm, of the polarimeter tube; and  $V$  is the volume, in mL, of Injection taken.

**Assay for sodium chloride**—Transfer an accurately measured volume of Injection, equivalent to about 90 mg of sodium chloride, to a conical flask, evaporate to a volume of about 10 mL, and add 10 mL of glacial acetic acid, 75 mL of methanol, and 0.5 mL of eosin Y TS. Titrate, with shaking, with 0.1 N silver nitrate VS to a pink endpoint. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of sodium chloride (NaCl).

## Basic Fuchsin

Benzenamine, 4-[(4-aminophenyl)(4-imino-2,5-cyclohexadien-1-ylidene)methyl-2-methyl]-, monohydrochloride.

C.I. Basic Violet 14 monohydrochloride [632-99-5].

» Basic Fuchsin is a mixture of rosaniline and pararosaniline hydrochlorides. It contains the equivalent of not less than 88.0 percent of rosaniline hydrochloride ( $C_{20}H_{19}N_3 \cdot HCl$ ), calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

### Identification—

**A:** To 5 mL of a solution (1 in 1000) add a few drops of hydrochloric acid: a yellow color is produced (*distinction from acid fuchsin*).

**B:** To 5 mL of a solution (1 in 500) add a few drops of tannic acid TS: a red precipitate is formed.

**C:** To 10 mL of a solution (1 in 500) add 10 mL of ammonia TS and 500 mg of zinc dust, and agitate the mixture: the solution becomes decolorized. Place a few drops of the decolorized solution on filter paper, and nearby on the same paper place a few drops of 3 N hydrochloric acid: a red color develops at the zone of contact.

**Loss on drying** (731)—Dry it at 105° to constant weight: it loses not more than 5.0% of its weight.

**Residue on ignition** (281)—Ignite 1 g with 0.5 mL of sulfuric acid: the weight of the residue is not more than 0.3%.

**Alcohol-insoluble substances**—Boil 1 g, accurately weighed, with 50 mL of alcohol under a reflux condenser for 15 minutes, filter through a tared filtering crucible, wash the residue on the filter with hot alcohol until the washings cease to be colored violet, and dry the crucible at 105° for 1 hour: the amount of insoluble residue is not more than 1.0%.

**Arsenic, Method II** (211): 8 ppm.

**Lead** (251): Place 1 g in a small Kjeldahl flask, add 5 mL of sulfuric acid, and insert a small funnel into the flask. Gently rotate the flask until the sulfuric acid has completely wetted the Basic Fuchsin, then heat with a small flame until carbonization is complete. Allow to cool, and add, in small quantities, 5 mL of nitric acid. Again heat gently until fumes

of sulfur trioxide are evolved. Allow to cool, add another 5 mL of nitric acid, and heat to the evolution of sulfur trioxide. Allow to cool, add about 25 mL of water, and boil for a few minutes. Cool, neutralize with stronger ammonia water, using litmus paper as the indicator, and add 5 mL of nitric acid. Transfer the solution to a 100-mL volumetric flask, dilute to volume, and mix. A 20-mL portion of this solution contains not more than 30 ppm of lead.

**Assay**—Dissolve about 100 mg of Basic Fuchsin, accurately weighed, in 175 mL of water in a 500-mL closed system titration vessel fitted with a gas inlet tube, a gas outlet tube, an upright reflux condenser, and a buret. Add about 25 mL of sodium tartrate solution (30 in 100) and a polytetrafluoroethylene-coated magnetic stirring bar, and heat to boiling. Flush this titration vessel for 15 minutes with nitrogen that has been passed through two successive gas washing bottles each containing 500 mL of a mixture of water, titanium trichloride solution (20 in 100), and hydrochloric acid (400:40:40) to which about 10 mg of safranin O has been added. Continue the heating and nitrogen flow, and while stirring titrate with 0.05 N titanium trichloride VS to a yellow endpoint. Each mL of 0.05 N titanium trichloride is equivalent to 3.379 mg of  $C_{20}H_{19}N_3 \cdot HCl$ .

## Fulvestrant

$C_{32}H_{47}F_5O_3S$  606.77

Estra-1,3,5(10)-triene-3,17-diol, 7-[9-[(4,4,5,5,5-pentafluoropentyl)sulfinyl]nonyl]-, (7 $\alpha$ ,17 $\beta$ ); 7 $\alpha$ -[9-[(4,4,5,5,5-pentafluoropentyl)sulfinyl]nonyl]estra-1,3,5(10)-triene-3,17 $\beta$ -diol [129453-61-8].

» Fulvestrant is a mixture of the diastereoisomers A and B. It contains not less than 97.0 percent and not more than 102.0 percent of  $C_{32}H_{47}F_5O_3S$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers. Store refrigerated at 2° to 8°.

### USP Reference standards (11)—

USP Fulvestrant RS

USP Fulvestrant System Suitability Mixture RS

Contains fulvestrant isomer A, fulvestrant isomer B, and fulvestrant  $\beta$ -isomer.

### Identification—

**A:** Infrared Absorption (197K)—

*Spectral range:* 4000 to 400  $cm^{-1}$ .

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Specific rotation** (781S): between +108° and +115° measured at 365 nm.

*Test solution:* 20 mg per mL, in methanol.

**Water, Method 1c** (921): not more than 0.5%.

**Residue on ignition** (281): not more than 0.1%.

### Related compounds—

*Mobile phase and System suitability solution*—Prepare as directed in the *Assay*.

*Standard solution*—Prepare as directed for the *Standard preparation* in the *Assay*.

**Test solution**—Use the *Assay preparation*.

**Chromatographic system** (see *Chromatography* <621>)—Proceed as directed in the *Assay*.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Fulvestrant taken by the formula:

$$100(CV/W)(1/F)(r_i / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Fulvestrant RS in the *Standard solution*; *V* is the volume, in mL, of the *Test solution*; *W* is the weight, in mg, of Fulvestrant taken to prepare the *Test solution*; *F* is the relative response factor as listed in the accompanying table; *r<sub>i</sub>* is the individual peak response for each impurity obtained from the *Test solution*; and *r<sub>s</sub>* is the fulvestrant peak response obtained from the *Standard solution*. Disregard impurity peaks less than 0.05%. The limits are as shown in the accompanying table.

Compound	Relative Retention Time	Relative Response Factor	Limit (%)
6-Keto-fulvestrant <sup>1</sup>	0.5	2.9	0.1
$\Delta$ 6,7-Fulvestrant <sup>2</sup>	0.9	3.3	0.1
Fulvestrant	1.0	1.0	—
Fulvestrant sulfone <sup>3</sup>	1.2	1.0	0.2
Fulvestrant extended <sup>4</sup>	1.7	1.0	0.3
Fulvestrant sterol dimer <sup>5</sup>	1.9	1.0	0.8
Fulvestrant $\beta$ -isomer <sup>6</sup>	1.1	—	*
Any individual unspecified impurity	—	1.0	0.1
Total impurities	—	—	1.0

<sup>1</sup>Estra-1,3,5(10)-triene-6-one-3,17-diol,7-[9-[(4,4,5,5,5-pentafluoropentyl)sulfinyl]nonyl]-(7 $\alpha$ ,17 $\beta$ )

<sup>2</sup>Estra-1,3,5(10),6-tetraene-3,17-diol,7-[9-[(4,4,5,5,5-pentafluoropentyl)sulfinyl]nonyl]-(7 $\alpha$ ,17 $\beta$ )

<sup>3</sup>Estra-1,3,5(10)-triene-3,17-diol,7-[9-[(4,4,5,5,5-pentafluoropentyl)sulfonyl]nonyl]-(7 $\alpha$ ,17 $\beta$ )

<sup>4</sup>Estra-1,3,5(10)-triene-3,17-diol,7-[9-[(4,4,5,5,5-pentafluoropentyl)sulfinyl]nonyl]-(7 $\alpha$ ,17 $\beta$ )

<sup>5</sup>7,7-Nonamethylene-bis(estra-1,3,5(10)-triene-3,17-diol-(7 $\alpha$ ,17 $\beta$ ))

<sup>6</sup>Estra-1,3,5(10)-triene-3,17-diol,7-[9-[(4,4,5,5,5-pentafluoropentyl)sulfinyl]nonyl]-(7 $\beta$ ,17 $\beta$ )

\*Fulvestrant  $\beta$ -isomer, a component of USP Fulvestrant System Suitability Mixture RS, is not a specified impurity.

### Diastereoisomer ratio—

**Mobile phase**—Prepare a filtered and degassed mixture of 2-methylpentane and dehydrated alcohol (880:120). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability solution**—Dissolve a suitable quantity of USP Fulvestrant System Suitability Mixture RS in *Mobile phase* to obtain a solution containing 1 mg of USP Fulvestrant System Suitability Mixture RS per mL.

**Test solution**—Transfer about 20 mg of Fulvestrant, accurately weighed, to a 20-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  25-cm column that contains 10- $\mu$ m packing L51. The flow rate is about 1 mL per minute. The column temperature is maintained at 40°. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between fulvestrant isomer A and fulvestrant isomer B is not less than 1.3; and the tailing factor for fulvestrant isomer B is not more than 1.5.

[NOTE—For the purpose of peak identification, the retention times are about 20 minutes for fulvestrant isomer B and 23 minutes for fulvestrant isomer A.]

**Procedure**—Inject a volume (about 10  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the responses for the two fulvestrant isomer peaks. Calculate the content of fulvestrant isomer A or fulvestrant isomer B, as a percentage, by the formula:

$$100(r_U / r_S)$$

in which *r<sub>U</sub>* is the peak response of either fulvestrant isomer A or fulvestrant isomer B; and *r<sub>S</sub>* is the total peak response of both fulvestrant isomer A and fulvestrant isomer B: between 42% and 48% of fulvestrant isomer A and between 52% and 58% of fulvestrant isomer B is obtained.

### Assay—

**Solution A**—Prepare a filtered and degassed mixture of water, acetonitrile, and methanol (410:320:270).

**Solution B**—Prepare a filtered and degassed mixture of acetonitrile, methanol, and water (490:410:100).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability solution**—Dissolve suitable quantities of USP Fulvestrant System Suitability Mixture RS in methanol to obtain a solution containing about 10 mg of USP Fulvestrant System Suitability Mixture RS per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Fulvestrant RS in methanol to obtain a solution having a known concentration of about 10 mg per mL.

**Assay preparation**—Transfer about 100 mg of Fulvestrant, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm  $\times$  15-cm column that contains 3.5- $\mu$ m packing L7. The flow rate is about 2 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–25	100	0	isocratic
25–55	100→0	0→100	linear gradient
55–65	0	100	isocratic
65–66	0→100	100→0	linear gradient
66–70	100	0	equilibration

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.1 for fulvestrant  $\beta$ -isomer and 1.0 for fulvestrant; the resolution, *R*, between fulvestrant and fulvestrant  $\beta$ -isomer is not less than 1.5; and the tailing factor for the fulvestrant peak is not more than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the fulvestrant peaks. Calculate the quantity, in mg, of C<sub>32</sub>H<sub>47</sub>F<sub>5</sub>O<sub>3</sub>S in the portion of Fulvestrant taken by the formula:

$$CV(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Fulvestrant RS in the *Standard preparation*; *V* is the volume, in mL, of the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak

responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Furazolidone

$C_8H_7N_3O_5$  225.16

2-Oxazolidinone, 3-[[[5-nitro-2-furanyl)methylene]amino]-3-[(5-Nitrofurfurylidene)amino]-2-oxazolidinone [67-45-8].

» Furazolidone contains not less than 97.0 percent and not more than 103.0 percent of  $C_8H_7N_3O_5$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers, and avoid exposure to direct sunlight.

### USP Reference standards <11>—

USP Furazolidone RS

#### Identification—

**A:** *Infrared Absorption* <197K>: previously dried.

**B:** *Ultraviolet Absorption* <197U>—

*Solution:* 10 µg per mL.

**C:** Add about 50 mg to 10 mL of a freshly prepared mixture of dimethylformamide and alcoholic potassium hydroxide TS (9:1): the solution becomes purple, immediately changes to deep blue, and, upon standing for 10 minutes, again turns purple.

**Loss on drying** <731>—Dry it at 100° for 1 hour: it loses not more than 1.0% of its weight.

**Residue on ignition** <281>: not more than 0.25%.

**Assay**—Transfer about 100 mg of Furazolidone, accurately weighed, to a 250-mL volumetric flask, dilute with dimethylformamide to volume, and mix. Transfer 5.0 mL of this solution to a 250-mL volumetric flask, dilute with water to volume, and mix (assay solution). Similarly, dissolve a suitable quantity of USP Furazolidone RS, accurately weighed, in dimethylformamide to obtain a Standard stock solution having a known concentration of about 400 µg per mL. Transfer 5.0 mL of this stock solution to a 250-mL volumetric flask, dilute with water to volume, and mix (Standard solution). Concomitantly determine the absorbances of the assay solution and the Standard solution at the wavelength of maximum absorbance at about 367 nm, with a suitable spectrophotometer, using dimethylformamide solution (1 in 50) as the blank. Calculate the quantity, in mg, of  $C_8H_7N_3O_5$  in the Furazolidone taken by the formula:

$$12.5C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Furazolidone RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the assay solution and the Standard solution, respectively.

## Furazolidone Oral Suspension

» Furazolidone Oral Suspension is a suspension of Furazolidone in a suitable aqueous vehicle. It contains not less than 90.0 percent and not more

than 110.0 percent of the labeled amount of furazolidone ( $C_8H_7N_3O_5$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.

### USP Reference standards <11>—

USP Furazolidone RS

**Identification**—Add a quantity of Oral Suspension, equivalent to about 50 mg of furazolidone, to 10 mL of a freshly prepared mixture of dimethylformamide and alcoholic potassium hydroxide TS (9:1): the solution turns purple, immediately changes to deep blue, and, upon standing for 10 minutes, again turns purple.

**pH** <791>: between 6.0 and 8.5.

**Assay**—Transfer an accurately measured volume of Oral Suspension, equivalent to about 160 mg of furazolidone, to a suitable flask. Add 5 mL of water, and mix. Transfer the mixture with the aid of dimethylformamide to a 1000-mL volumetric flask. Add about 500 mL of dimethylformamide, shake by mechanical means for 10 minutes, dilute with dimethylformamide to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix (assay solution). Similarly, dissolve a suitable quantity of USP Furazolidone RS, accurately weighed, in dimethylformamide to obtain a Standard stock solution having a known concentration of about 160 µg per mL. Transfer 5.0 mL of this stock solution to a 100-mL volumetric flask, dilute with water to volume, and mix (Standard solution). Concomitantly determine the absorbances of the assay solution and the Standard solution at the wavelength of maximum absorbance at about 367 nm, with a suitable spectrophotometer, using dimethylformamide solution (1 in 20) as the blank. Calculate the quantity, in mg, of furazolidone ( $C_8H_7N_3O_5$ ) in each mL of the Oral Suspension taken by the formula:

$$20(C / V)(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Furazolidone RS in the Standard solution; V is the volume, in mL, of Oral Suspension taken; and  $A_U$  and  $A_S$  are the absorbances of the assay solution and the Standard solution, respectively.

## Furazolidone Tablets

» Furazolidone Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_8H_7N_3O_5$ .

**Packaging and storage**—Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.

### USP Reference standards <11>—

USP Furazolidone RS

**Identification**—Add a quantity of powdered Tablets, equivalent to about 50 mg of furazolidone, to 10 mL of a freshly prepared mixture of dimethylformamide and alcoholic potassium hydroxide TS (9:1): the solution turns purple, immediately changes to deep blue, and, upon standing for 10 minutes, again turns purple.

**Uniformity of dosage units** <905>: meet the requirements.

**Assay**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of furazolidone, to a 250-mL volumetric flask. Add about 150 mL of dimethylformamide, warm to about 50°, and sonicate to aid in dissolving the furazolidone. Cool, dilute with dimethylformamide to volume, mix, and centrifuge a portion of the mixture. Transfer

5.0 mL of the clear solution so obtained to a 250-mL volumetric flask, dilute with water to volume, and mix (assay solution). Similarly, dissolve a suitable quantity of USP Furozolidone RS, accurately weighed, in dimethylformamide to obtain a Standard stock solution having a known concentration of about 400 µg per mL. Transfer 5.0 mL of this stock solution to a 250-mL volumetric flask, dilute with water to volume, and mix (Standard solution). Concomitantly determine the absorbances of the assay solution and the Standard solution at the wavelength of maximum absorbance at about 367 nm, with a suitable spectrophotometer, using dimethylformamide solution (1 in 50) as the blank. Calculate the quantity, in mg, of  $C_8H_7N_3O_5$  in the portion of Tablets taken by the formula:

$$12.5C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Furozolidone RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the assay solution and the Standard solution, respectively.

## Furosemide

$C_{12}H_{11}ClN_2O_5S$  330.74

Benzoic acid, 5-(aminosulfonyl)-4-chloro-2-[(2-furanylmethyl)amino]-.

4-Chloro-N-furfuryl-5-sulfamoylanthranilic acid [54-31-9].

» Furosemide contains not less than 98.0 percent and not more than 101.0 percent of  $C_{12}H_{11}ClN_2O_5S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

### USP Reference standards (11)—

USP Furosemide RS

USP Furosemide Related Compound A RS

2-Chloro-4-N-furfurylamino-5-sulfamoylbenzoic acid.

$C_{12}H_{11}ClN_2O_5S$  330.74

USP Furosemide Related Compound B RS

4-Chloro-5-sulfamoylanthranilic acid.

$C_7H_7ClN_2O_4S$  250.66

### Identification—

**A: Infrared Absorption** (197K).

**B: Ultraviolet Absorption** (197U)—

*Solution:* 8 µg per mL.

*Medium:* 0.02 N sodium hydroxide.

Absorptivities at 271 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** Dissolve about 5 mg in 10 mL of methanol. Transfer 1 mL of this solution to a flask, add 10 mL of 2.5 N hydrochloric acid, and reflux on a steam bath for 15 minutes. Cool, and add 15 mL of 1 N sodium hydroxide and 5 mL of sodium nitrite solution (1 in 1000). Allow the mixture to stand for 3 minutes, add 5 mL of ammonium sulfamate solution (1 in 200), mix, and add 5 mL of freshly prepared N-(1-naphthyl)ethylenediamine dihydrochloride solution (1 in 1000): a red to red-violet color is produced.

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.002%.

**Related compounds**—[NOTE—Protect Furosemide solutions from exposure to light.]

**Mobile phase**—Prepare a filtered and degassed mixture of water, tetrahydrofuran, and glacial acetic acid (70:30:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluting solution**—Dilute 22 mL of glacial acetic acid with a mixture of acetonitrile and water (50:50) to 1000 mL, and mix.

**System suitability solution**—Dissolve suitable quantities of USP Furosemide RS and USP Furosemide Related Compound A RS in *Diluting solution* to obtain a solution containing about 20 µg per mL and 12 µg per mL, respectively.

**Standard solution**—Prepare a solution in *Diluting solution* containing 5.0 µg each of USP Furosemide Related Compound A RS and USP Furosemide Related Compound B RS per mL.

**Test solution**—Transfer an accurately weighed quantity of Furosemide to a suitable volumetric flask, dissolve in and dilute with *Diluting solution* to volume to obtain a solution having a concentration of about 1.0 mg per mL, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a detector capable of recording at both 254 nm and 272 nm and a 4.6-mm × 25-cm column that contains packing L1. [NOTE—The 2,4-dichloro-5-sulfamoylbenzoic acid impurity does not respond at 272 nm and the 2,4-bis(furfurylamino)-5-sulfamoylbenzoic acid impurity has a very intense absorbance at 254 nm.] The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between furosemide and furosemide related compound A is not less than 2.5; and the relative standard deviation determined from furosemide is not more than 2.0%. [NOTE—The response for furosemide is at 254 nm.]

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. [NOTE—The chromatographic run time is not less than 2.5 times the retention time of the furosemide peak.] The sum of the responses at 254 nm of those peaks eluting before furosemide in the chromatogram obtained from the *Test solution* is not more than the response at 254 nm of the furosemide related compound B peak in the chromatogram obtained from the *Standard solution* (0.5%). The sum of the responses at 272 nm of those peaks eluting after furosemide in the chromatogram obtained from the *Test solution* is not more than the response at 272 nm of the furosemide related compound A peak in the chromatogram obtained from the *Standard solution* (0.5%).

**Assay**—Dissolve about 600 mg of Furosemide, accurately weighed, in 50 mL of dimethylformamide to which has been added 3 drops of bromothymol blue TS, and which previously has been neutralized with 0.1 N sodium hydroxide. Titrate with 0.1 N sodium hydroxide VS to a blue endpoint. Each mL of 0.1 N sodium hydroxide is equivalent to 33.07 mg of  $C_{12}H_{11}ClN_2O_5S$ .

## Furosemide Injection

» Furosemide Injection is a sterile solution of Furosemide in Water for Injection prepared with the aid of Sodium Hydroxide or, where intended solely for veterinary use, Diethanolamine or Monoethanolamine. It contains not less than

90.0 percent and not more than 110.0 percent of the labeled amount of furosemide ( $C_{12}H_{11}ClN_2O_5S$ ).

**Packaging and storage**—Store in single-dose or multiple-dose, light-resistant containers, of Type I glass.

**Labeling**—Injection intended solely for veterinary use is so labeled.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Furosemide RS

USP Furosemide Related Compound A RS

2-Chloro-4-*N*-furfurylamino-5-sulfamoylbenzoic acid.

$C_{12}H_{11}ClN_2O_5S$  330.74

USP Furosemide Related Compound B RS

4-Chloro-5-sulfamoylanthranilic acid.

$C_7H_7ClN_2O_4S$  250.66

**Identification**—Transfer to a 100-mL volumetric flask a volume of Injection, equivalent to about 40 mg of furosemide, dilute with water to volume, and mix. Dilute 2.0 mL of this solution with 0.02 N sodium hydroxide in a second 100-mL volumetric flask to volume, and mix. Dissolve about 10 mg of USP Furosemide RS in 6.0 mL of 0.1 N sodium hydroxide in a 25-mL volumetric flask, and dilute with water to volume. Dilute 2.0 mL of the resulting solution quantitatively with 0.02 N sodium hydroxide to obtain a Standard solution having a concentration of about 8 µg per mL. Concomitantly determine the UV absorption spectra of both solutions: the UV absorption spectra so obtained exhibit maxima and minima at the same wavelengths.

**Bacterial endotoxins** (85)—It contains not more than 3.6 USP Endotoxin Units per mg of furosemide.

**pH** (791): between 8.0 and 9.3 or, where labeled as intended solely for veterinary use, between 7.0 and 7.8 if it contains diethanolamine, or between 8.0 and 9.3 if it contains monoethanolamine.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Limit of furosemide related compound B**—[NOTE—Protect furosemide solutions from exposure to light.]

*Mobile phase, Diluting solution, System suitability solution and Chromatographic system*—Prepare as directed in the test for Related compounds under Furosemide.

*Standard solution*—Prepare a solution in Diluting solution containing 10.0 µg of USP Furosemide Related Compound B RS per mL.

*Test solution*—Transfer an accurately measured volume of Injection, equivalent to about 10 mg of furosemide, to a 10-mL volumetric flask, add Diluting solution to volume, and mix.

*Procedure*—Separately inject equal volumes (about 20 µL) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. The response at 254 nm obtained for any peak observed in the chromatogram of the Test solution at a retention time corresponding to that of the Reference Standard in the Standard solution is not greater than the response at 254 nm obtained for the peak in the chromatogram of the Standard solution, corresponding to not more than 1.0% of furosemide related compound B. Where the Injection is labeled as intended solely for veterinary use, the response at 254 nm obtained in the chromatogram of the Test solution at a retention time corresponding to that of the Reference Standard in the Standard solution is not greater than 2.5 times the response at 254 nm obtained for the peak in the chromatogram of the Standard solution, corresponding to not more than 2.5% of furosemide related compound B.

**Other requirements**—It meets the requirements under Injections (1).

**Assay**—[NOTE—Protect furosemide solutions from exposure to light.]

*Mobile phase, Diluting solution, System suitability solution, and Chromatographic system*—Prepare as directed in the test for Related compounds under Furosemide.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Furosemide RS in Diluting solution to obtain a solution having a known concentration of about 1.0 mg per mL.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 10 mg of furosemide, to a 10-mL volumetric flask, add Diluting solution to volume, and mix.

*Procedure*—Separately inject equal volumes (about 20 µL) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak responses. Using the response at 254 nm, calculate the quantity, in mg, of furosemide ( $C_{12}H_{11}ClN_2O_5S$ ) in each mL of the Injection taken by the formula:

$$10(C/V)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Furosemide RS in the Standard preparation; V is the volume, in mL, of Injection taken; and  $r_U$  and  $r_S$  are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Furosemide Oral Solution

» Furosemide Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of furosemide ( $C_{12}H_{11}ClN_2O_5S$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Furosemide RS

USP Furosemide Related Compound A RS

2-Chloro-4-*N*-furfurylamino-5-sulfamoylbenzoic acid.

$C_{12}H_{11}ClN_2O_5S$  330.74

USP Furosemide Related Compound B RS

4-Chloro-5-sulfamoylanthranilic acid.

$C_7H_7ClN_2O_4S$  250.66

**Identification**—

**A: Ultraviolet Absorption** (197U)—

*Solution*: 6 µg per mL.

*Medium*: 0.01 N sodium hydroxide.

Absorptivities are not significantly different.

**B:** The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

**Minimum fill** (755): meets the requirements.

**Uniformity of dosage units** (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 7.0 and 10.0.

**NOTE**—Throughout the following procedures, protect test or assay specimens, the USP Reference Standards, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

**Limit of furosemide related compound B—**

*Mobile phase, System suitability solution, and Chromatographic system*—Proceed as directed in the Assay.

*Standard solution*—Dissolve an accurately weighed quantity of USP Furosemide Related Compound B RS in *Diluting solution*, and dilute quantitatively, and stepwise if necessary, with *Diluting solution* to obtain a solution having a known concentration of about 15.0 µg per mL.

*Test solution*—Transfer an accurately measured portion of Oral Solution, equivalent to about 10 mg of furosemide, to a 10-mL volumetric flask, dissolve in and dilute with *Diluting solution* to volume, and mix.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks: the peak response of furosemide related compound B obtained from the *Test solution* is not greater than the corresponding peak response obtained from the *Standard solution*.

**Assay—**

*Mobile phase*—Prepare a filtered and degassed mixture of water, acetonitrile, and glacial acetic acid (165:35:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Diluting solution*—Prepare a mixture consisting of water, acetonitrile, and glacial acetic acid (22:22:1).

*System suitability solution*—Dissolve suitable quantities of USP Furosemide RS, USP Furosemide Related Compound A RS, and USP Furosemide Related Compound B RS in *Diluting solution* to obtain a solution containing about 0.1 mg of each per mL.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Furosemide RS in *Diluting solution*, and dilute quantitatively, and stepwise if necessary, with *Diluting solution* to obtain a solution having a known concentration of about 1 mg per mL.

*Assay preparation*—Transfer an accurately measured portion of Oral Solution, equivalent to about 10 mg of furosemide, to a 10-mL volumetric flask, dissolve in and dilute with *Diluting solution* to volume, and mix.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The flow rate is about 2 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.2 for furosemide related compound B, 1.0 for furosemide, and 1.1 for furosemide related compound A; the resolution, *R*, between furosemide and furosemide related compound A is not less than 1.5; and the tailing factor for the furosemide peak is not more than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of furosemide (C<sub>12</sub>H<sub>11</sub>ClN<sub>2</sub>O<sub>5</sub>S) in the portion of Oral Solution taken by the formula:

$$10C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Furosemide RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Furosemide Tablets**

» Furosemide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of furosemide (C<sub>12</sub>H<sub>11</sub>ClN<sub>2</sub>O<sub>5</sub>S).

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**Labeling**—The labeling indicates with which *Dissolution* test the product complies. Tablets intended solely for veterinary use are so labeled.

**USP Reference standards** <11>—

USP Furosemide RS

USP Furosemide Related Compound A RS

2-Chloro-4-*N*-furfurylamino-5-sulfamoylbenzoic acid.

C<sub>12</sub>H<sub>11</sub>ClN<sub>2</sub>O<sub>5</sub>S 330.74

USP Furosemide Related Compound B RS

4-Chloro-5-sulfamoylanthranilic acid.

C<sub>7</sub>H<sub>7</sub>ClN<sub>2</sub>O<sub>4</sub>S 250.66

**Identification**—Transfer a portion of finely powdered Tablets, equivalent to about 40 mg of furosemide, to a 100-mL volumetric flask. Add 25 mL of 0.1 N sodium hydroxide, and allow to stand for 30 minutes with occasional shaking. Dilute with water to volume, and mix. Filter the solution, discarding the first 10 mL of the filtrate, and transfer 2.0 mL to a second 100-mL volumetric flask. Add 0.02 N sodium hydroxide to volume, and mix. Proceed as directed in the *Identification* test under *Furosemide Injection*, beginning with "Dissolve about 10 mg of USP Furosemide RS."

**Dissolution** <711>—

*Test 1:* If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

*Medium:* pH 5.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 60 minutes.

*Procedure*—Determine the amount of C<sub>12</sub>H<sub>11</sub>ClN<sub>2</sub>O<sub>5</sub>S dissolved from UV absorbances at the isosbestic point at 274 nm on filtered portions of the solution under test, suitably diluted with pH 5.8 phosphate buffer, in comparison with a *Standard solution* having a known concentration of USP Furosemide RS in the same *Medium*.

*Tolerances*—Not less than 80% (*Q*) of the labeled amount of C<sub>12</sub>H<sub>11</sub>ClN<sub>2</sub>O<sub>5</sub>S is dissolved in 60 minutes.

*Test 2:* If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*. Tablets labeled as intended for veterinary use comply with this test.

*Apparatus 2:* 65 rpm.

*Medium, Time, and Procedure*—Proceed as directed under *Test 1*.

*Tolerances*—Not less than 80% (*Q*) of the labeled amount of C<sub>12</sub>H<sub>11</sub>ClN<sub>2</sub>O<sub>5</sub>S is dissolved in 60 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Limit of furosemide related compound B**—[NOTE—Protect furosemide solutions from exposure to light.]

*Mobile phase, Diluting solution, System suitability solution, and Chromatographic system*—Prepare as directed in the test for *Related compounds* under *Furosemide*.

*Standard solution*—Prepare a solution in *Diluting solution* containing 8.0 µg of USP Furosemide Related Compound B RS per mL.

*Test solution*—Transfer an accurately weighed portion of finely powdered Tablets, equivalent to about 10 mg of furosemide, to a 10-mL volumetric flask, add *Diluting solution* to volume, and mix.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. The response at 254 nm obtained for any peak observed in the chromatogram of the *Test solution* at a retention time corresponding to that of the Reference Standard in the *Standard solution* is not greater than the response at 254 nm obtained for the peak in the chromatogram of the *Standard solution*, corresponding to not more than 0.8% of furosemide related compound B.

**Assay**—[NOTE—Protect furosemide solutions from exposure to light.]

*Mobile phase, Diluting solution, System suitability solution, and Chromatographic system*—Prepare as directed in the test for *Related compounds* under *Furosemide*.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Furosemide RS in *Diluting solution* to obtain a solution having a known concentration of about 1.0 mg per mL.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of furosemide, to a 50-mL volumetric flask, add 30 mL of *Diluting solution*, and sonicate for 10 minutes. Add *Diluting solution* to volume, mix, and filter, discarding the first 10 mL of the filtrate.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Using the response at 254 nm, calculate the quantity, in mg, of furosemide ( $C_{12}H_{11}ClN_2O_5S$ ) in the portion of Tablets taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Furosemide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Gabapentin

$C_9H_{17}NO_2$  171.24  
Cyclohexanecarboxylic acid, 1-(aminomethyl)-;  
1-(Aminomethyl)cyclohexanecarboxylic acid [60142-96-3].

### DEFINITION

Gabapentin contains NLT 98.0% and NMT 102.0% of gabapentin ( $C_9H_{17}NO_2$ ), calculated on the anhydrous basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** (197K)
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Diluent:** 2.32 g/L of monobasic ammonium phosphate in water. Adjust with phosphoric acid to a pH of 2.0.

**Buffer:** 0.58 g/L of monobasic ammonium phosphate and 1.83 g/L of sodium perchlorate in water. Adjust with perchloric acid to a pH of 1.8.

**Mobile phase:** Acetonitrile and *Buffer* (24:76)

**Standard solution:** 14.0 mg/mL of USP Gabapentin RS in *Diluent*

**System suitability solution:** 2.3 mg/mL of USP Gabapentin RS from the *Standard solution* in *Diluent*

**Sample solution:** 14 mg/mL of Gabapentin in *Diluent*

**Chromatographic system**  
(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Column temperature:** 40°

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL

**System suitability**

**Samples:** *Standard solution* and *System suitability solution*

**Suitability requirements**

**Column efficiency:** NLT 1900 theoretical plates for the gabapentin peak, *System suitability solution*

**Relative standard deviation:** NMT 2.0% for the gabapentin peak, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of gabapentin ( $C_9H_{17}NO_2$ ) in the portion of Gabapentin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Gabapentin RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Gabapentin in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

### IMPURITIES

- RESIDUE ON IGNITION** (281): NMT 0.1%
- HEAVY METALS**, *Method II* (231): NMT 20 ppm
- EARLY-ELUTING IMPURITIES**

**Diluent, Buffer, and Mobile phase:** Prepare as directed in the *Assay*.

**Impurities solution:** 1.4 mg/mL of USP Gabapentin Related Compound A RS and 0.84 mg/mL of USP Gabapentin Related Compound B RS in methanol

**System suitability solution:** Dissolve a suitable quantity of USP Gabapentin RS in *Diluent* in a suitable volumetric flask, and add an appropriate volume of *Impurities solution* to obtain a solution containing 14.0 mg/mL of USP Gabapentin RS, 14 µg/mL of USP Gabapentin Related Compound A RS, and 8.4 µg/mL of USP Gabapentin Related Compound B RS in *Diluent*.

**Standard solution:** 8.4 µg/mL of USP Gabapentin Related Compound E RS in *Diluent*

**Sample solution:** 14 mg/mL of Gabapentin in *Diluent*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Column temperature:** 40°

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL

**System suitability**

**Sample:** *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 2.3 between gabapentin related compound A and gabapentin related compound B

**Relative standard deviation:** NMT 2.0% for gabapentin

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of any impurity in the portion of Gabapentin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak area of any impurity from the *Sample solution*

$r_S$  = peak area of gabapentin related compound E from the *Standard solution*

$C_S$  = concentration of gabapentin related compound E in the *Standard solution* (mg/mL)

$C_U$  = concentration of Gabapentin in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Table 1*)

**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Relative Retention Time <sup>a</sup>	Relative Response Factor <sup>b</sup>	Acceptance Criteria, NMT (%)
Gabapentin related compound E <sup>c</sup>	2.9	1.0	0.10
Gabapentin related compound A <sup>d</sup>	3.5	5.3	0.1
Gabapentin related compound B <sup>e</sup>	3.8	0.35	0.06
Gabapentin	1.0	—	—
Any other individual, unidentified impurity	—	0.41	0.10

<sup>a</sup> The relative retention times are calculated based on the retention time of gabapentin.

<sup>b</sup> The relative response factors are calculated based on the response of gabapentin related compound E due to the low absorptivity of gabapentin at the monitoring wavelength (215 nm).

<sup>c</sup> Carboxymethyl-cyclohexanecarboxylic acid.

<sup>d</sup> 2-Aza-spiro[4.5]decan-3-one.

<sup>e</sup> (1-Cyano-cyclohexyl)-acetic acid.

### LATE-ELUTING IMPURITIES

**Diluent and Buffer:** Prepare as directed in the *Assay*.

**Mobile phase:** Acetonitrile, methanol, and *Buffer* (35:30:35)

**Standard solution:** 2.8 µg/mL of USP Gabapentin Related Compound D RS in *Diluent*. Initially dissolve the USP Gabapentin Related Compound D RS in a small amount of methanol, then dilute with *Diluent*.

**Sample solution:** 14 mg/mL of Gabapentin in *Diluent*

**Chromatographic system**  
(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Column temperature:** 40°

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 13,600 theoretical plates

**Relative standard deviation:** NMT 7.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

[NOTE—Disregard peaks with a relative retention time of NMT 0.35, relative to gabapentin related compound D.]

Calculate the percentage of any impurity in the portion of Gabapentin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak area of any impurity from the *Sample solution*

$r_S$  = peak area of gabapentin related compound D from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = concentration of Gabapentin in the *Sample solution* (mg/mL)

$F$  = relative response factor: gabapentin related compound D, 1; all other impurities, 0.025

**Acceptance criteria**

**Individual impurities:** NMT 0.10%

**Total impurities:** NMT 0.5% (including impurities found in *Early-Eluting Impurities*)

## SPECIFIC TESTS

### • PH <791>

**Sample solution:** 20 mg/mL in water

**Acceptance criteria:** 6.5–8.0

### • WATER DETERMINATION, *Method I* <921>: NMT 0.5%

## ADDITIONAL REQUIREMENTS

### • PACKAGING AND STORAGE: Preserve in well-closed containers. Store at room temperature.

### • USP REFERENCE STANDARDS <11>

USP Gabapentin RS

USP Gabapentin Related Compound A RS

2-Aza-spiro[4.5]decan-3-one.

$C_9H_{15}NO$  153.22

USP Gabapentin Related Compound B RS

(1-Cyano-cyclohexyl)-acetic acid.

$C_9H_{13}NO_2$  167.21

USP Gabapentin Related Compound D RS

(1-(3-Oxo-2-aza-spiro[4.5]dec-2-ylmethyl)-cyclohexyl)-acetic acid.

$C_{18}H_{29}NO_3$  307.43

Carboxymethyl-cyclohexanecarboxylic acid.

$C_9H_{14}O_4$  186.21

## Gabapentin Capsules

### DEFINITION

Gabapentin Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of gabapentin ( $C_9H_{17}NO_2$ ).

### IDENTIFICATION

#### • A. INFRARED ABSORPTION <197K>

**Sample:** Empty the contents of NLT 10 Capsules, and grind to a fine powder. Use a quantity of the powder, equivalent to 2 mg of gabapentin, and 200 mg of potassium bromide.

**Acceptance criteria:** Meet the requirements

#### • B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Diluent:** 1.2 g/L of monobasic potassium phosphate in water. Adjust with 5 N potassium hydroxide to a pH of 6.9.

**Mobile phase:** Dissolve 1.2 g of monobasic potassium phosphate in 940 mL water. Adjust with 5 N potassium hydroxide to a pH of 6.9. Add 60 mL of acetonitrile and stir.

**Standard solution:** 4.0 mg/mL of USP Gabapentin RS in *Diluent*

**Sample solution:** Nominally 4.0 mg/mL of gabapentin, from the contents of NLT 20 Capsules, equivalent to 100 mg of gabapentin, in *Diluent*. Sonication for about 60 s may be necessary to dissolve the contents.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L7

**Flow rate:** 1.2 mL/min

**Injection volume:** 50 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 7000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of gabapentin ( $C_9H_{17}NO_2$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Gabapentin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of gabapentin in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### • DISSOLUTION <711>

**Medium:** 0.06 N hydrochloric acid (prepared by adding 51 mL of hydrochloric acid to 10 L of water); 900 mL

**Apparatus 2:** 50 rpm

**Time:** 20 min

**Sample solution:** Filter a portion of the solution under test using a suitable filter of 0.45-µm pore size.

**Mobile phase:** Prepare as directed in the *Assay*.

**Standard solution:** 0.0011L mg/mL of USP Gabapentin RS in the *Medium*, where L is the label claim in mg/Capsule

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 210 nm**Column:** 4.6-mm × 25-cm; 5-μm packing L7**Flow rate:** 1.2 mL/min**Injection volume:** 100 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Column efficiency:** NLT 7000 theoretical plates**Tailing factor:** NMT 2.0**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of gabapentin (C<sub>9</sub>H<sub>17</sub>NO<sub>2</sub>) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

 $r_U$  = peak response from the *Sample solution* $r_S$  = peak response from the *Standard solution* $C_S$  = concentration of the *Standard solution* (mg/mL) $V$  = volume of the *Medium* in the dissolution vessel, 900 mL $L$  = label claim (mg/Capsule)**Tolerances:** NLT 80% (Q) of the labeled amount of gabapentin (C<sub>9</sub>H<sub>17</sub>NO<sub>2</sub>) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

**IMPURITIES**• **ORGANIC IMPURITIES****Diluent:** Prepare as directed in the *Assay*.**Solution A:** Dissolve 1.2 g of monobasic potassium phosphate in 940 mL water. Adjust with 5 N potassium hydroxide to a pH of 6.9. Add 60 mL of acetonitrile and stir.**Solution B:** Dissolve 1.2 g of monobasic potassium phosphate in 700 mL water. Adjust with 5 N potassium hydroxide to a pH of 6.9. Add 300 mL of acetonitrile and stir.**Mobile phase:** See *Table 1*.**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0.0	100	0
4.0	100	0
45.0	0	100
45.1	100	0
50.0	100	0

**Standard solution:** 0.04 mg/mL each of USP Gabapentin RS and USP Gabapentin Related Compound A RS in *Diluent***Sample solution:** Nominally 20 mg/mL of gabapentin, from the contents of NLT 20 Capsules, equivalent to 500 mg of gabapentin, in *Diluent*. Sonication for about 30 s may be necessary.**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 210 nm**Column:** 4.6-mm × 25-cm; 5-μm packing L7**Flow rate:** 1.5 mL/min**Injection volume:** 50 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 2.0 for the gabapentin peak**Relative standard deviation:** NMT 5.0% for gabapentin and gabapentin related compound A**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of gabapentin related compound A in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response for gabapentin related compound A from the *Sample solution* $r_S$  = peak response for gabapentin related compound A from the *Standard solution* $C_S$  = concentration of USP Gabapentin Related Compound A RS in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of gabapentin in the *Sample solution* (mg/mL)

Calculate the percentage of any other unspecified degradation product, relative to gabapentin content, in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response for each unspecified impurity from the *Sample solution* $r_S$  = peak response for gabapentin from the *Standard solution* $C_S$  = concentration of USP Gabapentin RS in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of gabapentin in the *Sample solution* (mg/mL)**Acceptance criteria****Gabapentin related compound A:** NMT 0.4%**Any individual unspecified impurity:** NMT 0.1%**Total impurities:** NMT 1.0%**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.

• **USP REFERENCE STANDARDS** (11)

USP Gabapentin RS

USP Gabapentin Related Compound A RS

2-Aza-spiro[4.5]decan-3-one.

C<sub>9</sub>H<sub>15</sub>NO 153.22**Gabapentin Tablets****DEFINITION**Gabapentin Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of gabapentin (C<sub>9</sub>H<sub>17</sub>NO<sub>2</sub>).**IDENTIFICATION**• **A.  $C_U$  = nominal concentration of gabapentin in the *Sample solution* (mg/mL)

**Acceptance criteria**

**Gabapentin related compound A:** NMT 0.4%  
**Any individual unspecified impurity:** NMT 0.1%  
**Total impurities:** NMT 1.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** (11)  
 USP Gabapentin RS  
 USP Gabapentin Related Compound A RS  
 2-Aza-spiro[4.5]decan-3-one.  
 $C_9H_{15}NO$  153.22

**Gadodiamide**

$C_{16}H_{26}GdN_5O_8$  573.66  
 [5,8-Bis(carboxymethyl)-11-[2-(methylamino)-2-oxoethyl]-3-oxo-2,5,8,11-tetraazatridecan-13-oato(3-)]gadolinium.  
 [N,N-Bis[2-[(carboxymethyl)](methylcarbamoyl)methyl]-amino]ethyl]glycinato(3-)]gadolinium [131410-48-5].

» Gadodiamide contains not less than 97.0 percent and not more than 103.0 percent of  $C_{16}H_{26}GdN_5O_8$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** (11)—

- USP Gadodiamide RS  
 USP Gadodiamide Related Compound A RS  
 Gadolinium sodium diethylenetriamine pentaacetic acid monomethylamide.  
 $C_{15}H_{22}GdN_4NaO_9$  582.60  
 USP Gadodiamide Related Compound B RS  
 Gadolinium disodium diethylenetriamine pentaacetic acid.  
 $C_{14}H_{18}GdN_3Na_2O_{10}$  591.54  
 USP Endotoxin RS

**Clarity of solution**—*Reference solution*—

**REFERENCE SOLUTION A**—Transfer 1.0 g of hydrazine sulfate to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 4 to 6 hours. [Caution—Hydrazine sulfate is highly toxic. Avoid skin contact.]

**REFERENCE SOLUTION B**—Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25 mL of water, and mix to dissolve.

**PRIMARY OPALESCENT MIXTURE**—To the flask containing *Reference solution B*, add 25.0 mL of *Reference solution A*, mix, and allow to stand for 24 hours. [NOTE—The suspension is stable for 2 months. Mix before use, and do not use if it adheres to the container.]

**OPALESCENCE STANDARD**—Dilute 15.0 mL of the *Primary opalescent mixture* with water to 1000.0 mL, and mix. This standard must be freshly prepared.

**PROCEDURE**—Transfer 10.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 40 mL of this solution (*Reference solution*) to a 50-mL color comparison tube.

**Test solution**—Transfer an accurately weighed quantity of Gadodiamide, equivalent to about 15 g of anhydrous gadodiamide, to a 50-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Transfer 40 mL of this solution to a 50-mL color comparison tube.

**Blank**—Transfer 40 mL of water to a 50-mL color comparison tube.

**Procedure**—Five minutes after preparation of the *Reference solution*, view the *Reference solution*, the *Test solution*, and the *Blank* against a black background: the *Test solution* is not more opalescent than the *Reference solution*. [NOTE—If the *Test solution* is more opalescent than the *Reference solution*, heat the *Test solution* to 60° to 70° for 2 to 3 minutes, cool to room temperature, and view again.]

**Identification**—

**A: Infrared Absorption** (197K).

**B:** It exhibits the maximum absorption at the relevant wavelength specified when tested as directed under the test for *Content of gadolinium*.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—The total aerobic microbial count is not more than 500 cfu per g. The total combined molds and yeasts count is not more than 50 cfu per g.

**Bacterial endotoxins** (85)—It contains not more than 3.5 USP Endotoxin Units per g.

**Water, Method I** (921): between 3.0% and 14.0%.

**Limit of free gadolinium (III)**—

**Arsenazo III indicator**—Transfer 150 mg of arsenazo III disodium to a 100-mL volumetric flask, dilute with water to volume, and mix.

**MES buffer**—Transfer 48.8 g of 2-(N-morpholino)ethanesulfonic acid (MES) to a 250-mL volumetric flask. Add 180 mL of water and 25 mL of 2 N sodium hydroxide, and mix. Adjust with 2 N sodium hydroxide to a pH of 6.0, dilute with water to volume, and mix.

**Edetate disodium titrant**—Pipet 100 mL of 0.02 M edetate disodium VS into a 1000-mL volumetric flask, dilute with water to volume, and mix.

**Test solution**—Transfer about 1 g of Gadodiamide, accurately weighed, to a 125-mL conical flask, add 25 mL of *MES buffer* and 0.1 mL of *Arsenazo III indicator*, and mix. A turquoise color indicates the presence of excess gadolinium.

**Procedure**—Titrate the *Test solution* with *Edetate disodium titrant* to a violet-pink endpoint. Each mL of *Edetate disodium titrant* is equivalent to 0.3145 mg of excess gadolinium: not more than 0.3% of free gadolinium is found, calculated on the anhydrous basis.

**Limit of free diethylenetriamine pentaacetic acid bis-methylamide**—

**Arsenazo III indicator and MES buffer**—Proceed as directed for *Limit of free gadolinium (III)*.

**0.002 M gadolinium (III) titrant**—Transfer 18.6 g of gadolinium chloride to a 1000-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix. Pipet 10 mL of this solution into a conical flask, and add 25 mL of *MES buffer* and 0.1 mL of *Arsenazo III indicator*. Titrate with 0.02 M edetate disodium VS to a violet-pink endpoint, and determine the molarity. Pipet 40 mL of this solution into a 1000-mL volumetric flask, dilute with water to volume, and mix.

**Blank solution**—Transfer 25 mL of *MES buffer* and 0.1 mL of *Arsenazo III indicator* into a suitable flask, and mix.

**Test solution**—Transfer about 1 g of Gadodiamide, accurately weighed, to a 125-mL conical flask. Add 25 mL of MES buffer and 0.1 mL of Arsenazo III indicator, and mix. A violet-pink color indicates the presence of excess diethylenetriamine pentaacetic acid bismethylamide.

**Procedure**—Concomitantly titrate the *Blank solution* and the *Test solution* with 0.002 M gadolinium (III) titrant to a turquoise endpoint. Calculate the percentage of free diethylenetriamine pentaacetic acid bismethylamide in the portion of Gadodiamide taken by the formula:

$$100(V_U - V_B) M_T (419.43) / W$$

in which  $V_U$  is the volume of gadolinium (III) in the *Test solution*;  $V_B$  is the volume of gadolinium (III) in the *Blank solution*;  $M_T$  is the molarity of the 0.002 M gadolinium (III) titrant; 419.43 is the molecular weight of diethylenetriamine pentaacetic acid bismethylamide; and  $W$  is the weight, in mg, of Gadodiamide taken to prepare the *Test solution*: not more than 0.7% of diethylenetriamine pentaacetic acid bismethylamide is found, calculated on the anhydrous basis.

#### Limit of methylamine—

**Borate buffer**—Transfer 12.4 g of boric acid to a 500-mL volumetric flask, and suspend it in 300 mL of water. Add 100 mL of 1 N potassium hydroxide, and mix. Adjust with 1 N potassium hydroxide to a pH of 10.0, dilute with water to volume, and mix. Store in a closed plastic container.

**OPA reagent**—Transfer 100 mg of o-phthalaldehyde to an amber bottle, add 3 mL of methanol, and mix. Add 220 mL of Borate buffer and 0.1 mL of mercaptoethanol, and mix. [NOTE—This solution must be freshly prepared.]

**Standard solutions**—Transfer about 110 mg of methylamine hydrochloride, accurately weighed, to a 500-mL volumetric flask, and dilute with water to volume to obtain a solution having a concentration of about 100 µg of methylamine per mL. Pipet 1, 5, 10, and 20 mL of this solution into separate 100-mL volumetric flasks, dilute the contents of each flask with water to volume, and mix.

**Test solution**—Transfer about 1.5 g of Gadodiamide, accurately weighed, to a 10-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Proceed as follows for each of the *Standard solutions*. Add 3.0 mL of OPA reagent, mix, and within 1 minute measure the absorbance at 335 nm. Compare to a blank consisting of 3.0 mL of water and 3.0 mL of OPA reagent. Plot a calibration curve of absorbance versus standard concentration, in µg of methylamine per mL. Mix 3.0 mL of the *Test solution* with 3.0 mL of OPA reagent, and proceed as directed above. [NOTE—If the absorbance obtained with the *Test solution* exceeds the absorbance of the highest *Standard solution*, perform an additional quantitative dilution of the *Test solution*, and repeat the analysis.] Determine the concentration, in µg per mL, of methylamine in the *Test solution* by interpolation from the calibration curve. Calculate the amount of methylamine in the portion of Gadodiamide taken: not more than 0.05% of methylamine is found.

#### Limit of acetone, ethyl alcohol, and isopropyl alcohol—

**Internal standard solution**—Transfer about 500 mg of methyl ethyl ketone to a 100-mL volumetric flask, dilute with water to volume, and mix. Pipet 5 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix.

**Stock solution**—Transfer about 1000 mg each of acetone, ethyl alcohol, and isopropyl alcohol, accurately weighed, to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Diluted stock solution A**—Pipet 5 mL of the *Stock solution* into a 100-mL volumetric flask, dilute with water to volume, and mix.

**Diluted stock solution B**—Pipet 10 mL of the *Stock solution* into a 100-mL volumetric flask, dilute with water to volume, and mix.

**System suitability solution**—Pipet 10 mL of the *Internal standard solution* and 15 mL of *Diluted stock solution A* into a 100-mL volumetric flask, dilute with water to volume, and mix.

**Test solution 1**—Pipet 10 mL of the *Internal standard solution* into a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 7.0 mL of this solution to a 10-mL gas chromatographic headspace vial, add about 1300 mg of Gadodiamide, accurately weighed, and cap immediately. Swirl to dissolve.

**Test solution 2**—Pipet 10 mL of the *Internal standard solution* and 2.5 mL of *Diluted stock solution A* into a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 7.0 mL of this solution to a 10-mL gas chromatographic headspace vial, add about 1300 mg of Gadodiamide, accurately weighed, and cap immediately. Swirl to dissolve.

**Test solution 3**—Pipet 10 mL of the *Internal standard solution* and 15 mL of *Diluted stock solution A* into a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 7.0 mL of this solution to a 10-mL gas chromatographic headspace vial, add about 1300 mg of Gadodiamide, accurately weighed, and cap immediately. Swirl to dissolve.

**Test solution 4**—Pipet 10 mL of the *Internal standard solution* and 25 mL of *Diluted stock solution B* into a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 7.0 mL of this solution to a 10-mL gas chromatographic headspace vial, add about 1300 mg of Gadodiamide, accurately weighed, and cap immediately. Swirl to dissolve.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm × 30-m capillary column coated with a 1.8-µm phase G43. The column temperature is maintained at 40°. Helium is used as the carrier gas at a flow rate of about 1.5 mL per minute, and the split ratio is 1:15. The injection port and detector block are maintained at about 250°. Chromatograph the *System suitability solution* as directed for *Procedure*: the order of elution is ethyl alcohol, acetone, isopropyl alcohol, and methyl ethyl ketone; the resolution,  $R$ , between the ethyl alcohol and acetone peaks is not less than 1.0 and between the acetone and isopropyl alcohol peaks is not less than 1.0; and the relative standard deviation is not more than 3.0% for each of the three analytes.

**Procedure**—Separately inject equal volumes (about 1 µL) of each of the four *Test solutions* into the chromatograph, record the chromatograms, and measure the areas for the major peaks relative to the area for the internal standard peak. Plot the responses of the *Test solutions* versus the content, in µg per mL, of the relevant analyte in each vial, draw the straight line best fitting the four points, and calculate the correlation coefficient for the line. A suitable system is one that yields a line having a correlation coefficient of not less than 0.99. Calculate the percentage of each analyte in the portion of Gadodiamide taken by the formula:

$$a/(10,000b)$$

in which  $a$  is the intercept and  $b$  is the slope of the straight line, evaluated by linear regression analysis. [NOTE—If  $a$  is negative, report the result as none detected.] Not more than 0.2% of acetone, ethyl alcohol, and isopropyl alcohol is found, calculated on the anhydrous basis; and the sum of all three analytes is not more than 0.2%, calculated on the anhydrous basis.

**Related compounds—**

*Mobile phase*—Prepare as directed in the Assay.

*Postcolumn reagent*—Dissolve 120 mg of arsenazo III acid in 400 mL of water previously acidified with 6.3 mL of nitric acid. Add 650 mg of urea, and mix to dissolve. Pass the solution through a 0.45- $\mu$ m porosity filter, washing the filter with 600 mL of water. Dilute with water to 1000 mL, mix, and degas.

*System suitability solution*—Prepare an aqueous solution containing about 0.01 mg of USP Gadodiamide Related Compound A RS, 0.01 mg of USP Gadodiamide Related Compound B RS, and 2 mg of USP Gadodiamide RS in each mL.

*Test solution*—Transfer about 200 mg of Gadodiamide, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* <621>)—Proceed as directed in the Assay, except to use the *Postcolumn reagent* prepared as directed above. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the gadodiamide and gadodiamide related compound A peaks is not less than 1.0, and between gadodiamide related compound A and gadodiamide related compound B peaks is not less than 1.5; and the relative standard deviation for replicate injections is not more than 10%.

*Procedure*—Inject about 10  $\mu$ L of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. [NOTE—The tail of the gadodiamide peak may contain a small shoulder due to an isomer; the area of the shoulder should be included in the gadodiamide peak area.] Calculate the percentage of each impurity in the portion of Gadodiamide taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the response of each impurity; and  $r_s$  is the sum of all peaks having a percentage greater than 0.10%: not more than 2.0% of gadodiamide related compounds A and B is found; no individual impurity is more than 0.2%; and the sum of all impurities, other than gadodiamide related compounds A and B, is not more than 0.5%.

**Content of gadolinium—**

*Standard solutions*—Prepare three separate solutions in 0.2 M nitric acid to obtain concentrations of 100, 150, and 200  $\mu$ g of gadolinium per mL.

*Test solution*—Transfer about 600 mg of Gadodiamide, accurately weighed, to a 100-mL volumetric flask, dilute with water to volume, and mix. Pipet 10 mL of this solution into a 100-mL volumetric flask, dilute with 0.2 M nitric acid to volume, and mix.

*Procedure*—Concomitantly determine the absorbances of the *Standard solutions* and the *Test solution* at the gadolinium resonance line of 342.3 nm with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* <851>), using 0.2 M nitric acid as the blank. Plot the absorbances of the *Standard solutions* versus concentration, in  $\mu$ g per mL, of gadolinium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, in  $\mu$ g per mL, of gadolinium in the *Test solution*: the content of gadolinium is between 26.0% and 29.0%, calculated on the anhydrous basis.

**Assay—**

*Mobile phase*—Transfer 14.0 mL of triethylamine, 5.7 mL of glacial acetic acid, and 5.7 mL of water to a 1000-mL volumetric flask, dilute with water to volume, and mix. Transfer 50 mL of this solution to a 1000-mL volumetric flask, add 900 mL of water, and mix. Adjust with 1 N acetic acid or 1 N sodium hydroxide to a pH between 6.5 and 7.0. Dilute with water to volume, mix, filter, and degas (see *System Suitability* under *Chromatography* <621>).

*Postcolumn reagent*—Dissolve 325 mg of urea in a solution of 60 mg of arsenazo III acid in 550 mL of water previously acidified with 3.2 mL of nitric acid. Pass the solution through a 0.45- $\mu$ m porosity filter, wash the filter with 400 mL of water, dilute with water to 1000 mL, mix, and degas.

*Standard preparation*—Prepare an aqueous solution of USP Gadodiamide RS having a known concentration of about 0.6 mg per mL.

*Assay preparation*—Transfer about 60 mg of Gadodiamide, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 658-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m base-deactivated packing L1. A second pump mixes the *Mobile phase* with the *Postcolumn reagent* prior to detection via a T-junction. The system is maintained at a constant temperature between 20° and 35°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.5%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{16}H_{26}GdN_5O_8$  in the portion of Gadodiamide taken by the formula:

$$100C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Gadodiamide RS in the *Standard preparation*; and  $r_u$  and  $r_s$  are the gadodiamide peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Gadodiamide Injection

**DEFINITION**

Gadodiamide Injection is a sterile solution of Gadodiamide in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of gadodiamide ( $C_{16}H_{26}GdN_5O_8$ ). It may contain stabilizers and buffers. Gadodiamide Injection intended for intravascular use contains no antimicrobial agents.

**IDENTIFICATION**

- A. ULTRAVIOLET ABSORPTION (197U)**

Wavelength range: 240–300 nm

Solution: 57 mg/mL of gadodiamide in water

- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY**

- PROCEDURE**

**Solution A:** Dissolve 14 mL of triethylamine and 5.7 mL of glacial acetic acid in 1 L of water.

**Mobile phase:** Transfer 50 mL of *Solution A* to a 1-L volumetric flask. Add 900 mL of water. Adjust with 1 N acetic acid or 1 N sodium hydroxide to a pH between 6.5 and 7.0. Dilute with water to volume.

**Postcolumn reagent:** Dissolve 325 mg of urea in a solution of 60 mg of arsenazo III acid in 550 mL of water previously acidified with 3.2 mL of nitric acid. Pass the solution through a filter of 0.45- $\mu$ m pore size, wash the filter with 400 mL of water, and dilute with water to 1000 mL.

**Standard solution:** 0.18 mg/mL of USP Gadodiamide RS

**Sample solution:** Equivalent to a nominal concentration of 0.18 mg/mL of gadodiamide from Injection

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** Vis 658 nm

**Column:** 4.6-mm × 25-cm; 5-μm base-deactivated packing L1. [NOTE—A second pump mixes the *Mobile phase* with the *Postcolumn reagent* prior to detection via a T-junction.]

**Column temperature:** 20°–35° (system maintained at constant temperature)

**Flow rate:** 1.5 mL/min

**Injection volume:** 10 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Relative standard deviation:** NMT 2.5%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of gadodiamide

(C<sub>16</sub>H<sub>26</sub>GdN<sub>5</sub>O<sub>8</sub>) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of gadodiamide from the *Sample solution*

$r_S$  = peak response of gadodiamide from the *Standard solution*

$C_S$  = concentration of USP Gadodiamide RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of gadodiamide in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### IMPURITIES

##### • ORGANIC IMPURITIES

**Solution A, Mobile phase, and Chromatographic system:** Prepare as directed in the *Assay*.

**Postcolumn reagent:** Dissolve 120 mg of arsenazo III acid in 400 mL of water previously acidified with 6.3 mL of nitric acid. Add 650 mg of urea, and mix to dissolve. Pass the solution through a filter of 0.45-μm pore size, washing the filter with 600 mL of water. Dilute with water to 1000 mL.

**System suitability solution:** 10 μg/mL of USP Gadodiamide Related Compound A RS, 10 μg/mL of USP Gadodiamide Related Compound B RS, and 2 mg/mL of USP Gadodiamide RS in an aqueous solution

**Sample solution:** Equivalent to a nominal concentration of 2 mg/mL of gadodiamide from Injection

#### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 1.0 between the gadodiamide and gadodiamide related compound A peaks; NLT 1.5 between gadodiamide related compound A and gadodiamide related compound B peaks

**Relative standard deviation:** NMT 10%

[NOTE—The tail of the gadodiamide peak may contain a small shoulder due to an isomer. The area of the shoulder should be included in the gadodiamide peak area.]

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the volume of Injection taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each impurity

$r_T$  = sum of all peaks having a percentage greater than 0.10%

**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Acceptance Criteria, NMT (%)
Gadodiamide related compound A	2.0
Gadodiamide related compound B	2.0
Any other individual impurity	0.2
Total impurities (sum of all impurities other than gadodiamide related compounds A and B)	0.5

#### SPECIFIC TESTS

• **OSMOLALITY AND OSMOLARITY, Osmolality <785>:** 650–1000 mOsm/kg

• **PH <791>:** 5.5–7.0

• **BACTERIAL ENDOTOXINS TEST <85>:** NMT 0.029 USP Endotoxin Unit/mg of gadodiamide

• **INJECTIONS <1>:** Meets the requirements

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose plastic or Type I glass containers. Store at controlled room temperature, protected from light. Do not freeze.

• **LABELING:** Label containers of Injection to direct the user to discard any unused portion. Label it to state its routes of administration. Label it to indicate “serious injury can occur if given by intrathecal route.”

• **USP REFERENCE STANDARDS <11>**

USP Endotoxin RS

USP Gadodiamide RS

USP Gadodiamide Related Compound A RS

Gadolinium sodium diethylenetriamine pentaacetic acid monomethylamide.

C<sub>15</sub>H<sub>22</sub>GdN<sub>4</sub>NaO<sub>9</sub> 582.60

USP Gadodiamide Related Compound B RS

Gadolinium disodium diethylenetriamine pentaacetic acid.

C<sub>14</sub>H<sub>18</sub>GdN<sub>3</sub>Na<sub>2</sub>O<sub>10</sub> 591.54

## Gadopentetate Dimeglumine Injection

» Gadopentetate Dimeglumine Injection is a sterile solution of gadopentetate dimeglumine in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of gadopentetate dimeglumine (C<sub>14</sub>H<sub>20</sub>GdN<sub>3</sub>O<sub>10</sub> · 2C<sub>7</sub>H<sub>17</sub>NO<sub>5</sub>). It may contain small amounts of Meglumine and Pentetic Acid as stabilizers, and it may contain suitable buffers. Gadopentetate Dimeglumine Injection intended for intravascular use contains no antimicrobial agents.

**Packaging and storage—**Preserve in single-dose containers, preferably of Type I glass, protected from light. Store at controlled room temperature.

**Labeling**—Label containers of Injection intended for intravascular injection to direct the user to discard any unused portion remaining in the container.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Gadopentetate Monomeglumine RS

**Identification**—

**A:** *Ultraviolet Absorption* (197U)—

**Solutions:** 74 mg of USP Gadopentetate Monomeglumine RS per mL, and 94 mg of Gadopentetate Dimeglumine per mL.

**Medium:** water.

**B:** Dilute a volume of Injection with water to obtain a test solution having a concentration of 35 mg per mL. Separately apply 10  $\mu$ L of this solution and 10  $\mu$ L of a Standard solution containing 28 mg of USP Gadopentetate Monomeglumine RS per mL in a meglumine solution (0.075 in 1000) to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of 1,4-dioxane, water, and ammonium hydroxide (70:30:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Dip the plate in a detection reagent prepared by mixing 100 mg of ninhydrin and 250 mg of cadmium acetate with 1.0 mL of glacial acetic acid and diluting with alcohol to 50 mL. Heat the plate at 120° for 10 minutes, and locate the spots by examining the plate in daylight: the principal spot obtained from the test solution corresponds in appearance and  $R_f$  value to the principal spot obtained from the Standard solution (presence of meglumine).

**C:** Prepare the test solution and Standard solution as directed for *Identification* test A. Transfer 500 mL of 1 N sulfuric acid at 0° to a 1000-mL conical flask, immerse in an ice bath, and add 50 g of ceric sulfate tetrahydrate. Mix until dissolved, filter, and refrigerate (*Stock solution A*). Transfer 325 mL of 2 N sulfuric acid at 0° to a 500-mL volumetric flask. To 25 g of sodium arsenite, add 150 mL of 1 N sodium hydroxide, mix, and add in small portions to the sulfuric acid. Dilute with water to volume, and refrigerate (*Stock solution B*). Just prior to use, prepare a spray reagent by mixing equal volumes of *Stock solution A* and *Stock solution B* at a temperature not lower than 10°. [NOTE—Use the spray reagent within five minutes.] Proceed as directed under *Thin-layer Chromatographic Identification Test* (201), except to spray the plate first with the spray reagent and then with a 1% solution of 1,2-phenylenediamine in acetone. Locate the spots by examining the plate in daylight: the principal spot obtained from the test solution corresponds in appearance and  $R_f$  value to the principal spot obtained from the Standard solution (presence of gadopentetate).

**Bacterial endotoxins** (85)—It contains not more than 25 USP Endotoxin Units per mL of Injection.

**pH** (791): between 6.5 and 8.0.

**Heavy metals** (231)—

**Standard preparation**—Proceed as directed in the test for Heavy metals under *Diatrizoate Meglumine*.

**Test preparation**—In a 50-mL color-comparison tube, mix a volume of Injection, equivalent to 1.0 g of gadopentetate dimeglumine, with 5 mL of 1 N sodium hydroxide, dilute with water to 40 mL, and mix.

**Procedure**—Proceed as directed for *Procedure* in the test for Heavy metals under *Diatrizoate Meglumine*: the limit is 0.002%.

**Meglumine content**—Proceed as directed in the test for *Meglumine content* under *Diatrizoate Meglumine Injection*. The meglumine content is between 37.4% and 45.8% of the labeled amount of gadopentetate dimeglumine.

**Content of gadolinium**—

**Cesium chloride solution**—Dissolve 10.0 g of cesium chloride in 100.0 mL of water, and mix.

**Blank solution**—Transfer 10.0 mL of *Cesium chloride solution* and 1.0 mL of hydrochloric acid (spectrophotometric grade) to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Standard solutions**—Transfer about 1.153 g of gadolinium (III) oxide, accurately weighed, to a 100-mL volumetric flask, add 2.0 mL of hydrochloric acid to dissolve, dilute with water to volume, and mix. Transfer 3.0, 4.0, and 5.0 mL of this stock solution to separate 50-mL volumetric flasks, and to each flask add 5.0 mL of *Cesium chloride solution* and 0.5 mL of hydrochloric acid (spectrophotometric grade). Dilute the contents of each flask with water to volume, and mix. These *Standard solutions* contain, respectively, 600, 800, and 1000  $\mu$ g of gadolinium per mL.

**Test solution**—Treat an accurately measured volume of Injection, equivalent to about 469 mg of gadopentetate dimeglumine, with 0.2 mL of nitric acid in a porcelain crucible, concentrate on a hot plate, char with a burner, and ignite in a muffle furnace at 800° until all black particles disappear (approximately 1 hour). Allow the residue to cool on a refractory surface for about 5 minutes, then equilibrate to room temperature in a desiccator. Dissolve the white residue so obtained in a mixture of 1.0 mL of water and 1.0 mL of hydrochloric acid (spectrophotometric grade) with heating. Transfer this solution to a 100-mL volumetric flask, add 10.0 mL of *Cesium chloride solution*, dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard solutions* and the *Test solution* at the gadolinium emission line at 368.4 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-scattering* (851)) equipped with a gadolinium hollow-cathode lamp and a nitrous oxide-acetylene flame, using the *Blank solution* as the blank. Plot the absorbances of the *Standard solutions* versus their concentrations, in  $\mu$ g per mL, of gadolinium, and draw the straight line best fitting the three plotted points. From the graph so obtained and the absorbance of the *Test solution*, determine the concentration, in  $\mu$ g per mL, of gadolinium in the *Test solution*. Calculate the quantity, in  $\mu$ g, of gadolinium in each mL of the Injection taken by the formula:

$$100C/V$$

in which C is the concentration, in  $\mu$ g per mL, of gadolinium in the *Test solution*; and V is the volume, in mL, of Injection taken. The gadolinium content is between 15.1% and 18.4% of the labeled amount of gadopentetate dimeglumine.

**Content of pentetic acid**—

**Stock solution A**—Transfer about 50 g of sodium acetate and 10 mL of glacial acetic acid to a 1000-mL volumetric flask, and dilute with degassed water to volume. Adjust with 0.1 N sodium hydroxide or glacial acetic acid to a pH of 5.

**Stock solution B**—Transfer about 50.8 mg of xylenol orange to a 100-mL volumetric flask, and add degassed water to volume.

**Diluting solution**—Transfer 30 mL of *Stock Solution A* and 3 mL of *Stock Solution B* to a 200-mL volumetric flask, and dilute with degassed water to volume.

**Procedure**—Transfer an accurately measured volume of Injection, equivalent to about 938 mg of gadopentetate dimeglumine, to a suitable container, add 20 mL of water and 10 mL of *Diluting solution*, and mix. Adjust with 0.1 N sodium hydroxide or glacial acetic acid to a pH of 5. Titrate with 0.001 M gadolinium sulfate solution until the color changes from yellow to reddish violet. Each mL of 0.001 M gadolinium sulfate consumed is equivalent to 0.7867 mg of pentetic acid ( $C_{14}H_{23}N_3O_{10}$ ). The pentetic acid content is between 0.027% and 0.04%.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay—**

**Mobile phase**—Prepare a filtered and degassed mixture containing about 1.37 g of tetrabutylammonium perchlorate in a mixture of acetonitrile and water (120:880). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Transfer about 46.43 mg of USP Gadopentetate monomeglumine RS, accurately weighed, to a 25-mL volumetric flask containing 12.5 mL of 0.1% meglumine solution. Dilute with water to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 469 mg of gadopentetate dimeglumine, to a 200-mL volumetric flask. Dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 195-nm detector and a 4.6-mm × 12.5-cm column that contains 5-μm packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency is not less than 800 theoretical plates, the tailing factor is not more than 3.5, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{14}H_{20}GdN_3O_{10} \cdot 2C_7H_{17}NO_5$  in the portion of Injection taken by the formula:

$$(938.02 / 742.80)(200C)(R_U / R_S)$$

in which 938.02 and 742.80 are the molecular weights of gadopentetate dimeglumine and gadopentetate monomeglumine, respectively; C is the concentration, in mg per mL, of USP Gadopentetate Monomeglumine RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Gadoteridol

$C_{17}H_{29}GdN_4O_7$  558.68

Gadolinium, [10-(2-hydroxypropyl)-1,4,7,10-tetraazacyclododecane-1,4,7-triacetato(3-)- $N^1, N^4, N^7, N^{10}, O^1, O^4, O^7, O^{10}$ ].

(±)-[10-(2-Hydroxypropyl)-1,4,7,10-tetraazacyclododecane-1,4,7-triacetato(3-)]gadolinium [120066-54-8].

» Gadoteridol contains not less than 97.0 percent and not more than 101.0 percent of  $C_{17}H_{29}GdN_4O_7$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Gadoteridol RS

USP Gadoteridol Related Compound A RS

10-(2-hydroxypropyl)-1,4,7,10-tetraazacyclododecane-1,4,7-triacetic acid.

$C_{17}H_{32}N_4O_7$  404.46

USP Gadoteridol Related Compound B RS

1,4,7,10-tetraazacyclododecane-1,4,7-triacetic acid gadolinium salt.

USP Gadoteridol Related Compound C RS

1,4,7,10-tetraaza-11-oxo-bicyclo[8.2.2]tetradecane-4,7-diacetic acid.

**Identification—**

**A: Infrared Absorption** (197K).

**B: Ultraviolet Absorption** (197U)—

*Solution:* 10 mg per mL.

*Medium:* water.

**Water, Method I** (921): not more than 15%.

**Heavy metals, Method II** (231): not more than 0.001%.

**Limit of gadoteridol related compound A—**

**Buffer solution**—Dissolve 0.60 g of tromethamine and 3.72 g of edetate disodium in 3 L of water, adjust with 5 N sodium hydroxide to a pH of 7.0, dilute with water to 4 L, and mix. Filter, and chill between 5° and 8°.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution*, acetonitrile, and tetrahydrofuran (98.8:1.0:0.2). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Cupric acetate solution**—Transfer 3.99 g of cupric acetate and 12.11 g of tromethamine to a 2-L volumetric flask, dissolve in 1500 mL of water, adjust with glacial acetic acid to a pH of 7.0, dilute with water to volume, and mix. Filter, and chill between 5° and 8°.

**Standard stock solution**—Dissolve an accurately weighed quantity of USP Gadoteridol Related Compound A RS in *Buffer solution*, and dilute quantitatively and stepwise with *Buffer solution* to obtain a solution having a known concentration of about 6 μg per mL.

**Standard solution**—Just prior to injection onto the column, dilute 1.0 mL of the *Standard stock solution* with 1.0 mL of *Cupric acetate solution* to obtain a solution having a known concentration of about 3 μg of USP Gadoteridol Related Compound A RS per mL. [NOTE—The copper–gadoteridol related compound A complex is stable for at least 2 hours, if maintained at about 5°.]

**Test solution**—Transfer about 30 mg of Gadoteridol, accurately weighed, to a test tube, add 1.0 mL of *Buffer solution*, and mix on a vortex mixer to dissolve. Add 1.0 mL of *Cupric acetate solution*, and mix. Immediately inject the solution into the chromatograph. [NOTE—The copper–gadoteridol related compound A complex is stable for at least 2 hours, if maintained at about 5°.]

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.0-mm × 15-cm column that contains packing L21. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for gadoteridol related compound A and 2.0 for copper–edetate; the resolution,  $R$ , between gadoteridol related compound A and copper–edetate is not less than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of gadoteridol related compound A in the portion of Gadoteridol taken by the formula:

$$100(C / W)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Gadoteridol Related Compound A RS in the *Standard stock*

solution;  $W$  is the weight, in mg, of Gadoteridol taken to prepare the *Test solution*; and  $r_U$  and  $r_S$  are the gadoteridol related compound A peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.01% is found, calculated on the anhydrous basis.

#### Limit of free gadolinium (III)—

*Buffer solution, Mobile phase, Diluent, Standard stock solution 1, Standard stock solution 2, Standard solution, and Chromatographic system*—Proceed as directed for *Chromatographic purity, Test 1*.

*Test solution*—Transfer about 60 mg of Gadoteridol, accurately weighed, to a vial, add 2.0 mL of *Diluent*, and mix. Immediately place the vial in a bath maintained at about 5°.

*Procedure*—Proceed as directed for *Procedure under Chromatographic purity, Test 1*. Calculate the percentage of free gadolinium (III) in the portion of Gadoteridol taken by the formula:

$$200(157.25 / 334.38)(C / W)(r_U / r_S)$$

in which 157.25 is the molecular weight of gadolinium and 334.38 is the molecular weight of gadolinium acetate;  $C$  is the concentration, in mg per mL, of gadolinium acetate, calculated on the anhydrous basis, in the *Standard solution*;  $W$  is the weight, in mg, of Gadoteridol taken to prepare the *Test solution*; and  $r_U$  and  $r_S$  are the free gadolinium (III) peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.01% is found.

**Limit of regioisomer**—Using the chromatogram of the *Assay preparation* as obtained in the *Assay*, calculate the percentage of regioisomer peak at a relative retention time of about 1.2 in relation to that of the gadoteridol peak by the formula:

$$100r_R / (r_R + r_G)$$

in which  $r_R$  and  $r_G$  are the regioisomer and gadoteridol peak responses, respectively, in the *Assay preparation*: not more than 2.5% is found.

#### Chromatographic purity—

##### TEST 1: GADOLINIUM-CONTAINING IMPURITIES—

*Buffer solution*—Dissolve 10.2 g of monobasic potassium phosphate, 0.165 g of dibasic potassium phosphate, and 1.76 g of edetate disodium in 3000 mL of water, and filter.

*Mobile phase*—Prepare a degassed mixture of *Buffer solution* and acetonitrile (98:2). Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

*Diluent*—Transfer 3.40 g of monobasic potassium phosphate, 4.21 g of dibasic potassium phosphate, and 0.584 g of edetate disodium to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

*Standard stock solution 1*—Quantitatively dissolve an accurately weighed quantity of gadolinium (Gd III) acetate in water to obtain a solution having a concentration of about 0.4 mg per mL.

*Standard stock solution 2*—Prepare a solution of USP Gadoteridol Related Compound B RS in water to obtain a solution having a known concentration of about 0.6 mg per mL.

*Standard solution*—Transfer 1.0 mL of *Standard stock solution 1* and 2.0 mL of *Standard stock solution 2* to a 10-mL volumetric flask, and dilute with *Diluent* to volume. Transfer 1.0 mL of this solution to a vial, add 3.0 mL of *Diluent*, and mix.

*Test solution*—Transfer about 60 mg of Gadoteridol, accurately weighed, to a vial, add 2.0 mL of *Diluent*, and mix. Immediately place the vial in a bath maintained at about 5°.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a fluorometric detector operating at an excitation wavelength of 275 nm and an emission wavelength of 314 nm, and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is

about 1 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for free gadolinium (III), 1.6 for 1,4,7,10-tetraazacyclododecane-1,4,7,10-tetraacetic acid gadolinium sodium salt (gadoteridol related compound D), and 2.2 for gadoteridol related compound B; and the relative standard deviation for replicate injections is not more than 5.0%.

*Procedure*—Separately inject equal volumes (about 50 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Allow the *Test solution* to elute for not less than 1.3 times the retention time of the gadoteridol peak. Calculate the percentage of gadoteridol related compound D in the portion of Gadoteridol taken by the formula:

$$200(C / W)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Gadoteridol Related Compound B RS, calculated on the anhydrous basis, in the *Standard solution*;  $W$  is the weight, in mg, of Gadoteridol taken to prepare the *Test solution*; and  $r_U$  and  $r_S$  are the gadoteridol related compound D peak responses obtained from the *Test solution* and the *Standard solution*, respectively. Calculate the percentage of gadoteridol related compound B in the portion of Gadoteridol taken by the formula:

$$200(C / W)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Gadoteridol Related Compound B RS, calculated on the anhydrous basis, in the *Standard solution*;  $W$  is the weight, in mg, of Gadoteridol taken to prepare the *Test solution*; and  $r_U$  and  $r_S$  are the gadoteridol related compound B peak responses obtained from the *Test solution* and *Standard solution*, respectively. Calculate the percentage of any other impurity in the portion of Gadoteridol taken by the formula:

$$200(C / W)(r_i / r_S)$$

in which  $r_i$  is the peak response of any other impurity obtained from the *Test solution*; and  $r_S$  is the peak response for gadoteridol related compound B obtained from the *Standard solution*: not more than 0.1% of any individual impurity is found, and not more than 0.3% of gadolinium-containing impurities is found.

##### TEST 2 (NONGADOLINIUM-CONTAINING IMPURITIES)—

*50 mM Ammonium phosphate buffer*—Dissolve 17.25 g of monobasic ammonium phosphate in 3000 mL of water, and filter.

*pH 5.0 Buffer*—Transfer 2000 mL of *50 mM Ammonium* to a 2-L beaker, and adjust with ammonium hydroxide to a pH of 5.0.

*pH 7.0 Buffer*—Transfer 1000 mL of *50 mM Ammonium* to a 1-L beaker, and adjust with ammonium hydroxide to a pH of 7.0.

*Mobile phase*—Prepare a filtered and degassed mixture of *pH 5.0 buffer* and acetonitrile (87:13). Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

*Standard solution*—Dissolve an accurately weighed quantity of USP Gadoteridol Related Compound C RS in *pH 7.0 Buffer* to obtain a solution having a known concentration of about 5 μg per mL.

*System suitability solution*—Prepare a solution in *pH 7.0 buffer* containing about 2 mg of USP Gadoteridol RS and 0.002 mg of USP Gadoteridol Related Compound C RS per mL.

*Test solution*—Transfer about 50 mg of Gadoteridol to a 25-mL volumetric flask, dissolve in and dilute with *pH 7.0 Buffer* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L18. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the responses as directed for *Procedure*: the relative retention times are about 1.0 for gadoteridol, 1.2 for 1,4,7,10-tetraaza-1,4,7-tris-(carboxymethyl)-11-oxo-bicyclo [8.2.2] tetradecanium chloride (gadoteridol related compound F), 1.5 for 1,4,7,10-tetraaza-13-oxo-bicyclo [8.2.1] tridecane-4,7-diacetic acid (gadoteridol related compound E), and 1.7 for gadoteridol related compound C; and the resolution, *R*, between gadoteridol and gadoteridol related compound C is not less than 5. Chromatograph the *Standard solution* as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 4.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Allow the *Test solution* to elute for not less than twice the retention time of the gadoteridol peak. Calculate the percentage of gadoteridol related compound C in the portion of Gadoteridol taken by the formula:

$$2.5(C / W)(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of USP Gadoteridol Related Compound C RS in the *Standard solution*; *W* is the weight, in mg, of Gadoteridol taken to prepare the *Test solution*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses for gadoteridol related compound C obtained from the *Test solution* and *Standard solution*, respectively. Calculate the percentages of gadoteridol related compound F and gadoteridol related compound E in the portion of Gadoteridol taken by the formula:

$$2.5(1 / F)(C / W)(r_i / r_S)$$

in which *F* is the relative response factor for gadoteridol related compound F (0.68) or for gadoteridol related compound E (1.7); *r<sub>i</sub>* is the peak response for gadoteridol related compound E or gadoteridol related compound F in the *Test solution*; and *C*, *W*, and *r<sub>S</sub>* are as defined above. Calculate the percentage of any other impurity in the portion of Gadoteridol taken by the formula:

$$2.5(C / W)(r_i / r_S)$$

in which *r<sub>i</sub>* is the response of any other impurity in the chromatogram of the *Test solution*; and *C*, *W*, and *r<sub>S</sub>* are as defined above: not more than 0.1% of any other impurity is found, and the total of nongadolinium-containing impurities is not more than 0.3%, calculated on the anhydrous basis.

**Other requirements**—Where the label states that Gadoteridol is sterile, it meets the requirements for *Sterility Tests* <71> and *Bacterial endotoxins* under *Gadoteridol Injection*. Where the label states that Gadoteridol must be subjected to further processing during the preparation of injectable dosage form, it meets the requirements for *Bacterial endotoxins* under *Gadoteridol Injection*.

#### Assay—

**Buffer solution**—Dissolve 10.2 g of monobasic potassium phosphate and 0.165 g of dibasic potassium phosphate in 3 L of water, and filter.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (98:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Gadoteridol RS in *Buffer solution* to obtain a solution having a known concentration of about 0.6 mg per mL.

**Assay preparation**—Transfer about 60 mg of Gadoteridol, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Buffer solution* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a fluorometric detector operating at an excitation wavelength of 275 nm and an emission wavelength of 314 nm, and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between the gadoteridol peak and the peak with a relative retention time of about 1.2 is not less than 1.2; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>17</sub>H<sub>29</sub>GdN<sub>4</sub>O<sub>7</sub> in the portion of Gadoteridol taken by the formula:

$$100C(r_U / r_S)$$

in which *C* is the concentration of USP Gadoteridol RS, in mg per mL, in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the gadoteridol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Gadoteridol Injection

» Gadoteridol Injection is a sterile solution of Gadoteridol in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of gadoteridol (C<sub>17</sub>H<sub>29</sub>GdN<sub>4</sub>O<sub>7</sub>). It may contain buffers and stabilizers. Gadoteridol Injection intended for intravenous use contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose *Containers for Injections* as described under *Injections* <1>, preferably of Type I glass. Store at controlled room temperature, and protect from light.

**Labeling**—Label containers of Injection intended for intravenous injection to direct the user to examine the product to ensure that all solids are dissolved, to discard the product if solids persist, and to discard any unused portion remaining in the container.

#### USP Reference standards <11>—

USP Endotoxin RS  
USP Gadoteridol RS  
USP Gadoteridol Related Compound A RS  
10-(2-hydroxypropyl)-1,4,7,10-tetraazacyclododecane-1,4,7-triacetic acid.  
C<sub>17</sub>H<sub>32</sub>N<sub>4</sub>O<sub>7</sub> 404.46

#### Identification—

**A: Ultraviolet Absorption** (197U)—

*Solution*: 10 mg per mL.

*Medium*: water.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** <85>—It contains not more than 8.3 USP Endotoxin Units per mL of gadoteridol.

**pH** <791>: between 6.5 and 8.0.

**Particulate matter** <788>: meets the requirements for small-volume injections.

**Limit of free gadolinium (III)—**

*Buffer solution, Mobile phase, and Diluent*—Proceed as directed for *Test 1* in the *Chromatographic purity* test under *Gadoteridol*.

*Standard solution*—Prepare a solution of gadolinium (Gd III) acetate in water to obtain a solution having a known concentration of about 0.4 mg of gadolinium acetate per mL. Transfer 1.0 mL of the solution to a 10-mL volumetric flask, dilute with *Diluent* to volume, and mix. Transfer 1.0 mL of this solution to a small vial, add 3.0 mL of *Diluent*, and mix.

*Test solution*—Transfer an accurately measured volume of Injection, equivalent to about 150 mg of gadoteridol, to a small vial, dilute with *Diluent* to 5.0 mL, and mix. Immediately place in a bath maintained at about 5°.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a fluorometric detector operating at an excitation wavelength of 275 nm and an emission wavelength of 314 nm and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 5.0%.

*Procedure*—Separately inject equal volumes (about 20 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for about 1.5 times the retention time of the gadoteridol peak, and measure the peak responses. Calculate the percentage, by weight, of free gadolinium (III) in the volume of Injection taken by the formula:

$$500(157.25/334.38)(C/VP)(r_U / r_S)$$

in which 157.25 and 334.38 are the molecular weights of gadolinium and gadolinium acetate, respectively; C is the concentration, in mg per mL, of gadolinium (Gd III) acetate, calculated on the anhydrous basis, in the *Standard solution*; V is the volume, in mL, of Injection taken for the *Test solution*; P is the labeled potency of gadoteridol, in mg per mL, in the Injection; and  $r_U$  and  $r_S$  are the peak responses for free gadolinium (III) obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.02% is found.

**Limit of gadoteridol related compound A—**

*Buffer solution, Mobile phase, Cupric acetate solution, Standard stock solution, Standard solution, and Chromatographic system*—Proceed as directed for the *Limit of gadoteridol related compound A* test under *Gadoteridol*.

*Test solution*—Transfer an accurately measured volume of Injection, equivalent to about 30 mg of gadoteridol, to a test tube, dilute with chilled *Buffer solution* to 1.0 mL, and mix. Add 1.0 mL of chilled *Cupric acetate solution*, mix on a vortex mixer for about 10 seconds, and immediately inject as directed for *Procedure*.

*Procedure*—Separately inject equal volumes (about 50 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of gadoteridol related compound A in the Injection by the formula:

$$0.2(C/VP)(r_U / r_S)$$

in which C is the concentration, in μg per mL, of USP Gadoteridol Related Compound A RS in the *Standard solution*; V is the volume, in mL, of Injection taken for the *Test solution*; P is the labeled potency, in mg per mL, of gadoteridol in the Injection; and  $r_U$  and  $r_S$  are the peak responses of gadoteridol related compound A in the *Test solution* and the *Standard solution*, respectively: not more than 0.02% is found.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay—**

*Buffer solution, Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Gadoteridol*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 150 mg of gadoteridol, to a 250-mL volumetric flask, dilute with *Buffer solution* to volume, and mix.

*Procedure*—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg per mL, of gadoteridol ( $C_{17}H_{29}GdN_4O_7$ ) in the volume of Injection taken by the formula:

$$250(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Gadoteridol RS in the *Standard preparation*; V is the volume of Injection taken, in mL; and  $r_U$  and  $r_S$  are the gadoteridol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Gadoversetamide**

$C_{20}H_{34}GdN_5O_{10}$  661.76  
(Gadoversetamide) [8,11-bis(carboxymethyl)-14-[2-[(2-methoxyethyl)amino]-2-oxoethyl]-6-oxo-2-oxa-5,8,11,14-tetraazahexadecan-16-oato(3-)], gadolinium.  
[N,N-Bis[2-[(carboxymethyl)[[(2-methoxyethyl)carbamoyl]methyl]amino]ethyl]glycinato(3-)]gadolinium [131069-91-5].

» Gadoversetamide contains not less than 97.0 percent and not more than 102.0 percent of  $C_{20}H_{34}GdN_5O_{10}$ , calculated on an anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

**USP Reference standards <11>—**

USP Endotoxin RS

USP Gadodiamide Related Compound B RS

Gadolinium disodium diethylenetriamine pentaacetic acid.

$C_{14}H_{18}GdN_3Na_2O_{10}$  591.54

USP Gadoversetamide RS

USP Gadoversetamide Related Compound A RS

Hydrogen [8, 11, 14-tris(carboxymethyl)-6-oxo-2-oxa-5,8,11,14-tetraazahexadecan-16-oato(4-)]gadolinium.

**Identification—**

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** The lanthanide selectivity test detects gadolinium (III) in 0.1 N nitric acid with arsenazo (III). Prepare  $1.5 \times 10^{-4}$  M arsenazo (III) solution by dissolving 30 mg of arsenazo (III) and 160 mg of urea in 100 mL water, adding 1.6 mL of nitric acid, and diluting with water to 250 mL. Add 10 mg of Gadoversetamide to 1.0 mL of the  $1.5 \times 10^{-4}$  M arsenazo

(III) solution, and mix. The color changes from a wine red to green-blue, indicating the presence of gadolinium.

**Bacterial endotoxins** (85): not more than 15 USP Endotoxin Units per g of gadoversetamide.

**Water, Method 1a** (921): not more than 10.0% (w/w), a solvent mixture of methanol and formamide (9:1) being used.

**Limits of free gadolinium (III) and total chelatable material—**

**MES buffer**—Dissolve 97.6 g of 2-morpholinoethanesulfonic acid (MES) in about 950 mL of water, and mix. Adjust with 20% sodium hydroxide to a pH of 6, dilute with water to 1000 mL, and mix.

**Edetate titrant:** 0.002 M edetate disodium VS.

**0.003 M Gadolinium (III) titrant**—Transfer 0.790 g of gadolinium chloride to a 1000-mL volumetric flask, dilute with water to volume, and mix.

**Test solution**—Transfer about 5 g of Gadoversetamide, accurately weighed, into a 250-mL flask, and add 20 mL of water and 2 mL of hydrochloric acid. Stir, and heat to boiling. Rinse the sides of the flask with water. Add 50 mL of MES buffer and 100 to 150  $\mu$ L of xylene orange TS to impart a light yellow color. Heat to boiling, adjust with ammonium hydroxide to a pH of 6, and continue boiling for 2 minutes. If the solution is yellow, proceed as directed under *Uncomplexed chelatable material*. If the color is red-violet, proceed as directed under *Free gadolinium (III)*.

**Uncomplexed chelatable material**—Continue boiling, and titrate with 0.003 M Gadolinium (III) titrant to a red-violet endpoint that undergoes no further color change upon addition of more titrant. Record the volume of titrant used to reach the endpoint.

**Free gadolinium (III)**—Continue boiling and titrate with Edetate titrant to a yellow or yellow-orange endpoint that undergoes no further color change upon addition of more titrant. Record the volume of titrant used to reach the endpoint.

**Calculations**—If the Test solution was titrated with Edetate titrant, calculate the percentage of Free gadolinium (III) in the portion of Gadoversetamide taken by the formula:

$$(66.18/W)(V_{EU})(M_E)$$

in which *W* is the weight, in g, of Gadoversetamide taken; *V<sub>EU</sub>* is the volume, in mL, of Edetate titrant used to titrate the Test solution; and *M<sub>E</sub>* is the molarity of the Edetate titrant. If the sample was titrated with 0.003 M Gadolinium (III) titrant, calculate the percentage of Uncomplexed chelatable material in the portion of Gadoversetamide taken by the formula:

$$(66.18/W)(V_{GU})(M_G)$$

in which *W* is as defined herein; *V<sub>GU</sub>* is the volume, in mL, of 0.003 M Gadolinium (III) titrant used to titrate the Test solution; and *M<sub>G</sub>* is the molarity of the 0.003 M Gadolinium (III) titrant. Not more than 0.05% of free gadolinium III and not more than 0.1% of uncomplexed chelatable material, both calculated on the anhydrous basis, are found.

**Limit of 2-methoxyethylamine—**

**Mobile phase**—Add 2 mL of 5 M phosphoric acid to 550 mL of water, mix, and adjust with 10% (w/w) ammonium hydroxide to a pH of 5.0. Add 450 mL of acetonitrile, mix, filter, and degas.

**0.4 M Borate buffer**—Add 12.4 g of boric acid to 300 mL of water, and swirl to suspend. Add 100 mL of 1 N potassium hydroxide, and mix. Adjust with about 60 mL of 1 N potassium hydroxide to a pH of 10.0, dilute with water to 500 mL, and mix. Test the pH, and adjust if necessary.

**o-Phthalaldehyde reagent**—Dissolve 25 mg of o-phthalaldehyde in 0.75 mL of methanol, add 25 mL of 0.4 M Borate buffer having a pH of 10.0 and 25  $\mu$ L of 2-mer-

captoethanol, and mix. [NOTE—Protect from light. Discard after 3 days.]

**Standard solutions**—Prepare aqueous solutions of 2-methoxyethylamine having known concentrations of about 1, 20, and 50  $\mu$ g per mL, respectively. Derivatize by adding an equal volume of o-Phthalaldehyde reagent to each solution immediately before injection.

**Test solution**—Transfer about 250 mg of Gadoversetamide, accurately weighed, to a 5-mL volumetric flask, and dissolve in and dilute with water to volume. Derivatize the solution by combining equal volumes of o-Phthalaldehyde reagent and Test solution immediately before injection.

**Chromatographic system** (see Chromatography (621))—The liquid chromatograph is equipped with a 335-nm detector and a 250-mm  $\times$  4.6-mm column that contains 5- $\mu$ m packing L1. The flow rate is about 1 mL per minute. Chromatograph the Standard solutions, and record the chromatograms as directed for Procedure: the relative retention times of o-phthalaldehyde and 2-methoxyethylamine are about 0.6 and 1.0, respectively. Plot the concentration of 2-methoxyethylamine in each Standard solution versus its peak area, and perform a regression analysis to obtain a slope and an intercept. The correlation coefficient, *r*, is not less than 0.995, and the relative standard deviation for replicate injections of the 50  $\mu$ g per mL Standard solution is not more than 5%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the Test solution and the Standard solutions into the chromatograph, record the chromatograms, and measure the peak responses. Determine the concentration, in  $\mu$ g per mL, of 2-methoxyethylamine in the Test solution from the standard response line. Calculate the percentage of 2-methoxyethylamine by the formula:

$$0.5C/W$$

in which *C* is the concentration, in  $\mu$ g per mL, of 2-methoxyethylamine obtained from the Standard response line; and *W* is the weight, in mg, of Gadoversetamide taken. Not more than 0.10% (w/w) of 2-methoxyethylamine is present, calculated on the anhydrous basis.

**Limit of residual solvents—**

**Internal standard solution**—Dilute butyl alcohol with water (3:5000).

**Standard solutions**—To four separate 5-mL volumetric flasks, transfer the following designated compositions:

Flask	Isopropyl alcohol	Acetonitrile	Internal standard
1	25 $\mu$ g	25 $\mu$ g	1.0 mL
2	100 $\mu$ g	100 $\mu$ g	1.0 mL
3	250 $\mu$ g	250 $\mu$ g	1.0 mL
4	500 $\mu$ g	500 $\mu$ g	1.0 mL

Dilute each flask with water to volume, and mix. The resulting Standard solutions contain about 5, 20, 50, and 100  $\mu$ g of isopropyl alcohol and acetonitrile per mL.

**Test solution**—Transfer about 500 mg of Gadoversetamide, accurately weighed, to a 5-mL volumetric flask. Add 1.0 mL of Internal standard solution, dissolve in and dilute with water to volume, and mix.

**Chromatographic system** (see Chromatography (621))—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm  $\times$  30-m capillary column with a 1.0- $\mu$ m thickness of phase G35. Helium is used as the carrier gas, at a flow rate of about 5 mL per minute. The column temperature is maintained at 35° for 5 minutes, then increased at a rate of 15° per minute to 110°. The injection port temperature is maintained at 150°, and the detector temperature is maintained at 300°. Chromatograph the Standard solutions, and record the peak area ratios as di-

rected for *Procedure*: the relative retention times are about 0.5 for isopropyl alcohol, 0.7 for acetonitrile, and 1.0 for butyl alcohol. Plot the concentration for each standard versus its peak area ratio, and perform a regression analysis. The correlation coefficient,  $r$ , is not less than 0.995 for each analyte; and the relative standard deviation for replicate injections of the 100  $\mu\text{g}$  per mL *Standard solution* is not more than 5%.

*Procedure*—Separately inject equal volumes (about 2  $\mu\text{L}$ ) of the *Test solution* and the *Standard solutions* into the chromatograph, record the chromatograms, and measure the peak area ratios of the standard peak to the internal standard peak. Determine the concentration of isopropyl alcohol and acetonitrile from the respective standard response lines. Calculate the percentage (w/w) of each solvent in the portion of Gadoversetamide taken by the formula:

$$0.5C/W$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL (obtained from the respective standard response line) of isopropyl alcohol and acetonitrile in the *Test solution*; and  $W$  is the weight (anhydrous), in mg, of the portion of Gadoversetamide taken: not more than 0.1% (w/w) of isopropyl alcohol is found; and not more than 0.025% (w/w) of acetonitrile is found. The total residual solvent content (sum of the % w/w isopropyl alcohol and the % w/w acetonitrile) does not exceed 0.1% w/w.

#### Related compounds—

*Solution A*—Dissolve 2.06 g of monobasic potassium phosphate and 18.6 mL of 20% w/w tetraethylammonium hydroxide in 950 mL of water. Adjust with phosphoric acid to a pH of 7, dilute with water to make 1000 mL, mix, filter, and degas.

*Solution B*—Prepare a filtered and degassed mixture of *Solution A* and acetonitrile (475:25).

*Mobile phase*—Use a mixture of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard stock solution*—Transfer about 50 mg each of USP Gadoversetamide Related Compound A RS and USP Gadodiamide Related Compound B RS, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with water to volume, and mix. [NOTE—The solution may be stored for a week.]

*Standard solutions*—Prepare aqueous solutions of diluted *Standard stock solution* containing about 25, 150, and 250  $\mu\text{g}$  of each Reference Standard per mL.

*Test solution*—Transfer about 250 mg of Gadoversetamide, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 205-nm detector and a metal-free 4.6-  $\times$  150-mm column that contains 5- $\mu\text{m}$  packing L1. The flow rate is 1 mL per minute. The chromatograph is programmed to pump a mixture of *Solution A* to *Solution B* (97:3). The column temperature is maintained at about 25°. The relative retention times are about 0.6 for gadodiamide related compound B and 0.7 for gadoversetamide related compound A; the resolution,  $R_s$ , between gadodiamide related compound B and gadoversetamide related compound A is not less than 1.0; and the relative standard deviation for replicate injections is not more than 5% for the 250  $\mu\text{g}$  per mL *Standard solution*.

*Procedure*—Separately inject equal volumes (about 50  $\mu\text{L}$ ) of the *Test solution* and the *Standard solutions* into the chromatograph. Allow 1 hour between injections to remove slow-eluting impurities. Determine the quantities, in  $\mu\text{g}$  per mL, of gadoversetamide related compound A and gadodiamide related compound B from the respective Standard response lines. Calculate the percentage of gadoversetamide

related compound A in the portion of Gadoversetamide taken by the formula:

$$100C/V$$

in which  $C$  is the concentration of gadoversetamide related compound A, in  $\mu\text{g}$  per mL, obtained from the Standard response line; and  $V$  is the concentration of gadoversetamide, in  $\mu\text{g}$  per mL, in the *Test solution*. Not more than 1.0% (w/w) of gadoversetamide related compound A is found, calculated on the anhydrous basis. Calculate the percentage of gadodiamide related compound B in the portion of Gadoversetamide taken by the following formula:

$$92.2C/V$$

in which  $C$  is the concentration of gadodiamide related compound B, in  $\mu\text{g}$  per mL, obtained from the Standard response line; and  $V$  is as described herein. Not more than 0.5% (w/w) of gadodiamide related compound B is found, calculated on the anhydrous basis.

#### Assay—

*Mobile phase*—Dissolve 1.5 g of boric acid in about 950 mL of water, and mix. Adjust with ammonium hydroxide to a pH of 6.8, add 15 mL of acetonitrile, dilute with water to make 1000 mL, mix, filter, and degas.

*Standard preparations*—Prepare solutions of USP Gadoversetamide RS in *Mobile phase* having known concentrations of about 1.2, 1.0, and 0.8 mg per mL.

*Assay preparation*—Transfer about 100 mg of Gadoversetamide, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 205-nm detector and a metal-free 4.6-  $\times$  250-mm column that contains 5- $\mu\text{m}$  packing L1. The column temperature is maintained at about 50°. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparations*, and record the peak responses as directed for *Procedure*. Plot the concentration of each Standard versus its peak area and perform a regression analysis to obtain a slope and intercept for the Standard response line. The correlation coefficient,  $r$ , is not less than 0.995; and the relative standard deviation for replicate injections of the 1.0 mg per mL *Standard preparation* is not more than 2%.

*Procedure*—Separately inject equal volumes (about 10  $\mu\text{L}$ ) of the *Assay preparation* and *Standard preparations* into the chromatograph, record the chromatograms, and measure the area of the gadoversetamide peak. Determine the quantity, in mg per mL, of gadoversetamide from the Standard response line. Calculate the quantity, in % (w/w), of  $\text{C}_{20}\text{H}_{34}\text{GdN}_5\text{O}_{10}$  in the portion of Gadoversetamide taken by the formula:

$$10,000C/W$$

in which  $C$  is the concentration, in mg per mL, obtained from the Standard response line; and  $W$  is the weight (anhydrous), in mg, of the portion of Gadoversetamide taken to prepare the *Assay preparation*.

## Gadoversetamide Injection

» Gadoversetamide Injection is a sterile solution of Gadoversetamide in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of gadoversetamide ( $\text{C}_{20}\text{H}_{34}\text{GdN}_5\text{O}_{10}$ ). It may con-

tain buffers and stabilizers. It contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose Type I glass containers or plastic syringes. Store at controlled room temperature.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Gadoversetamide RS

USP Gadoversetamide Related Compound A RS

Hydrogen [8, 11, 14-tris(carboxymethyl)-6-oxo-2-oxa-5,8,11,14-tetraazahexadecan-16-oato(4-)]gadolinium.

**Bacterial endotoxins** (85): not more than 5 USP Endotoxin Units per mL of gadoversetamide.

**pH** (791): between 5.5 and 7.5.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Relaxivity** (761)—

**Standard solutions**—Dissolve an accurately weighed quantity of manganese (II) chloride tetrahydrate in water, and quantitatively dilute with water to obtain solutions having known concentrations of 0.9 mM, 2.7 mM, and 4.5 mM.

**Test stock solution**—Transfer 5.0 mL of the Injection to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Test solutions**—Transfer 1.0, 2.0, 4.0, and 6.0 mL of *Test stock solution* to individual 100-mL volumetric flasks, dilute each with water to volume, and mix. These solutions have concentrations of 0.504 mM, 1.008 mM, 2.016 mM, and 3.024 mM, respectively, based on the label claim.

**Apparatus**—Use a mini-NMR spectrometer with suitable sensitivity (see *Apparatus* under *Nuclear Magnetic Resonance* (761)).

**System suitability**—Place a portion of each of the *Standard solutions* into a separate 10-mm specimen tube. Warm to 40° for not less than 10 minutes, and measure the resonance frequency ( $T_1$ ), at 20 MHz. The average  $T_1$  for replicate measurements must be within 5% of 156 ms for the 0.9 mM *Standard solution*, 52 ms for the 2.7 mM *Standard solution*, and 32 ms for the 4.5 mM *Standard solution*.

**Procedure**—Place an accurately measured portion of each *Test solution* into a 10-mm specimen tube. Warm to 40° for not less than 10 minutes, and measure the resonance frequency ( $T_1$ ) of each *Test solution*. Plot  $1/T_1$  versus the molarities of the *Test solutions*, and perform a regression analysis. The slope of the plotted line is the relaxivity. The relaxivity is between 4.0 and 5.0 sec<sup>-1</sup> mM<sup>-1</sup>.

**Related compounds**—

**Solution A**—Proceed as directed for *Mobile phase* in the test for *Related compounds* under *Gadoversetamide*.

**Solution B**—Prepare a filtered and degassed mixture of *Solution A* and acetonitrile (475:25).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solutions**—Prepare aqueous solutions of USP Gadoversetamide Related Compound A RS having known concentrations of about 30 µg per mL, 150 µg per mL, and 360 µg per mL.

**Test solution**—Transfer 5.0 mL of the Injection to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—Proceed as directed in the test for *Related compounds* under *Gadoversetamide*. The chromatograph is programmed as follows.

Time (minutes)	Solution A %	Solution B %	Elution
0–15	97	3	equilibration
15–16	97→0	3→100	linear gradient
16–26	0	100	isocratic
26–27	0→97	100→3	linear gradient
27–45	97	3	re-equilibration

Plot the concentration, in µg per mL, of each *Standard solution* versus its peak area, and perform a regression analysis to obtain a slope and intercept for the *Standard response line*. The relative standard deviation for replicate injections of the 360 µg per mL *Standard solution* is not more than 5%; and the correlation coefficient,  $r$ , of the regression analysis is not less than 0.995.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Test Solution*, the *Standard solutions*, and water (blank) into the chromatograph, record the chromatograms, and measure the peak responses. Allow about 1 hour between injections to remove slow-eluting impurities from the column. Calculate the percentage of gadoversetamide related compound A relative to the amount of gadoversetamide (C<sub>20</sub>H<sub>34</sub>GdN<sub>5</sub>O<sub>10</sub>) in the portion of Injection taken, based on the label claim, by the formula:

$$0.003C$$

in which  $C$  is the concentration of gadoversetamide related compound A in the *Test solution*, in µg per mL, obtained from the *Standard response line*: not more than 1.0% (w/w) of gadoversetamide related compound A is found.

**Other requirements**—It meets the requirements of the *Identification tests* under *Gadoversetamide*. It also meets the requirements under *Injections* (1).

**Assay**—

**Mobile phase, Standard preparations, and Chromatographic system**—Proceed as directed in the *Assay* under *Gadoversetamide*.

**Assay preparation**—Transfer about 3.0 mL of the Injection, accurately measured, to a 1000-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Procedure**—Proceed as directed in the *Assay* under *Gadoversetamide*. Calculate the quantity, in mg per mL, of gadoversetamide (C<sub>20</sub>H<sub>34</sub>GdN<sub>5</sub>O<sub>10</sub>) in the volume of Injection taken by the formula:

$$1000C/V$$

in which  $C$  is the concentration, in mg per mL, of gadoversetamide in the *Assay preparation*, obtained from the *Standard response line*; and  $V$  is the volume, in mL, of Injection taken.

## Galantamine Hydrobromide

C<sub>17</sub>H<sub>21</sub>NO<sub>3</sub> · HBr 368.27  
 6*H*-Benzofuro[3*a*,3,2-*ef*][2]benzazepin-6-ol, 4*a*,5,9,10,11,12-hexahydro-3-methoxy-11-methyl-, hydrobromide, (4*a*S,6*R*,8*a*S)-;  
 (4*a*S,6*R*,8*a*S)-4*a*,5,9,10,11,12-Hexahydro-3-methoxy-11-methyl-6*H*-benzofuro[3*a*,3,2-*ef*][2]benzazepin-6-ol hydrobromide [1953-04-4].

**DEFINITION**

Galantamine Hydrobromide contains NLT 98.0% and NMT 102.0% of  $C_{17}H_{21}NO_3 \cdot HBr$ , calculated on the dried basis.

**IDENTIFICATION**• **A. INFRARED ABSORPTION** (197K)

[NOTE—Specimens are to be prepared using undried USP Galantamine Hydrobromide RS and the test article.]

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *System suitability solution*, as obtained in the Assay.
- **C. IDENTIFICATION TESTS—GENERAL, Bromide (191):** Meets the requirements of the silver nitrate precipitate test  
**Sample solution:** A solution of 7 mg/mL in water

**ASSAY**• **PROCEDURE**

**Diluent:** Methanol and water (1:19)

**Buffer:** 0.79 g/L of dibasic sodium phosphate dihydrate and 2.46 g/L of anhydrous monobasic sodium phosphate in water

**Solution A:** Methanol and *Buffer* (1:19)

**Solution B:** Acetonitrile

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
6.0	100	0
20.0	95	5
35.0	85	15
50.0	80	20
51.0	40	60
55.0	40	60
56.0	100	0
60.0	100	0

**System suitability solution:** 1 mg/mL of USP Galantamine Hydrobromide Related Compounds Mixture RS in *Diluent*

**Standard solution:** 1.0 mg/mL of USP Galantamine Hydrobromide RS in *Diluent*

**Sample solution:** 1.0 mg/mL of Galantamine Hydrobromide in *Diluent*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 10-cm; 3.5-μm packing L1

**Column temperature:** 55°

**Flow rate:** 1.5 mL/min

**Injection size:** 20 μL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—For relative retention times, see *Impurity Table 1*.]

**Suitability requirements**

**Resolution:** NLT 4.5 between galantamine and 6α-hexahydrogalantamine, *System suitability solution*

**Tailing factor:** NMT 2.0 for galantamine hydrobromide, *System suitability solution*

**Relative standard deviation:** NMT 1.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{17}H_{21}NO_3 \cdot HBr$  in the portion of Galantamine Hydrobromide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Galantamine Hydrobromide RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of Galantamine Hydrobromide in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

**IMPURITIES****Inorganic Impurities**

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **HEAVY METALS, Method II** (231): NMT 20 ppm

• **LIMIT OF PALLADIUM**

[NOTE— Perform this test only if palladium is a known inorganic impurity of the manufacturing process.]

**Standard stock solution:** 20 mg/L of palladium reference stock solution (NIST traceable) in water

**Aqua regia:** Under a hood, carefully mix hydrochloric acid and nitric acid (3:1).

[NOTE— To obtain each of the required *Standard solutions*, it is recommended that the required volume of *Standard stock solution* be mixed with a volume of *Aqua regia* equivalent to 5% of the final volume, followed by water.]

**Standard solution A:** 0.2 mg/L of palladium from *Standard stock solution* in water

**Standard solution B:** 1.0 mg/L of palladium from *Standard stock solution* in water

**Standard solution C:** 2.0 mg/L of palladium from *Standard stock solution* in water.

**System suitability solution:** Prepare a solution having a known concentration of 1.6 mg/L of palladium, as directed for *Standard solutions*.

**Sample solution:** Weigh 1 g of Galantamine Hydrobromide. Transfer the sample to an appropriate digestion system, and digest using appropriate acids (e.g., nitric acid or mixtures of nitric acid and sulfuric acid and mixtures of nitric acid and hydrogen peroxide). After digestion, heat to dryness. Add 0.5 mL of *Aqua regia* and 2 mL of water. Warm gently to dissolve any residue. Allow to cool. Transfer quantitatively to a 10-mL volumetric flask, and dilute with water to volume.

**Digestion blank solution:** Prepare this solution following the procedure for the *Sample solution*, without the test article.

**Spectrometric conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectroscopy (flame)

**Analytical wavelength:** 247.6 nm (0.2-nm slit width)

**Lamp:** Palladium hollow-cathode

**Blank solution:** Dilute 5 mL of *Aqua regia* with water to 100 mL.

**System suitability**

**Samples:** *Standard solution A*, *Standard solution B*, *Standard solution C*, *System suitability solution*, and *Blank solution*

Using the *Standard solutions* and *Blank solution*, construct a calibration curve.

**Suitability requirements**

**Correlation coefficient:** NLT 0.99

**Recovery:** 87.5%–112.5%, *System suitability solution*.  
[NOTE— Recovery is calculated using the calibration curve.]

**Analysis**

**Samples:** *Sample solution* and *Digestion blank solution*  
Calculate the concentration of palladium in the *Sample solution*, using the calibration curve, corrected for the *Digestion blank solution* and the sample weight. Calculate the amount of palladium in the Galantamine Hydrobromide taken to prepare the *Sample solution*.

**Acceptance criteria:** NMT 10 ppm

**Organic Impurities**• **PROCEDURE**

**Diluent, Buffer, Solution A, Solution B, Mobile phase, System suitability solution, Sample solution, Chro-**

**matographic system, and System suitability:** Prepare as directed in the Assay.

**Standard solution:** 5.0 µg/mL of USP Galantamine Hydrobromide RS in *Diluent*

#### Analysis

**Samples:** *Sample solution* and *Standard solution*

[NOTE—Ignore the peak due to bromide near the void volume and any peak below 0.05%.]

Calculate the percentage of each impurity in the portion of Galantamine Hydrobromide taken, on the dried basis:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times (100/100 - L)$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of galantamine from the *Standard solution*

$C_S$  = concentration of USP Galantamine Hydrobromide RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the *Sample solution* (mg/mL)

$F$  = relative response factor from *Impurity Table 1*

$L$  = *Loss on Drying* in percent

**Acceptance criteria:** See *Impurity Table 1*.

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
N-Desmethyl-galantamine <sup>a</sup>	0.29	1.2	0.6

<sup>b</sup> (4a*S*,6*R*,8a*S*)-4a,5,9,10,11,12-Hexahydro-3-hydroxy-11-methyl-6*H*-benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol.

<sup>c</sup> [4a*S*-(4α*α*,6β,8a*R*<sup>\*</sup>)]-4a,5,9,10,11,12-Hexahydro-3-methoxy-11-methyl-6*H*-benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol, *N*-oxide.

<sup>d</sup> [4a*S*-(4α*α*,6β,8a*R*<sup>\*</sup>)]-4a,5,7,8,9,10,11,12-Octahydro-3-methoxy-11-methyl-6*H*-benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol.

<sup>e</sup> [4a*S*-(4α*α*,6α,8a*R*<sup>\*</sup>)]-4a,5,9,10,11,12-Hexahydro-3-methoxy-11-methyl-6*H*-benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol.

<sup>f</sup> [4a*S*-(4a*R*<sup>\*</sup>,8a*R*<sup>\*</sup>)]-9,10,11,12-Tetrahydro-3-methoxy-11-methyl-4a*H*-benzofuro[3a,3,2-*ef*][2]benzazepine.

<sup>g</sup> (4a*S*,8a*S*)-4a,5,9,10,11,12-Hexahydro-3-methoxy-11-methyl-6*H*-benzofuro[3a,3,2-*ef*][2]benzazepin-6-one. [NOTE—This is a process impurity that may be found in galantamine hydrobromide isolated from a natural source.]

<sup>h</sup> Do not include the 4*R*,8*R*-stereoisomer.

**Impurity Table 1 (Continued)**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Any unspecified impurity	—	1.0	0.10
Total impurities <sup>h</sup>	—	—	1.0

<sup>a</sup> (4a*S*,6*R*,8a*S*)-4a,5,9,10,11,12-Hexahydro-3-methoxy-6*H*-benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol.

<sup>b</sup> (4a*S*,6*R*,8a*S*)-4a,5,9,10,11,12-Hexahydro-3-hydroxy-11-methyl-6*H*-benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol.

<sup>c</sup> [4a*S*-(4α*α*,6β,8a*R*<sup>\*</sup>)]-4a,5,9,10,11,12-Hexahydro-3-methoxy-11-methyl-6*H*-benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol, *N*-oxide.

<sup>d</sup> [4a*S*-(4α*α*,6β,8a*R*<sup>\*</sup>)]-4a,5,7,8,9,10,11,12-Octahydro-3-methoxy-11-methyl-6*H*-benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol.

<sup>e</sup> [4a*S*-(4α*α*,6α,8a*R*<sup>\*</sup>)]-4a,5,9,10,11,12-Hexahydro-3-methoxy-11-methyl-6*H*-benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol.

<sup>f</sup> [4a*S*-(4a*R*<sup>\*</sup>,8a*R*<sup>\*</sup>)]-9,10,11,12-Tetrahydro-3-methoxy-11-methyl-4a*H*-benzofuro[3a,3,2-*ef*][2]benzazepine.

<sup>g</sup> (4a*S*,8a*S*)-4a,5,9,10,11,12-Hexahydro-3-methoxy-11-methyl-6*H*-benzofuro[3a,3,2-*ef*][2]benzazepin-6-one. [NOTE—This is a process impurity that may be found in galantamine hydrobromide isolated from a natural source.]

<sup>h</sup> Do not include the 4*R*,8*R*-stereoisomer.

#### SPECIFIC TESTS

• **LOSS ON DRYING (731):** Dry a sample at 105° for 4 h: it loses NMT 0.5% of its weight.

#### • ENANTIOMERIC PURITY

[NOTE—If Galantamine Hydrobromide is not isolated from a natural source, perform either *Procedure 1* or *Procedure 2*.]

##### Procedure 1

**Background electrolyte solution:** 8.9 g/L of dibasic sodium phosphate dihydrate in water. Adjust with phosphoric acid to a pH of 3.0.

**Run buffer:** 19.6 g/L of α-cyclodextrin hydrate in *Background electrolyte solution*. Pass the solution through a 0.22-µm filter.

**Standard solution:** 5 µg/mL of USP Galantamine Hydrobromide Racemic RS in water. Pass the solution through a 0.22-µm filter, discarding the first 8 mL.

**Sample solution:** 0.5 mg/mL of Galantamine Hydrobromide in water. Pass the solution through a 0.22-µm filter, discarding the first 8 mL.

**Capillary rinse procedure:** Use separate *Run buffer* vials for the capillary rinse and sample analysis. Proceed as directed in the table below.

Step #	Solution/Gas	Time (min)
1	0.1 N sodium hydroxide	15
2	Water	10
3	Suitable gas	5

[NOTE—If a new or dry capillary is being used, rinse with 1 N sodium hydroxide for 30 min, followed by rinsing with water for 15 min. Dry it with air or nitrogen for 10 min.]

#### Electrophoretic system

(See *Capillary Electrophoresis (727)*, *System Suitability*.)

**Mode:** High performance CE

**Detector:** UV 214 nm

**Column:** 75-µm × 60-cm uncoated fused-silica

**Column temperature:** 20°

**Applied voltage:** 250 V/cm, positive polarity

**Run time:** 35 min

#### System suitability

**Sample:** *Standard solution*. [NOTE—For the purpose of identification, the 4*S*,8*S* stereoisomer elutes at an approximate relative migration time (RMT) of 1.00, and the 4*R*,8*R* stereoisomer elutes at an RMT of about 1.05.]

**Suitability requirements****Resolution:** NLT 2.5 between the two enantiomers**Relative standard deviation:** NMT 10% for the 4*R*, 8*R* stereoisomer peak

Measure the migration times and peak responses: the migration times for the 4*R*,8*R* stereoisomer in the electropherograms for the *Sample solution* should not deviate by more than 5% of the migration time for the same component in the electropherogram of the *Standard solution*.

**Analysis****Samples:** *Standard solution* and *Sample solution***Injection:** [NOTE—Rinse the capillary between injections as follows: water for 5 min, followed by *Run buffer* for 5 min. Rinse times are based on a rinse pressure of 1.4 bar.]**Sample solution:** 34.5 mbar for 4 s**Run buffer:** 6.9 mbar for 5 s

Calculate the corrected peak responses using the formula:

$$\text{Result} = (r/m)$$

*r* = peak response*m* = migration time of the peak, in minCalculate the limit of the 4*R*,8*R* isomer, in percent, in the portion of Galantamine Hydrobromide taken:

$$\text{Result} = (r_{\text{CU}}/r_{\text{CS}}) \times (C_{\text{S}}/C_{\text{U}}) \times P \times 100$$

*r*<sub>CU</sub> = average corrected peak responses for the 4*R*, 8*R* isomer from the *Sample solution**r*<sub>CS</sub> = average corrected peak responses for the 4*R*, 8*R* isomer from the *Standard solution**C*<sub>S</sub> = concentration of USP Galantamine Hydrobromide RS in the *Standard solution* (mg/mL)*C*<sub>U</sub> = concentration of Galantamine Hydrobromide in the *Sample solution* (mg/mL)*P* = chiral purity of USP Galantamine Hydrobromide Racemic RS, 0.5**Acceptance criteria:** NMT 0.10% of the 4*R*,8*R* stereoisomer**Procedure 2**

[NOTE—Use low-actinic glassware and vials. It is recommended that precautions be taken to protect all solutions from light.]

**Buffer:** 8.2 g/L of sodium acetate in water**Mobile phase:** Acetonitrile and *Buffer* (1:49). Adjust with acetic acid to a pH of 6.5.**System suitability solution:** 1.2 mg/mL of USP Galantamine Hydrobromide RS and 3.6 µg/mL of USP Galantamine Hydrobromide Racemic RS in water.[NOTE—This solution will contain about 1.8 µg/mL of the 4*R*,8*R* stereoisomer.]**Sample solution:** 1.2 mg/mL of Galantamine Hydrobromide in water**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 230 nm**Column:** 4.0-mm × 15-cm; 5-µm packing L41.

[NOTE—Alternatively a 2.0-mm × 15.0-cm column containing 5-µm L41 packing can be used with a recommended flow rate of about 0.2 mL/min.]

**Flow rate:** 0.8 mL/min**Injection size:** 5 µL**System suitability****Sample:** *System suitability solution*. [NOTE—The 4*R*,8*R* stereoisomer elutes first as the minor peak followed by the major peak due to galantamine (which is the same as the 4*S*,8*S* stereoisomer).]**Suitability requirements****Resolution:** NLT 3.0 between the 4*R*,8*R* stereoisomer and galantamine peaks**Relative standard deviation:** NMT 5.0% for the 4*R*, 8*R* stereoisomer peak**Analysis****Sample:** *Sample solution*Calculate the percentage of 4*R*,8*R* stereoisomer in the portion of Galantamine Hydrobromide taken:

$$\text{Result} = 100 \times [r_{4R,8R}/(r_{4R,8R} + r_{4S,8S})]$$

*r*<sub>4*R*,8*R*</sub> = peak area of the 4*R*,8*R* stereoisomer from the *Sample solution**r*<sub>4*S*,8*S*</sub> = peak area of the galantamine peak from the *Sample solution***Acceptance criteria:** NMT 0.10% of the 4*R*,8*R* stereoisomer**• OPTICAL ROTATION, Specific Rotation <781>**[NOTE—If Galantamine Hydrobromide is isolated from a natural source, perform the test for *Optical Rotation*.]**Acceptance criteria:** −90° to −100°**Sample solution:** 20 mg/mL in water**ADDITIONAL REQUIREMENTS****• PACKAGING AND STORAGE:** Store at room temperature. Preserve in well-closed containers.**• LABELING:** Label it to state if the source is naturally derived or is synthetic. If the source is not natural, perform either *Procedure 1* or *Procedure 2* of the test for *Enantiomeric Purity*. If the source is natural, perform the test for *Optical Rotation* <781>, *Specific Rotation*.**• USP REFERENCE STANDARDS <11>**

USP Galantamine Hydrobromide RS

USP Galantamine Hydrobromide Racemic RS

A 50:50 mixture of 4*S*,8*S* and 4*R*,8*R* isomers.

USP Galantamine Hydrobromide Related Compounds Mixture RS

Contains galantamine hydrobromide, 6β-hexahydrogalantamine, 6β-octahydrogalantamine, 6α-hexahydrogalantamine, and tetrahydrogalantamine.

**Galantamine Tablets****DEFINITION**Galantamine Tablets contain an amount of Galantamine Hydrobromide equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of galantamine (C<sub>17</sub>H<sub>21</sub>NO<sub>3</sub>).**IDENTIFICATION****• A. ULTRAVIOLET ABSORPTION <197U>** The spectrum of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Uniformity of Dosage Units*.**• B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.**ASSAY****• PROCEDURE****Buffer solution:** 5.34 g/L of dibasic sodium phosphate dihydrate in water. Adjust with phosphoric acid to a pH of 6.5.**Solution A:** Methanol and *Buffer solution* (1:19)**Solution B:** Acetonitrile and methanol (19:1)**Mobile phase:** See *Table 1*.**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	100	0
40.0	75	25
45.0	60	40

Table 1 (Continued)

Time (min)	Solution A (%)	Solution B (%)
46.0	40	60
55.0	40	60
56.0	100	0
61.0	100	0

**Diluent:** Dissolve 35.4 g of edetate disodium in 950 mL water, and add 50 mL of methanol. [NOTE—First dissolve in water, then add methanol.]

**Standard solution:** 0.62 mg/mL of USP Galantamine Hydrobromide RS in *Diluent*

**Sample solution:** 0.48 mg/mL of galantamine from powdered Tablets (NLT 10) in *Diluent*. Pass through a PTFE filter of 0.45- $\mu$ m or finer pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm  $\times$  10-cm; 3- $\mu$ m L1 packing

**Column temperature:** 35°

**Flow rate:** 1.5 mL/min

**Injection volume:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of galantamine ( $C_{17}H_{21}NO_3$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Galantamine Hydrobromide RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of galantamine in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of galantamine, 287.35

$M_{r2}$  = molecular weight of galantamine hydrobromide, 368.27

**Acceptance criteria:** 90.0%–110.0%

## PERFORMANCE TESTS

### • DISSOLUTION <711>

#### Test 1

**Medium:** Water; 500 mL

**Apparatus 2:** 50 rpm

**Time:** 20 min

**Standard solution:** ( $L/400$ ) mg/mL of USP Galantamine Hydrobromide RS in *Medium*, where  $L$  is the label claim in mg

**Sample solution:** Pass portions of the solution through a suitable filter of 0.2- $\mu$ m pore size.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** UV

**Analytical wavelength:** 288 nm

**Cell:** 5-cm cell for 4-mg and 8-mg Tablets; 1-cm cell for 12-mg Tablets

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of galantamine ( $C_{17}H_{21}NO_3$ ) dissolved in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times (M_{r1}/M_{r2}) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of USP Galantamine Hydrobromide RS in the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$M_{r1}$  = molecular weight of galantamine, 287.35

$M_{r2}$  = molecular weight of galantamine hydrobromide, 368.27

**Tolerances:** NLT 80% (Q) of the labeled amount of galantamine ( $C_{17}H_{21}NO_3$ ) is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

**Medium, Apparatus 2, Time, Standard solution, Sample solution, and Analysis:** Proceed as directed for *Test 1*.

**Tolerances:** NLT 70% (Q) of the labeled amount of galantamine ( $C_{17}H_{21}NO_3$ ) is dissolved.

**Test 3:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3*.

**Medium:** Water; 500 mL

**Apparatus 2:** 50 rpm, use peak vessels

**Time:** 20 min

**Buffer:** Triethylamine and 3.45 g/L of monobasic sodium phosphate in water (1:1000). Adjust with phosphoric acid to a pH of 4.5.

**Mobile phase:** Acetonitrile, methanol, and *Buffer* (10:10:80). Filtered and de-aerated.

**Standard solution:** ( $L/400$ ) mg/mL of USP Galantamine Hydrobromide RS in water, where  $L$  is the label claim in mg

**Sample solution:** Pass a portion of the solution through a suitable filter of 0.45- $\mu$ m pore size. Use the filtrate.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Column temperature:** 30°

**Flow rate:** 1 mL/min

**Injection volume:** 20  $\mu$ L

**Run time:** Two times the retention time of galantamine

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

Calculate the percentage of the labeled amount of galantamine ( $C_{17}H_{21}NO_3$ ) dissolved in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak area of the *Sample solution*

$r_S$  = peak area of the *Standard solution*

$C_S$  = concentration of USP Galantamine Hydrobromide RS in the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$M_{r1}$  = molecular weight of galantamine, 287.35

$M_{r2}$  = molecular weight of galantamine hydrobromide, 368.27

**Tolerances:** NLT 80% (Q) of the labeled amount of galantamine ( $C_{17}H_{21}NO_3$ ) is dissolved.

### • UNIFORMITY OF DOSAGE UNITS (905)

#### Procedure for content uniformity

**Standard solution:** 0.05 mg/mL of USP Galantamine Hydrobromide RS in 0.1 N hydrochloric acid

**Sample solution:** Add 1 Tablet to each appropriately sized volumetric flask to obtain a final galantamine

concentration of 0.04 mg/mL. Add an appropriate amount of 0.1 N hydrochloric acid, equivalent to 75% of the total volume of the volumetric flask, and mechanically shake for 45 min. Dilute with 0.1 N hydrochloric acid to volume. Pass a portion of the solution through a suitable filter of 0.2- $\mu$ m pore size, and use the filtrate.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** UV

**Analytical wavelength:** Absorption maximum at about 289 nm

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Determine the amount of galantamine ( $C_{17}H_{21}NO_3$ ) dissolved in filtered portions of the *Sample solution* in comparison with the *Standard solution*.

Calculate the percentage of the labeled amount of galantamine ( $C_{17}H_{21}NO_3$ ) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of USP Galantamine Hydrobromide RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of galantamine, 287.35

$M_{r2}$  = molecular weight of galantamine hydrobromide, 368.27

**Acceptance criteria:** Meet the requirements for coated Tablets

## IMPURITIES

### • ORGANIC IMPURITIES

**Buffer solution, Solution A, Solution B, Mobile phase, Diluent, Standard solution, and Sample solution:** Prepare as directed in the Assay.

**System suitability solution:** 0.6 mg/mL of USP Galantamine Hydrobromide Related Compounds Mixture RS in *Diluent*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Injection volume:** 20  $\mu$ L

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 1.5 between 6 $\beta$ -hexahydrogalantamine and 6 $\beta$ -octahydrogalantamine, *System suitability solution*

**Relative standard deviation:** NMT 2.0% for galantamine, *Standard solution*

[NOTE—Identify the impurities using the approximate relative retention times given in *Table 2*.]

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

[NOTE—Ignore the peak due to bromide near the void volume.]

Calculate the percentage of each of the impurities including the unspecified degradation impurities in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (100/F)$$

$r_U$  = peak area of each impurity from the *Sample solution*

$r_S$  = peak area of galantamine from the *Standard solution*

$C_S$  = concentration of USP Galantamine Hydrobromide RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of galantamine in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of galantamine, 287.35

$M_{r2}$  = molecular weight of galantamine hydrobromide, 368.27

$F$  = relative response factor for each of the impurities relative to galantamine (see *Table 2*)

**Acceptance criteria:** See *Table 2*.

**Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
N-Desmethylgalantamine <sup>a</sup>	0.41	1.1	0.5
6 $\beta$ -Hexahydrogalantamine (also known as galantamine N-oxide) <sup>b</sup>	0.73	1.1	0.75
6 $\beta$ -Octahydrogalantamine (also known as lycoramine) <sup>c,d</sup>	0.86	—	—
Galantamine hydrobromide	1.00	1.0	—
6 $\alpha$ -Hexahydrogalantamine (also known as epigalantamine) <sup>e</sup>	1.15	1.1	0.5
Tetrahydrogalantamine <sup>f,d</sup>	2.09	—	—
Individual, unspecified degradation impurity	—	1.0	0.2
Total impurities	—	—	1.5

<sup>a</sup> [4aS,6R,8aS]-4a,5,9,10,11,12-Hexahydro-3-methoxy-6H-benzofuro[3a,3,2-ef][2]benzazepin-6-ol.

<sup>b</sup> [4aS-(4 $\alpha$ ,6 $\beta$ ,8aR\*)]-4a,5,9,10,11,12-Hexahydro-3-methoxy-11-methyl-6H-benzofuro[3a,3,2-ef][2]benzazepin-6-ol, N-oxide.

<sup>c</sup> [4aS-(4 $\alpha$ ,6 $\beta$ ,8aR\*)]-4a,5,7,8,9,10,11,12-Octahydro-3-methoxy-11-methyl-6H-benzofuro[3a,3,2-ef][2]benzazepin-6-ol.

<sup>d</sup> Impurities are not quantified and are intended for system suitability evaluation only.

<sup>e</sup> [4aS-(4 $\alpha$ ,6 $\alpha$ ,8aR\*)]-4a,5,9,10,11,12-Hexahydro-3-methoxy-11-methyl-6H-benzofuro[3a,3,2-ef][2]benzazepin-6-ol.

<sup>f</sup> [4aS-(4aR\*,8aR\*)]-9,10,11,12-Tetrahydro-3-methoxy-11-methyl-4aH-benzofuro[3a,3,2-ef][2]benzazepine.

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.

• **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

### • USP REFERENCE STANDARDS (11)

USP Galantamine Hydrobromide RS

USP Galantamine Hydrobromide Related Compounds Mixture RS

Contains galantamine hydrobromide, 6 $\beta$ -hexahydrogalantamine, 6 $\beta$ -octahydrogalantamine, 6 $\alpha$ -hexahydrogalantamine, and tetrahydrogalantamine.

## Gallamine Triethiodide

$C_{30}H_{60}I_3N_3O_3$  891.53

Ethanaminium, 2,2',2''-[1,2,3-benzenetriyltris(oxy)]tris[*N,N,N*-triethyl]-, triiodide.

[*v*-Pheneny]tris(oxyethylene)]tris[triethylammonium] triiodide [65-29-2].

» Gallamine Triethiodide contains not less than 98.0 percent and not more than 101.0 percent of  $C_{30}H_{60}I_3N_3O_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers, protected from light.

**USP Reference standards** (11)—

USP Gallamine Triethiodide RS

**Clarity and color of solution**—A solution (1 in 50) is clear and colorless.

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** A solution (1 in 100) responds to the tests for *Iodide* (191).

**pH** (791): between 5.3 and 7.0, in a solution (1 in 50).

**Loss on drying** (731)—Dry it at 100° for 4 hours: it loses not more than 1.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals** (231)—Dissolve 1.0 g in 25 mL of water: the limit is 0.002%.

**Assay**—

*Sodium perchlorate buffer*—Prepare a 0.14 M solution of sodium perchlorate in water, and adjust with 10 N sodium hydroxide or 0.05 M phosphoric acid to a pH of 3.0.

*Mobile phase*—Prepare a filtered and degassed mixture of *Sodium perchlorate buffer* and acetonitrile (69:31). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Gallamine Triethiodide RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL.

*Assay preparation*—Transfer about 25 mg of Gallamine Triethiodide, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 200-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 1.4, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into

the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{30}H_{60}I_3N_3O_3$  in the portion of Gallamine Triethiodide taken by the formula:

$$25C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Gallamine Triethiodide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Gallamine Triethiodide Injection

» Gallamine Triethiodide Injection is a sterile solution of Gallamine Triethiodide in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of gallamine triethiodide ( $C_{30}H_{60}I_3N_3O_3$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Gallamine Triethiodide RS

**Identification**—Evaporate a volume of Injection, equivalent to not less than 200 mg of gallamine triethiodide, to dryness. Take up the residue in warm alcohol, and pass through fine filter paper. Remove a portion of the filtrate, equivalent to about 100 mg of gallamine triethiodide, and evaporate to dryness: the residue responds to the *Identification* tests under *Gallamine Triethiodide*.

**Bacterial endotoxins** (85)—It contains not more than 5.0 USP Endotoxin Units per mg of gallamine triethiodide.

**pH** (791): between 6.5 and 7.5.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Sodium perchlorate buffer*, *Mobile phase*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Gallamine Triethiodide*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of gallamine triethiodide, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{30}H_{60}I_3N_3O_3$  in the portion of Injection taken by the formula:

$$100C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Gallamine Triethiodide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Gallium Citrate Ga 67 Injection

$C_6H_5^{67}GaO_7$

1,2,3-Propanetricarboxylic acid, 2-hydroxy-, gallium- $^{67}Ga$  (1:1) salt.

Gallium- $^{67}Ga$  citrate (1:1) [41183-64-6; 52260-70-5].

» Gallium Citrate Ga 67 Injection is a sterile aqueous solution of radioactive, essentially carrier-free gallium citrate Ga 67 suitable for intravenous administration. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{67}Ga$  as citrate expressed in megabecquerels (microcuries or millicuries) per mL at the time indicated in the labeling. Other chemical forms of radioactivity do not exceed 3.0 percent of the total radioactivity. It may contain a preservative or stabilizer.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* (1): the time and date of calibration; the amount of  $^{67}Ga$  as labeled gallium citrate expressed as total megabecquerels (MBq) (microcuries [ $\mu Ci$ ] or millicuries [ $mCi$ ]) and concentration as megabecquerels ( $\mu Ci$  or  $mCi$ ) per mL at the time of calibration; the expiration date and time; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calibrations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of  $^{67}Ga$  is 78.26 hours.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Bacterial endotoxins** (85)—It meets the requirements of the *Bacterial Endotoxins Test*, the limit of endotoxin content being not more than 175/V USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

**pH** (791): between 4.5 and 8.0.

**Radiochemical purity**—Place 10 to 20  $\mu L$  of Injection about 3 cm from one end of a 3- × 55-cm strip of chromatographic paper (see *Chromatography* (621)). While spots are wet, immediately develop the chromatogram at room temperature to the 14-cm mark by ascending chromatography, using a solvent system consisting of a mixture of 1.36 g of sodium acetate and 0.58 mL of glacial acetic acid in each 100 mL of water. Allow the strip to partially dry, cover with clear tape, and determine the radioactivity distribution by scanning the chromatogram with a suitable collimated radiation detector: not less than 97.0% of the total radioactivity is found as gallium citrate when measured at the solvent front ( $R_f$  value equal to or greater than 0.9).

**Radionuclide identification** (see *Radioactivity* (821))—Its gamma-ray spectrum is identical to that of a specimen of  $^{67}Ga$  of known purity that exhibits major photopeaks having energies of 93.3, 184.6, and 300.2 KeV.

**Radionuclidic purity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radionuclidic purity of the Injection: not less than 99% of the total radioactivity is present as  $^{67}Ga$  at the time of calibration.

**Other requirements**—It meets the requirements under *Injections* (1), except that the Injection may be distributed or dispensed prior to the completion of the test for *Sterility*, the latter test being started on the day of manufacture, and except that it is not subject to the recommendation on *Container Content*.

**Assay for radioactivity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radioactivity in MBq ( $\mu Ci$  or  $mCi$ ) per mL of Gallium Ga 67 Injection by use of a calibrated system as directed under *Radioactivity* (821).

## Ganciclovir

$C_9H_{13}N_5O_4$  255.23  
6H-Purin-6-one, 2-amino-1,9-dihydro-9-[[2-hydroxy-1-(hydroxymethyl)ethoxy]methyl]-;  
9-[[2-Hydroxy-1-(hydroxymethyl)ethoxy]methyl]guanine  
[82410-32-0].

### DEFINITION

Ganciclovir contains NLT 98.0% and NMT 102.0% of  $C_9H_{13}N_5O_4$ , calculated on the anhydrous basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. ULTRAVIOLET ABSORPTION** (197U)  
Sample solution: 10  $\mu g/mL$  in methanol

### ASSAY

#### PROCEDURE

**Solution A:** Trifluoroacetic acid and water (0.5 in 1000)  
**Mobile phase:** Acetonitrile and *Solution A* (1:1)

**System suitability solution:** 0.1 mg/mL each of USP Ganciclovir RS and USP Ganciclovir Related Compound A RS in *Mobile phase*. [NOTE—Sonicate the solution if necessary.]

**Standard solution:** 0.22 mg/mL of USP Ganciclovir RS in *Mobile phase*

**Sample solution:** 0.22 mg/mL of Ganciclovir in *Mobile phase*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L9

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 20  $\mu L$

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times for ganciclovir related compound A and ganciclovir are 0.9 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.4 between ganciclovir and ganciclovir related compound A

**Column efficiency:** NLT 5000 theoretical plates

**Tailing factor:** NMT 1.4

**Relative standard deviation:** NMT 1.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_9H_{13}N_5O_4$  in the portion of Ganciclovir taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Ganciclovir RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Ganciclovir in the *Sample solution* (mg/mL)  
**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

**IMPURITIES****Inorganic Impurities**

- **HEAVY METALS, Method II** (231): NMT 20 ppm
- **RESIDUE ON IGNITION** (281): NMT 0.1%

**Organic Impurities****• PROCEDURE**

**Solution A, Mobile phase, System suitability solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Sample solution:** 0.22 mg/mL of Ganciclovir in *Mobile phase*

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Ganciclovir taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each impurity in the *Sample solution*

$r_T$  = sum of the responses of all the peaks

**Acceptance criteria**

**Ganciclovir related compound A:** NMT 0.5%

**Total impurities:** NMT 1.5%

**SPECIFIC TESTS**

- **WATER DETERMINATION, Method I** (921): NMT 6.0%  
[NOTE—Ganciclovir is extremely hygroscopic.]

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.
- **USP REFERENCE STANDARDS** (11)  
USP Ganciclovir RS  
USP Ganciclovir Related Compound A RS

---

**Ganciclovir for Injection**

---

» Ganciclovir for Injection is a freeze-dried powder prepared by the neutralization of Ganciclovir with the aid of Sodium Hydroxide. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ganciclovir ( $C_9H_{13}N_5O_4$ ), calculated on the anhydrous basis.

**Caution**—Handle Ganciclovir for Injection with great care, as it is a potent cytotoxic agent and suspected carcinogen.

**Packaging and storage**—Preserve in *Containers for Sterile Solids*, as described under *Injections* (1). Store between 15° and 30°, unless otherwise specified by the manufacturer. Protect from moisture.

**Labeling**—Label it to state that it is to be handled with great care because it is a potent cytotoxic agent and suspected carcinogen.

**USP Reference standards** (11)—

USP Endotoxin RS  
USP Ganciclovir RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.84 Endotoxin Unit per mg of Ganciclovir for Injection.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product To Be Examined*.

**pH** (791): between 10.8 and 11.4, in the solution constituted as directed in the labeling.

**Water, Method I** (921)—Proceed as directed in the chapter, except to use the following modifications. Use a mixture of anhydrous formamide and methanol (1:1) in place of methanol as the titration vessel solvent. The *Reagent* volume required in order to condition the titration vessel solvent is not greater than 10% of the initial volume of solvent. The concentration of Ganciclovir for Injection in the titration vessel is not greater than 7 mg per mL. Not more than 3.0% is found.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Assay**—

**Mobile phase**—Dissolve 1.4 g of monobasic ammonium phosphate and 2.0 g of phosphoric acid in 500 mL of water in a 1000-mL volumetric flask. Dilute with water to volume, mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Transfer about 75 mg of hypoxanthine to a 500-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

**Standard stock preparation**—Dissolve an accurately weighed amount of USP Ganciclovir RS in water to obtain a solution having a known concentration of about 250 µg per mL.

**Standard preparation**—Transfer 20.0 mL of the *Standard stock preparation* and 10.0 mL of the *Internal standard solution* to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

**Assay stock preparation**—Constitute Ganciclovir for Injection in a portion of water, quantitatively transfer with water to a suitable volumetric flask, and dilute with water to volume to obtain a solution having a concentration of about 1 mg per mL.

**Assay preparation**—Transfer 5.0 mL of the *Assay stock preparation* and 10.0 mL of the *Internal standard solution* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 10-cm column that contains packing L1. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for hypoxanthine and 1.0 for ganciclovir; the resolution,  $R$ , between hypoxanthine and ganciclovir is not less than 3.0; the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak response ratios for the major peaks. Calculate

the quantity, in mg, of ganciclovir ( $C_9H_{13}N_5O_4$ ) in the container of Ganciclovir for Injection taken by the formula:

$$CD(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Ganciclovir RS in the *Standard preparation*;  $D$  is the dilution factor, in mL, used to prepare the *Assay preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of ganciclovir to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ganciclovir Oral Suspension

### DEFINITION

Ganciclovir Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of ganciclovir ( $C_9H_{13}N_5O_4$ ). Prepare Ganciclovir Oral Suspension 100 mg/mL as follows (see *Pharmaceutical Compounding* (795)—Nonsterile Preparations).

Ganciclovir	10 g
Vehicle for Oral Solution (regular or sugar-free), NF, a sufficient quantity to make	100 mL

Empty the contents of the required number of capsules into a suitable mortar, or use *Ganciclovir* powder. Add sufficient *Vehicle* to wet the powder, and triturate to form a smooth paste. Add additional *Vehicle* to about half the final volume, and transfer the contents of the mortar to a calibrated bottle. Using additional *Vehicle*, rinse the mortar, and transfer the contents, stepwise and quantitatively, to bring to final volume. Mix well.

**[CAUTION]**—Avoid skin contact or inhalation of ganciclovir by using protective gloves and a fume hood or surgical mask.]

### ASSAY

#### • PROCEDURE

**Solution A:** 25-mM monobasic sodium phosphate solution. Adjust with phosphoric acid to a pH of 2.5.

**Mobile phase:** Acetonitrile and *Solution A* (2.5: 97.5). Filter and degas.

**Internal standard solution:** 0.4 mg/mL of hypoxanthine  
**Standard stock solution:** 1.0 mg/mL of USP Ganciclovir RS

**Standard solution:** 6 µg/mL of ganciclovir and 4 µg/mL of hypoxanthine prepared from *Standard stock solution* and *Internal standard solution*

**Sample solution:** Transfer about 1 mL of Oral Suspension from each bottle to a plastic weighing cup, and weigh to determine density. [NOTE—The exact volume of Oral Suspension taken from each bottle is calculated by the suspension density.] Transfer the Oral Suspension to a 100-mL volumetric flask, and add 50 mL of water. Place the volumetric flask on a mechanical shaker for 30 min, and dilute with water to volume. Transfer 0.6 mL of this solution and 1 mL of the *Internal standard solution* to a 100-mL volumetric flask, and dilute with water to volume to obtain a solution with a nominal concentration of 6 µg/mL of ganciclovir and 4 µg/mL of hypoxanthine.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 10-cm; 5-µm packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 10 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for hypoxanthine and ganciclovir are 0.75 and 1.0, respectively.]

#### Suitability requirements

**Relative standard deviation:** NMT 1.5% for replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ganciclovir ( $C_9H_{13}N_5O_4$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of ganciclovir to the internal standard from the *Sample solution*

$R_S$  = peak response ratio of ganciclovir to the internal standard from the *Standard solution*

$C_S$  = concentration of ganciclovir in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of ganciclovir in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### SPECIFIC TESTS

- **pH (791):** 4.0–5.0

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature.
- **LABELING:** Label it to state that it is to be well shaken before use, and to state the *Beyond-Use Date*.
- **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded
- **USP REFERENCE STANDARDS (11)**  
USP Ganciclovir RS

## Absorbent Gauze

» Absorbent Gauze is cotton, or a mixture of cotton, and not more than 53.0 percent, by weight, of rayon, and is in the form of a plain woven cloth conforming to the standards set forth herein. Absorbent Gauze that has been rendered sterile is packaged to protect it from contamination.

NOTE—Condition all Absorbent Gauze for not less than 4 hours in a standard atmosphere of  $65 \pm 2\%$  relative humidity at  $21 \pm 1.1^\circ$  before determining the weight, thread count, and absorbency. Remove the Absorbent Gauze from its wrappings before placing it in the conditioning atmosphere, and if it is in the form of bolts or rolls, cut the quantity necessary for the various tests from the piece, excluding the first two and the last two meters when the total quantity of Gauze available so permits.

**Packaging and storage**—Preserve in well-closed containers. Absorbent Gauze that has been rendered sterile is so packaged that the sterility of the contents of the package is maintained until the package is opened for use.

**Labeling**—Its type or thread count, length, and width and the number of pieces contained are stated on the container, and the designation “non-sterilized” or “not sterilized” appears prominently thereon unless the Gauze has been rendered sterile, in which case it may be labeled to indicate that it is sterile. The package label of sterile Gauze indicates that the contents may not be sterile if the package bears evidence of damage or has been previously opened.

The name of the manufacturer, packer, or distributor is stated on the package.

**General characteristics**—Absorbent Gauze is white cloth of various thread counts and weights. It may be supplied in various lengths and widths, and in the form of rolls or folds.

The accompanying table designates for each commercial type the thread count and weight in g per square meter.

Type	Threads per 2.54 Cm		Average Count, Threads per 6.45 Sq. Cm	Weight, <sup>1</sup> g per Sq. Meter
	Warp	Filling		
I	41 to 47	33 to 39	76 to 84 <sup>2</sup>	43.8 to 55.8
II	30 to 34	26 to 30	57 to 63	32.9 to 41.9
III	26 to 30	22 to 26	49 to 55	28.4 to 36.2
IV	22 to 26	18 to 22	41 to 47	24.5 to 31.1
V	20 to 24	16 to 20	37 to 43	22.5 to 28.8
VI	18 to 22	14 to 18	33 to 39	19.8 to 25.2
VII	18 to 22	8 to 14	27 to 35	18.1 to 23.1
VIII	12 to 16	8 to 12	21 to 27	12.1 to 15.5

<sup>1</sup> For Absorbent Gauze that contains purified rayon, increase these values by 2.5%.

<sup>2</sup> For Type I rolled gauze, the range is 75 to 85 threads per 6.45 sq. cm.

**Thread count**—If the dimensions of the piece permit, count the warp and filling threads of Absorbent Gauze in three separate 76.2-mm squares, not counting threads nearer any edge than one-tenth of the dimension of the fabric and not including the same threads in any two counts. For pieces not greater than 76.2 mm in either dimension, count all the threads in three different places in that dimension of the piece.

Average the three counts for the warp and filling, respectively: the average lies within the ranges tabulated under *General characteristics*.

For Absorbent Gauze packaged in rolls, count the number of warp and filling threads in areas of 1.27 cm square at five points evenly spread along the center line of the bandage, no point being within 30.5 cm of either end of the bandage.

**Length**—Unfold or unroll it, smooth it without stretching it, and measure its length along the center line: the length is not less than 98.0% of that stated on the label.

**Width**—Measure the width at each of the points selected for the *Thread*: the average of the three measurements is within 1.6 mm of the width stated on the label.

**Weight**—Weigh a piece of gauze of stated size: the weight, expressed in terms of g per m<sup>2</sup>, meets the requirements for weight under *General characteristics*.

**Absorbency**—Fold about 0.1 m<sup>2</sup> into a 10-cm section. For Absorbent Gauze packaged in rolls, use the entire roll. Hold the folded or rolled Gauze horizontally almost in contact with the surface of water at approximately 25°, and allow it to drop lightly upon the water: complete submersion takes place in not more than 30 seconds.

**Sterility** (71)—Absorbent Gauze that has been rendered sterile meets the requirements.

**Dried and ignited residue, Acid or alkali, and Dextrin or starch, in water extract**—Place 20 ± 0.1 g in 500 mL of water, and boil the mixture for 15 minutes, adding boiling water as necessary to maintain the original vol-

ume. Pour the water through a funnel into a 1000-mL volumetric flask, transfer the Absorbent Gauze to the funnel, press out the excess water with a glass rod, and wash it with two 250-mL portions of boiling water, pressing the gauze after each washing. Cool the combined washings, dilute to volume, and mix. Then apply the following tests.

**Dried residue**—Evaporate 400 mL of the extract, filtering if necessary, in a suitable dish on a steam bath, and dry the residue at 105° to constant weight: the weight of the residue so obtained does not exceed an amount, in mg, calculated by the formula:

$$80 - 0.6C$$

in which C is the corrected percentage of cotton (50 mg maximum, or 0.6%).

**Ignited residue**—Ignite the dried residue in a muffle furnace at a dull-red heat to constant weight: the weight of the ignited residue does not exceed an amount, in mg, calculated by the formula:

$$20 - 0.14C$$

in which C is the corrected percentage of cotton (13 mg maximum, or 0.16%).

**Acid or alkali**—To separate 200-mL portions of the extract, add 3 drops of phenolphthalein TS and 1 drop of methyl orange TS, respectively: no pink color develops in either portion.

**Dextrin or starch**—To a 200-mL portion of the extract add 1 drop of iodine TS: no red, violet, or blue color develops.

**Residue on ignition**—Place about 5 g, accurately weighed, in a suitable dish, and moisten with 2 N sulfuric acid. Gently heat the mixture until it is charred, then ignite more strongly until the carbon is completely consumed: the weight of the residue corresponds to not more than the percentage of the weight of the Gauze, calculated by the formula:

$$0.002C + 0.015(100 - C)$$

in which C is the corrected percentage of cotton (0.89% maximum).

**Fatty matter**—Pack 10 ± 0.01 g in a continuous-extraction thimble with a tared flask, and extract with ether for 5 hours, adjusting the rate so that the ether siphons not less than four times per hour. The ether extract in the flask shows no trace of blue, green, or brownish color. Evaporate the extract to dryness, and dry at 105° to constant weight: the weight of the residue does not exceed an amount, in mg, calculated by the formula:

$$0.4C + 30$$

in which C is the corrected percentage of cotton (70 mg maximum, or 0.7%).

**Alcohol-soluble dyes**—Pack 10 g in a narrow percolator, and extract slowly with alcohol until the percolate measures 50 mL: when observed downward in a column 20 cm in depth, the percolate may show a yellowish color, but neither a blue nor a green tint.

**Cotton and rayon content**—

**Sulfuric acid solution** (59.5% by weight)—Add sulfuric acid slowly to water until the specific gravity, determined at 20°, is between 1.4902 and 1.4956.

**Procedure**—Place about 500 mg of Absorbent Gauze, previously bleached and dried at 110° to constant weight and accurately weighed, in a glass-stoppered, 125-mL flask, add 50.0 mL of *Sulfuric acid solution*, and shake by mechanical means for 30 minutes. Pass the mixture through a tared sintered-glass crucible, using three 10-mL portions of *Sulfuric acid solution* to rinse the flask and applying suction each time to drain the acid. Wash the residue in the crucible with

50 mL of 2 N sulfuric acid, then wash it with water until the filtrate is neutral to litmus. Add 40 mL of 6 N ammonium hydroxide to the crucible, allow the residue to soak for 10 minutes, then apply suction to remove the liquid. Similarly wash the residue with three 50-mL portions of water, allowing the residue to soak for 15 minutes each time. Dry the residue at 105° to 110° to constant weight. Calculate *C*, the corrected percentage of cotton, taken by the formula:

$$[100(1.046 / G) - 1.6]$$

in which *J* is the weight, in mg, of the residue; *G* is the weight, in mg, of the portion of Absorbent Gauze taken; and 1.046 and 1.6 are empirical correction factors. Calculate *R*, the corrected percentage of rayon, taken by the formula:

$$100 - C.$$

## Petrolatum Gauze

» Petrolatum Gauze is Absorbent Gauze saturated with White Petrolatum. The weight of the petrolatum in the gauze is not less than 70.0 percent and not more than 80.0 percent of the weight of petrolatum gauze. Petrolatum Gauze is sterile. It may be prepared by adding, under aseptic conditions, molten, sterile White Petrolatum to dry, sterile Absorbent Gauze, previously cut to size, in the ratio of 60 g of petrolatum to each 20 g of gauze.

**Packaging and storage**—Each Petrolatum Gauze unit is so packaged individually that the sterility of the unit is maintained until the package is opened for use.

**Labeling**—The package label bears a statement to the effect that the sterility of the Petrolatum Gauze cannot be guaranteed if the package bears evidence of damage or has been opened previously. The package label states the width, length, and type or thread count of the Gauze.

**Sterility** (71): meets the requirements.

**Other tests**—The petrolatum recovered by draining in the Assay has the characteristics of and meets the requirements of the tests under *White Petrolatum*. The conditioned gauze obtained in the Assay meets the requirements of the tests for *Thread count*, *Length*, *Width*, and *Weight* under *Absorbent Gauze*.

**Assay**—Weigh not less than 20 units of Petrolatum Gauze, place them in a heated glass funnel, maintaining the temperature at approximately 75°, and allow the petrolatum to melt and drain from the funnel. Draining may be facilitated by pressing the gauze with a glass rod or porcelain spatula.

Wash the gauze on the funnel with successive portions of warm methyl chloroform until it is free from petrolatum, allow the residual methyl chloroform to evaporate spontaneously, condition the gauze in a standard atmosphere of 65 ± 2% relative humidity at 21 ± 1.1° for not less than 4 hours, and weigh. The difference between the weight of the gauze and that of the Petrolatum Gauze taken represents the weight of petrolatum.

## Absorbable Gelatin Film

» Absorbable Gelatin Film is Gelatin in the form of a sterile, absorbable, water-insoluble film.

**Packaging and storage**—Preserve in a hermetically sealed or other suitable container in such manner that the sterility of the product is maintained until the container is opened for use.

**Labeling**—The package bears a statement to the effect that the sterility of Absorbable Gelatin Film cannot be guaranteed if the package bears evidence of damage, or if the package has been previously opened.

**Sterility** (71): meets the requirements.

**Residue on ignition** (281): not more than 2.0%.

**Proteolytic digest**—Place 150 mg (±5 mg) in a glass-stoppered, 150-mL flask containing 100 mL of a 1 in 100 solution of pepsin in 0.1 N hydrochloric acid, previously warmed to 37°. Maintain at 37 ± 1°, and agitate gently every 30 minutes until digestion is complete: the average time of three proteolytic digest determinations is between 4 and 8 hours.

## Absorbable Gelatin Sponge

» Absorbable Gelatin Sponge is Gelatin in the form of a sterile, absorbable, water-insoluble sponge.

**Packaging and storage**—Preserve in a hermetically sealed or other suitable container in such manner that the sterility of the product is maintained until the container is opened for use.

**Labeling**—The package bears a statement to the effect that the sterility of Absorbable Gelatin Sponge cannot be guaranteed if the package bears evidence of damage, or if the package has been previously opened.

**Sterility** (71): meets the requirements.

**Residue on ignition** (281): not more than 2.0%.

**Digestibility**—Place a 50-mg piece in a beaker of water. Knead gently between the fingers until thoroughly wet, and until all the air has been removed, taking care not to break the tissue. Lift from the water, and remove the excess water with absorbent paper. Place the wetted sample in a 150-mL flask that contains 100 mL of a 1 in 100 solution of pepsin in 0.1 N hydrochloric acid previously warmed to 37°. Maintain at a temperature of 37°, and agitate gently and continuously until digestion is complete: the average digestion time of three determinations is not more than 75 minutes.

**Water absorption**—Cut a portion of about 10 mg from 1 Absorbable Gelatin Sponge, weigh accurately, and place in a beaker of water. Knead gently between the fingers until thoroughly wet, and until all air has been removed, taking care not to break the tissue. Lift the portion of sponge from the water, and blot twice by pressing firmly between two pieces of absorbent paper. Drop the expressed sponge into a tared weighing bottle containing about 20 mL of water, and allow to stand for 2 minutes. Lift the sponge from the water with a suitable hooked instrument, allow to drain over the weighing bottle for 5 seconds, and discard the sponge. Again weigh the weighing bottle and water: the loss in weight represents the weight of water absorbed by the sponge. Absorbable Gelatin Sponge absorbs not less than 35 times its weight of water.

## Gemcitabine Hydrochloride

$C_9H_{11}F_2N_3O_4 \cdot HCl$  299.66

Cytidine, 2'-deoxy-2',2'-difluoro-, monohydrochloride.

2'-Deoxy-2',2'-difluorocytidine monohydrochloride ( $\beta$ -isomer) [122111-03-9].

» Gemcitabine Hydrochloride contains not less than 97.5 percent and not more than 101.5 percent of  $C_9H_{11}F_2N_3O_4 \cdot HCl$ , calculated on the as-is basis.

**Caution**—*Gemcitabine Hydrochloride is a potent cytotoxic agent. Great care should be taken to prevent inhaling particles and exposing the skin to it.*

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Cytosine RS

USP Endotoxin RS

USP Gemcitabine Hydrochloride RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** It meets the requirements of the tests for *Chloride* (191).

**Specific rotation** (781S): between +43° and +50°, at 20°.

*Test solution:* 10 mg per mL.

**pH** (791): between 2.0 and 3.0, in a solution containing 10 mg per mL.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals**, *Method I* (231): 0.001%.

**Chromatographic purity**—

*Solution A*—Proceed as directed for *Mobile phase* in the *Assay*.

*Solution B*—Prepare filtered and degassed methanol.

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed under *Chromatographic system*. Make adjustments, if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability solution*—Proceed as directed in the *Assay*.

*Standard solution*—Dissolve an accurately weighed quantity of USP Gemcitabine Hydrochloride RS and USP Cytosine RS in water, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 2 µg per mL of each.

*Test solution*—Transfer about 50 mg of Gemcitabine Hydrochloride, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—Proceed as directed under *Assay*. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–8	97	3	isocratic
8–13	97→50	3→50	linear gradient
13–20	50	50	isocratic
20–25	50→97	50→3	re-equilibration

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for gemcitabine  $\alpha$ -anomer and 1.0 for gemcitabine; the resolution,  $R$ , between gemcitabine  $\alpha$ -anomer and gemcitabine is not less than 8.0; and the tailing factor for gemcitabine is not more than 1.5. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.1 for cytosine and 1.0 for gemcitabine; the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject a volume (about 20 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of cytosine in the portion of Gemcitabine taken by the formula:

$$2.5(C_c / W)(r_t / r_s)$$

in which  $C_c$  is the concentration of USP Cytosine RS in the *Standard solution*, in µg per mL;  $W$  is the weight, in mg, of Gemcitabine taken;  $r_t$  is the peak response for cytosine in the *Test solution*; and  $r_s$  is the response for cytosine in the *Standard solution*: not more than 0.1% of cytosine is found. Calculate the percentage of each impurity other than cytosine in the portion of Gemcitabine taken by the formula:

$$2.5(C_s / W)(r_i / r_s)$$

in which  $C_s$  is the concentration of USP Gemcitabine Hydrochloride RS in the *Standard solution*, in µg per mL;  $W$  is the weight, in mg, of Gemcitabine taken;  $r_i$  is the peak response for each impurity in the *Test solution*; and  $r_s$  is the response due to gemcitabine in the *Standard solution*: not more than 0.1% of gemcitabine  $\alpha$ -anomer or any other individual impurity is found; and the sum of all impurities is not more than 0.2%. Exclude from the sum of all impurities any peaks that are below the limit of quantitation (0.02%).

**Other requirements**—Where the label states that Gemcitabine Hydrochloride is sterile, it meets the requirements for *Bacterial endotoxins* and *Sterility* under *Gemcitabine for Injection*. Where the label states that Gemcitabine Hydrochloride must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Gemcitabine for Injection*.

**Assay**—

*Mobile phase*—Prepare a filtered and degassed solution containing 13.8 g of monobasic sodium phosphate and 2.5 mL of phosphoric acid in 1000 mL of water. [NOTE—The pH of this solution is between 2.4 and 2.6.]

*System suitability solution*—Transfer about 10 mg of Gemcitabine Hydrochloride to a small vial, add 4 mL of a solution containing 168 mg of potassium hydroxide per mL of methanol, cap tightly, and sonicate. Heat at 55° for 6 to 16 hours, allow to cool, and transfer the contents to a 100-mL volumetric flask with successive washes of 1% (v/v) phosphoric acid. Dilute with 1% phosphoric acid to volume, and mix. [NOTE—This solution contains about 0.02 mg per mL of gemcitabine  $\alpha$ -anomer.]

*Standard preparation*—Dissolve an accurately weighed quantity of USP Gemcitabine Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.1 mg per mL.

*Assay preparation*—Transfer about 20 mg of Gemcitabine Hydrochloride, accurately weighed, to a 200-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 275-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1.2 mL per minute. Chromatograph the *System suitability solution*, and record the peak

responses as directed for *Procedure*: the resolution,  $R$ , between the gemcitabine  $\alpha$ -anomer and gemcitabine is not less than 8.0; and the tailing factor determined from gemcitabine is not more than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_9H_{11}F_2N_3O_4 \cdot HCl$  in the portion of Gemcitabine Hydrochloride taken by the formula:

$$200C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Gemcitabine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Gemcitabine for Injection

» Gemcitabine for Injection contains an amount of Gemcitabine Hydrochloride equivalent to not less than 95 percent and not more than 105 percent of the labeled amount of gemcitabine ( $C_9H_{11}F_2N_3O_4$ ).

**Caution**—Gemcitabine Hydrochloride is a potent cytotoxic agent. Great care should be taken to prevent inhaling particles and exposing the skin to it.

**Packaging and storage**—Preserve in *Containers for Sterile Solids*, as described under *Injections* (1). Store at controlled room temperature. Do not refrigerate after reconstitution.

### USP Reference standards (11)—

USP Cytosine RS

USP Endotoxin RS

USP Gemcitabine Hydrochloride RS

### Identification—

**A:** *Ultraviolet Absorption* (197U).

*Solution*: 16  $\mu$ g per mL.

**Medium**: 0.14 M phosphate buffer with a pH of 2.5, prepared as follows. Add 13.8 g of monobasic sodium phosphate and 2.5 mL of phosphoric acid to 1000 mL of Purified Water.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Clarity of solution**—Dissolve it in the solvent and at the concentration recommended in the labeling: not more than 10 NTU (see *Spectrophotometry and Light-Scattering* (851)), determined by ratio turbidimetry within 15 minutes of reconstitution, corrected for a diluent blank.

**Bacterial endotoxins** (85)—It contains not more than 0.05 USP Endotoxin Unit per mg of gemcitabine.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Uniformity of dosage units** (905): meets the requirements for *Weight Variation*.

**pH** (791): between 2.7 and 3.3, in a solution containing 40 mg in each mL of 0.9% sodium chloride solution.

**Particulate matter** (788): meets the requirements for small-volume injections.

### Chromatographic purity—

*Mobile phase, System suitability solution, Standard solution, and Chromatographic system*—Proceed as directed in the test for *Chromatographic purity* for *Gemcitabine Hydrochloride*.

*Test solution*—Reconstitute the vial with an appropriate amount of water to achieve a solution of 2 mg per mL, based on the labeled content of gemcitabine.

*Procedure*—Proceed as directed in *Chromatographic purity* for *Gemcitabine Hydrochloride*. Calculate the amount of cytosine, expressed as a percentage of gemcitabine hydrochloride, by the formula:

$$0.1(263.20/299.66)(C_C V/L)(r_i / r_S)$$

in which 263.20 and 299.66 are the molecular weights of gemcitabine and gemcitabine hydrochloride, respectively;  $C_C$  is the concentration of USP Cytosine RS in the *Standard solution*, in  $\mu$ g per mL;  $V$  is the volume, in mL, of water used to reconstitute the vial;  $L$  is the labeled amount of gemcitabine in the vial, in mg;  $r_i$  is the peak response for cytosine in the *Test solution*; and  $r_S$  is the response for cytosine in the *Standard solution*: not more than 0.1% of cytosine is found. Similarly, calculate the amount of each impurity other than cytosine, expressed as a percentage of gemcitabine hydrochloride, by the formula:

$$0.1(263.20/299.66)(C_S V/L)(r_i / r_S)$$

in which 263.20 and 299.66 are the molecular weights of gemcitabine and gemcitabine hydrochloride, respectively;  $C_S$  is the concentration of USP Gemcitabine Hydrochloride RS in the *Standard solution*, in  $\mu$ g per mL;  $V$  is the volume, in mL, of water used to reconstitute the vial;  $L$  is the labeled amount of gemcitabine in the vial, in mg;  $r_i$  is the response for gemcitabine  $\alpha$ -anomer or any other individual impurity in the *Test solution*; and  $r_S$  is the peak response for gemcitabine in the *Standard solution*. Not more than 0.1% of gemcitabine  $\alpha$ -anomer is found; not more than 0.2% each of any other impurity is found; and the sum of all impurities is not more than 0.3%. Exclude from the sum of all impurities any peaks that are below the limit of quantitation (0.02%).

### Assay—

*Mobile phase, System suitability solution, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Gemcitabine Hydrochloride*.

*Assay preparation*—Constitute a suitable number of vials of Gemcitabine for Injection with Purified Water to obtain a solution having a concentration of about 0.1 mg per mL, based on the labeled content of gemcitabine.

*Procedure*—Proceed as directed in the *Assay* under *Gemcitabine Hydrochloride*. Calculate the amount, in mg, of gemcitabine ( $C_9H_{11}F_2N_3O_4$ ) in each vial of Gemcitabine for Injection taken by the formula:

$$(263.20/299.66)(CV/N)(r_U / r_S)$$

in which 263.20 and 299.66 are the molecular weights of gemcitabine and gemcitabine hydrochloride, respectively;  $V$  is the total volume, in mL, of the *Assay preparation*;  $N$  is the number of vials taken; and the other terms are as defined therein.

## Gemfibrozil

$$\text{C}_{15}\text{H}_{22}\text{O}_3 \quad 250.33$$

Pentanoic acid, 5-(2,5-dimethylphenoxy)-2,2-dimethyl-  
2,2-Dimethyl-5-(2,5-xylyloxy)valeric acid [25812-30-0].

» Gemfibrozil contains not less than 98.0 percent and not more than 102.0 percent of  $C_{15}H_{22}O_3$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards**  $\langle 11 \rangle$ —

USP Gemfibrozil RS

USP Gemfibrozil Related Compound A RS

(*E,Z*)-2,2-Dimethyl-5-[2,5-dimethyl-4-(propene-1-yl)phenoxy]valeric acid.

$C_{18}H_{26}O_3$  290.40

**Identification,** *Infrared Absorption* (197K).

**Melting range** (741): between 58° and 61°.

**Water, Method I** (921): not more than 0.25%.

**Heavy metals, Method II (231):** 0.002%.

### Related compounds—

**Mobile phase**—Add 10 mL of glacial acetic acid to 750 mL of methanol in a 1000-mL volumetric flask, dilute with water to volume, mix, and pass through a membrane filter.

**System suitability solution**—Dissolve accurately weighed quantities of USP Gemfibrozil RS, USP Gemfibrozil Related Compound A RS, and 2,5-dimethylphenol in *Mobile phase* to obtain a solution having known concentrations of about 0.2 mg per mL, 0.05 mg per mL, and 0.05 mg per mL, respectively.

**Standard solution**—Transfer 10 mg each of USP Gemfibrozil RS and USP Gemfibrozil Related Compound A RS, both accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Test solution**—Transfer about 100 mg of Gemfibrozil, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 276-nm detector and a 4.0-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.35 for 2,5-dimethylphenol, 1.0 for gemfibrozil, and 2.1 for gemfibrozil related compound A; and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for at least three times the retention time of gemfibrozil, and measure the areas for the major peaks. Calculate the percentage of gemfibrozil related compound A in the portion of Gemfibrozil taken by the formula:

$$1000(C/W)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Gemfibrozil Related Compound A RS in the *Standard solution*; W is the weight, in mg, of Gemfibrozil taken to prepare the *Test solution*; and  $r_U$  and  $r_S$  are the peak areas for gemfibrozil related compound A obtained from the *Test so-*

lution and the *Standard solution*, respectively: not more than 0.1% of gemfibrozil related compound A is found. Calculate the percentage of any other impurity in the portion of Gemfibrozil taken by the formula:

$$1000(C_G / W)(r_i / r_G)$$

in which  $C_G$  is the concentration, in mg per mL, of USP Gemfibrozil RS in the *Standard solution*;  $r_i$  is the peak area of each individual impurity obtained from the *Test solution*;  $r_G$  is the gemfibrozil peak area obtained from the *Standard solution*; and  $W$  is as defined above: not more than 0.1% of any other impurity is found; and not more than 0.5% of total impurities is found.

**Assay—**

**Mobile phase**—Add 10 mL of glacial acetic acid to 800 mL of methanol in a 1000-mL volumetric flask, dilute with water to volume, mix, and pass through a membrane filter.

**Standard preparation**—Dissolve a suitable quantity of USP Gemfibrozil RS, accurately weighed, in methanol to obtain a solution having a known concentration of about 1 mg per mL. Transfer 5.0 mL of this solution to a 25.0-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Transfer about 100 mg of Gemfibrozil, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a 25.0-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**System suitability preparation**—Prepare a solution in *Mobile phase* containing, in each mL, about 0.2 mg of gemfibrozil and about 0.05 mg of 2,5-xyleneol.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 276-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 0.8 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph about 10 µL of the *System suitability preparation*: the resolution, *R*, between gemfibrozil and 2,5-xenolol is not less than 8.0.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph by means of a suitable microsyringe or sampling valve, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{15}H_{22}O_3$  in the portion of Gemfibrozil taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Gemfibrozil RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Gemfibrozil Capsules

» Gemfibrozil Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of gemfibrozil ( $C_{15}H_{22}O_3$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards**  $\langle 11 \rangle$ —

USP Gemfibrozil RS

**Identification**—Shake a portion of Capsule contents, equivalent to about 100 mg of gemfibrozil, with 10 mL of 0.1 N sodium hydroxide. Filter the mixture into a 50-mL centrifuge tube, and acidify the filtrate with 3 N sulfuric acid

to obtain a copious precipitate. Centrifuge, and discard the clear solution. Wash the precipitate with small portions of water, and allow it to air-dry: the IR absorption spectrum of a potassium bromide dispersion of the precipitate, previously dried over silica gel for 4 hours, exhibits maxima only at the same wavelengths as those of a similar preparation of USP Gemfibrozil RS.

#### Dissolution <711>—

**Medium:** 0.2 M pH 7.5 phosphate buffer prepared by dissolving 545 g of monobasic potassium phosphate in 5 L of water, adding 131 g of sodium hydroxide, diluting with water to about 19.5 L, and mixing well. Adjust with either 1 N phosphoric acid or 1 N sodium hydroxide to a pH of 7.5, and dilute with water to 20 L; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 45 minutes.

**Procedure**—Determine the amount of  $C_{15}H_{22}O_3$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm on filtered portions of the solution under test, suitably diluted with 1 N sodium hydroxide, in comparison with a Standard solution obtained as follows. Prepare a Standard stock solution of USP Gemfibrozil RS having a known concentration of about 0.33 mg per mL in **Medium**. [NOTE—Initially dissolve the USP Reference Standard in an amount of methanol not to exceed 1% of the volume of the Standard stock solution.] Quantitatively dilute the Standard stock solution with 1 N sodium hydroxide to obtain a Standard solution having a concentration estimated to correspond to that of the filtered and diluted solution under test.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{15}H_{22}O_3$  is dissolved in 45 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

#### Assay—

**Mobile phase, Standard preparation, and System suitability preparation**—Proceed as directed in the Assay under Gemfibrozil.

**Assay preparation**—Remove, as completely as possible, the contents of not fewer than 20 Capsules, weigh, and mix. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of gemfibrozil, to a 100-mL volumetric flask, add about 80 mL of methanol, and shake to dissolve. Dilute with methanol to volume, mix, and filter. Transfer 5.0 mL of this clear solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the Assay under Gemfibrozil. Calculate the quantity, in mg, of  $C_{15}H_{22}O_3$  in the portion of Capsules taken by the formula:

$$500C(r_U / r_S)$$

in which the terms are as defined therein.

## Gemfibrozil Tablets

» Gemfibrozil Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of gemfibrozil ( $C_{15}H_{22}O_3$ ).

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards <11>—

USP Gemfibrozil RS

**Identification**—A portion of finely ground Tablets, equivalent to about 100 mg of gemfibrozil, responds to the *Identification* test under Gemfibrozil Capsules.

#### Dissolution <711>—

**Medium:** 0.2 M pH 7.5 phosphate buffer prepared by dissolving 545 g of monobasic potassium phosphate in 5 L of water, adding 131 g of sodium hydroxide, diluting with water to about 19.5 L, and mixing well. Adjust with either 1 N phosphoric acid or 1 N sodium hydroxide to a pH of 7.5, and dilute with water to 20 L; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes.

**Procedure**—Determine the amount of  $C_{15}H_{22}O_3$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm on filtered portions of the solution under test, suitably diluted with 1 N sodium hydroxide, in comparison with a Standard solution obtained as follows. Prepare a Standard stock solution of USP Gemfibrozil RS having a known concentration of about 0.33 mg per mL in **Medium**. [NOTE—Initially dissolve the USP Reference Standard in an amount of methanol not to exceed 1% of the volume of the Standard stock solution.] Quantitatively dilute the Standard stock solution with 1 N sodium hydroxide to obtain a Standard solution having a concentration estimated to correspond to that of the filtered and diluted solution under test.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{15}H_{22}O_3$  is dissolved in 30 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

#### Assay—

**Mobile phase, Standard preparation, System suitability preparation, and Chromatographic system**—Proceed as directed in the Assay under Gemfibrozil.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of gemfibrozil, to a 100-mL volumetric flask, add about 80 mL of methanol, and shake to dissolve. Dilute with methanol to volume, mix, and filter. Transfer 5.0 mL of this clear solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the Assay under Gemfibrozil. Calculate the quantity, in mg, of gemfibrozil ( $C_{15}H_{22}O_3$ ) in the portion of Tablets taken by the formula:

$$500C(r_U / r_S)$$

in which the terms are as defined therein.

## Gentamicin Sulfate

Gentamicin sulfate (salt).

Gentamycin sulfate [1405-41-0].

» Gentamicin Sulfate is the sulfate salt, or a mixture of such salts, of the antibiotic substances produced by the growth of *Micromonospora purpurea*. It has a potency equivalent to not less than 590 µg of gentamicin per mg, calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Gentamicin Sulfate RS

**Identification**—

A: *Infrared Absorption* (197K).

B: It responds to the tests for *Sulfate* (191).

**Specific rotation** (781S): between +107° and +121°.

*Test solution*: 10 mg per mL, in water.

**pH** (791): between 3.5 and 5.5, in a solution (1 in 25).

**Loss on drying** (731)—Dry it in vacuum at a pressure not exceeding 5 mm of mercury at 110° for 3 hours: it loses not more than 18.0% of its weight.

**Residue on ignition** (281): not more than 1.0%.

**Limit of methanol**—

*Internal standard solution*—Transfer 2.5 mL of *n*-propyl alcohol to a 500-mL volumetric flask, dilute with water to volume, and mix. This solution contains 0.50% (v/v) of *n*-propyl alcohol.

*Standard preparation*—Transfer 1.25 mL of methanol and 1.25 mL of *n*-propyl alcohol to a 500-mL volumetric flask, dilute with water to volume, and mix to obtain a *Standard preparation* containing 0.25% (v/v) of methanol and 0.25% (v/v) of *n*-propyl alcohol.

*Control solution*—Dissolve 0.50 g of Gentamicin Sulfate in 2.0 mL of water.

*Test preparation*—Dissolve 0.50 g of Gentamicin Sulfate in 1.0 mL of *Internal standard solution*, add 1.0 mL of water, and mix.

*Chromatographic system* (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 4-mm × 1.5-m column packed with support S3. The column temperature is maintained at a constant temperature between 120° and 140°, and the injection port and detector block are maintained at a constant temperature at least 50° higher than the column temperature. Nitrogen is used as the carrier gas at a constant flow rate of between 30 and 40 mL per minute. Chromatograph the *Standard preparation*, and measure the peak responses as directed under *Procedure*: the resolution,  $R$ , between the *n*-propyl alcohol peak and the methanol peak is not less than 1.0. Chromatograph the *Control solution*, measure the peak responses as directed under *Procedure*, and examine the chromatogram: if any peak is observed at a retention time corresponding to that of *n*-propyl alcohol, use the response of that peak to correct the *n*-propyl alcohol peak response in the chromatogram obtained from the *Test preparation*.

*Procedure*—Using a syringe with a polytef-tipped plunger, separately inject equal volumes (about 2 µL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the *n*-propyl alcohol and the methanol peak area responses. Calculate the percentage of methanol in the Gentamicin Sulfate taken by the formula:

$$1.58(P/M)(R_U/R_S)$$

in which  $P$  is the percentage (v/v) of methanol in the *Standard preparation*;  $M$  is the quantity, in g, of Gentamicin Sulfate taken to prepare the *Test preparation*;  $R_U$  is the ratio of the methanol peak area response to the *n*-propyl alcohol peak area response (corrected, if necessary, by subtracting the response of any peak at the locus of the *n*-propyl alcohol peak observed in the chromatogram of the *Control solution*) in the chromatogram obtained from the *Test preparation*; and  $R_S$  is the ratio of the methanol peak area response to the *n*-propyl alcohol peak area response in the chromato-

gram obtained from the *Standard preparation*: not more than 1.0% of methanol is found.

**Content of gentamicins**—

*o*-Phthalaldehyde solution—Dissolve 1.0 g of *o*-phthalaldehyde in 5 mL of methanol, and add 95 mL of 0.4 M boric acid, previously adjusted with 8 N potassium hydroxide to a pH of 10.4, and 2 mL of thioglycolic acid. Adjust the resulting solution with 8 N potassium hydroxide to a pH of 10.4.

*Mobile phase*—Mix 700 mL of methanol, 250 mL of water, and 50 mL of glacial acetic acid. Dissolve 5 g of sodium 1-heptanesulfonate in this solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Prepare a solution of USP Gentamicin Sulfate RS in water containing about 0.65 mg per mL. Transfer 10 mL of this solution to a suitable test tube, add 5 mL of isopropyl alcohol and 4 mL of *o*-Phthalaldehyde solution, mix, and add isopropyl alcohol to obtain 25 mL of solution. Heat at 60° in a water bath for 15 minutes, and cool.

*Test preparation*—Using Gentamicin Sulfate, proceed as directed for *Standard preparation*.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 330-nm detector and a 5-mm × 10-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the resolution,  $R$ , between any two peaks is not less than 1.25, the capacity factor determined from the gentamicin  $C_1$  peak is between 2 and 7, the column efficiency determined from the gentamicin  $C_2$  peak is not less than 1200 theoretical plates, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. The elution order is gentamicin  $C_1$ , gentamicin  $C_{1a}$ , gentamicin  $C_{2a}$ , and gentamicin  $C_2$ . Calculate the percentage contents of gentamicin  $C_1$ , gentamicin  $C_{1a}$ , gentamicin  $C_{2a}$ , and gentamicin  $C_2$  in the portion of Gentamicin Sulfate taken by the formula:

$$100r_i/r_s$$

in which  $r_i$  is the peak area response corresponding to the particular gentamicin; and  $r_s$  is the sum of the area responses of all four peaks: the content of gentamicin  $C_1$  is between 25% and 50%, the content of gentamicin  $C_{1a}$  is between 10% and 35%, and the sum of the contents of gentamicin  $C_{2a}$  and gentamicin  $C_2$  is between 25% and 55%.

**Other requirements**—Where the label states that Gentamicin Sulfate is sterile, it meets the requirements for *Sterility Tests* (71) and for *Bacterial endotoxins* in *Gentamicin Injection*. Where the label states that Gentamicin Sulfate must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* in *Gentamicin Injection*.

**Assay**—Proceed with Gentamicin Sulfate as directed under *Antibiotics—Microbial Assays* (81).

## Gentamicin Sulfate Cream

» Gentamicin Sulfate Cream contains the equivalent of not less than 90.0 percent and not more

than 135.0 percent of the labeled amount of gentamicin.

**Packaging and storage**—Preserve in collapsible tubes or in other tight containers, and avoid exposure to excessive heat.

**USP Reference standards** (11)—  
USP Gentamicin Sulfate RS

**Identification**—Shake a quantity of Cream, equivalent to about 5 mg of gentamicin, with a mixture of 200 mL of chloroform and 5 mL of water. Allow to separate, and filter the aqueous phase: the filtrate so obtained meets the requirements of the *Identification* test under *Gentamicin Injection*.

**Minimum fill** (755): meets the requirements.

**Assay**—Proceed with Cream as directed in the *Assay* under *Gentamicin Sulfate Ointment*.

---

## Gentamicin Uterine Infusion

---

» Gentamicin Uterine Infusion is a sterile solution of Gentamicin Sulfate in Water for Injection. It contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of gentamicin. It may contain suitable buffers, preservatives, and sequestering agents.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

**Labeling**—Label Uterine Infusion to indicate that it is for veterinary use only. The label states that it must be diluted with 0.9% Sodium Chloride Irrigation before aseptic uterine infusion.

**USP Reference standards** (11)—  
USP Gentamicin Sulfate RS

**Identification**—It responds to the *Identification* test under *Gentamicin Injection*, Uterine Infusion being used instead of Injection.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 3.0 and 5.5.

**Assay**—Proceed as directed for gentamicin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Uterine Infusion diluted quantitatively and stepwise with *Buffer No. 3* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard (0.1 µg of gentamicin per mL).

---

## Gentamicin Injection

---

» Gentamicin Injection contains an amount of Gentamicin Sulfate equivalent to not less than 90.0 percent and not more than 125.0 percent of the labeled amount of gentamicin. It may contain suitable buffers, preservatives, and sequestering agents, unless it is intended for intrathecal use, in which case it contains only suitable tonicity agents.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Gentamicin Sulfate RS

**Identification**—Apply separately a volume of Injection equivalent to 20 µg of gentamicin and the same volume of a similar preparation of USP Gentamicin Sulfate RS to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel having an average pore size of 6 nm. [NOTE—Dilute the Injection with water, if necessary, to obtain a test solution containing 1000 µg of gentamicin per mL. Where the Injection contains less than 1000 µg per mL, apply a volume of it, equivalent to 20 µg of gentamicin, to the chromatographic plate, in separate portions of not more than 20 µL each, each application being allowed to dry before the next is applied.] Place the plate in a suitable chromatographic chamber, and develop the chromatogram in a solvent system consisting of the lower phase of a mixture of chloroform, methanol, and ammonium hydroxide (20:13:10) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, air-dry, and expose the plate to vapors of iodine in a detection jar containing iodine crystals: the intensities and  $R_f$  values of the three principal spots obtained from the test solution correspond to those obtained from the Standard solution.

**Bacterial endotoxins** (85)—It contains not more than 0.71 USP Endotoxin Unit per mg of gentamicin.

**pH** (791): between 3.0 and 5.5.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Injection diluted quantitatively and stepwise with *Buffer No. 3* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard (0.1 µg of gentamicin per mL).

---

## Gentamicin Sulfate Ointment

---

» Gentamicin Sulfate Ointment contains the equivalent of not less than 90.0 percent and not more than 135.0 percent of the labeled amount of gentamicin.

**Packaging and storage**—Preserve in collapsible tubes or other tight containers, and avoid exposure to excessive heat.

**USP Reference standards** (11)—  
USP Gentamicin Sulfate RS

**Identification**—Shake a quantity of Ointment, equivalent to about 5 mg of gentamicin, with a mixture of 200 mL of chloroform and 5 mL of water. Allow to separate, and filter the aqueous layer: the filtrate so obtained meets the requirements of the *Identification* test under *Gentamicin Injection*.

**Minimum fill** (755): meets the requirements.

**Water, Method I** (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

**Assay**—Proceed with Ointment as directed under *Antibiotics—Microbial Assays* (81), using an accurately weighed quantity of Ointment, equivalent to about 1 mg of gentamicin, shaken with about 50 mL of ether in a separator, and extracted with four 20-mL portions of *Buffer No. 3*. Combine the aqueous extracts, and dilute quantita-

tively and stepwise with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

### Gentamicin Sulfate Ophthalmic Ointment

» Gentamicin Sulfate Ophthalmic Ointment contains the equivalent of not less than 90.0 percent and not more than 135.0 percent of the labeled amount of gentamicin.

**Packaging and storage**—Preserve in collapsible ophthalmic ointment tubes, and avoid exposure to excessive heat.

**USP Reference standards** (11)—

USP Gentamicin Sulfate RS

**Identification**—Shake a quantity of Ophthalmic Ointment, equivalent to about 5 mg of gentamicin, with a mixture of 200 mL of chloroform and 5 mL of water. Allow to separate, and filter the aqueous layer: the filtrate so obtained meets the requirements of the *Identification* test under *Gentamicin Injection*.

**Sterility** (71): meets the requirements.

**Minimum fill** (755): meets the requirements.

**Metal particles**—It meets the requirements of the test for *Metal Particles in Ophthalmic Ointments* (751).

**Other requirements**—It meets the requirements of the test for *Water* and of the *Assay* in *Gentamicin Sulfate Ointment*.

### Gentamicin Sulfate Ophthalmic Solution

» Gentamicin Sulfate Ophthalmic Solution is a sterile, buffered solution of Gentamicin Sulfate with preservatives. It contains the equivalent of not less than 90.0 percent and not more than 135.0 percent of the labeled amount of gentamicin.

**Packaging and storage**—Preserve in tight containers, and avoid exposure to excessive heat.

**USP Reference standards** (11)—

USP Gentamicin Sulfate RS

**pH** (791): between 6.5 and 7.5.

**Other requirements**—It meets the requirements of the *Identification* test under *Gentamicin Injection* and meets the requirements under *Sterility Tests* (71), when tested as directed in the section *Membrane Filtration in Test for Sterility of the Product To Be Examined*.

**Assay**—Proceed with Ophthalmic Solution as directed in the *Assay* under *Gentamicin Injection*.

### Gentamicin Sulfate and Betamethasone Acetate Ophthalmic Solution

» Gentamicin Sulfate and Betamethasone Acetate Ophthalmic Solution contains not less than

90.0 percent and not more than 125.0 percent of the labeled amount of gentamicin and contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of betamethasone acetate ( $C_{24}H_{31}FO_6$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Betamethasone Acetate RS

USP Gentamicin Sulfate RS

**Identification**—

**A:** Apply 10  $\mu$ L of Ophthalmic Solution and 10  $\mu$ L of a Standard solution containing 5 mg per mL of USP Gentamicin Sulfate RS in water to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and in a paper-lined tank develop the chromatogram in a solvent system consisting of the lower phase mixture of dichloromethane, methanol, and ammonium hydroxide (1:1:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the plate to air-dry. Locate the spots on the plate by placing it in a tank containing about 15 g of iodine crystals for 15 minutes: the  $R_f$  values of the three principal spots obtained from the test solution correspond to those obtained from the Standard solution.

**B:** The retention time of the major peak obtained in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay for betamethasone acetate*.

**pH** (791): between 5.5 and 7.0.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration in Test for Sterility of the Product To Be Examined*.

**Other requirements**—It meets the requirements under *Antimicrobial Effectiveness Tests* (51).

**Assay for gentamicin**—Proceed as directed for gentamicin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Ophthalmic Solution diluted quantitatively and stepwise with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

**Assay for betamethasone acetate**—

*Mobile phase*—Prepare a filtered and degassed mixture of water and acetonitrile (8:7). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Internal standard solution*—Dissolve a quantity of *o*-phenylphenol in methanol to obtain a solution containing about 0.55 mg per mL.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Betamethasone Acetate RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.45 mg per mL. Transfer 2.0 mL of this solution to a 10-mL volumetric flask, add 1.0 mL of *Internal standard solution*, dilute with methanol to volume, and mix to obtain a solution having a known concentration of about 0.09 mg of USP Betamethasone Acetate RS per mL.

*Assay preparation*—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 2 mg of betamethasone acetate, to a 10-mL volumetric flask. Dilute with methanol to volume, and mix. Transfer a portion of this solution to a centrifuge tube, and centrifuge. Transfer 4.0 mL of the clear supernatant to a 10-mL volumetric flask. Add 1.0 mL of *Internal standard solution*, dilute with a mixture of methanol and water (1:1) to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-mm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative retention times are about 1.3 for o-phenylphenol and 1.0 for betamethasone acetate; the resolution,  $R$ , between the betamethasone acetate and o-phenylphenol peaks is not less than 3.9; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of betamethasone acetate ( $C_{24}H_{31}FO_6$ ) in each mL of the Ophthalmic Solution taken by the formula:

$$25(C/V)(R_U/R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Betamethasone Acetate RS, calculated on the anhydrous basis, in the *Standard preparation*;  $V$  is the volume, in mL, of Ophthalmic Solution taken to prepare the *Assay preparation*; and  $R_U$  and  $R_S$  are the ratios of the betamethasone acetate peak response to the internal standard peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Gentamicin Sulfate and Betamethasone Valerate Ointment

» Gentamicin Sulfate and Betamethasone Valerate Ointment contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of gentamicin and an amount of betamethasone valerate equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of betamethasone ( $C_{22}H_{29}FO_5$ ).

**Packaging and storage**—Preserve in collapsible tubes or other tight containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Betamethasone Valerate RS

USP Beclomethasone Dipropionate RS

USP Gentamicin Sulfate RS

**Identification**—

**A:** Transfer an amount of Ointment, equivalent to about 15 mg of gentamicin, to a centrifuge tube, and add 10 mL of a mixture of methanol and 0.1 N hydrochloric acid (4:1) and 25 mL of solvent hexane. Rotate for 30 minutes, and centrifuge. Discard the upper phase. Apply 25  $\mu$ L of the lower phase and 25  $\mu$ L of a Standard solution containing 3 mg per mL of USP Gentamicin Sulfate RS in a mixture of methanol and 0.1 N hydrochloric acid (4:1) to a suitable thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of the lower phase of a mixture of chloroform, methanol, and ammonium hydroxide (1:1:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the spots to air-dry. Locate the spots on the plate by placing it in a tank containing about 15 g of iodine crys-

als for 15 minutes: the  $R_f$  values of the three principal spots obtained from the test solution correspond to those obtained from the Standard solution.

**B:** The retention time of the major peak obtained in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay for betamethasone*.

**Microbial enumeration tests** <61> and **Tests for specified microorganisms** <62>—It meets the requirements of the tests for absence of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Salmonella* species, and *Escherichia coli*.

**Minimum fill** <755>: meets the requirements.

**Assay for gentamicin**—Proceed as directed for gentamicin under *Antibiotics—Microbial Assays* <81>, using an accurately weighed quantity of Ointment, equivalent to about 3 mg of gentamicin, shaken with about 50 mL of ether in a separator and extracted with three 25-mL portions of *Buffer No. 3*. Combine the aqueous extracts, and dilute quantitatively and stepwise with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

**Assay for betamethasone**—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and water (475:300). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Diluent**—Transfer 25 mL of water to a 500-mL volumetric flask. Add 2.5 mL of glacial acetic acid, dilute with methanol to volume, and mix.

**Internal standard solution**—Dissolve a quantity of USP Beclomethasone Dipropionate RS in *Diluent* to obtain a solution containing about 0.4 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Betamethasone Valerate RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.45 mg per mL. Transfer 5.0 mL of this solution to a stoppered vial, add 10.0 mL of *Internal standard solution*, and mix to obtain a solution having a known concentration of about 0.15 mg of USP Betamethasone Valerate RS per mL.

**Assay preparation**—Transfer an accurately weighed portion of Ointment, equivalent to about 2 mg of betamethasone, to a 50-mL centrifuge tube. Add 10.0 mL of *Internal standard solution* and 5.0 mL of *Diluent*, and shake vigorously for 10 minutes. Place the tube in an ice-methanol bath for 15 minutes, then centrifuge to separate the phases. Transfer the clear supernatant to a stoppered flask, and allow to warm to room temperature (*Assay preparation*).

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 2.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.5 for beclomethasone dipropionate and 1.0 for betamethasone valerate; the resolution,  $R$ , between the betamethasone valerate and beclomethasone dipropionate peaks is not less than 3.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of betamethasone ( $C_{22}H_{29}FO_5$ ) in the portion of Ointment taken by the formula:

$$(392.47 / 476.58)(15C)(R_U / R_S)$$

in which 392.47 and 476.58 are the molecular weights of betamethasone and betamethasone valerate, respectively;  $C$  is the concentration, in mg per mL, of USP Betamethasone Valerate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are

the ratios of the betamethasone valerate peak response to the internal standard peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Gentamicin Sulfate and Betamethasone Valerate Otic Solution

» Gentamicin Sulfate and Betamethasone Valerate Otic Solution contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of gentamicin and an amount of betamethasone valerate equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of betamethasone ( $C_{22}H_{29}FO_5$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

### USP Reference standards (11)—

USP Beclomethasone Dipropionate RS

USP Betamethasone Valerate RS

USP Gentamicin Sulfate RS

### Identification—

**A:** Transfer an amount of Otic Solution, equivalent to about 3 mg of gentamicin, to a centrifuge tube. Dissolve an accurately weighed quantity of USP Gentamicin Sulfate RS quantitatively in water to obtain a solution having a concentration of about 5 mg per mL. Transfer 1.0 mL of this solution to a centrifuge tube. To each centrifuge tube add 3 mL of water and 4 g of potassium carbonate, and mix. Add 1 mL of isopropyl alcohol to each tube, mix, and centrifuge. Use the upper phases as the test solution and Standard solution, respectively. Separately apply 20  $\mu$ L of each of these solutions to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of the lower phase of a mixture of methanol, dichloromethane, and ammonium hydroxide (1:1:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the plate to air-dry. Locate the spots on the plate by placing it in a tank containing about 15 g of iodine crystals for 15 minutes: the  $R_f$  values of the three principal spots obtained from the test solution correspond to those obtained from the Standard solution.

**B:** The retention time of the major peak obtained in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay for betamethasone*.

**pH** (791): between 3.0 and 5.0.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Salmonella* species, and *Escherichia coli*.

**Assay for gentamicin**—Proceed as directed for gentamicin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Otic Solution diluted quantitatively and stepwise with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

### Assay for betamethasone—

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile and water (3:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Prepare a mixture of methanol and glacial acetic acid (1000:1).

**Internal standard solution**—Dissolve a quantity of USP Beclomethasone Dipropionate RS in methanol to obtain a solution containing about 0.8 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Betamethasone Valerate RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1.2 mg per mL. Transfer 2.0 mL of this solution to a 10-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with *Diluent* to volume, and mix to obtain a solution having a known concentration of about 0.24 mg of USP Betamethasone Valerate RS per mL.

**Assay preparation**—Add 5.0 mL of *Internal standard solution* to a 10-mL volumetric flask. Transfer to the flask an accurately measured volume of Otic Solution, equivalent to about 2 mg of betamethasone, dilute with methanol to volume, and mix. Centrifuge a portion of this solution, and use the clear supernatant as the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative retention times are about 1.6 for beclomethasone dipropionate and 1.0 for betamethasone valerate; the resolution,  $R$ , between the betamethasone valerate and beclomethasone dipropionate peaks is not less than 3.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of betamethasone ( $C_{22}H_{29}FO_5$ ) in each mL of the Otic Solution taken by the formula:

$$(392.47 / 476.58)(10C / V)(R_U / R_S)$$

in which 392.47 and 476.58 are the molecular weights of betamethasone and betamethasone valerate, respectively;  $C$  is the concentration, in mg per mL, of USP Betamethasone Valerate RS in the *Standard preparation*;  $V$  is the volume, in mL, of Otic Solution taken to prepare the *Assay preparation*; and  $R_U$  and  $R_S$  are the ratios of the betamethasone valerate peak response to the internal standard peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Gentamicin Sulfate and Betamethasone Valerate Topical Solution

» Gentamicin Sulfate and Betamethasone Valerate Topical Solution contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of gentamicin and an amount of betamethasone valerate equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of betamethasone ( $C_{22}H_{29}FO_5$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** <11>—

USP Beclomethasone Dipropionate RS

USP Betamethasone Valerate RS

USP Gentamicin Sulfate RS

**Identification**—

**A:** Separately apply 50  $\mu$ L of Topical Solution and 50  $\mu$ L of a Standard solution containing 1.2 mg per mL of USP Gentamicin Sulfate RS in water to a thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of the lower phase of a mixture of methanol, chloroform, and ammonium hydroxide (1:1:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the plate to air-dry. Locate the spots on the plate by placing it in a tank containing about 15 g of iodine crystals for 15 minutes: the  $R_f$  values of the three principal spots obtained from the test solution correspond to those obtained from the Standard solution.

**B:** The retention time of the major peak obtained in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay for betamethasone*.

**pH** <791>: between 3.0 and 4.5.

**Microbial enumeration tests** <61> and **Tests for specified microorganisms** <62>—It meets the requirements of the tests for absence of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Salmonella* species, and *Escherichia coli*.

**Assay for gentamicin**—Proceed as directed for gentamicin under *Antibiotics—Microbial Assays* <81>, using an accurately measured volume of Topical Solution diluted quantitatively and stepwise with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

**Assay for betamethasone**—

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile and water (3:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Diluent**—Prepare a mixture of methanol and glacial acetic acid (1000:1).

**Internal standard solution**—Dissolve a quantity of USP Beclomethasone Dipropionate RS in methanol to obtain a solution containing about 0.6 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Betamethasone Valerate RS in *Diluent* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.35 mg per mL. Transfer 5.0 mL of this solution to a 25-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with a mixture of methanol and water (4:1) to volume, and mix to obtain a solution having a known concentration of about 0.07 mg of USP Betamethasone Valerate RS per mL.

**Assay preparation**—Add 5.0 mL of *Internal standard solution* to a 25-mL volumetric flask. Transfer to the flask an accurately measured volume of Topical Solution, equivalent to about 1.4 mg of betamethasone, dilute with a mixture of methanol and water (4:1) to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative retention times are about 1.6 for beclomethasone dipropionate and 1.0 for betamethasone valerate; the resolution,  $R_s$ , between the betamethasone valerate and beclomethasone dipropionate peaks is not less than 4.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of betamethasone ( $C_{22}H_{29}FO_5$ ) in each mL of the Topical Solution taken by the formula:

$$(392.47 / 476.58)(25C / V)(R_U / R_S)$$

in which 392.47 and 476.58 are the molecular weights of betamethasone and betamethasone valerate, respectively;  $C$  is the concentration, in mg per mL, of USP Betamethasone Valerate RS in the *Standard preparation*;  $V$  is the volume, in mL, of Topical Solution taken to prepare the *Assay preparation*; and  $R_U$  and  $R_S$  are the ratios of the betamethasone valerate peak response to the internal standard peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Gentamicin and Prednisolone Acetate Ophthalmic Ointment

» Gentamicin and Prednisolone Acetate Ophthalmic Ointment contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of gentamicin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of prednisolone acetate ( $C_{23}H_{30}O_6$ ).

**Packaging and storage**—Preserve in collapsible ophthalmic ointment tubes, and avoid exposure to excessive heat.

**USP Reference standards** <11>—

USP Gentamicin Sulfate RS

USP Prednisolone Acetate RS

**Identification**—

**A:** Shake a quantity of Ophthalmic Ointment, equivalent to about 5 mg of gentamicin, with a mixture of 200 mL of chloroform and 5 mL of water. Allow to separate, and filter the aqueous layer: the filtrate so obtained meets the requirements of the *Identification* test under *Gentamicin Sulfate Injection*.

**B:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay for prednisolone acetate* exhibits a major peak for prednisolone acetate, the retention time of which corresponds to that obtained in the chromatogram of the *Standard preparation* obtained as directed in the *Assay for prednisolone acetate*.

**Sterility** <71>: meets the requirements.

**Minimum fill** <755>: meets the requirements.

**Water, Method I** <921>: not more than 2.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

**Metal particles**—It meets the requirements of the test for *Metal Particles in Ophthalmic Ointments* <751>.

**Assay for gentamicin**—Proceed with Ophthalmic Ointment as directed for gentamicin under *Antibiotics—Microbial Assays* <81>, using an accurately weighed quantity of Ophthalmic Ointment, equivalent to about 1 mg of gentamicin, shaken with about 50 mL of ether in a separator, and extracted with four 20-mL portions of *Buffer No. 3*. Combine the aqueous extracts, and dilute quantitatively and stepwise with *Buffer No. 3* to obtain a *Test Dilution* having a concentration of gentamicin assumed to be equal to the median dose level of the Standard.

**Assay for prednisolone acetate—**

**Mobile phase**—Prepare a suitable mixture of water and acetonitrile (60:40), and pass through a suitable filter having a porosity of 1  $\mu\text{m}$  or less. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Internal standard solution**—Prepare a solution in methanol containing about 2.7 mg of fluorometholone acetate per mL.

**Standard preparation**—Transfer about 38 mg of USP Prednisolone Acetate RS, accurately weighed, to a 100-mL volumetric flask, dissolve in methanol, dilute with methanol to volume, and mix. Transfer 8.0 mL of this solution to a 50-mL volumetric flask, add 25 mL of *n*-hexane, and shake. Add 2.0 mL of *Internal standard solution*, dilute with methanol to volume, and shake vigorously for 30 seconds. Allow the layers to separate, remove the upper *n*-hexane layer by aspiration, and discard the aspirate. Dilute the solution in the volumetric flask with methanol to volume, and mix. Centrifuge a portion of this solution, and use the clear liquid as the *Standard preparation*. This solution contains about 0.06 mg of USP Prednisolone Acetate RS per mL.

**Assay preparation**—Transfer an accurately weighed portion of Ophthalmic Ointment, equivalent to about 3 mg of prednisolone acetate, to a 50-mL volumetric flask, add 25 mL of *n*-hexane, and shake. Add 2.0 mL of *Internal standard solution*, dilute with methanol to volume, and shake vigorously for 30 seconds. Allow the layers to separate, remove the upper *n*-hexane layer by aspiration, and discard the aspirate. Dilute the solution in the volumetric flask with methanol to volume, and mix. Centrifuge a portion of this solution, and use the clear liquid as the *Assay preparation*.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  20-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and measure the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5; the resolution, *R*, between the prednisolone acetate peak and the fluorometholone acetate peak is not less than 2.0; the column efficiency is not less than 2500 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 30  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of prednisolone acetate ( $\text{C}_{23}\text{H}_{30}\text{O}_6$ ) in the portion of Ophthalmic Ointment taken by the formula:

$$50C(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Prednisolone Acetate RS in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the ratios of the response of the prednisolone acetate peak area to that of the fluorometholone acetate peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Gentamicin and Prednisolone Acetate Ophthalmic Suspension

» Gentamicin and Prednisolone Acetate Ophthalmic Suspension is a sterile aqueous suspension containing Gentamicin Sulfate and Prednisolone Acetate. It contains the equivalent of not less than 90.0 percent and not more than

130.0 percent of the labeled amount of gentamicin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of prednisolone acetate ( $\text{C}_{23}\text{H}_{30}\text{O}_6$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Gentamicin Sulfate RS

USP Prednisolone Acetate RS

**Identification**—

**A:** It meets the requirements of the *Identification* test in *Gentamicin Injection*.

**B:** The retention time of the prednisolone acetate peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for prednisolone acetate*.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* in *Test for Sterility of the Product To Be Examined*.

**pH** <791>: between 5.4 and 6.6.

**Assay for gentamicin**—Proceed with Ophthalmic Suspension as directed in the *Assay in Gentamicin Sulfate Injection*.

**Assay for prednisolone acetate—**

**Diluting solvent**—Mix 700 mL of methanol and 300 mL of water.

**Mobile phase**—Prepare a suitable mixture of water and acetonitrile (60:40), and pass through a suitable filter having a porosity of 1  $\mu\text{m}$  or less. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Transfer about 60 mg of USP Prednisolone Acetate RS, accurately weighed, to a 50-mL volumetric flask, dissolve in methanol, dilute with methanol to volume, and mix. Transfer 8.0 mL of this solution to a second 50-mL volumetric flask, dilute with *Diluting solvent* to volume, and mix. This solution contains about 0.2 mg of USP Prednisolone Acetate RS per mL.

**Assay preparation**—Transfer an accurately measured volume of well-mixed Ophthalmic Suspension, equivalent to about 10 mg of prednisolone acetate, to a 50-mL volumetric flask, dilute with *Diluting solvent* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and measure the peak responses as directed under *Procedure*: the tailing factor for the analyte peak is not more than 1.25, the column efficiency is not less than 2000 theoretical plates, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 30  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of prednisolone acetate ( $\text{C}_{23}\text{H}_{30}\text{O}_6$ ), in each mL of the Ophthalmic Suspension taken by the formula:

$$50(C / V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Prednisolone Acetate RS in the *Standard preparation*; *V* is the volume, in mL, of Ophthalmic Suspension taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the prednisolone acetate peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Gentian Violet

$C_{25}H_{30}ClN_3$  407.98

Methanaminium, *N*-[4-bis[4-(dimethylamino)phenyl]methylene]-2,5-cyclohexadien-1-ylidene]-*N*-methyl-, chloride;

C. I. Basic violet 3;

[4-Bis[*p*-(dimethylamino)phenyl]methylene]-2,5-cyclohexadien-1-ylidene]dimethylammonium chloride [548-62-9].

### DEFINITION

Gentian Violet contains NLT 96.0% and NMT 100.5% of gentian violet ( $C_{25}H_{30}ClN_3$ ), calculated on the anhydrous basis.

### IDENTIFICATION

- **A.**  
**Sample:** 1 mg  
**Analysis:** Sprinkle the *Sample* on 1 mL of sulfuric acid.  
**Acceptance criteria:** The *Sample* dissolves in the acid with an orange or brown-red color. When this solution is diluted cautiously with water, the color changes to brown, then to green, and finally to blue.
- **B.**  
**Sample:** 20 mg  
**Analysis:** Dissolve the *Sample* in 10 mL of water, and add 5 drops of hydrochloric acid. To 5 mL of this solution add tannic acid TS dropwise.  
**Acceptance criteria:** A deep blue precipitate is formed.
- **C.**  
**Sample:** The remainder of the solution prepared for Identification test B  
**Analysis:** To the *Sample* add about 500 mg of zinc dust, and warm the mixture.  
**Acceptance criteria:** Rapid decolorization occurs. Place a drop of the decolorized solution adjacent to a drop of 6 N ammonium hydroxide on a filter paper: a blue color is produced at the zone of contact.

### ASSAY

#### PROCEDURE

**Sample solution:** Transfer about 400 mg of Gentian Violet to a 300-mL conical flask, add 25 mL of water and 10 mL of hydrochloric acid, displace the air in the flask with carbon dioxide, and pass a stream of carbon dioxide through the flask. Add 50.0 mL of 0.1 N titanium trichloride VS, heat to boiling, and boil gently for 10 min, swirling the liquid occasionally. Cool the solution, and add 5 mL of ammonium thiocyanate solution (1 in 10).

#### Analysis

**Sample:** *Sample solution*

Titrate with 0.1 N ferric ammonium sulfate VS until a faint red color is produced. Perform a blank determination. Each mL of 0.1 N titanium trichloride is equivalent to 20.40 mg of gentian violet ( $C_{25}H_{30}ClN_3$ ).

**Acceptance criteria:** 96.0%–100.5% on the anhydrous basis

### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 1.5%

- **ARSENIC, Method I** (211)

**Test preparation:** Mix 300 mg with 2.5 g each of powdered potassium nitrate and anhydrous sodium carbonate, and heat the mixture in a crucible until the organic matter is completely oxidized. Dissolve the cooled residue in 15 mL of 2 N sulfuric acid, and evaporate the solution by heating until copious white fumes begin to evolve. Dissolve the residue in 35 mL of water.

**Analysis:** Proceed as directed in the chapter.

**Acceptance criteria:** NMT 10 ppm

#### LEAD

**Sample solution:** Place 1.0 g in a small Kjeldahl flask, add 5 mL of sulfuric acid, and insert a small funnel into the flask. Gently rotate the flask until the sulfuric acid has completely wetted the sample, then heat gently until complete carbonization has taken place. Allow to cool, and add, in small quantities, 5 mL of nitric acid. Again heat gently until copious white fumes are evolved. Allow to cool, add another 5 mL of nitric acid, and again heat until white fumes are evolved. Allow to cool, cautiously add about 25 mL of water, and boil for a few min. After cooling, neutralize to litmus paper with ammonium hydroxide, and add 5 mL of nitric acid. Transfer the solution to a 100-mL volumetric flask, and dilute with water to volume.

**Analysis:** Use 20 mL of this solution for the limit test for Lead (251). Perform a blank determination.

**Acceptance criteria:** NMT 30 ppm

#### ZINC

**Standard stock solution:** 1 g/mL of zinc prepared as follows. Transfer 1 g of zinc to a 1000-mL volumetric flask, add 50 mL of nitric acid, and dilute with water to volume.

**Standard solution:** 0.50 µg/mL of zinc, from *Standard stock solution* in water

**Sample solution:** Weigh 0.50 g of Gentian Violet in a suitable tared crucible. Place in a low-temperature plasma ashing apparatus, and ash until a constant weight is attained. Pipet 10 mL of 6 N nitric acid into the crucible, and heat to dissolve the ash. Transfer the solution to a 500-mL volumetric flask, and dilute with water to volume. Prepare a reagent blank.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Apparatus:** Atomic absorption spectrophotometer

**Analytical wavelength:** Zinc emission line, 213.9 nm

**Lamp:** Zinc

**Flame:** Air–acetylene

**Blank:** Water

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and reagent blank

**Acceptance criteria:** 0.05%; the absorbance of the *Sample solution*, corrected for that of the reagent blank, is NMT the absorbance of the *Standard solution*, similarly corrected.

#### ORGANIC IMPURITIES

**Sample solution A:** 1 mg/mL of Gentian Violet in methanol

**Sample solution B:** 0.01 mg/mL of Gentian Violet in methanol from *Sample solution A*

**Chromatographic system**(See *Chromatography* <621>, *Thin-Layer Chromatography*.)**Mode:** TLC**Adsorbent:** 0.25-mm layer of octadecylsilanized chromatographic silica gel**Application volume:** 5  $\mu$ L**Developing solvent system:** Upper layer separated from a well-shaken mixture of butyl alcohol, glacial acetic acid, and water (80:20:100)**Analysis****Samples:** *Sample solution A* and *Sample solution B*

Allow the spots to dry, and develop the chromatogram in a suitable chamber with a solvent system until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, allow the solvent to evaporate, and visually locate the spots on the plate.

**Acceptance criteria:** 1.0%; *Sample solution A* exhibits a principal spot and NMT one secondary spot, which, if present in the chromatogram from *Sample solution A*, is not more intense than the principal spot from *Sample solution B*.**SPECIFIC TESTS**

- **WATER DETERMINATION**, *Method I* <921>: NMT 7.5%

- **ALCOHOL-INSOLUBLE SUBSTANCES**

**Sample:** 1.0 g**Analysis:** Boil the *Sample* with 50 mL of alcohol under a reflux condenser for 15 min, pass through a tared filtering crucible, wash the residue on the filter with hot alcohol until the last washing is not colored violet, and dry the crucible at 105° for 1 h.**Acceptance criteria:** NMT 1.0% of insoluble residue remains.**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

---

**Gentian Violet Cream**

---

**DEFINITION**Gentian Violet Cream is Gentian Violet in a suitable cream base. It contains, in each 100 g, NLT 1.20 g and NMT 1.60 g of gentian violet ( $C_{25}H_{30}ClN_3$ ).**IDENTIFICATION**

- **A.**  
**Sample:** 0.1 g  
**Analysis:** Dissolve the *Sample* in 5 mL of sulfuric acid.  
**Acceptance criteria:** An orange or brown-red color is produced.
- **B.** The visible absorption spectrum of the *Sample solution* used for measurement of absorbance in the *Assay* exhibits maxima at the same wavelengths as that of a similar solution of USP Gentian Violet RS, concomitantly measured.

**ASSAY**

- **PROCEDURE**

**Standard solution:** 13.5  $\mu$ g/mL of USP Gentian Violet RS in hydrochloric acid**Sample stock solution:** Transfer 500 mg of Cream to a 100-mL volumetric flask. Add 15 mL of hydrochloric acid, warm in a water bath to disperse the Cream thoroughly, cool, and add hydrochloric acid to volume. Pass the mixture through a sintered-glass filter of fine pore size.**Sample solution:** Pipet 2 mL of the *Sample stock solution* into a 10-mL volumetric flask, and add hydrochloric acid to volume.**Blank:** Hydrochloric acid**Instrumental conditions****Analytical wavelength:** 435 nm**Cell:** 1 cm. [NOTE—Use quartz cells having tightly fitting covers to prevent the corrosion caused by hydrochloric acid.]**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the quantity, in g/100 g, of gentian violet ( $C_{25}H_{30}ClN_3$ ) in the portion of Cream taken:

$$\text{Result} = (A_U/A_S) \times C_S \times (1/W) \times V \times D \times (1/F) \times 100$$

 $A_U$  = absorbance from the *Sample solution* $A_S$  = absorbance from the *Standard solution* $C_S$  = concentration of USP Gentian Violet RS in the *Standard solution* ( $\mu$ g/mL) $W$  = weight of the sample in the *Sample stock solution*, 0.5 g $V$  = volume of the *Sample stock solution*, 100 mL $D$  = dilution factor, 5 $F$  = conversion factor,  $10^6 \mu$ g/g**Acceptance criteria:** It contains, in each 100 g, 1.20–1.60 g of gentian violet ( $C_{25}H_{30}ClN_3$ ).**PERFORMANCE TESTS**

- **MINIMUM FILL** <755>: Meets the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in collapsible tubes or other tight containers, and avoid exposure to excessive heat.
- **USP REFERENCE STANDARDS** <11>  
USP Gentian Violet RS

---

**Gentian Violet Topical Solution**

---

**DEFINITION**Gentian Violet Topical Solution contains, in each 100 mL, NLT 0.95 g and NMT 1.05 g of gentian violet ( $C_{25}H_{30}ClN_3$ ).**IDENTIFICATION**

- **A.**  
**Sample solution:** 1 in 5 dilution in water  
**Analysis:** Add 5 drops of hydrochloric acid. To 5 mL of this solution add tannic acid TS dropwise.  
**Acceptance criteria:** A deep blue precipitate is formed.
- **B.**  
**Sample solution:** 1 in 5 dilution in water  
**Analysis:** To the remaining solution from *Identification* test A add 500 mg of zinc dust, and warm the mixture.  
**Acceptance criteria:** Rapid decolorization occurs. Place a drop of the decolorized solution adjacent to a drop of 6 N ammonium hydroxide on a filter paper. A blue color is produced at the zone of contact.

**ASSAY**

- **PROCEDURE**

**Sample solution:** Pipet 25 mL of Topical Solution into a 300-mL conical flask, add 25 mL of water and 10 mL of hydrochloric acid, displace the air in the flask with carbon dioxide, and pass a stream of carbon dioxide through the flask. Add 50.0 mL of 0.1 N titanium trichloride VS, heat to boiling, and boil gently for 10 min, swirling the liquid occasionally. Cool the solution, and add 5 mL of ammonium thiocyanate solution (1 in 10).**Analysis:** Titrate with 0.1 N ferric ammonium sulfate VS until a faint red color is produced. Perform a blank determination. Each mL of 0.1 N titanium trichloride is equivalent to 20.40 mg of gentian violet ( $C_{25}H_{30}ClN_3$ ).

**Acceptance criteria:** It contains, in each 100 mL, 0.95–1.05 g of gentian violet ( $C_{25}H_{30}ClN_3$ ).

### SPECIFIC TESTS

#### • SOLUTION OF RESIDUE IN ALCOHOL

**Sample:** 10 mL

**Analysis:** Evaporate the *Sample* on a steam bath to dryness.

**Acceptance criteria:** The residue dissolves completely in 10 mL of alcohol.

#### • ALCOHOL DETERMINATION (611): 8.0%–10.0%

### ADDITIONAL REQUIREMENTS

#### • PACKAGING AND STORAGE: Preserve in tight containers.

## Glimepiride

$C_{24}H_{34}N_4O_5S$  490.62

1*H*-Pyrrole-1-carboxamide, 3-ethyl-2,5-dihydro-4-methyl-*N*-[2-[4-[[[(4-methylcyclohexyl)amino]carbonyl]amino]sulfonyl]phenyl]ethyl]-2-oxo-, *trans*-.

1-[[*p*-[2-(3-Ethyl-4-methyl-2-oxo-3-pyrroline-1-carboxamido)ethyl]phenyl]sulfonyl]-3-(*trans*-4-methylcyclohexyl)urea [93479-97-1].

» Glimepiride contains not less than 98.0 percent and not more than 102.0 percent of  $C_{24}H_{34}N_4O_5S$ , calculated on the anhydrous basis.

**Packaging and storage**—Store in well-closed containers, at a temperature not exceeding 25°.

### USP Reference standards (11)—

USP Glimepiride RS

USP Glimepiride Related Compound A RS  
Glimepiride *cis*-isomer.

USP Glimepiride Related Compound B RS  
Glimepiride sulfonamide.

USP Glimepiride Related Compound C RS  
Glimepiride urethane.

USP Glimepiride Related Compound D RS  
Glimepiride 3-isomer.

### Identification, Infrared Absorption (197K).

**Water, Method 1c (921)**—Dissolve about 0.25 g of Glimepiride, accurately weighed, in dimethylformamide previously dried over a molecular sieve (2 mm, pore size 0.4 nm), and dilute with the same solvent to 5.0 mL. Use 1.0 mL of the solution. Perform a blank determination, using 1.0 mL of the solvent. The water content is not more than 0.5%.

**Residue on ignition (281):** not more than 0.2%.

**Heavy metals, Method II (231):** 0.001%.

### Limit of *cis*-isomer (glimepiride related compound A)—

**Mobile phase**—Transfer 100 mL of isopropyl alcohol into a 1-L volumetric flask, add 1 mL of glacial acetic acid, dilute with hexane to volume, filter, and degas.

**System suitability stock solution**—Dissolve about 1 mg of USP Glimepiride Related Compound A RS in 1 mL of methylene chloride. Add 3 mL of *Mobile phase*, and mix.

**System suitability solution**—Transfer about 10 mg of USP Glimepiride RS to a 20-mL volumetric flask, and dissolve in 5 mL of methylene chloride. Dilute with *Mobile phase* to volume, and mix. Transfer 5 mL of this solution to a separate flask, add 50  $\mu$ L of the *System suitability stock solution*, and mix.

**Test solution**—Transfer about 10 mg of Glimepiride to a 20-mL volumetric flask, and dissolve in 5 mL of methylene chloride. Dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 228-nm detector and a 3-mm  $\times$  15-cm column containing 5- $\mu$ m packing L20. The flow rate is about 0.5 mL per minute. [NOTE—The analyses could also be performed with 4.6-mm  $\times$  15-cm, 4.6-mm  $\times$  25-cm, 4-mm  $\times$  12.5-cm, or 4-mm  $\times$  25-cm columns containing packing L20. It is recommended that the flow rate be adjusted to about 1.1 mL per minute for a 4.6-mm column and to about 0.8 mL per minute for a 4.0-mm column.] Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are 1.0 for glimepiride and not more than 0.9 for the glimepiride *cis*-isomer, and the signal-to-noise ratio of the glimepiride *cis*-isomer peak is not less than 15.

**Procedure**—Inject about 10  $\mu$ L of the *Test solution* into the chromatograph, and measure the peak areas for the glimepiride *cis*-isomer and glimepiride. Calculate the percentage of glimepiride *cis*-isomer in the portion of Glimepiride taken by the formula:

$$100r_{cis} / (r_{cis} + r_G)$$

in which  $r_{cis}$  and  $r_G$  are the peak areas for the glimepiride *cis*-isomer and glimepiride, respectively: not more than 0.8% of the glimepiride *cis*-isomer is found.

### Related compounds—

**Mobile phase, Diluent, System suitability solution, and Chromatographic system**—Prepare as directed in the *Assay*.

**Test solution**—Use the *Assay preparation*.

**Diluted test solution 1**—Dilute 5.0 mL of the *Test solution* with *Diluent* to 100.0 mL. Dilute 5.0 mL of the solution obtained with *Diluent* to 50.0 mL. This solution contains about 0.001 mg of glimepiride per mL.

**Diluted test solution 2**—Dilute 1.0 mL of *Diluted test solution 1* with *Diluent* to 10.0 mL.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Test solution* and *Diluted test solutions 1* and 2 into the chromatograph, record the chromatograms, and measure the peak response for glimepiride obtained from *Diluted test solution 1* and the responses for all other peaks, except the glimepiride peak, obtained from the *Test solution*. Disregard any peak with an area less than that of the glimepiride peak in the chromatogram obtained from *Diluted test solution 2*. Continue the elution for 2.5 times the retention time of the glimepiride peak. Calculate the percentage of each related compound (see *Table 1*) and any unknown impurity in the portion of Glimepiride taken by the formula:

$$100(C_S / C_T)(r_i / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of glimepiride in *Diluted test solution 1*;  $C_T$  is the concentration, in mg per mL, of glimepiride in the *Test solution*;  $r_i$  is the peak response for each individual peak obtained from the *Test solution*; and  $r_S$  is the glimepiride peak obtained from *Diluted test solution 1*.

Table 1

Name	Relative Retention Time	Limit (%)
Glimepiride related compound B <sup>1</sup>	0.2	0.4
Glimepiride related compound C <sup>2</sup>	0.3	0.1
Glimepiride related compound D <sup>3</sup>	1.1	0.2

<sup>1</sup> Glimepiride-sulfonamide<sup>2</sup> Glimepiride-urethane<sup>3</sup> Glimepiride-3-isomer

In addition to not exceeding the limits for each impurity in Table 1, not more than 0.1% of any unspecified individual impurity is found; and not more than 0.5% of total impurities, excluding glimepiride related compound B, is found.

**Assay—**

**Mobile phase**—Dissolve 0.5 g of monobasic sodium phosphate in 500 mL of water. Adjust with phosphoric acid to a pH of 2.1 to 2.7, and add 500 mL of acetonitrile.

**Diluent**—Prepare a mixture of acetonitrile and water (4:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Glimepiride RS in *Diluent* to obtain a solution having a known concentration of about 0.2 mg per mL.

**System suitability solution**—Prepare a solution in *Diluent* containing 0.1 mg each of USP Glimepiride Related Compound B RS, USP Glimepiride Related Compound C RS, and USP Glimepiride Related Compound D RS per mL. Dilute 1 mL of this solution with the *Standard preparation* to 50 mL.

**Assay preparation**—Transfer about 20.0 mg of Glimepiride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix. [NOTE—Keep the *Assay preparation* at a temperature not exceeding 12°, and store it no longer than 15 hours.]

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 228-nm detector and a 4-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and identify the glimepiride peak and the peaks due to the related compounds listed in Table 1. Record the peak responses as directed for *Procedure*: the resolution, *R*, between glimepiride related compound B and glimepiride related compound C is not less than 4.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas of the major peaks. Calculate the percentage of C<sub>24</sub>H<sub>34</sub>N<sub>4</sub>O<sub>5</sub>S in the portion of Glimepiride taken by the formula:

$$10,000(C/W)[100/(100 - L)](r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Glimepiride RS in the *Standard preparation*; W is the weight, in mg, of Glimepiride taken to prepare the *Assay preparation*; L is the percentage of water as determined in the test for *Water*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses for the glimepiride obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Glimepiride Tablets

**DEFINITION**

Glimepiride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of glimepiride (C<sub>24</sub>H<sub>34</sub>N<sub>4</sub>O<sub>5</sub>S).

**IDENTIFICATION**

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****• PROCEDURE**

[NOTE—Store the solutions containing glimepiride for NMT 24 h.]

**Mobile phase:** Dissolve 0.5 g of monobasic sodium phosphate in 500 mL of water. Adjust with 10% phosphoric acid to a pH of 2.1–2.7, and add 500 mL of acetonitrile.

**Diluent:** Acetonitrile and water (9:1)

**System suitability solution:** 0.1 mg/mL of USP Glimepiride RS and 0.02 mg/mL each of USP Glimepiride Related Compound B RS and USP Glimepiride Related Compound C RS in *Diluent*

**Standard solution:** 0.1 mg/mL of USP Glimepiride RS in *Diluent*

**Sample solution:** Transfer 5 whole Tablets into a suitable volumetric flask to prepare a solution of approximately 0.1 mg/mL of glimepiride, based on the label claim. Add water to 10% of the volume of the flask. Shake the flask to completely dissolve the Tablets. Add acetonitrile to about 70% of the volume of the flask, and swirl. Sonicate the samples in a water bath not to exceed 20° for NLT 5 min and NMT 10 min, with occasional shaking. Allow the solutions to come to room temperature, dilute with acetonitrile to volume, mix, and filter.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 228 nm

**Column:** 4-mm × 12.5-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for glimepiride related compound B, glimepiride related compound C, and glimepiride are 0.25, 0.35, and 1.0, respectively. Identify the glimepiride peak and the peaks due to the related compounds based on their relative retention times.]

**Suitability requirements**

**Resolution:** NLT 1.5 between glimepiride related compound B and glimepiride related compound C, *System suitability solution*

**Tailing factor:** NMT 2.0 for the glimepiride peak, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of glimepiride (C<sub>24</sub>H<sub>34</sub>N<sub>4</sub>O<sub>5</sub>S) in the portion of Tablets taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

*r<sub>U</sub>* = peak response from the *Sample solution*

*r<sub>S</sub>* = peak response from the *Standard solution*

*C<sub>S</sub>* = concentration of glimepiride in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of glimepiride in the  
Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

## PERFORMANCE TESTS

### • DISSOLUTION <711>

#### Test 1

**Medium:** pH 7.8 phosphate buffer (0.58 g of monobasic potassium phosphate and 8.86 g of dibasic sodium phosphate, anhydrous, in 1000 mL of water, adjusted with 10% phosphoric acid or 1 N sodium hydroxide to a pH of 7.8); 900 mL

**Apparatus 2:** 75 rpm

**Time:** 15 min

**Mobile phase:** Prepare as directed in the Assay.

**Diluting solution:** Methanol and water (1:1)

**Standard solution:** Prepare a solution of USP Glimepiride RS in a mixture of acetonitrile and water (90:10) having a known concentration of about 0.125 mg/mL of glimepiride. Transfer 4.0 mL of this solution into a 200-mL volumetric flask, dilute with *Medium* to volume, and mix. Transfer 15.0 mL of this solution into a 50-mL volumetric flask, dilute with *Diluting solution* to volume, and mix. The final solution contains about 0.75 µg/mL of glimepiride.

**Sample solution:** Withdraw approximately 10 mL of the solution under test, and transfer to a centrifuge tube. Centrifuge for 5 min at 2500 rpm. Pipet 3.0 mL of the supernatant into a 10-mL volumetric flask, dilute with *Diluting solution* to volume, and mix.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 228 nm

**Column:** 4.0-mm × 12.5-cm; packing L1

**Flow rate:** 1.0 mL/min

**Injection size:** 50 µL

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis:** Calculate the percentage of the labeled amount of glimepiride ( $C_{24}H_{34}N_4O_5S$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of glimepiride ( $C_{24}H_{34}N_4O_5S$ ) is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** pH 7.8 phosphate buffer (add 250 mL of 0.2 M monobasic potassium phosphate to 223 mL of 0.2 M sodium hydroxide, dilute with water to 1 L, and adjust with 0.2 M sodium hydroxide or phosphoric acid to a pH of 7.8); 900 mL

**Apparatus 2:** 75 rpm

**Time:** 45 min

**Buffer solution:** 4.0 g/L of ammonium acetate in water. Adjust with acetic acid to a pH of 5.3.

**Mobile phase:** Acetonitrile and *Buffer solution* (1:1)

**Diluent:** Methanol and acetonitrile (1:1)

**Standard stock solution:** 0.22 mg/mL of USP Glimepiride RS in *Diluent*

**Standard solution:** (L/1000) mg/mL of USP Glimepiride RS in *Medium*, from the *Standard stock solution*, where L is the label claim in mg/Tablet

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 225 nm

**Column:** 4.6-mm × 10-cm; 5-µm packing L1

**Flow rate:** 1.3 mL/min

**Injection size:** 100 µL

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis:** Calculate the percentage of the labeled amount of glimepiride ( $C_{24}H_{34}N_4O_5S$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of glimepiride ( $C_{24}H_{34}N_4O_5S$ ) is dissolved.

**Test 3:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

**Medium:** pH 7.8 phosphate buffer (prepared as indicated for *Test 1*); 900 mL

**Apparatus 2:** 75 rpm

**Time:** 20 min

**Buffer solution:** 1.36 g/L of monobasic potassium phosphate in water. Adjust with 10% sodium hydroxide to a pH of  $7.0 \pm 0.05$ .

**Mobile phase:** *Buffer solution* and acetonitrile (675:325)

**Standard stock solution:** 0.22 mg/mL of USP Glimepiride RS in methanol

**Standard solution:** (L/1000) mg/mL of glimepiride in *Medium*, from the *Standard stock solution*, where L is the label claim in mg/Tablet

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 228 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L1

**Column temperature:** 35°

**Flow rate:** 1.5 mL/min

**Injection size:** 100 µL

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 2000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis:** Calculate the percentage of the labeled amount of glimepiride ( $C_{24}H_{34}N_4O_5S$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of glimepiride ( $C_{24}H_{34}N_4O_5S$ ) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

**IMPURITIES****• ORGANIC IMPURITIES**

[NOTE—Store the solutions containing glimepiride for NMT 24 h.]

**Mobile phase and Diluent:** Prepare as directed in the Assay.

**System suitability solution:** 4 µg/mL of USP Glimepiride RS and 2 µg/mL each of USP Glimepiride Related Compound B RS and USP Glimepiride Related Compound C RS in Diluent

**Sensitivity solution:** Transfer 5.0 mL of the *System suitability solution* into a 100-mL volumetric flask, and dilute with Diluent to volume.

**Sample solution:** Finely powder NLT 10 Tablets, and transfer a portion of the powder to a 50-mL centrifuge tube. Add Diluent to prepare a solution containing 0.1 mg/mL of glimepiride, based on the label claim. Sonicate in a water bath at a temperature not to exceed 20° for NLT 5 min and NMT 10 min, with occasional mixing. Centrifuge the samples, and use the clear supernatant.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 228 nm

**Column:** 4-mm × 25-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

**System suitability**

**Samples:** *System suitability solution* and *Sensitivity solution*

[NOTE—The relative retention times for glimepiride related compound B, glimepiride related compound C, and glimepiride are 0.2, 0.3, and 1.0, respectively. Identify the glimepiride peak and the peaks due to the related compounds based on their relative retention times.]

**Suitability requirements**

**Resolution:** NLT 4 between glimepiride related compound B and glimepiride related compound C, *System suitability solution*

**Relative standard deviation:** NMT 2.0% of the glimepiride peak, *System suitability solution*

**Signal-to-noise ratio:** NLT 10, *Sensitivity solution*

Calculate the signal-to-noise ratio, *S/N*, for the peaks of glimepiride related compounds B and C:

$$\text{Result} = (2H)/h$$

*H* = measured height of the respective related compound peak

*h* = amplitude of the average measured baseline noise

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

[NOTE—Continue the elution for at least two times the retention time of the glimepiride peak.]

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times (1/F) \times 100$$

*r<sub>U</sub>* = peak response for each impurity from the *Sample solution*

*r<sub>T</sub>* = sum of all the peak responses from the *Sample solution*

*F* = relative response factor: 1.3 for glimepiride related compound B, and 1.0 for any other impurity

**Acceptance criteria**

**Glimepiride related compound B:** NMT 2.5%

**Any other individual impurity:** NMT 0.5%

**Total impurities (excluding glimepiride related compound B):** NMT 1.0%

**Total impurities (including glimepiride related compound B):** NMT 3.5%

[NOTE—Disregard any peak less than 0.1%.]

**ADDITIONAL REQUIREMENTS**

**• PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.

**• LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

**• USP REFERENCE STANDARDS <11>**

**Identification—**

**A:** *Infrared Absorption* <197K>.

**B:** *Ultraviolet Absorption* <197U>—

*Solution:* 20 µg per mL.

*Medium:* methanol.

**C:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Loss on drying** <731>—Dry it in vacuum at 100° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** <281>: not more than 0.4%.

**Heavy metals, Method II** <231>—The limit is 0.005%.

**Related compounds**—[NOTE—Use low-actinic glassware for solutions containing glipizide and glipizide related compounds.]

**TEST 1** (limit of methyl-*N*-4-[2-(5-methylpyrazine-2-carboxamido)ethyl] benzenesulfonyl carbamate)—

**Buffer solution**—Add 4.0 mL of *n*-butylamine to 1000 mL of water. Adjust with phosphoric acid to a pH of  $3.00 \pm 0.05$ .

**Diluent**—Prepare a mixture of water, acetonitrile, and methanol (3:1:1).

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution*, acetonitrile, and methanol (3:1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard stock solution**—Prepare a solution of USP Glipizide RS in methanol containing about 0.1 mg per mL.

**Standard solution**—Prepare a solution of USP Glipizide Related Compound A RS in methanol containing about 0.1 mg per mL. Pipet 2.0 mL of this solution into a 100-mL volumetric flask, add 2.0 mL of the *Standard stock solution*, dilute with *Diluent* to volume, and mix. This solution contains about 0.002 mg of USP Glipizide RS and about 0.002 mg of USP Glipizide Related Compound A RS per mL.

**Test solution**—Transfer about 25 mg of Glipizide, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Pipet 4.0 mL of this solution into a 10-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The column temperature is maintained at 30°. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 5.0% for each peak. [NOTE—The retention time of the glipizide peak is about 45 minutes; for the purpose of identification, the relative retention times for glipizide related compound A and glipizide are about 0.12 and 1.0, respectively.]

**Procedure**—Separately inject equal volumes (about 35  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. In the *Test solution*, identify the peaks that correspond to glipizide related compounds A, B, and C, based on their relative retention times: the relative retention time for glipizide related compound A is given above; glipizide related compound B, if present, elutes immediately after glipizide related compound A, and these two peaks are not resolved by this method; glipizide related compound C elutes at a relative retention time of approximately 1.1. Disregard these impurities when using *Test 1*, as they will be controlled using *Test 2*.

In the *Test solution*, identify the peak that corresponds to methyl-*N*-4-[2-(5-methylpyrazine-2-carboxamido)ethyl]benzenesulfonyl carbamate impurity, based on its relative retention time, which is about 0.18. Calculate the percentage of this impurity and any other individual impurity in the portion of Glipizide taken by the formula:

$$100(C_G / C_T)(r_i / r_{SG})$$

in which  $C_G$  is the concentration, in mg per mL, of glipizide in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of Glipizide in the *Test solution*;  $r_i$  is the peak response for each individual impurity obtained from the *Test solution*;  $r_{SG}$  is the glipizide peak response obtained from the *Standard solution*. Disregard any impurity peak that is less than 0.05%. Not more than 0.5% of any individual impurity is found.

**TEST 2** (limit of related compounds A, B, and C)—

*0.02 M Phosphate buffer*, *Mobile phase*, *Impurity standard stock solution*, *System suitability solution*, *Sensitivity solution*, and *Chromatographic system*—Proceed as directed in the *Assay*.

**Impurity standard solution**—Accurately transfer 5.0 mL of the *Impurity standard stock solution* into a 100-mL volumetric

flask, and dilute with methanol to volume. Accurately transfer 10.0 mL of the solution obtained into another 100-mL volumetric flask containing 20 mL of acetonitrile and 60 mL of *0.02 M Phosphate buffer*. Sonicate the solution for about 5 minutes, dilute with *0.02 M Phosphate buffer* to volume, and mix. This solution contains about 0.0005 mg of each of glipizide related compounds A, B, and C per mL.

**Test solution**—Use *Assay preparation*.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Impurity standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each of the glipizide related compounds A, B, or C in the portion of Glipizide taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of the respective glipizide related compound in the *Impurity standard solution*;  $C_T$  is the concentration, in mg per mL, of Glipizide in the *Test solution*;  $r_U$  and  $r_S$  are the peak responses for the respective glipizide related compound obtained from the *Test solution* and the *Impurity standard solution*, respectively. Not more than 0.5% of any individual impurity is found; and not more than 1.5% of total impurities is found, the results for *Test 1* and *Test 2* being combined.

**Assay**—[NOTE—Use low-actinic glassware for solutions containing glipizide and glipizide related compounds.]

*0.02 M Phosphate buffer*—Dissolve 2.84 g of anhydrous dibasic sodium phosphate in 1000 mL of water. Adjust with phosphoric acid to a pH of  $6.00 \pm 0.05$ .

**Mobile phase**—Prepare a filtered and degassed mixture of *0.02 M Phosphate buffer*, acetonitrile, and methanol (70:20:10). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard stock preparation**—Transfer accurately weighed amounts of USP Glipizide RS to a suitable volumetric flask, and dissolve in methanol with the aid of sonication for about 5 minutes to obtain a solution having a known concentration of about 1.0 mg of glipizide per mL.

**Standard preparation**—Accurately transfer 10.0 mL of the *Standard stock preparation* into a 100-mL volumetric flask containing 20 mL of acetonitrile and 60 mL of *0.02 M Phosphate buffer*. Sonicate the solution for about 5 minutes, dilute with *0.02 M Phosphate buffer* to volume, and mix. This solution contains about 0.1 mg of glipizide per mL.

**Impurity standard stock solution**—Transfer accurately weighed amounts of USP Glipizide Related Compound A RS, USP Glipizide Related Compound B RS, and USP Glipizide Related Compound C RS to a suitable volumetric flask, and dissolve in methanol with the aid of sonication for about 5 minutes to obtain a solution having known concentrations of about 0.1 mg of each of glipizide related compounds A, B, and C per mL. [NOTE—Glipizide related compound A is *N*-{2-[(4-aminosulfonyl)phenyl]ethyl}-5-methyl-pyrazinecarboxamide; glipizide related compound B is 6-methyl-*N*-[2-(4-sulfamoylphenyl)ethyl]pyrazine-2-carboxamide; and glipizide related compound C is 1-cyclohexyl-3-[[4-[2-[(6-methylpyrazin-2-yl)carbonyl]amino]ethyl]phenyl]-sulfonyl]urea.]

**System suitability stock solution**—Transfer an accurately weighed amount of USP Glipizide RS to a suitable volumetric flask, dissolve in methanol with the aid of sonication for about 5 minutes, and add an accurately measured volume of *Impurity standard stock solution* to obtain a solution containing about 1.0 mg of glipizide and about 0.005 mg of each of glipizide related compounds A, B, and C per mL.

**System suitability solution**—Accurately transfer 10.0 mL of the *System suitability stock solution* into a 100-mL volumetric flask containing 20 mL of acetonitrile and 60 mL of *0.02 M Phosphate buffer*. Sonicate the solution for about 5 minutes, dilute with *0.02 M Phosphate buffer* to volume, and mix.

**Sensitivity solution**—Accurately transfer 5.0 mL of the *System suitability solution* into a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Assay stock preparation**—Transfer about 100 mg of Glipizide, accurately weighed, to a 100-mL volumetric flask, dissolve in about 50 mL of methanol with the aid of sonication for about 5 minutes, dilute with methanol to volume, and mix.

**Assay preparation**—Accurately transfer 10.0 mL of the *Assay stock preparation* into a 100-mL volumetric flask containing 20 mL of acetonitrile and 60 mL of 0.02 M *Phosphate buffer*. Sonicate the solution for about 5 minutes, dilute with 0.02 M *Phosphate buffer* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L43. The column temperature is maintained at 40°. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the elution order is glipizide related compound A, glipizide related compound B, glipizide, and glipizide related compound C; the resolution, *R*, between glipizide related compound A and glipizide related compound B peaks is not less than 1.8, and the resolution, *R*, between glipizide and glipizide related compound C peaks is also not less than 1.8; the tailing factor for the glipizide peak is not more than 2.0; and the relative standard deviation for 5 replicate injections is not more than 1.5% for the glipizide peak and not more than 5.0% for each of the related compounds peaks. Chromatograph the *Sensitivity solution*, and record the peak responses as directed for *Procedure*: the signal-to-noise ratio for each of glipizide related compound A and glipizide related compound B peaks is not less than 15.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of C<sub>21</sub>H<sub>27</sub>N<sub>5</sub>O<sub>4</sub>S in the portion of Glipizide taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which *C<sub>S</sub>* and *C<sub>U</sub>* are the concentrations, in mg per mL, of glipizide in the *Standard preparation* and the *Assay preparation*, respectively; and *r<sub>U</sub>* and *r<sub>S</sub>* are the glipizide peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Glipizide Tablets

» Glipizide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of glipizide (C<sub>21</sub>H<sub>27</sub>N<sub>5</sub>O<sub>4</sub>S).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.

### USP Reference standards <11>—

USP Glipizide RS

USP Glipizide Related Compound A RS

N-{2-[(4-Aminosulfonyl)phenyl]ethyl}-5-methyl-pyrazine-carboxamide.

C<sub>14</sub>H<sub>16</sub>N<sub>4</sub>O<sub>3</sub>S 320.37

### Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, as obtained in the *Assay*.

B: Transfer a quantity of finely powdered Tablets, equivalent to about 10 mg of glipizide, to a glass-stoppered centrifuge tube, add 10 mL of methanol, insert a stopper into the tube, and shake. Centrifuge the mixture, and use the clear supernatant as the test solution. Separately apply, as streaks about 7 cm in length, 100 μL of the test solution and 100 μL of a Standard solution of USP Glipizide RS in methanol containing 1 mg per mL, to a thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel. Allow the streaks to dry, and develop the chromatogram in a solvent system consisting of a mixture of toluene, ethyl acetate, and 98% formic acid (5:3:2) until the solvent front has moved to within 2.5 cm of the top of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry the plate at 80° for 30 minutes. Cool the plate, spray it with 0.5% sodium hypochlorite solution, and allow the plate to air-dry. Spray the plate with alcohol, air-dry, and spray with a freshly prepared mixture of 1% soluble starch solution and 1% potassium iodide solution (1:1): the *R<sub>F</sub>* value of the principal band obtained from the test solution corresponds to that obtained from the Standard solution.

### Dissolution <711>—

TEST 1—

**Medium:** simulated intestinal fluid TS (without pancreatin); 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 45 minutes.

Determine the amount of C<sub>21</sub>H<sub>27</sub>N<sub>5</sub>O<sub>4</sub>S dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm of filtered portions of the solution under test, in comparison with a Standard solution having a known concentration of USP Glipizide RS in the same medium.

**Tolerances**—Not less than 80% (Q) of the label claim of C<sub>21</sub>H<sub>27</sub>N<sub>5</sub>O<sub>4</sub>S is dissolved in 45 minutes.

TEST 2—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

**Medium:** simulated intestinal fluid TS (without pancreatin), with pH adjusted to pH 7.5 ± 0.1 with 0.2 N sodium hydroxide; 900 mL.

**Apparatus 2 and Time**—Proceed as directed under *Test 1*.

Determine the amount of C<sub>21</sub>H<sub>27</sub>N<sub>5</sub>O<sub>4</sub>S dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm of filtered portions of the solution under test, in comparison with a Standard solution having a known concentration of USP Glipizide RS in the same medium.

**Tolerances**—Not less than 80% (Q) of the label claim of C<sub>21</sub>H<sub>27</sub>N<sub>5</sub>O<sub>4</sub>S is dissolved in 45 minutes.

**Uniformity of dosage units** <905>: meet the requirements, the following procedure being used where the test for *Content Uniformity* is required.

**Buffer, Mobile phase, and Standard preparation**—Prepare as directed in the *Assay*.

**Test preparation**—Transfer 1 Tablet to an appropriate volumetric flask, add a volume of *Buffer* equal to one-half of the total flask volume, and shake by mechanical means for 10 minutes to allow the Tablet to disintegrate completely. Dilute with methanol to volume, and sonicate for 15 minutes to obtain a solution having a concentration of about 0.05 mg of glipizide per mL. Filter through a solvent-resistant filter.

**Chromatographic system** (see *Chromatography* <621>)—Proceed as directed in the *Assay*. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure

the responses for the major peaks. Calculate the quantity, in mg, of  $C_{21}H_{27}N_5O_4S$  in the Tablet taken by the formula:

$$CV(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Glipizide RS in the *Standard preparation*; V is the volume, in mL, of the *Test preparation* taken; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively.

#### Related compounds—

*Buffer and Mobile phase*—Prepare as directed in the *Assay*.

*Standard stock solution*—Dissolve an accurately weighed quantity of USP Glipizide Related Compound A RS in methanol to obtain a solution having a known concentration of about 50 µg per mL.

*Standard solution*—Dissolve an accurately weighed quantity of USP Glipizide RS in methanol. To this solution add sufficient *Standard stock solution*, and dilute quantitatively with methanol to obtain a solution having known concentrations of about 100 µg per mL of USP Glipizide RS and about 0.5 µg per mL of USP Glipizide Related Compound A RS. Transfer 25 mL of this solution to a 50-mL volumetric flask, dilute with *Buffer* to volume, and mix.

*Test solution*—Use the *Assay preparation*.

*Chromatographic system*—Prepare as directed in the *Assay*. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.2 for glipizide related compound A and 1.0 for glipizide; the resolution, *R*, between glipizide related compound A and glipizide is not less than 1.5; and the relative standard deviation for replicate injections is not more than 5% for glipizide related compound A.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of N-[2-[(4-aminosulfonyl)phenyl]ethyl]-5-methyl-pyrazine-carboxamide (glipizide related compound A) in the Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Glipizide Related Compound A RS in the *Standard solution*; and  $r_U$  and  $r_S$  are the peak responses of glipizide related compound A obtained from the *Test solution* and the *Standard solution*, respectively: not more than 2.0% of glipizide related compound A relative to the glipizide content, as determined in the *Assay*, is found.

#### Assay—

*Buffer*—Dissolve 13.8 g of monobasic sodium phosphate in water, and dilute with water to 1000 mL. Adjust with 2.0 N sodium hydroxide to a pH of  $6.00 \pm 0.05$ .

*Mobile phase*—Prepare a filtered and degassed mixture of *Buffer* and methanol (55 : 45). Make adjustments if necessary (see *System suitability* under *Chromatography* <621>).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Glipizide RS in methanol, and dilute quantitatively with methanol to obtain a solution having a known concentration of about 0.1 mg per mL. Transfer 25.0 mL of this solution to a 50-mL volumetric flask, dilute with *Buffer* to volume, and mix to obtain a solution having a known concentration of about 0.05 mg per mL.

*Assay preparation*—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg of glipizide, to a 100-mL volumetric flask. Add 50 mL of methanol, and place in an ultrasonic bath for 15 minutes. Dilute with *Buffer* to volume, and place in the ultrasonic bath for an additional 15 minutes. Filter through a solvent-resistant filter.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 225-nm detector and a 3.9-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{21}H_{27}N_5O_4S$  in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Glipizide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Glipizide and Metformin Hydrochloride Tablets

### DEFINITION

Glipizide and Metformin Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of glipizide ( $C_{21}H_{27}N_5O_4S$ ) and metformin hydrochloride ( $C_4H_{11}N_5 \cdot HCl$ ).

### IDENTIFICATION

#### • A. INFRARED ABSORPTION <197A>

**Sample:** Transfer NLT 10 Tablets to a suitable container, add 10 mL of methanol, and shake to remove any Tablet coating. Drain the methanol, add 20 mL of water, and stir until the Tablets dissolve (1 h). Transfer the solution to a separatory funnel, and extract twice with 10-mL portions of chloroform, shaking for approximately 5 min. Transfer the lower organic layer into a beaker containing 3 to 4 g of anhydrous magnesium sulfate. Repeat the extraction of the solution in the separatory funnel two more times, each time using 20-mL portions of chloroform. Swirl the mixture in the beaker for 1 min. Filter, and collect the filtrate. Evaporate the solvent under vacuum, and dry the residue under vacuum for 4 h at 105°. Mound the residue onto a diamond cell.

**Acceptance criteria:** The IR spectrum exhibits maxima only at the same wavelengths as a similarly obtained spectrum of USP Glipizide RS.

- **B.** The retention time of the major peak from the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay for Glipizide*.
- **C.** The retention time of the major peak from the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay for Metformin Hydrochloride*.

### ASSAY

#### • GLIPIZIDE

**Solution A:** 2.6 g/L of dibasic ammonium phosphate in water. Adjust with ammonium hydroxide to a pH of 8.0.

**Solution B:** Acetonitrile, water, and *Solution A* (1:14:5)

**Solution C:** Acetonitrile, water, and *Solution A* (2:1:1)

**Diluent:** Acetonitrile and water (60:40)

**Standard stock solution:** Transfer a weighed quantity of USP Glipizide RS to a suitable low-actinic volumetric flask. Dissolve first in acetonitrile, using 60% of the final volume, by sonicating for 20 min, then dilute with water to volume to obtain a solution having a concen-

tration of 0.1 mg/mL of glipizide. [NOTE—The solution is stable for 2 weeks when stored at 5° and protected from light.]

**Standard solution:** Transfer 25.0 mL of *Standard stock solution* to a 200-mL low-actinic volumetric flask. Add 75 mL of *Diluent*, and dilute with water to volume to obtain a solution having a known glipizide concentration of 0.0125 mg/mL. [NOTE—The solution is stable for 2 weeks when stored at 5° and protected from light.]

**System suitability solution:** Transfer approximately 5 mg of USP Glipizide Related Compound A RS to a 500-mL volumetric flask, and fill halfway with acetonitrile. Sonicate for 30 min to dissolve, and dilute with acetonitrile to volume. Transfer 1 mL of this solution to a 50-mL low-actinic volumetric flask, and dilute with *Standard solution* to volume.

**Sample solution:** Transfer NLT 5 Tablets to a suitable volumetric flask, and fill halfway with *Diluent*. Sonicate for 30 min, and shake vigorously for another 30 min to dissolve. Dilute with water to volume, and mix to obtain a solution with a final glipizide concentration of 0.0125 mg/mL. Pass a portion of this solution through a nylon or PVDF filter of 0.2-μm pore size, and use the filtrate. [NOTE—The solution is stable for 2 weeks when stored at 5° and protected from light.]

**Mobile phase:** See the gradient table below.

Time (min)	Solution B (%)	Solution C (%)
0	100	0
3	100	0
18	0	100
20	0	100
22	100	0
30	100	0

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 223 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L7

**Flow rate:** 1 mL/min

**Injection size:** 50 μL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for glipizide related compound A and glipizide are 0.92 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** Greater than 1.2 between glipizide related compound A and glipizide, *System suitability solution*

**Relative standard deviation:** Less than 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>21</sub>H<sub>27</sub>N<sub>5</sub>O<sub>4</sub>S in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Glipizide RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of glipizide in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### • METFORMIN HYDROCHLORIDE

**Solution A:** 9.41 g/L of sodium 1-hexanesulfonate in water, and adjust with trifluoroacetic acid to a pH of 2.0 (50 mM hexanesulfonic acid solution)

**Solution B:** Acetonitrile and water (40:60)

**Mobile phase:** *Solution A*, *Solution B*, and water (3:2:5)

**Diluent pH 2.0:** Acetonitrile, *Solution A*, and water (7:30:63)

**Standard solution:** 0.1 mg/mL of USP Metformin Hydrochloride RS in *Diluent pH 2.0*

**System suitability solution:** 5 μg/mL of USP Metformin Related Compound A RS in water. Pipet 0.5 mL of this solution into a 50-mL volumetric flask, and dilute with *Standard solution* to volume.

**Sample solution:** Dilute a portion of the *Sample solution*, obtained as directed in the *Assay for Glipizide*, with *Diluent pH 2.0*, to obtain a solution having a concentration of 0.1 mg/mL of metformin hydrochloride.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 218 nm

**Column:** 4.6-mm × 15-cm; 3.5-μm packing L11

**Flow rate:** 1 mL/min

**Injection size:** 25 μL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for metformin related compound A and metformin are 0.26 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 3.0 between metformin related compound A and metformin, *System suitability solution*

**Relative standard deviation:** Less than 2.0%, determined from the metformin peak, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>4</sub>H<sub>11</sub>N<sub>5</sub> · HCl in each Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Metformin Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of metformin hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION <711>

###### Test 1

**Medium:** 0.05 M phosphate buffer, pH 6.8 ± 0.05. (Dissolve 12.96 g of monobasic potassium phosphate and 1.66 g of sodium hydroxide in approximately 400 mL of water, and dilute with water to 2000 mL. Adjust the pH, if necessary, with diluted sodium hydroxide); 1000 mL. [NOTE—Tight control of the pH is critical.]

**Apparatus 2:** 50 rpm

**Time:** 45 min for glipizide, and 30 min for metformin hydrochloride.

**Determination of glipizide:** Determine the amount of glipizide (C<sub>21</sub>H<sub>27</sub>N<sub>5</sub>O<sub>4</sub>S) dissolved as follows.

**Solution A:** Dissolve approximately 3.4 g of monobasic potassium phosphate in approximately 800 mL of water. Adjust with 10 N sodium hydroxide solution to a pH of 6.0 ± 0.1. Dilute with water to 1000 mL.

**Mobile phase:** Methanol and *Solution A* (13:12)

**Standard stock solution:** Transfer 50 mg of USP Glipizide RS to a 1000-mL low-actinic volumetric flask, and dissolve in 100 mL of methanol. Dilute with *Medium* to volume, and sonicate for 5 min. [NOTE—This solution is stable for 7 days at 5° when protected from light.]

**Standard solution:** Dilute the *Standard stock solution* with *Medium* to obtain a solution containing (L/1000) mg/mL, with L being the glipizide Tablet label claim, in mg.

**Sample solution:** After the specified time, withdraw 10 mL of the solution under test. Pass the solution through a suitable PVDF filter of 0.45- $\mu$ m pore size or a glass fiber filter of 1.0- $\mu$ m pore size, discarding the first mL.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Flow rate:** 1 mL/min

**Injection size:** 50  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Record the chromatograms running for 8 min and measure the peak response for glipizide.

Calculate the percentage of  $C_{21}H_{27}N_5O_4S$  dissolved:

$$\text{Result} = (r_U \times C_S \times V \times 100) / (r_S \times L)$$

$r_U$  = peak response from the *Sample solution*

$C_S$  = concentration of glipizide in the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 1000 mL

$r_S$  = peak response from the *Standard solution*

$L$  = label claim for glipizide (mg/Tablet)

#### Determination of metformin hydrochloride

**Test 1:** Determine the amount of metformin hydrochloride dissolved by employing UV absorption at the wavelength of maximum absorbance at 233 nm on portions of the *Sample solution*, suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the amount of  $C_4H_{11}N_5 \cdot HCl$  dissolved:

$$\text{Result} = (A_U \times C_S \times V \times 100) / (A_S \times L)$$

$A_U$  = absorbance from the *Sample solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 1000 mL

$A_S$  = absorbance from the *Standard solution*

$L$  = label claim for metformin hydrochloride (mg/Tablet)

**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_{21}H_{27}N_5O_4S$  is dissolved in 45 min. NLT 80% (Q) of the labeled amount of  $C_4H_{11}N_5 \cdot HCl$  is dissolved in 30 min.

**Test 2:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

**Medium:** 0.05 M phosphate buffer, pH 6.8; 1000 mL

**Apparatus 2:** 50 rpm

**Time:** 60 min for both metformin hydrochloride and glipizide

**pH 6.0 buffer solution:** 4.3 g/L of octanesulfonic acid sodium salt and 6.9 g/L of monobasic monohydrate sodium phosphate in water, adjusted with diluted sodium hydroxide to a pH of  $6.00 \pm 0.05$

**Glipizide standard stock solution:** 0.05 mg/mL of USP Glipizide RS in methanol

**Standard solution:** Transfer a quantity of USP Metformin Hydrochloride RS to a volumetric flask, add a suitable aliquot of *Glipizide standard stock solution*, and dilute with *Medium* to obtain a final concentration

of (L/1000) mg/mL, where L is the Tablet label claim for both metformin hydrochloride and glipizide, in mg.

**Sample solution:** Pass a portion of the solution under test through a suitable polyethersulfone filter of 0.45- $\mu$ m pore size, discarding the first few mL.

**Mobile phase:** Methanol and pH 6.0 buffer solution (1:1)

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 260 nm

**Sample compartment chiller:** 4°

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Flow rate:** 1.0 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2 between the glipizide and metformin hydrochloride peaks

**Relative standard deviation:** NMT 2.0% for both glipizide and metformin hydrochloride

**Analysis:** Calculate the percentages of  $C_{21}H_{27}N_5O_4S$  and  $C_4H_{11}N_5 \cdot HCl$  dissolved:

$$\text{Result} = (r_U / r_S) \times (C_S / L) \times V \times 100$$

$r_U$  = peak response for glipizide or metformin hydrochloride from the *Sample solution*

$r_S$  = peak response for glipizide or metformin hydrochloride from the *Standard solution*

$C_S$  = concentration of glipizide or metformin hydrochloride in the *Standard solution* (mg/mL)

$L$  = label claim for glipizide or metformin hydrochloride (mg/Tablet)

$V$  = volume of *Medium*, 1000 mL

**Tolerances:** NLT 80% (Q) of the labeled amounts of  $C_{21}H_{27}N_5O_4S$  and  $C_4H_{11}N_5 \cdot HCl$  is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### IMPURITIES

##### Organic Impurities

##### • PROCEDURE 1: GLIPIZIDE

**Solution A, Solution B, Solution C, Sample solution, and Chromatographic system:** Prepare as directed in the Assay for *Glipizide*.

##### Analysis

**Sample:** *Sample solution*

Calculate the percentage of glipizide related compound A (approximate relative retention time 0.92) and other individual impurities in the portion of Tablets taken:

$$\text{Result} = (r_U / r_T) \times (1 / F) \times 100$$

$r_U$  = peak response of each impurity

$r_T$  = sum of all the peak responses

$F$  = relative response factor for each impurity equal to 1.4 for glipizide related compound A and 1.0 for all other peaks

##### Acceptance criteria

**Glipizide related compound A:** NMT 2.0%

**Individual impurities:** NMT 0.5% of any other individual glipizide related impurity (eluting after approximately 8 min)

**Total impurities:** NMT 1.0%, excluding glipizide related compound A. [NOTE— Disregard the broad peak due to metformin that elutes before 8 min. Disregard any peak observed in the blank, and disregard any peak less than 0.05%.]

• **PROCEDURE 2: METFORMIN HYDROCHLORIDE**

**Solution A, Solution B, Mobile phase, Sample solution, and Chromatographic system:** Prepare as directed in the Assay for Metformin Hydrochloride.

**Analysis**

**Sample:** Sample solution

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each impurity

$r_T$  = sum of all the peak responses

**Acceptance criteria**

**Individual impurities:** NMT 0.1%

**Total impurities:** NMT 0.5%

[NOTE— Disregard any peak less than 0.05%. Disregard any peak observed in the blank.]

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.

• **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

• **USP REFERENCE STANDARDS** (11)

USP Glipizide RS

USP Glipizide Related Compound A RS

*N*-{2-[(4-Aminosulfonyl)phenyl]ethyl}-5-methylpyrazinecarboxamide.

$C_{14}H_{16}N_4O_3S$  320.37

## Immune Globulin

» Immune Globulin conforms to the regulations of the FDA concerning biologics (640.100 to 640.104) (see *Biologics* (1041)). It is a sterile, nonpyrogenic solution of globulins that contains many antibodies normally present in adult human blood, prepared by pooling approximately equal amounts of material (source blood, plasma, serum, or placentas) from not less than 1000 donors. It contains not less than 15 g and not more than 18 g of protein per 100 mL, not less than 90.0 percent of which is gamma globulin. It contains 0.3 M glycine as a stabilizing agent and contains a suitable preservative. It has a potency of component antibodies of diphtheria antitoxin based on the U.S. Standard Diphtheria Antitoxin and a diphtheria test toxin, tested in guinea pigs (not less than 2 antitoxin units per mL), and antibodies for measles and poliovirus. It meets the requirements of the tests for heat stability in absence of gelation on heating, and for pH.

**Packaging and storage**—Preserve at a temperature between 2° and 8°.

**Expiration date**—The expiration date is not later than 3 years after date of issue from manufacturer's cold storage (5°, 3 years).

**Labeling**—Label it to state that passive immunization with Immune Globulin modifies hepatitis A, prevents or modifies

measles, and provides replacement therapy in persons having hypo- or agammaglobulinemia, that it is not standardized with respect to antibody titers against hepatitis B surface antigen and that it should be used for prophylaxis of viral hepatitis type B only when the specific Immune Globulin is not available, that it may be of benefit in women who have been exposed to rubella in the first trimester of pregnancy but who would not consider a therapeutic abortion, and that it may be used in immunosuppressed patients for passive immunization against varicella if the specific Immune Globulin is not available. Label it also to state that it is not indicated for routine prophylaxis or treatment of rubella, poliomyelitis, or mumps, or for allergy or asthma in patients who have normal levels of immunoglobulin, that the plasma units from which it has been derived have been tested and found non-reactive for hepatitis B surface antigen, and that it should not be administered intravenously but be given intramuscularly, preferably in the gluteal region.

## Rh<sub>0</sub> (D) Immune Globulin

» Rh<sub>0</sub> (D) Immune Globulin conforms to the regulations of the FDA concerning biologics (see *Biologics* (1041)). It is a sterile, nonpyrogenic solution of globulins derived from human blood plasma containing antibody to the erythrocyte factor Rh<sub>0</sub> (D). It contains not less than 10 g and not more than 18 g of protein per 100 mL, not less than 90.0 percent of which is gamma globulin. It has a potency, determined by a suitable method, not less than that of the U.S. Reference Rh<sub>0</sub> (D) Immune Globulin. It contains 0.3 M glycine as a stabilizing agent and contains a suitable preservative.

**Packaging and storage**—Preserve at a temperature between 2° and 8°.

**Expiration date**—The expiration date is not later than 6 months from the date of issue from manufacturer's cold storage, or not later than 1 year from the date of manufacture, as indicated on the label.

## Glucagon

HSQGTFTSDY SKYLSRRRAQ DFLVQALMNT

$C_{153}H_{225}N_{43}O_{49}S$

Glucagon (human) [16941-32-5].

3482.75

### DEFINITION

Glucagon is a polypeptide hormone that has the property of increasing the concentration of glucose in the blood. It has the same structure (29 amino acids) as the hormone produced by the  $\alpha$ -cells of the human pancreas. Glucagon is produced by microbial processes using recombinant DNA (rDNA) technology. The host cell-derived protein content and/or the host cell-derived or vector-derived DNA content are determined by validated methods. During the course of product development, it must be demonstrated that the manufacturing process produces Glucagon having a biological activity of NLT 0.80 USP unit/mg, using a validated bioassay approved by a competent authority. It contains NLT 90% and NMT 105% of  $C_{153}H_{225}N_{43}O_{49}S$ , calculated on the anhydrous basis.

**IDENTIFICATION**

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- B.** Determine the peptide fragments, using the following peptide mapping procedure.

**Ammonium bicarbonate buffer:** Prepare a 1 M solution of ammonium bicarbonate, and adjust with ammonia to a pH of 10.3. Prepare a mixture of 1 M ammonium bicarbonate and water (1:9).

**Enzyme solution:** 2 mg/mL of  $\alpha$ -chymotrypsin (peptide mapping grade) in *Ammonium bicarbonate buffer*.

**Solution A:** Prepare a degassed mixture of 0.5 mL of trifluoroacetic acid and 1000 mL of water.

**Solution B:** Prepare a degassed mixture of 0.5 mL of trifluoroacetic acid, 600 mL of ethanol, and 400 mL of water.

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	100	0
35	53	47
45	0	100
46	100	0
75	100	0

**Standard digest solution:** Prepare a 5-mg/mL solution of USP rGlucagon RS in 0.01 M hydrochloric acid. Mix 200  $\mu$ L of this solution with 800  $\mu$ L of *Ammonium bicarbonate buffer*. To this solution add 25  $\mu$ L of *Enzyme solution*, and place in a closed vial at about 37° for 2 h. Remove the vial, and stop the reaction immediately by adding 120  $\mu$ L of glacial acetic acid.

**Sample digest solution:** Prepare a 5-mg/mL solution of Glucagon in 0.01 M hydrochloric acid. Proceed as directed for *Standard digest solution*, beginning with "Mix 200  $\mu$ L of this solution".

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Column:** 4.0-mm  $\times$  5-cm; 5- $\mu$ m or less packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 20  $\mu$ L

**System suitability**

**Sample:** *Standard digest solution*

**Suitability requirements**

**Chromatogram similarity:** The chromatogram from the *Standard digest solution* is similar to the reference chromatogram provided with the lot of USP rGlucagon RS being used.

**Analysis**

**Samples:** *Standard digest solution* and *Sample digest solution*

**Acceptance criteria:** The chromatographic profile of the *Sample digest solution* corresponds to that of the *Standard digest solution*.

**ASSAY****PROCEDURE**

**Solution A:** Dissolve 16.3 g of monobasic potassium phosphate in 750 mL of water, adjust with phosphoric acid to a pH of 2.7 ( $\pm 0.05$ ), add water to 800 mL, add 200 mL of acetonitrile, and degas.

**Solution B:** Prepare a degassed solution of acetonitrile and water (4:6).

**Mobile phase:** See *Table 2*. [NOTE—The ratio of *Solution A* to *Solution B* can be adjusted to obtain a retention time of about 21 min for the main peak.]

**Table 2**

Time (min)	Solution A (%)	Solution B (%)
0	61	39
25 <sup>a</sup>	61	39
29	12	88
30	12	88
31	61	39
70	61	39

<sup>a</sup> The end time of the isocratic elution can be adjusted so that the gradient begins after the fourth desamido peak elutes (relative retention time about 1.4). The rest of the program is then adjusted accordingly with this offset.

**System suitability solution:** Reconstitute a vial of USP rGlucagon RS in 0.01 N hydrochloric acid to obtain a solution having a concentration of about 0.5 mg/mL. Let stand at 50° for 48 h. At least 7% total of all four desamido glucagons should be present in the solution.

**Standard solution:** Reconstitute a vial of USP rGlucagon RS in 0.01 N hydrochloric acid to obtain a solution having a concentration of about 0.5 mg/mL.

**Sample solution:** 0.5 mg/mL of Glucagon in 0.01 N hydrochloric acid

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 3-mm  $\times$  15-cm; 3- $\mu$ m packing L1

**Column temperature:** 45°

**Flow rate:** 0.5 mL/min

**Injection volume:** 15  $\mu$ L

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

**Resolution:** Four peaks eluting after the glucagon peak that correspond to the desamido glucagons are clearly visible. The resolution between the main peak and the first eluting desamido peak is NLT 1.5, *System suitability solution*

**Tailing factor:** NMT 1.8 for the glucagon peak, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of glucagon ( $C_{153}H_{225}N_{43}O_{49}S$ ) in the portion of Glucagon taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 90%–105% on the anhydrous basis

**IMPURITIES****ORGANIC IMPURITIES**

**Solution A, Solution B, Mobile phase, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Glucagon taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each impurity

$r_T$  = sum of the responses of all peaks

**Acceptance criteria:** NMT 2.0% total of all four desamido glucagons is found, and NMT 6.0% of total impurities and related compounds is found.

### SPECIFIC TESTS

- **WATER DETERMINATION, Method 1c (921):** NMT 10%, determined on a 20- to 50-mg sample
- **BACTERIAL ENDOTOXINS TEST (85):** NMT 10 USP Endotoxin Units/mg

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in airtight containers, protected from light, and store in a freezer.
- **USP REFERENCE STANDARDS (11)**  
USP Endotoxin RS  
USP rGlucagon RS

## Glucagon for Injection

### DEFINITION

Glucagon for Injection is a sterile lyophilized mixture of the hydrochloride of glucagon with one or more suitable buffering and stabilizing agents. It contains NLT 65% and NMT 110% of the labeled amount of glucagon.

### IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B. GLUCOGEN BIOIDENTITY TESTS (123):** Meets the requirements

### ASSAY

#### PROCEDURE

**Solution A:** Dissolve 16.3 g of monobasic potassium phosphate in 750 mL of water, adjust with phosphoric acid to a pH of 2.7 ( $\pm 0.05$ ), add water to 800 mL, add 200 mL of acetonitrile, and degas.

**Solution B:** Prepare a degassed solution of acetonitrile and water (4:6).

**Mobile phase:** See *Table 1*. [NOTE—The ratio of *Solution A* to *Solution B* can be adjusted to obtain a retention time of about 21 min for the main peak.]

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	61	39
25 <sup>a</sup>	61	39
29	12	88
30	12	88
31	61	39
70	61	39

<sup>a</sup> The end time of the isocratic elution can be adjusted so that the gradient begins after the 4th desamido peak elutes (relative retention time about 1.4). The rest of the program is then adjusted accordingly with this offset.

**System suitability solution:** Reconstitute a vial of USP rGlucagon RS in 0.01 N hydrochloric acid to obtain a solution having a concentration of about 0.5 mg/mL. Let stand at 50° for 48 h. At least 7% total of all four desamido glucagons should be present in the solution.

**Standard solution:** Reconstitute a vial of USP rGlucagon RS in 0.01 N hydrochloric acid to obtain a solution having a concentration of about 0.5 mg/mL.

**Sample solution:** Dissolve an adequate amount of Glucagon for Injection in order to obtain a 0.5-mg/mL concentration of glucagon in 0.01 N hydrochloric acid.

### Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 3-mm  $\times$  15-cm; 3- $\mu$ m or less packing L1

**Column temperature:** 45°

**Flow rate:** 0.5 mL/min

**Injection volume:** 15  $\mu$ L

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.5 between the main peak and the first eluting desamido peak. Four peaks eluting after the glucagon peak that correspond to the desamido glucagons are clearly visible, *System suitability solution*

**Tailing factor:** NMT 1.8 for the glucagon peak, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of glucagon ( $C_{153}H_{225}N_{43}O_{49}S$ ) in the portion of Glucagon for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 65%–110%

### PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements

### IMPURITIES

#### ORGANIC IMPURITIES

**Solution A, Solution B, Mobile phase, System suitability solution, Standard solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Sample solution:** Dissolve the substance to be examined in water in order to obtain a concentration of 0.5 mg/mL of glucagon.

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Glucagon for Injection taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each impurity

$r_T$  = sum of the responses of all peaks

**Acceptance criteria:** NMT 14% total of all four desamido glucagons is found, and NMT 31% of total impurities and related compounds is found.

### SPECIFIC TESTS

- **WATER DETERMINATION, Method 1c (921):** NMT 4.0%
- **PH AND CLARITY OF SOLUTION:** Dissolve it in the solvent and in the concentration recommended in the labeling; the pH of the solution is between 1.7 and 3.5, and the solution is clear.
- **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 10 USP Endotoxin Units/mg.
- **STERILITY TESTS (71):** Meets the requirements
- **CONSTITUTED SOLUTION:** At the time of use, it meets the requirements for *Injections (1)*, *Constituted Solutions*.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve as described in *Injections (1)*, *Containers for Sterile Solids*.

- **LABELING:** The labeling states that the material is of recombinant DNA origin.
- **USP REFERENCE STANDARDS** (11)
  - USP Endotoxin RS
  - USP rGlucagon RS

## Gluconolactone

$C_6H_{10}O_6$

178.14

D-Gluconic acid  $\delta$ -lactone;  
Glucono delta-lactone [90-80-2].

### DEFINITION

Gluconolactone contains NLT 99.0% and NMT 101.0% of gluconolactone ( $C_6H_{10}O_6$ ).

### IDENTIFICATION

- **A.**

**Sample solution:** Dissolve 0.5 g of Gluconolactone in 5 mL of warm water in a test tube.

**Analysis:** To the *Sample solution* add 1 mL of freshly distilled phenylhydrazine, and heat on a steam bath for 30 min. Cool the solution, induce crystallization by scratching the inner surface of the test tube with a glass rod, and collect the crystals of the phenylhydrazine of gluconic acid. Dissolve the crystals in 10 mL of hot water to which a small amount of activated charcoal has been added, filter, and recrystallize. Wash the crystals with 2 mL of cold water, and dry the crystals at 105° for 1 h.

**Acceptance criteria:** The crystals obtained melt between 195° and 200°.

### ASSAY

- **PROCEDURE**

**Sample:** 600 mg

**Titrimetric system**  
(See *Titrimetry* (541).)

**Mode:** Residual titration

**Titrant:** 0.1 N sodium hydroxide VS

**Back-titrant:** 0.1 N hydrochloric acid VS

**Endpoint detection:** Visual

**Analysis:** Dissolve the *Sample* in 100 mL of water in a 300-mL conical flask, add 50.0 mL of *Titrant*, and allow to stand for 15 min. Add phenolphthalein TS. Titrate excess alkali with *Back-titrant*. Perform a blank determination. Each mL of *Back-titrant* is equivalent to 17.81 mg of gluconolactone ( $C_6H_{10}O_6$ ).

**Acceptance criteria:** 99.0%–101.0%

### IMPURITIES

- **LEAD** (251)
 

**Test preparation:** Prepare as directed in the chapter.

**Analysis:** Use 10 mL of *Diluted Standard Lead Solution* (10  $\mu$ g of lead) for the procedure.

**Acceptance criteria:** NMT 10 ppm
- **HEAVY METALS** (231)
 

**Test preparation:** 40 mg/mL

**Acceptance criteria:** NMT 20 ppm

### SPECIFIC TESTS

- **REDUCING SUBSTANCES**

**Sample solution:** Transfer 10.0 g to a 400-mL beaker, add 40 mL of water, and swirl to dissolve. Add 2 drops

of phenolphthalein TS, and neutralize with sodium hydroxide solution (1 in 2). Dilute with water to 50 mL, and add 50 mL of alkaline cupric tartrate TS. Heat so that the solution begins to boil in 4 min, and allow boiling to continue for 120 s. Pass the suspension through a medium pore size filtering crucible, and wash the filter with three 5-mL portions of water. Place the crucible in an upright position in the original beaker, add 5 mL of water and 3 mL of nitric acid to the crucible, mix with a glass rod to ensure complete solution of the cuprous oxide, and wash the solution from the crucible into a beaker with the aid of 5 mL of water. Add bromine TS, usually 5–10 mL, until the solution becomes yellow in color, and dilute with water to 75 mL. Add a few glass beads, boil until the bromine has been driven off, and cool. Slowly add ammonium hydroxide until a deep blue color appears, then adjust with glacial acetic acid to a pH of 4, and add water to make 100 mL.

**Analysis:** Add 4 g of potassium iodide to the *Sample solution*, and titrate with 0.1 N sodium thiosulfate VS, adding starch TS just before the endpoint is reached.

**Acceptance criteria:** NMT 16.1 mL of 0.1 N sodium thiosulfate is consumed.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

## Glucose Enzymatic Test Strip

» Glucose Enzymatic Test Strip consists of the enzymes glucose oxidase and horseradish peroxidase, a suitable substrate for the reaction of hydrogen peroxide catalyzed by peroxidase, and other inactive ingredients impregnated and dried on filter paper. When tested in human urine containing known glucose concentrations, it reacts in the specified times to produce colors corresponding to the color chart provided.

**Packaging and storage**—Preserve in the original container, in a dry place, at controlled room temperature.

**Identification**—Remove the Strips from the container, and test them as directed in the instructions provided by the manufacturer, first in dextrose solution (1 in 50) and then in sucrose solution (1 in 50): color develops from the dextrose solution, but not from the sucrose solution.

### Calibration

**Glucose standard solutions**—Dissolve anhydrous dextrose in separate portions of freshly voided, normal, glucose-free human urine, previously adjusted to a pH of 6.0 with dilute formic acid (1 in 5), and with sodium hydroxide solution (1 in 2), respectively, to obtain separate solutions of the final concentrations corresponding to the color chart calibrations provided. Allow the standard solutions to stand for 1 hour prior to use.

**Procedure**—Remove the Strips from the container, and test each *Glucose standard solution* as directed in the instructions provided by the manufacturer: the colors formed on each of the Strips during the specified times match the colors on the color chart provided.

## Glutamine

$C_5H_{10}N_2O_3$  146.14  
L-Glutamine;  
2-Aminoglutaric acid [56-85-9].

### DEFINITION

Glutamine contains NLT 98.5% and NMT 101.5% of L-glutamine ( $C_5H_{10}N_2O_3$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

### ASSAY

#### • PROCEDURE

**Sample:** 150 mg of Glutamine

**Blank:** Mix 3 mL of formic acid and 50 mL of glacial acetic acid.

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid VS

**Endpoint detection:** Potentiometric

**Analysis:** Dissolve the *Sample* in 3 mL of formic acid and 50 mL of glacial acetic acid, and titrate with the *Titrant*. Perform a *Blank* determination.

Calculate the percentage of glutamine ( $C_5H_{10}N_2O_3$ ) in the *Sample* taken:

$$\text{Result} = \{(V_S - V_B) \times N \times F/W\} \times 100$$

$V_S$  = volume of *Titrant* consumed by the *Sample* (mL)

$V_B$  = volume of *Titrant* consumed by the *Blank* (mL)

$N$  = actual normality of the *Titrant* (mEq/mL)

$F$  = equivalency factor, 146.1 mg/mEq

$W$  = *Sample* weight (mg)

**Acceptance criteria:** 98.5%–101.5% on the dried basis

### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.3%

- **CHLORIDE AND SULFATE, Chloride** (221)

**Standard solution:** 0.50 mL of 0.020 N hydrochloric acid

**Sample:** 0.7 g of Glutamine

**Acceptance criteria:** NMT 0.05%

- **CHLORIDE AND SULFATE, Sulfate** (221)

**Standard solution:** 0.25 mL of 0.020 N sulfuric acid

**Sample:** 0.8 g of Glutamine

**Acceptance criteria:** NMT 0.03%

- **IRON** (241): NMT 30 ppm

- **HEAVY METALS, Method I** (231): NMT 15 ppm

#### • RELATED COMPOUNDS

**Standard solution:** 0.05 mg/mL of USP Glutamine RS in water

**Sample solution:** 10 mg/mL of Glutamine in water

**Chromatographic system**

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 5  $\mu$ L

**Developing solvent system:** Butyl alcohol, glacial acetic acid, and water (3:1:1)

**Spray reagent:** 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)

**Analysis:** Dry the plate at 80° for 30 min. Spray the plate with *Spray reagent*, heat at 80° for 10 min, and examine under white light.

**Acceptance criteria:** No secondary spot of the *Sample solution* is larger or more intense than the principal spot of the *Standard solution* (NMT 0.5%).

### SPECIFIC TESTS

- **OPTICAL ROTATION, Specific Rotation** (781S)

**Sample solution:** 40 mg/mL in water. Warm at 40° to dissolve.

**Analysis:** Proceed as directed in the chapter, except measure at 20°.

**Acceptance criteria:** +6.3° to +7.3°

- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 0.3% of its weight.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.

- **USP REFERENCE STANDARDS** (11)

USP Glutamine RS

## Glutaryl Concentrate

$C_5H_8O_2$  100.12  
Pentanedial;  
Glutarylaldehyde [111-30-8].

### DEFINITION

Glutaryl Concentrate is a solution of glutarylaldehyde in Purified Water. It contains NLT 100.0% and NMT 104.0% of the labeled amount of glutaryl ( $C_5H_8O_2$ ). The labeled amount is 50.0 g of  $C_5H_8O_2$  per 100 g of Concentrate.

### IDENTIFICATION

#### • A.

**Solution A:** Add 4 mL of sulfuric acid to 0.8 g of 2,4-dinitrophenylhydrazine, then add 6 mL of water, dropwise, with swirling. When dissolution is essentially complete, add 20 mL of alcohol, and filter. The filtrate is the 2,4-dinitrophenylhydrazine reagent.

**Analysis:** Add 0.4 mL of Concentrate to 20 mL of *Solution A*, mix by swirling, and allow to stand for 5 min. Collect the precipitate on a filter, and rinse thoroughly with alcohol. Dissolve the precipitate in 20 mL of hot ethylene dichloride, filter, and cool the filtrate in an ice bath until crystallization occurs. Collect the precipitate on a filter. Redissolve the precipitate by refluxing with 30 mL of acetone, filter, and cool the filtrate in an ice bath until crystallization occurs. Collect the precipitate on a filter.

**Acceptance criteria:** The 2,4-dinitrophenylhydrazone so obtained melts at 185°–195°, within a 3° range (see *Melting Range or Temperature* (741)).

### ASSAY

#### • PROCEDURE

**Solution A:** 35 g/L of hydroxylamine hydrochloride prepared as follows. Dissolve 35 g of hydroxylamine hydrochloride in 150 mL of water in a 1000-mL volumetric flask. Add isopropyl alcohol to volume.

**Solution B:** Transfer 65 mL of triethanolamine to a glass-stoppered, 1000-mL volumetric flask, and add water to volume.

**Analysis:** To 500 mL of *Solution A* add 15 mL of a solution of bromophenol blue in alcohol (1 in 2500), and add *Solution B* from a buret to obtain a neutralized solution that appears greenish-blue by transmitted light. Transfer 65.0 mL of the neutralized solution to a glass-stoppered, 500-mL conical flask, add 50.0 mL of *Solution B*, purge with nitrogen, and insert the stopper. Add

a weighed quantity of Concentrate containing 1.2 g of glutaral by means of a suitable weighing pipet. Insert the stopper, and allow to stand for 60 min, swirling the flask occasionally. Titrate with 0.5 N sulfuric acid VS to a greenish-blue endpoint, and perform a blank determination (see *Titrimetry* (541), *Residual Titrations*). Calculate the percentage of the labeled amount of glutaral ( $C_5H_8O_2$ ) in the Concentrate taken:

$$\text{Result} = \{[(V_B - V_S) \times N \times F] / W\} \times 100$$

$V_B$  = volume of 0.5 N sulfuric acid VS consumed by the blank (mL)

$V_S$  = volume of 0.5 N sulfuric acid VS consumed by the Sample solution (mL)

$N$  = normality of the sulfuric acid

$F$  = equivalency factor for glutaraldehyde, 0.05006 g/mEq

$W$  = weight of Concentrate taken (g)

Acceptance criteria: 100.0%–104.0%

## IMPURITIES

- **HEAVY METALS** (231): NMT 10 ppm

## SPECIFIC TESTS

- **SPECIFIC GRAVITY** (841): 1.126–1.135 at 20°

## ACIDITY

**Analysis:** Transfer 60.0 g to a conical flask, add phenolphthalein TS, and titrate with 0.10 N alcoholic potassium hydroxide to a pink endpoint that is permanent for NLT 15 s.

**Acceptance criteria:** NMT 40 mL of 0.10 N potassium hydroxide is consumed, corresponding to NMT 0.4% (w/w) of acid, calculated as acetic acid.

- **pH** (791): 3.7–4.5

## CLARITY OF SOLUTION

**Analysis:** Transfer 5.0 mL of Concentrate to a glass-stoppered, 100-mL graduated cylinder, add water to obtain 100 mL of mixture, insert the stopper, and mix by inverting the graduated cylinder several times. Allow the bubbles to rise, and view downward through the solution against a dark background.

**Acceptance criteria:** The solution is clear.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light, and avoid exposure to excessive heat.
- **LABELING:** The label states that this article is not intended for direct administration to humans or animals.

## Glyburide

$C_{23}H_{28}ClN_3O_5S$  494.00

Benzamide, 5-chloro-N-[2-[4-[[[(cyclohexylamino)carbonyl]amino]-sulfonyl]phenyl]ethyl]-2-methoxy-

1-[[p-[2-(5-Chloro-o-anisamido)ethyl]phenyl]sulfonyl]-3-cyclohexylurea [10238-21-8].

» Glyburide contains not less than 98.0 percent and not more than 102.0 percent of  $C_{23}H_{28}ClN_3O_5S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

## USP Reference standards (11)—

USP Glyburide RS

## Identification—

**A: Infrared Absorption** (197M).

**B:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for glyburide, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

**Loss on drying**—Dry it at 105° for 6 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Heavy metals, Method II** (231): 0.002%.

## Chromatographic purity—

**Mobile phase**—Prepare as directed in the *Assay*.

**Test solution**—To about 10 mg of Glyburide, accurately weighed, add 10 mL of acetonitrile, and shake to dissolve. Add 4 mL of water, and mix.

**Chromatographic system**—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 2 mL per minute. Chromatograph the *Test solution*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 3500 theoretical plates.

**Procedure**—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for the major peaks. Calculate the percentage of each impurity in the portion of Glyburide taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses of all of the peaks: not more than 1.5% of any impurity, which elutes before glyburide, is found; not more than 0.5% of any other individual impurity is found; and not more than 2.0% of total impurities is found.

## Assay—

**Mobile phase**—Dissolve 2.6 g of monobasic ammonium phosphate in 450 mL of water. Add 550 mL of acetonitrile, filter, and degas. Adjust, if necessary, with phosphoric acid or sodium hydroxide to a pH of  $5.25 \pm 0.30$ . Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Dissolve progesterone in acetonitrile to obtain a solution containing about 0.2 mg per mL.

**Standard preparation**—To about 10 mg of USP Glyburide RS, accurately weighed, add 20.0 mL of *Internal standard solution*, and shake vigorously to dissolve. Add 4.0 mL of water, and mix.

**Assay preparation**—To about 10 mg of Glyburide, accurately weighed, add 20.0 mL of *Internal standard solution*, and shake vigorously to dissolve. Add 4.0 mL of water, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.4 for glyburide and 1.0 for progesterone; the resolution,  $R$ , between glyburide and progesterone is not less than 5.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the heights for the major peaks. Calculate the quantity,

in mg, of  $C_{23}H_{28}ClN_3O_5S$  in the portion of Glyburide taken by the formula:

$$W_5 (R_U / R_S)$$

in which  $W_5$  is the weight, in mg, of USP Glyburide RS taken to prepare the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak height ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Glyburide Tablets

### DEFINITION

Glyburide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of glyburide ( $C_{23}H_{28}ClN_3O_5S$ ).

### IDENTIFICATION

#### • INFRARED ABSORPTION <197K>

**Sample:** Grind to a fine powder a number of Tablets, equivalent to 15 mg of glyburide. Add 30 mL of acetonitrile, and shake. Filter the mixture, evaporate the filtrate to dryness, and dry the residue in a vacuum at 60° for 3 h.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Dissolve 2.6 g of monobasic ammonium phosphate in 450 mL of water. Add 550 mL of acetonitrile, filter, and degas. Adjust, if necessary, with phosphoric acid or sodium hydroxide to a pH of 5.25 ± 0.30.

**Progesterone solution:** 0.2 mg/mL of progesterone in acetonitrile

**System suitability solution:** Dissolve 10 mg of USP Glyburide RS in 20 mL of *Progesterone solution*. Add 4.0 mL of water.

**Standard solution:** To 10 mg of USP Glyburide RS add 20.0 mL of acetonitrile, and shake vigorously to dissolve. Add 4.0 mL of water.

**Sample solution:** Transfer NLT 20 Tablets to a suitable container. Add water equivalent to 0.4 mL of water per mg of glyburide, and swirl to disperse and wet Tablet material. Then add acetonitrile equivalent to 2.0 mL of acetonitrile per mg of glyburide, and shake for 30 min. Centrifuge a portion of the suspension, and use the clear supernatant.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L7

**Flow rate:** 2 mL/min

**Injection size:** 10 µL

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times for glyburide and progesterone are about 0.4 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 5.0 between glyburide and progesterone

**Relative standard deviation:** NMT 2.0% for glyburide

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of glyburide ( $C_{23}H_{28}ClN_3O_5S$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Glyburide RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of glyburide in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### • DISSOLUTION <711>

**Test 1** (nonmicronized glyburide)

**Medium:** 0.05 M borate buffer, pH 9.5 (381.5 g of sodium borate and 19.1 g of sodium hydroxide in 20 L of water, and adjust with phosphoric acid to a pH of 9.5 ± 0.1); 500 mL

**Apparatus 2:** 75 rpm

**Time:** 45 min. [NOTE—Use low-actinic volumetric flasks.]

**Mobile phase:** Acetonitrile and water (1:1), containing 4.0 mL of phosphoric acid per L of solution

**Standard stock solution:** 0.15 mg/mL of USP Glyburide RS in *Medium*. [NOTE—Sonicate for about 25 min to dissolve, and dilute with *Medium* to volume.]

**Standard solutions:** Dilute the *Standard stock solution* with *Medium* to obtain 0.003 mg/mL (for Tablets labeled to contain 1.5 mg), 0.006 mg/mL (for Tablets labeled to contain 3.0 mg), 0.009 mg/mL (for Tablets labeled to contain 4.5 mg), and 0.012 mg/mL (for Tablets labeled to contain 6.0 mg).

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Column:** 4.6-mm × 30-cm; 10-µm packing L1

**Flow rate:** 2 mL/min

**Injection size:** 50 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 4000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 3.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Determine the percentage of glyburide ( $C_{23}H_{28}ClN_3O_5S$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = Tablet label claim (mg)

$V$  = volume of *Medium*, 500 mL

**Tolerances:** NLT 70% (Q) of the labeled amount of glyburide ( $C_{23}H_{28}ClN_3O_5S$ ) is dissolved.

**Test 2** (micronized glyburide): If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** 0.05 M phosphate buffer, pH 8.5 (6.8 g of monobasic potassium phosphate and 1.99 g of sodium hydroxide in 1 L of water, and adjust with diluted phosphoric acid or diluted sodium hydroxide to a pH of 8.5 ± 0.05); 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Mobile phase:** Acetonitrile and water containing 5 g/L of monobasic ammonium phosphate (480:520)

**Standard stock solution:** Transfer 67 mg of USP Glyburide RS to a 500-mL volumetric flask, dissolve in 40 mL of methanol with sonication for 5 min, and dilute with *Medium* to volume.

**Standard solutions:** Dilute the *Standard stock solution* with *Medium* to obtain solutions having known concentrations of 0.0017 mg/mL (for Tablets labeled to contain 1.5 mg), 0.0034 mg/mL (for Tablets labeled to

contain 3 mg), 0.0047 mg/mL (for Tablets labeled to contain 4.5 mg), and 0.0067 mg/mL (for Tablets labeled to contain 6 mg).

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.5- $\mu$ m pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Column:** 4.0-mm  $\times$  25-cm; 10- $\mu$ m packing L7

**Flow rate:** 1.5 mL/min

**Injection size:** 50  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Determine the percentage of glyburide ( $C_{23}H_{28}ClN_3O_5S$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = Tablet label claim (mg)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 75% (Q) of the labeled amount of glyburide ( $C_{23}H_{28}ClN_3O_5S$ ) is dissolved.

**Test 3 (micronized glyburide):** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

**Medium:** 0.05 M phosphate buffer, pH 7.5 (40.8 g of monobasic potassium phosphate and 9.4 g of sodium hydroxide, in 6 L of water, and adjust with diluted sodium hydroxide to a pH of  $7.5 \pm 0.1$ ); 900 mL

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Mobile phase:** Proceed as directed in the *Assay*.

**Diluent:** Acetonitrile and water (5:1)

**Standard stock solution:** 0.67 mg/mL of USP Glyburide RS in *Diluent*

**Standard solution:** 6.7  $\mu$ g/mL of USP Glyburide RS in *Medium* from *Standard stock solution*

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L7

**Flow rate:** 2 mL/min

**Injection size:** 75  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Determine the percentage of glyburide ( $C_{23}H_{28}ClN_3O_5S$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = Tablet label claim (mg)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 75% (Q) of the labeled amount of glyburide ( $C_{23}H_{28}ClN_3O_5S$ ) is dissolved.

**Test 4 (nonmicronized glyburide):** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

**Medium:** 0.05 M borate buffer, pH 8.0, with 0.014 M hexadecyltrimethylammonium bromide (prepared by dissolving about 180.0 g of hexadecyltrimethylammonium bromide, 55.6 g of boric acid, 67.1 g of potassium chloride, and 2.8 g of sodium hydroxide in 1500 mL of water at 50° under vigorous stirring for several hours, cooling to room temperature, diluting with water to 2000 mL, adjusting with diluted hydrochloric acid or diluted sodium hydroxide to a pH of  $8.0 \pm 0.05$ , and diluting 50 mL of this solution with water to 900 mL); 900 mL

**Apparatus 1:** 50 rpm

**Time:** 45 min

**Mobile phase:** Acetonitrile and water (11:9) containing 5.2 g of monobasic ammonium phosphate for each 2 L

**Standard stock solution:** 0.27 mg/mL of USP Glyburide RS in alcohol. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Medium* to volume.

**Standard solution:** 2.8  $\mu$ g/mL of USP Glyburide RS in *Medium*, from the *Standard stock solution*

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 5- $\mu$ m pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 226 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L7

**Flow rate:** 2 mL/min

**Injection size:** 100  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 2000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Determine the percentage of glyburide ( $C_{23}H_{28}ClN_3O_5S$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = Tablet label claim (mg)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 75% (Q) of the labeled amount of glyburide ( $C_{23}H_{28}ClN_3O_5S$ ) is dissolved.

**Test 5 (micronized glyburide):** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.

**Medium:** 0.05 M phosphate buffer, pH 7.5 (40.8 g of monobasic potassium phosphate and 9.4 g of sodium hydroxide, in 6 L of water, and adjust with diluted sodium hydroxide to a pH of  $7.5 \pm 0.1$ ); 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Standard solution:** USP Glyburide RS in *Medium* in a concentration similar to the one expected in the *Sample solution*

**Sample solution:** Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary.

**Mobile phase, Diluent, Chromatographic system, System suitability, and Analysis:** Proceed as directed for *Test 3*.

**Tolerances:** NLT 75% (Q) of the labeled amount of glyburide ( $C_{23}H_{28}ClN_3O_5S$ ) is dissolved.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** <11>  
USP Glyburide RS

## Glyburide and Metformin Hydrochloride Tablets

**DEFINITION**

Glyburide and Metformin Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of glyburide ( $C_{23}H_{28}ClN_3O_5S$ ) and metformin hydrochloride ( $C_4H_{11}N_5 \cdot HCl$ ).

**IDENTIFICATION**

- **A. GLYBURIDE:** The retention time of the glyburide peak of the *Sample solution* corresponds to that of the major peak of the *Standard solution*, as obtained in the Assay for Glyburide.
- **B. METFORMIN HYDROCHLORIDE:** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay for Metformin Hydrochloride.

**ASSAY**• **GLYBURIDE**

**Solution A:** 28.8 g/L of monobasic ammonium phosphate

**Mobile phase:** Acetonitrile and *Solution A* (40:60). Adjust with 1 N sodium hydroxide to a pH of 5.3.

**Diluent:** Acetonitrile and water (50:50)

**Standard stock solution:** 0.25 mg/mL of USP Glyburide RS prepared as follows: Dissolve first in the acetonitrile, using 50% of the final volume, and then dilute with water to volume.

**Standard solution:** 0.025 mg/mL of USP Glyburide RS in *Diluent*, from the *Standard stock solution*

**System suitability solution 1:** Prepare a solution containing 0.025 mg/mL of USP Glyburide Related Compound A RS in *Diluent*. Transfer 50  $\mu$ L of this solution to a 50-mL volumetric flask, and dilute with *Standard solution* to volume.

**System suitability solution 2:** 5.0 mg/mL of USP Metformin Hydrochloride RS in *System suitability solution 1*

**Sample solution:** Dissolve NLT 5 Tablets in *Diluent* by stirring with a magnetic stirring bar for a least 1 h. Dilute to obtain a solution containing 0.025 mg/mL of glyburide, based on the label claim. Centrifuge a portion of this solution at 3000 rpm for 10 min and use the clear supernatant. [NOTE—Retain a portion of this solution for the Assay for Metformin Hydrochloride.]

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L7

**Column temperature:** 40°

**Flow rate:** 1.2 mL/min

**Injection size:** 100  $\mu$ L

**System suitability**

**Sample:** *System suitability solution 2*

[NOTE—The relative retention time for the peak due to glyburide related compound A is about 0.30 with respect to glyburide.]

**Suitability requirements**

**Capacity factor, k':** NLT 7 for the peak due to glyburide

**Column efficiency:** NLT 3000 theoretical plates for the peak due to glyburide

**Relative standard deviation:** NMT 1.5% for the peak due to glyburide

**Relative standard deviation:** NMT 10% for the peak due to glyburide related compound A

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Record the chromatograms for about 1.25 times the retention time of the glyburide peak. Calculate the percentage of  $C_{23}H_{28}ClN_3O_5S$  in the Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Glyburide RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of glyburide in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0% of glyburide label claim

• **METFORMIN HYDROCHLORIDE**

**Solution A:** Transfer 1.0 g each of sodium heptanesulfonate and sodium chloride to a 2000-mL volumetric flask. Add 1800 mL of water, and adjust with 0.06 M phosphoric acid to a pH of 3.85. Dilute with water to volume.

**Mobile phase:** Acetonitrile and *Solution A* (10:90)

**Diluent:** Acetonitrile and water (1:40)

**Standard solution:** 0.25 mg/mL of USP Metformin Hydrochloride RS in *Diluent*. [NOTE—Sonicate to achieve complete dissolution, if necessary.]

**System suitability stock solution:** 25  $\mu$ g/mL each of USP Metformin Related Compound B RS and USP Metformin Related Compound C RS in *Diluent*

**System suitability solution:** Transfer 0.5 mL of the *System suitability stock solution* to a 50-mL volumetric flask, and dilute with *Standard solution* to volume.

**Sample solution:** Dilute with water a portion of the retained *Sample solution* from the Assay for Glyburide to obtain 0.25 mg/mL of metformin hydrochloride based on the label claim.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 218 nm

**Column:** 3.9-mm  $\times$  30-cm; 10- $\mu$ m packing L1

**Column temperature:** 30°

**Flow rate:** 1 mL/min

**Injection size:** 5  $\mu$ L

**System suitability**

**Sample:** *System suitability solution*

[NOTE—The relative retention times for metformin related compound B, metformin, and metformin related compound C are about 0.86, 1.0, and 2.1–2.3, respectively. (Metformin related compound C can have a variable retention time.)]

**Suitability requirements**

**Resolution:** NLT 1.5 between metformin related compound B and metformin

**Tailing factor:** 0.8–2.0 for the metformin peak

**Relative standard deviation:** NMT 1.5% for the metformin peak and NMT 10% for each of the peaks due to metformin related compound B and metformin related compound C.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_4H_{11}N_5 \cdot HCl$  in the Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

- $C_s$  = concentration of USP Metformin Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of metformin hydrochloride in the *Sample solution* (mg/mL)  
**Acceptance criteria:** 90.0%–110.0% of metformin label claim

**PERFORMANCE TESTS****• DISSOLUTION <711>****Glyburide**

**Medium:** 0.05 M boric acid and 0.05 M potassium chloride solution. Prepare by dissolving 3.09 g of boric acid and 3.73 g of potassium chloride in 250 mL of water, adjust with 1 N sodium hydroxide to a pH of 9.5, and dilute with water to 1 L; 500 mL.

**Apparatus 2:** 75 rpm

**Time:** 30 min

**Standard solution:** Transfer 10 mg of USP Glyburide RS to a 100-mL volumetric flask. Dissolve in 20 mL of acetonitrile, and dilute with *Medium* to volume. Dilute further with *Medium* to obtain a solution having a glyburide concentration, in mg/mL, of L/500 where L is the label claim, in mg, of glyburide.

**Sample solution:** Sample per *Dissolution <711>*. Pass a portion of the solution under test through a 0.45- $\mu$ m polypropylene filter or a 1- $\mu$ m glass fiber filter. Dilute with *Medium*, if necessary.

**Solution A:** 28.7 mg/mL of monobasic ammonium phosphate in water

**Mobile phase:** *Solution A* and acetonitrile (1:1). Adjust with 1 N sodium hydroxide to a pH of 5.3.

**Chromatographic system**

(See *Chromatography <621>*, *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L7

**Column temperature:** 30°

**Flow rate:** 1.5 mL/min

**Injection size:** 200  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 5000

**Tailing factor:** 0.8–2.0

**Relative standard deviation:** NMT 2%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Determine the percentage of  $C_{23}H_{28}ClN_3O_5S$  dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of glyburide in the *Sample solution* (mg/mL)

**Tolerances:** NLT 85% (Q) of the labeled amount of glyburide is dissolved.

**Metformin hydrochloride**

**Medium:** 0.05 M phosphate buffer, pH 6.8. Prepare by dissolving 6.8 g of monobasic potassium phosphate in 1000 mL of water, and adjust with 0.2 N sodium hydroxide to a pH of  $6.8 \pm 0.1$ ; 1000 mL.

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Standard solution:** Dissolve a quantity of USP Metformin Hydrochloride RS in *Medium*. Dilute further, if necessary, with *Medium* to obtain a solution having a metformin hydrochloride concentration, in mg/mL, of L/1000 where L is the label claim, in mg, of metformin hydrochloride.

**Sample solution:** Sample per *Dissolution <711>*. Pass a portion of the solution under test through a 0.45- $\mu$ m polypropylene filter or a 1- $\mu$ m glass fiber filter. Dilute with *Medium*, if necessary.

**Spectrometric conditions**

(See *Spectrophotometry and Light-Scattering <851>*.)

**Mode:** UV-Vis

**Analytical wavelength:** 232 nm

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_4H_{11}N_5 \cdot HCl$  dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

- $A_U$  = absorbance of the *Sample solution*  
 $A_S$  = absorbance of the *Standard solution*  
 $C_S$  = concentration of USP Metformin Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of metformin hydrochloride in the *Sample solution* (mg/mL)

**Tolerances:** NLT 85% (Q) of the labeled amount of metformin hydrochloride is dissolved.

- UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements for *Weight Variation* for metformin hydrochloride and for *Content Uniformity* for glyburide

**IMPURITIES****Organic Impurities****• PROCEDURE 1: GLYBURIDE**

**Solution A, Mobile phase, Diluent, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay for Glyburide*.

**Standard solution:** Dilute 1.0 mL of the *Standard solution* from the *Assay for Glyburide* with *Diluent* to 100 mL.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each glyburide impurity in the Tablets:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Glyburide RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of glyburide in the *Sample solution* (mg/mL)  
 $F$  = relative response factor, use 0.8 for glyburide related compound A, and use 1.0 for all other impurities

**Acceptance criteria**

[NOTE—Disregard any peak less than 0.05%, and disregard any peak observed in the blank.]

**Glyburide related compound A:** NMT 1.0%

**Any other individual impurities:** NMT 0.2%

**Total impurities:** NMT 0.50%, excluding glyburide related compound A

**• PROCEDURE 2: METFORMIN HYDROCHLORIDE**

**Solution A, Mobile phase, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay for Metformin Hydrochloride*.

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

- $r_U$  = peak response for each impurity from the *Sample solution*  
 $r_T$  = sum of the responses of all peaks from the *Sample solution*

**Acceptance criteria**

[NOTE—Disregard any peak less than 0.05%, and disregard any peak observed in the blank.]

**Individual impurities:** NMT 0.1%

**Total impurities:** NMT 0.5 %

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)

Glycerol [56-81-5].

**DEFINITION**

Glycerin contains NLT 99.0% and NMT 101.0% of C<sub>3</sub>H<sub>8</sub>O<sub>3</sub>, calculated on the anhydrous basis.

**IDENTIFICATION** [NOTE—Compliance is determined by meeting the requirements for *Identification* tests A, B, and C.]

- **A. INFRARED ABSORPTION** (197F)

- **B. LIMIT OF DIETHYLENE GLYCOL AND ETHYLENE GLYCOL**

**Standard solution:** 2.0 mg/mL of USP Glycerin RS, 0.050 mg/mL of USP Ethylene Glycol RS, 0.050 mg/mL of USP Diethylene Glycol RS, and 0.10 mg/mL of 2,2,2-trichloroethanol (internal standard) in methanol

**Sample solution:** 50 mg/mL of Glycerin and 0.10 mg/mL of 2,2,2-trichloroethanol (internal standard) in methanol

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.53-mm × 30-m fused-silica analytical column coated with 3.0-μm G43 stationary phase, and a deactivated split liner with glass wool

**Temperature**

**Injector:** 220°

**Detector:** 250°

**Column:** See the temperature program table.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
100	—	100	4
100	50	120	10
120	50	220	6

**Carrier gas:** Helium

**Injection size:** 1.0 μL

**Flow rate:** 4.5 mL/min

**Injection type:** Split ratio, about 10:1

**System suitability**

**Sample:** *Standard solution*

[NOTE—The relative retention times for ethylene glycol, 2,2,2-trichloroethanol, diethylene glycol, and glycerin are about 0.3, 0.6, 0.8 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 1.5 between diethylene glycol and glycerin

**Analysis**

**Sample:** *Sample solution*

**Acceptance criteria:** If a peak at the retention times for the diethylene glycol or ethylene glycol is present in the *Sample solution*, the peak response ratio relative to 2,2,2-trichloroethanol is NMT the peak response ratio for diethylene glycol or ethylene glycol relative to 2,2,2-trichloroethanol in the *Standard solution*; NMT 0.10% each for diethylene glycol and ethylene glycol is found.

- **C.** Examine the chromatograms obtained in *Identification* test B. The retention time of the glycerin peak of the *Sample solution* corresponds to that obtained in the *Standard solution*.

**ASSAY**

- **PROCEDURE**

**Sodium periodate solution:** Dissolve 60 g of sodium metaperiodate in sufficient water containing 120 mL of 0.1 N sulfuric acid to make 1000 mL. Do not heat to dissolve the periodate. If the solution is not clear, pass through a sintered-glass filter. Store the solution in a glass-stoppered, light-resistant container. Test the suitability of this solution as follows. Pipet 10 mL into a 250-mL volumetric flask, and dilute with water to volume. To 550 mg of Glycerin dissolved in 50 mL of water, add 50 mL of the diluted periodate solution with a pipet. For a blank, pipet 50 mL of the solution into a flask containing 50 mL of water. Allow the solutions to stand for 30 min, then to each add 5 mL of hydrochloric acid and 10 mL of potassium iodide TS, and rotate to mix. Allow to stand for 5 min, add 100 mL of water, and titrate with 0.1 N sodium thiosulfate, shaking continuously and adding 3 mL of starch TS as the endpoint is approached. The ratio of the volume of 0.1 N sodium thiosulfate required for the glycerin–periodate mixture to that required for the blank should be between 0.750 and 0.765.

**Analysis:** Transfer 400 mg of Glycerin to a 600-mL beaker, dilute with 50 mL of water, add bromothymol blue TS, and acidify with 0.2 N sulfuric acid to a definite green or greenish yellow color. Neutralize with 0.05 N sodium hydroxide to a definite blue endpoint, free from green color. Prepare a blank containing 50 mL of water, and neutralize in the same manner. Pipet 50 mL of the *Sodium periodate solution* into each beaker, mix by swirling gently, cover with a watch glass, and allow to stand for 30 min at room temperature (not exceeding 35°) in the dark or in subdued light. Add 10 mL of a mixture of equal volumes of ethylene glycol and water, and allow to stand for 20 min. Dilute each solution with water to 300 mL, and titrate with 0.1 N sodium hydroxide VS to a pH of 8.1 ± 0.1 for the specimen under assay and 6.5 ± 0.1 for the blank, using a pH meter. Each mL of 0.1 N sodium hydroxide, after correction for the blank, is equivalent to 9.210 mg of C<sub>3</sub>H<sub>8</sub>O<sub>3</sub>.

**Acceptance criteria:** 99.0%–101.0% on the anhydrous basis

**IMPURITIES****Inorganic Impurities**

- **CHLORIDE AND SULFATE**, *Chloride* <221>: A 7.0-g portion shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid (NMT 10 ppm).
- **CHLORIDE AND SULFATE**, *Sulfate* <221>: A 10-g portion shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid (NMT 20 ppm).
- **HEAVY METALS** <231>  
**Analysis:** Mix 4.0 g with 2 mL of 0.1 N hydrochloric acid, and dilute with water to 25 mL.  
**Acceptance criteria:** NMT 5 ppm
- **RESIDUE ON IGNITION** <281>: Heat 50 g in an open, shallow 100-mL porcelain dish until it ignites, and allow it to burn without further application of heat in a place free from drafts. Cool, moisten the residue with 0.5 mL of sulfuric acid, and ignite to constant weight: the weight of the residue does not exceed 5 mg (0.01%).

**Organic Impurities****• PROCEDURE 1: RELATED COMPOUNDS**

**System suitability solution:** 0.5 mg/mL each of USP Diethylene Glycol RS and USP Glycerin RS

**Sample solution:** 50 mg/mL of Glycerin

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.53-mm × 30-m fused-silica analytical column coated with 3.0-μm G43 stationary phase, and an inlet liner having an inverted cup or spiral structure

**Temperature**

**Injector:** 220°

**Detector:** 250°

**Column:** See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
100	—	100	—
100	7.5	220	4

**Carrier gas:** Helium

**Injection size:** 0.5 μL

**Linear velocity:** 38 cm/s

**Injection type:** Split ratio, about 10:1

**System suitability**

**Sample:** *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 7.0 between diethylene glycol and glycerin

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each impurity, excluding any solvent peaks and diethylene glycol, in the portion of Glycerin taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_T$  = sum of the responses of all the peaks from the *Sample solution*

**Acceptance criteria**

**Individual impurities:** NMT 0.1%

**Total impurities:** NMT 1.0%

**• PROCEDURE 2: LIMIT OF CHLORINATED COMPOUNDS**

**Sample:** 5 g of Glycerin

**Analysis:** Transfer the *Sample* into a dry, round-bottom, 100-mL flask. Add 15 mL of morpholine, and connect the flask by a ground joint to a reflux condenser. Reflux gently for 3 h. Rinse the condenser with 10 mL of water, receiving the washings in the flask, and cau-

tiously acidify with nitric acid. Transfer the solution to a suitable comparison tube, add 0.50 mL of silver nitrate TS, and dilute with water to 50.0 mL.

**Acceptance criteria:** The turbidity is not greater than that of a blank to which 0.20 mL of 0.020 N hydrochloric acid has been added, the refluxing being omitted (NMT 30 ppm of Cl).

**• PROCEDURE 3: FATTY ACIDS AND ESTERS**

**Sample solution:** Mix 50 g of Glycerin with 50 mL of freshly boiled water and 5 mL of 0.5 N sodium hydroxide VS. Boil the mixture for 5 min, cool, and add phenolphthalein TS.

**Analysis:** Titrate the excess alkali with 0.5 N hydrochloric acid VS. Perform a blank determination (see *Titrimetry* <541>, *Residual Titrations*).

**Acceptance criteria:** NMT 1 mL of 0.5 N sodium hydroxide is consumed.

**SPECIFIC TESTS**

- **COLOR:** When viewed downward against a white surface in a 50-mL color-comparison tube, the color is not darker than the color of a standard made by diluting 0.40 mL of ferric chloride CS with water to 50 mL and similarly viewed in a color-comparison tube of approximately the same diameter and color as that containing the Glycerin.
- **SPECIFIC GRAVITY** <841>: NLT 1.249
- **WATER DETERMINATION**, *Method I* <921>: NMT 5.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.

**• USP REFERENCE STANDARDS <11>**

USP Diethylene Glycol RS

USP Ethylene Glycol RS

USP Glycerin RS

1,2,3-Propanetriol.

C<sub>3</sub>H<sub>8</sub>O<sub>3</sub> 92.10

**Glycerin Ophthalmic Solution**

» Glycerin Ophthalmic Solution is a sterile, anhydrous solution of Glycerin, containing not less than 98.5 percent of glycerin (C<sub>3</sub>H<sub>8</sub>O<sub>3</sub>). It may contain one or more suitable antimicrobial preservatives. [NOTE—In the preparation of this Ophthalmic Solution, use Glycerin that has a low water content, in order that the Ophthalmic Solution may comply with the *Water* limit. This may be ensured by using Glycerin having a specific gravity of not less than 1.2607, corresponding to a concentration of 99.5 percent.]

NOTE—Do not use the Ophthalmic Solution if it contains crystals, or is cloudy or discolored, or contains a precipitate.

**Packaging and storage**—Preserve in tight containers of glass or plastic, containing not more than 15 mL, protected from light. The container or individual carton is sealed and tamper-proof so that sterility is ensured at time of first use.

**USP Reference standards <11>—**

USP Glycerin RS

**Identification**—It responds to the *Identification* test under *Glycerin*.

**Sterility** <71>: meets the requirements.

**pH** <791>: between 4.5 and 7.5, determined potentiometrically in a solution prepared by the addition of 5 mL of Sodium Chloride Injection to 5 mL of Ophthalmic Solution.

**Water, Method I** (921): not more than 1.0%.

**Assay**—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 3 g of glycerin, to a 500-mL volumetric flask, dilute with water to volume, and mix. Transfer a 3-mL portion to a conical flask, add 100.0 mL of a solution of potassium periodate (prepared by dissolving 3 g of potassium periodate in about 500 mL of warm water, cooling to room temperature, and then diluting with water to 1000 mL), swirl, and allow to stand at room temperature for 10 minutes. Add 4 g of sodium bicarbonate and 2 g of potassium iodide, and titrate immediately with 0.1 N potassium arsenite VS, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination, using water in place of the Ophthalmic Solution, and note the difference in volumes required. Each mL of 0.1 N potassium arsenite is equivalent to 2.303 mg of glycerin ( $C_3H_8O_3$ ).

## Glycerin Oral Solution

» Glycerin Oral Solution contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of glycerin ( $C_3H_8O_3$ ).

**Packaging and storage**—Preserve in tight containers.

**Identification**—Heat a few drops with about 500 mg of potassium bisulfate in a test tube: pungent vapors of acrolein are evolved.

**pH** (791): between 5.5 and 7.5.

**Assay**—Transfer an accurately measured volume of Oral Solution, equivalent to about 3 g of glycerin, to a 500-mL volumetric flask, dilute with water to volume, and mix. Transfer a 3-mL portion to a conical flask, add 100.0 mL of a solution of potassium periodate (prepared by dissolving 3 g of potassium periodate in about 500 mL of warm water, cooling to room temperature, and then diluting with water to 1000 mL), swirl, and allow to stand at room temperature for 10 minutes. Add 4 g of sodium bicarbonate and 2 g of potassium iodide, and titrate immediately with 0.1 N potassium arsenite VS, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination, using water in place of the Oral Solution, and note the difference in volumes required. Each mL of 0.1 N potassium arsenite is equivalent to 2.303 mg of glycerin ( $C_3H_8O_3$ ).

## Glycerin Suppositories

» Glycerin Suppositories contain Glycerin solidified with Sodium Stearate. [NOTE—If preferred, the Sodium Stearate for Glycerin Suppositories may be prepared during the making of the Suppositories by the direct reaction between Stearic Acid and Sodium Bicarbonate, Sodium Carbonate, or Sodium Hydroxide, these being taken in the correct proportion.] Glycerin Suppositories contain not less than 75.0 percent and not more than 90.0 percent, by weight, of glycerin ( $C_3H_8O_3$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Stearic Acid RS

### Identification—

**A:** Dissolve 1 g of sodium borate in 100 mL of water, add 25 drops of phenolphthalein TS, and mix. To a test tube containing 0.5 mL of this solution add 2 drops of 1 Suppository that has been melted: the pink solution becomes colorless, and when it is heated the pink color reappears.

**B:** Disperse 12 Suppositories in about 125 mL of water in a 250-mL beaker on a hot plate. Cool, add 1.5 mL of hydrochloric acid, and pour the mixture into a 250-mL separator. Extract with 75 mL of hexanes, discarding the lower aqueous layer and collecting the organic layer in a beaker. Evaporate with the aid of a steam bath to near dryness: the IR absorption spectrum of a mineral oil dispersion of the residue so obtained exhibits maxima only at the same wavelengths as those of a mineral oil dispersion of USP Stearic Acid RS.

**Water, Method I** (921): not more than 15.0%.

**Assay**—Transfer an accurately weighed quantity of Suppositories, equivalent to about 250 mg of glycerin, to a 250-mL volumetric flask. Dissolve in water, dilute with water to volume, and mix. Pipet 5 mL of this solution into a 250-mL conical flask, and add 50.0 mL of a reagent prepared by mixing 40 mL of dilute sulfuric acid (1 in 20) with 60 mL of potassium periodate solution (1 in 1000) acidified with 3 to 5 drops of sulfuric acid. Heat the solution on a steam bath for 15 minutes, cool to room temperature, and add 1 g of potassium iodide. Allow the flask to stand for 5 minutes, and titrate with 0.02 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination, using water in place of Suppositories, and note the difference in volumes required. Each mL of the difference in volume of 0.02 N sodium thiosulfate consumed is equivalent to 0.4604 mg of glycerin ( $C_3H_8O_3$ ).

## Glycine

$C_2H_5NO_2$   
Glycine [56-40-6].

75.07

### DEFINITION

Glycine contains NLT 98.5% and NMT 101.5% of glycine ( $C_2H_5NO_2$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M)

### ASSAY

- **PROCEDURE**

**Sample:** 150 mg of Glycine

**Blank:** 100 mL of glacial acetic acid

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid VS

**Endpoint detection:** Visual

**Analysis:** Dissolve the *Sample* in 100 mL of glacial acetic acid, and add 1 drop of crystal violet TS. Titrate with the *Titrant* to a green endpoint. Perform the *Blank* determination.

Calculate the percentage of glycine ( $C_2H_5NO_2$ ) in the *Sample* taken:

$$\text{Result} = \{(V_s - V_b) \times N \times F/W\} \times 100$$

$V_s$  = Titrant volume consumed by the *Sample* (mL)

$V_b$  = Titrant volume consumed by the *Blank* (mL)

*N* = actual normality of the *Titrant* (mEq/mL)  
*F* = equivalency factor, 75.07 mg/mEq  
*W* = *Sample weight* (mg)  
**Acceptance criteria:** 98.5%–101.5% on the dried basis

**IMPURITIES**

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **CHLORIDE AND SULFATE, Chloride** (221)  
*Standard solution:* 0.10 mL of 0.020 N hydrochloric acid  
*Sample:* 1 g of Glycine  
*Acceptance criteria:* NMT 0.007%
- **CHLORIDE AND SULFATE, Sulfate** (221)  
*Standard solution:* 0.20 mL of 0.020 N sulfuric acid  
*Sample:* 3 g of Glycine  
*Acceptance criteria:* NMT 0.0065%
- **HEAVY METALS, Method I** (231): NMT 20 ppm
- **HYDROLYZABLE SUBSTANCES**  
*Sample solution:* 100 mg/mL of Glycine  
*Analysis:* Boil 10 mL of the *Sample solution* for 1 min, and set aside for 2 h.  
*Acceptance criteria:* The solution appears as clear and as mobile as 10 mL of the same solution that has not been boiled.

**SPECIFIC TESTS**

- **LOSS ON DRYING** (731): Dry a sample at 105° for 2 h: it loses NMT 0.2% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)  
 USP Glycine RS

## Glycine Irrigation

» Glycine Irrigation is a sterile solution of Glycine in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of glycine (C<sub>2</sub>H<sub>5</sub>NO<sub>2</sub>).

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I or Type II glass.

**USP Reference standards** (11)—

USP Endotoxin RS  
 USP Glycine RS

**Identification**—Evaporate a portion of Irrigation to dryness, and obtain the IR absorption spectrum of a mineral oil dispersion of the residue: it exhibits maxima only at the same wavelengths as that of a similar preparation of USP Glycine RS.

**Bacterial endotoxins** (85)—It contains not more than 0.5 Endotoxin Unit per mL.

**pH** (791): between 4.5 and 6.5, determined potentiometrically on a portion to which 0.3 mL of saturated potassium chloride has been added for each 100 mL.

**Other requirements**—It meets the requirements under *Injections* (1), except that the container in which the solution is packaged may be designed to empty rapidly and may exceed 1000 mL in capacity.

**Assay**—Dilute an accurately measured volume of Irrigation, equivalent to about 150 mg of glycine, with water to 25 mL, and add 10 mL of formaldehyde TS, previously adjusted to a pH of 9.0, and 5 drops of mixed indicator solution (prepared by dissolving 75 mg of phenolphthalein and 25 mg of thymol blue in a mixture of equal volumes of alcohol and water to make 100 mL). Titrate with 0.1 N sodium hydroxide VS until the yellow color disappears and a

faint violet color appears. Each mL of 0.1 N sodium hydroxide is equivalent to 7.507 mg of glycine (C<sub>2</sub>H<sub>5</sub>NO<sub>2</sub>).

## Glycopyrrolate

C<sub>19</sub>H<sub>28</sub>BrNO<sub>3</sub> 398.33  
 Pyrrolidinium, 3-[(*SR*)-(cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethyl-, [*RS*-] bromide;  
 (*RS*)-[3-(*SR*)-Hydroxy-1,1-dimethylpyrrolidinium bromide] α-cyclopentylmandelate [596-51-0].

**DEFINITION**

Glycopyrrolate contains NLT 98.0% and NMT 102.0% of C<sub>19</sub>H<sub>28</sub>BrNO<sub>3</sub>, calculated on the dried basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL, Bromide** (191)  
*Sample solution:* 25 mg/mL  
*Acceptance criteria:* Meets the requirements

**ASSAY****PROCEDURE**

**Buffer:** Prepare a solution of 1.0 g of anhydrous sodium sulfate and 200 mg of sodium 1-hexanesulfonate monohydrate in 650 mL of water. To this solution add 3.0 mL of 1 N sulfuric acid, and mix.

**Mobile phase:** Acetonitrile, methanol, and *Buffer* (20:15:65)

**Standard solution:** 0.1 mg/mL of USP Glycopyrrolate RS in *Mobile phase*

**Sample solution:** 0.1 mg/mL of Glycopyrrolate in *Mobile phase*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 222 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Column temperature:** 40°

**Flow rate:** 1.2 mL/min

**Injection size:** 50 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 1.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of glycopyrrolate

(C<sub>19</sub>H<sub>28</sub>BrNO<sub>3</sub>) in the portion of Glycopyrrolate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

*r<sub>U</sub>* = peak response of Glycopyrrolate from the *Sample solution*

*r<sub>S</sub>* = peak response of glycopyrrolate from the *Standard solution*

*C<sub>S</sub>* = concentration of USP Glycopyrrolate RS in the *Standard solution* (mg/mL)

*C<sub>U</sub>* = concentration of Glycopyrrolate in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

#### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.3%

- **ORGANIC IMPURITIES**

**Buffer:** Prepare a solution of 1.0 g of anhydrous sodium sulfate and 200 mg of sodium 1-hexanesulfonate monohydrate in 650 mL of water. To this solution add 3.0 mL of 1 N sulfuric acid, and mix.

**Diluent:** Prepare a solution of 1.0 g of anhydrous sodium sulfate, 6.8 g of monobasic potassium phosphate, and 200 mg of sodium 1-hexanesulfonate monohydrate in 650 mL of water. To this solution add 3.0 mL of 1 N sulfuric acid, 150 mL of methanol, and 200 mL of acetonitrile, and mix. Adjust with phosphoric acid to a pH of 2.8.

**Solution A:** Acetonitrile, methanol, and *Buffer* (20:15:65)

**Solution B:** Acetonitrile, methanol, and *Buffer* (50:15:35)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	100	0
10	100	0
25	10	90
35	10	90
37	100	0
45	100	0

**Standard solution:** 1.5 µg/mL each of USP Glycopyrrolate RS, USP Glycopyrrolate Related Compound A RS, USP Glycopyrrolate Related Compound B RS, and USP Glycopyrrolate Related Compound C RS in *Diluent*. Sonicate, if necessary, to facilitate dissolution.

**Sample solution:** 1.0 mg/mL of Glycopyrrolate in *Diluent*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 222 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L1

**Column temperature:** 40°

**Flow rate:** 1 mL/min

**Injection size:** 50 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between glycopyrrolate and glycopyrrolate related compound B

**Tailing factor:** NMT 2.0 for the glycopyrrolate peak

**Relative standard deviation:** NMT 6.0% for each peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of glycopyrrolate related compounds A, B, and C in the portion of Glycopyrrolate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each related compound from the *Sample solution*

$r_S$  = peak response of the corresponding related compound from the *Standard solution*

$C_S$  = concentration of the corresponding related compound in the *Standard solution* (mg/mL)

$C_U$  = concentration of glycopyrrolate in the *Sample solution* (mg/mL)

Calculate the percentage of any other individual impurity in the portion of Glycopyrrolate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of glycopyrrolate from the *Standard solution*

$C_S$  = concentration of USP Glycopyrrolate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Glycopyrrolate in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*.

**Table 2**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
5-Nitroisophthalic acid <sup>a</sup>	0.45	0.15

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.2 between the erythro isomer and glycopyrrolate, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 6.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of erythro isomer in the portion of Glycopyrrolate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of the erythro isomer from the *Sample solution*

$r_S$  = peak response of glycopyrrolate from the *Standard solution*

$C_S$  = concentration of USP Glycopyrrolate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Glycopyrrolate in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 3.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Erythro isomer (R,R/S,S-glycopyrrolate) <sup>a</sup>	0.89	0.4
Glycopyrrolate	1.00	—

<sup>a</sup> USP Glycopyrrolate Erythro Isomer RS.

#### SPECIFIC TESTS

- **Loss on Drying** (731): Dry at 105° for 3 h: it loses NMT 0.5% of its weight.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at room temperature.
- **USP REFERENCE STANDARDS** (11)
  - USP Glycopyrrolate RS
  - USP Glycopyrrolate Related Compound A RS  
5-Nitrobenzene-1,3-dicarboxylic acid.  
 $C_8H_5NO_6$  211.13
  - USP Glycopyrrolate Related Compound B RS  
1-Methylpyrrolidin-3-yl-2-cyclopentyl-2-hydroxy-2-phenylacetate.

## Glycopyrrolate Injection

» Glycopyrrolate Injection is a sterile solution of Glycopyrrolate in Water for Injection. It contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of glycopyrrolate ( $C_{19}H_{28}BrNO_3$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Glycopyrrolate RS

**Identification**—

**Spray reagent**—Dissolve 2 g of bismuth subnitrate in a solution consisting of 100 mL of water and 25 mL of glacial acetic acid (Solution A). Dissolve 40 g of potassium iodide in 100 mL of water (Solution B). Add 10 mL of Solution A and 10 mL of Solution B to a solution consisting of 100 mL of water and 20 mL of glacial acetic acid, and mix.

**Procedure**—Pipet an amount of Injection equivalent to about 1 mg of glycopyrrolate into a 10-mL volumetric flask, dilute with water to volume, and mix to obtain the test solution. Prepare a Standard solution of USP Glycopyrrolate RS in water containing about 0.1 mg of glycopyrrolate per mL. Apply 30  $\mu$ L of the test solution and 30  $\mu$ L of the Standard solution to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of butyl alcohol, glacial acetic acid, and

water (3:1:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, and allow to air-dry. Spray the plate with *Spray reagent*, and allow to air-dry: the  $R_f$  value and color of the principal spot obtained from the test solution correspond to those obtained from the Standard solution.

**Bacterial endotoxins** (85)—It contains not more than 555.5 USP Endotoxin Units per mg of glycopyrrolate.

**pH** (791): between 2.0 and 3.0.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

**Mobile phase**—Dissolve 1.0 g of anhydrous sodium sulfate and 200 mg of sodium 1-pentanesulfonate in 615 mL of water in a 1000-mL volumetric flask. Add 3.0 mL of 1 N sulfuric acid, 235 mL of acetonitrile, and 150 mL of methanol, and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Glycopyrrolate RS in *Mobile phase*, and dilute quantitatively with *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL.

**Resolution solution**—Prepare a solution of benzaldehyde in *Mobile phase* containing about 0.5 mg per mL. Transfer 2.0 mL of this solution to a 25-mL volumetric flask, dilute with *Standard preparation* to volume, and mix.

**Assay preparation**—Dilute a volume of Injection, quantitatively if necessary, with *Mobile phase* to obtain a solution having a concentration of about 0.2 mg of glycopyrrolate per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 222-nm detector and a 3.9-mm  $\times$  30-cm column containing packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed under *Procedure*: the resolution,  $R$ , between the benzaldehyde and glycopyrrolate peaks is not less than 3.0. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 35  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of glycopyrrolate ( $C_{19}H_{28}BrNO_3$ ) in each mL of the Injection taken by the formula:

$$C(L/D)(r_U/r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Glycopyrrolate RS in the *Standard preparation*;  $L$  is the labeled quantity, in mg per mL, of glycopyrrolate in the Injection;  $D$  is the concentration, in mg per mL, of glycopyrrolate in the *Assay preparation*, on the basis of the labeled quantity and the extent of dilution; and  $r_U$  and  $r_S$  are the glycopyrrolate peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Glycopyrrolate Tablets

#### DEFINITION

Glycopyrrolate Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of glycopyrrolate ( $C_{19}H_{28}BrNO_3$ ).

#### IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****• PROCEDURE**

**Buffer:** Prepare a solution of 1.0 g of anhydrous sodium sulfate and 200 mg of sodium 1-hexanesulfonate monohydrate in 650 mL of water. To this solution add 3.0 mL of 1 N sulfuric acid, and mix.

**Mobile phase:** Acetonitrile, methanol, and *Buffer* (20:15:65)

**Standard solution:** 0.1 mg/mL of USP Glycopyrrolate RS in *Mobile phase*

**Sample solution:** 0.1 mg/mL of glycopyrrolate in *Mobile phase*. Prepare by transferring 10 Tablets to a suitable volumetric flask. Add *Mobile phase* to 50% of the volume of the flask, and sonicate for 10 min or until the Tablets disintegrate completely. Add *Mobile phase* to 75% of the volume of the flask, shake mechanically for 30 min, and dilute with *Mobile phase* to volume. Centrifuge a portion of the solution, and pass the supernatant through a suitable filter, discarding the first few mL of the filtrate.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 222 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Column temperature:** 40°

**Flow rate:** 1.2 mL/min

**Injection size:** 50 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 1.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of glycopyrrolate (C<sub>19</sub>H<sub>28</sub>BrNO<sub>3</sub>) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of glycopyrrolate from the *Sample solution*

$r_S$  = peak response of glycopyrrolate from the *Standard solution*

$C_S$  = concentration of USP Glycopyrrolate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of glycopyrrolate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 93.0%–107.0%

**PERFORMANCE TESTS****• DISSOLUTION <711>**

**Medium:** Water; 500 mL

**Apparatus 1:** 100 rpm

**Time:** 45 min

**Buffer:** 1.0 g of anhydrous sodium sulfate and 200 mg of sodium 1-pentanesulfonate in 620 mL of water

**Mobile phase:** Acetonitrile, methanol, *Buffer*, and 1 N sulfuric acid (200:180:620:3)

**Standard stock solution:** 0.2 mg/mL of USP Glycopyrrolate RS in *Medium*. A small volume of methanol, not exceeding 20% of the final volume, can be used to solubilize glycopyrrolate.

**Standard solution:** (L/500) mg/mL of glycopyrrolate in *Medium* from the *Standard stock solution*, where L is the label claim in mg/Tablet. Prepare this solution fresh, and refrigerate immediately at 5°.

**Sample solution:** Pass a portion of the solution under test through a suitable filter, discarding the first few mL of the filtrate. Refrigerate the samples at 5°.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Temperature**

**Column:** 40°

**Sampler:** 5°

**Flow rate:** 1.2 mL/min

**Injection size:** 80 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

Calculate the average percentage of the labeled amount of glycopyrrolate dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of glycopyrrolate in the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 500 mL

**Tolerances:** NLT 75% (Q) of the labeled amount of glycopyrrolate (C<sub>19</sub>H<sub>28</sub>BrNO<sub>3</sub>) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS <905>:** Meet the requirements

**IMPURITIES****• ORGANIC IMPURITIES**

**Buffer:** Prepare a solution of 1.0 g of anhydrous sodium sulfate and 200 mg of sodium 1-hexanesulfonate monohydrate in 650 mL of water. To this solution add 3.0 mL of 1 N sulfuric acid, and mix.

**Diluent:** Prepare a solution of 1.0 g of anhydrous sodium sulfate, 6.8 g of monobasic potassium phosphate, and 200 mg of sodium 1-hexanesulfonate monohydrate in 650 mL of water. To this solution add 3.0 mL of 1 N sulfuric acid, 150 mL of methanol, and 200 mL of acetonitrile, and mix. Adjust with phosphoric acid to a pH of 2.8.

**Solution A:** Acetonitrile, methanol, and *Buffer* (20:15:65)

**Solution B:** Acetonitrile, methanol, and *Buffer* (50:15:35)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	100	0
10	100	0
25	10	90
35	10	90
37	100	0
45	100	0

**Standard solution:** 1.5 μg/mL each of USP Glycopyrrolate RS, USP Glycopyrrolate Related Compound B RS, and USP Glycopyrrolate Related Compound C RS in *Diluent*. Sonicate, if necessary, to facilitate dissolution.

**Sample solution:** 500 μg/mL of glycopyrrolate in *Diluent*. Prepare by transferring the equivalent of 25 mg of glycopyrrolate from a portion of NLT 20 powdered Tablets to a 50-mL volumetric flask. Add 30 mL of *Diluent*, sonicate for 10 min, shake mechanically for 30 min, and dilute with *Diluent* to volume. Centrifuge a portion of the solution, and pass the supernatant through a suitable filter, discarding the first few mL of the filtrate.

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 222 nm**Column:** 4.6-mm × 15-cm; 5-μm packing L1**Column temperature:** 40°**Flow rate:** 1 mL/min**Injection size:** 50 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Resolution:** NLT 2.0 between glycopyrrolate and glycopyrrolate related compound B**Tailing factor:** NMT 2.0 for the glycopyrrolate peak**Relative standard deviation:** NMT 6.0% for the glycopyrrolate and glycopyrrolate related compound C peaks**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of glycopyrrolate related compound C in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response of glycopyrrolate related compound C from the *Sample solution* $r_S$  = peak response of glycopyrrolate related compound C from the *Standard solution* $C_S$  = concentration of USP Glycopyrrolate Related Compound C RS in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of glycopyrrolate in the *Sample solution* (mg/mL)

Calculate the percentage of any other individual impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response of each impurity from the *Sample solution* $r_S$  = peak response of glycopyrrolate from the *Standard solution* $C_S$  = concentration of USP Glycopyrrolate RS in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of glycopyrrolate in the *Sample solution* (mg/mL)**Acceptance criteria:** See *Table 2*.**Table 2**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
5-Nitroisophthalic acid <sup>a</sup>	0.45	— <sup>d</sup>
Glycopyrrolate	1.00	—
Glycopyrrolate base <sup>b</sup>	1.14	— <sup>d</sup>
Cyclopentylmandelic acid <sup>c</sup>	2.68	0.5
Any other individual impurity	—	0.2
Total impurities	—	1.2

<sup>a</sup> Glycopyrrolate related compound A.<sup>b</sup> Glycopyrrolate related compound B.<sup>c</sup> Glycopyrrolate related compound C.<sup>d</sup> Disregard the peaks due to 5-nitroisophthalic acid and glycopyrrolate base, because these are process impurities and are controlled in the drug substance monograph.**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.

- USP REFERENCE STANDARDS** <11>

USP Glycopyrrolate RS

USP Glycopyrrolate Related Compound B RS

1-Methylpyrrolidin-3-yl-2-cyclopentyl-2-hydroxy-2-phenylacetate.

C<sub>18</sub>H<sub>25</sub>NO<sub>3</sub> 303.40

USP Glycopyrrolate Related Compound C RS

2-Cyclopentyl-2-hydroxy-2-phenylacetic acid.

C<sub>13</sub>H<sub>16</sub>O<sub>3</sub> 220.26**Gold Sodium Thiomalate**C<sub>4</sub>H<sub>3</sub>AuNa<sub>2</sub>O<sub>4</sub>S plus C<sub>4</sub>H<sub>4</sub>AuNaO<sub>4</sub>S 368.09

Butanedioic acid, mercapto-, monogold(1+) sodium salt.

Mercaptosuccinic acid, monogold(1+) sodium salt

[12244-57-4].

» Gold Sodium Thiomalate is a mixture of the mono- and di-sodium salts of gold thiomalic acid. It contains not less than 44.8 percent and not more than 49.6 percent of Au. It contains not less than 49.0 percent and not more than 52.5 percent of Au on a dry, alcohol- and glycerin-free basis.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**Identification**—

**A:** To 2 mL of a solution (1 in 10) add 1 mL of calcium nitrate solution (1 in 10): a white precipitate is formed, and it dissolves in 2 N nitric acid and reappears upon the addition of ammonium acetate TS.

**B:** To 2 mL of a solution (1 in 10) add 4 mL of silver nitrate TS: a yellowish precipitate is formed, and it dissolves completely in an excess of 6 N ammonium hydroxide.

**C:** To 2 mL of a solution (1 in 10) add 1 mL of 6 N ammonium hydroxide and 1 mL of 30 percent hydrogen peroxide, evaporate in a porcelain dish, and ignite. Add 20 mL of water to the ignited residue, and filter: particles of gold remain on the filter. Separate portions of the filtrate meet the requirements of the tests for *Sodium* <191> and for *Sulfate* <191>.

**pH** <791>: between 5.8 and 6.5, in a solution (1 in 10).

**Loss on drying** <731>—Dry it at 60° and at a pressure not exceeding 5 mm of mercury for 2 hours: it loses not more than 8.0% of its weight.

**Limit of alcohol**—

**Standard solution**—Transfer 50 mg of dehydrated alcohol to a 200-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL to a 50-mL volumetric flask, and dilute with water to volume. This solution contains about 0.025 mg of alcohol per mL.

**Test solution**—Transfer about 50 mg of Gold Sodium Thiomalate, accurately weighed, to a 10-mL volumetric flask, and dilute with water to volume.

**Chromatographic system** (see *Chromatography* <621>)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m fused-silica capillary column coated with a 3.0-μm film of phase G43. The column temperature is maintained at 40° for 8.5 minutes, then the temperature is increased at 30° per minute to 240°. The total chromatographic time is about 15 minutes. The injection

port and detector block temperatures are maintained at 150°. The carrier gas is helium, flowing at a rate of about 2 mL per minute, and the split flow rate is about 20 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*; the relative standard deviation for replicate injections is not more than 4.6%.

**Procedure**—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of alcohol (C<sub>2</sub>H<sub>5</sub>OH) in the portion of Gold Sodium Thiomalate taken by the formula:

$$100(C_a / C_b)(r_U / r_S)$$

in which  $C_a$  is the concentration, in mg per mL, of C<sub>2</sub>H<sub>5</sub>OH in the *Standard solution*;  $C_b$  is the concentration, in mg per mL, of Gold Sodium Thiomalate in the *Test solution*; and  $r_U$  and  $r_S$  are the alcohol peak responses obtained from the *Test solution* and the *Standard solution*, respectively. Not more than 4.0% is found.

**Limit of glycerin**—[NOTE—This procedure is based on the absorption characteristics of a sodium–copper–glycerin complex. The stability of this complex prepared as directed herein is such that all measurements are to be taken within 1 hour. Thoroughly rinse all glassware used in this procedure with water to avoid large blank errors.]

**Sodium hydroxide solution**—Dissolve 23.6 g of sodium hydroxide in water to obtain 100 mL of solution.

**Cupric chloride solution**—Dissolve 3.8 g of cupric chloride in water to obtain 100 mL of solution.

**Glycerin standard solutions**—Dissolve an accurately weighed quantity of glycerin in water to obtain a solution having a known concentration of about 8 mg per mL. Pipet 1.0, 2.0, and 3.0 mL of this solution into a series of 10-mL volumetric flasks, followed by 4.0, 3.0, and 2.0 mL of water, respectively.

**Reagent blank**—Pipet 5.0 mL of water into a 10-mL volumetric flask.

**Test solution**—Dissolve about 400 mg Gold Sodium Thiomalate, accurately weighed, in 5.0 mL of water in a 10-mL volumetric flask.

**Procedure**—To each of the *Glycerin standard solutions*, the *Reagent blank*, and the *Test solution* add 1.0 mL of *Sodium hydroxide solution*, and mix. With vigorous shaking, and in increments of 0.1 mL, add *Cupric chloride solution*, checking for turbidity after each addition. After the solutions turn slightly turbid, add an excess of 0.1 mL of *Cupric chloride solution*, insert the stopper, and shake for 1 minute. Dilute with water to volume, and mix. Centrifuge the solutions in tapered, graduated 15-mL centrifuge tubes. The presence of 1 mm to 4 mm of copper hydroxide precipitate is observed. Using a suitable spectrophotometer equipped with 1-cm cells, and using water as a reference, measure the absorbance of the clear supernatant at a wavelength of 635 nm. Subtract the absorbance value of the *Reagent blank*, which is 0.040 or less, from the absorbance values of the *Glycerin standard solutions* and the *Test solution*. Plot the corrected absorbance readings of the *Glycerin standard solutions* against the corresponding weight of glycerin. From the standard curve so obtained, and the corrected absorbance of the *Test solution*, determine the weight of glycerin in the test specimen: not more than 5.5% is found.

**Assay**—Dissolve about 600 mg of Gold Sodium Thiomalate, accurately weighed, in water in a 25-mL volumetric flask, dilute with water to volume, and mix. Pass the entire solution through a clean, dry 0.5-µm filter into a clean, dry receiver. Pipet 20.0 mL of the filtrate into a 300-mL Kjeldahl flask, add 20 mL of nitric acid, and mix. To this solution add

15 mL of sulfuric acid slowly, with mixing. Heat over a low flame, gently at first, and then increase the heat until fumes of sulfur trioxide are evolved. Allow the flask and contents to cool to room temperature, add 30 mL of water slowly, with mixing, and 20 mL of hydrogen peroxide TS, again heat to fumes of sulfur trioxide, cool, and dilute with 30 mL of water. Pass the mixture through an ignited, tared filtering crucible, wash with water, heat the crucible and contents over a low flame to dry the precipitate, and ignite at 650 ± 50° to constant weight. The weight of the residue so obtained, multiplied by 1.25, is the weight of Au in the Gold Sodium Thiomalate taken.

## Gold Sodium Thiomalate Injection

» Gold Sodium Thiomalate Injection is a sterile solution of Gold Sodium Thiomalate in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of Gold Sodium Thiomalate.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, and store protected from light.

**Identification**—It responds to *Identification tests A and B* under *Gold Sodium Thiomalate*.

**pH** (791): between 5.8 and 6.5.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Transfer an accurately measured volume of Injection, equivalent to about 500 mg of gold sodium thiomalate, to a 300-mL Kjeldahl flask, and proceed as directed in the *Assay* under *Gold Sodium Thiomalate*, beginning with “add 20 mL of nitric acid.” The weight of the gold so obtained, multiplied by 2.116, represents the weight of Gold Sodium Thiomalate in the portion of Injection taken.

## Gonadorelin Acetate

C<sub>55</sub>H<sub>75</sub>N<sub>17</sub>O<sub>13</sub> · xC<sub>2</sub>H<sub>4</sub>O<sub>2</sub> · yH<sub>2</sub>O 1374.46  
Luteinizing hormone-releasing factor acetate (salt) hydrate.  
5-Oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosylglycyl-L-leucyl-L-arginyl-L-prolylglycinamide acetate (salt) hydrate  
[52699-48-6; 33515-09-2].

» Gonadorelin Acetate is a synthetic polypeptide hormone having the property of stimulating the release of the luteinizing hormone from the hypothalamus. It contains not less than 80 percent by weight of C<sub>55</sub>H<sub>75</sub>N<sub>17</sub>O<sub>13</sub>, the remainder being acetic acid and water.

**NOTE**—Gonadorelin Acetate is extremely hygroscopic. Protect from exposure to moisture, and store in a desiccator.

**Packaging and storage**—Preserve in tight, well-sealed containers, protected from moisture. Store at a temperature of not more than 8°.

**Labeling**—Label it to indicate it is for veterinary use only.

**USP Reference standards** (11)—

USP Gonadorelin Acetate RS

$C_{55}H_{75}N_{17}O_{13} \cdot xC_2H_4O_2 \cdot yH_2O$  1182.3 (acetate free)

USP Gonadorelin Acetate Related Compound A RS

Gonadorelin free acid.

$C_{55}H_{74}N_{16}O_{14}$  1183.3

**Identification**—

**A:** The monoisotopic mass by *Mass Spectrometry* (736) is  $1181.6 \pm 1$  mass units.

**B:** The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution*, as obtained in the test for *Related compounds*.

**Specific rotation** (781S): between  $-54^\circ$  and  $-66^\circ$ , at  $20^\circ$ , calculated with reference to the peptide content determined in the *Assay*.

*Test solution:* 10 mg per mL, in 1% (v/v) acetic acid.

**Water**, *Method 1c* (921): not more than 7.0%, determined by directly introducing not less than 2 mg of the solid substance into the titrator.

**Limit of fluoride**—[NOTE—Use polypropylene vessels for preparation of solutions and standards.]

*Standard solutions*—Prepare a series of calibration standards containing 10, 1, 0.1, and 0.05 ppm fluoride dissolved in an ionic strength adjustment buffer suitable for the electrode in use (pH about 5).

*Test solution*—Dissolve between 3 and 5 mg of Gonadorelin Acetate in 1.375 mL of the same buffer as that used for the preparation of the *Standard solutions*.

*Procedure*—Using a fluoride ion-selective electrode connected to a pH/ion meter, measure the potential of each *Standard solution*, and plot the response versus the logarithm of the concentration. Determine the regression line using the least squares method. The test is considered valid if the slope of the curve is in the range of  $-54$  to  $-60$  mV per decade and the regression curve has a square of the correlation coefficient,  $r^2$ , not less than 0.995. From the calibration curve and the concentration of the *Test solution*, determine the amount of fluoride in the sample: not more than 0.1% (w/w) is found.

**Acetic acid and trifluoroacetic acid**—

*Solution A*—To 900 mL of water add 7.0 mL of phosphoric acid and 5.0 mL of concentrated ammonia. Mix, and dilute with water to 1000 mL, pass through a  $0.45\text{-}\mu\text{m}$  filter, and degas. Add 20 mL of methanol, mix, and degas for an additional 2 minutes.

*Solution B*—Prepare a degassed mixture of acetonitrile and water (1:1).

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Diluent*—Dilute 5.0 mL of phosphoric acid with water to 1000 mL, and mix thoroughly.

*Trifluoroacetic acid stock solution*—Add about 50 mL of water to a 100-mL volumetric flask with a stopper. Tare the stoppered flask on an analytical balance until there is no further significant drift in the reading. Carefully add 670  $\mu\text{L}$  of trifluoroacetic acid to the flask, stopper immediately, and weigh. Dilute with water to volume.

*Standard solutions*—Accurately weigh out 150, 75, and 10 mg of sodium acetate trihydrate into three separate 100-mL volumetric flasks. Add 10 mL, 2 mL, and 100  $\mu\text{L}$ , respectively, of the *Trifluoroacetic acid stock solution* to the flasks, and dilute each with *Diluent* to the 100-mL mark.

Calculate the concentration, in mg per mL, of acetic acid in each *Standard solution* using the following equation:

$$0.00434W_A$$

in which  $W_A$  is the weight, in mg, of sodium acetate trihydrate taken. Calculate the concentration, in mg per mL, of trifluoroacetic acid in each *Standard solution* using the following equation:

$$0.0001(W_TV)$$

in which  $W_T$  is the weight, in mg, of trifluoroacetic acid used for preparation of the *Trifluoroacetic acid stock solution*; and  $V$  is the volume, in mL, of *Trifluoroacetic acid stock solution* used to prepare the *Standard solution*.

*Test solution*—Prepare duplicate samples by accurately weighing out two separate aliquots of about 4.0 mg of Gonadorelin Acetate and dissolving each with 1 mL of the *Diluent*.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a  $4.6\text{-mm} \times 25\text{-cm}$  column containing  $5\text{-}\mu\text{m}$  packing L1. The flow rate is approximately 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–5	100	0	isocratic
5–6	100→0	0→100	linear
6–14	0	100	isocratic
14–15	0→100	100→0	return to initial
15–25	100	0	re-equilibration

Chromatograph the *Standard solutions*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 2000 theoretical plates for the trifluoroacetic acid peak and not less than 10,000 for the acetic acid peak; and the relative standard deviation for six replicate injections of the most concentrated *Standard solution* is not more than 2.0%.

*Procedure*—Inject in duplicate equal volumes (about 20  $\mu\text{L}$ ) of each of the *Standard solutions* followed by the duplicate *Test solutions*. Plot the peak areas of each of the components in the *Standard solutions* versus concentration, in mg per mL, and determine the regression line using the least squares method. The test is considered valid if the regression curves for both acetic acid and trifluoroacetic acid have a square of the correlation coefficient,  $r^2$ , not less than 0.995. From the resulting graph, determine the percentages of acetic acid and trifluoroacetic acid in the *Test solution*: between 8% and 12.5% of acetic acid is found, and not more than 0.25% of trifluoroacetic acid is found.

**Related compounds**—

*Standard solution*—Dissolve an accurately weighed quantity of USP Gonadorelin Acetate RS in water to obtain a solution having a known concentration of about 0.5 mg per mL.

*System suitability solution*—Dissolve an accurately weighed quantity of USP Gonadorelin Acetate Related Compound A RS in water to obtain a solution having a known concentration of about 0.5 mg per mL. Mix equal volumes of this solution and the *Standard solution*.

*Test solution*—Dissolve an accurately weighed quantity of Gonadorelin Acetate in water to obtain a solution having a known concentration of about 0.5 mg per mL.

**SYSTEM 1**—

*Solvent 1*—Mix 1 mL of trifluoroacetic acid with 1 L of water. Pass through a  $0.45\text{-}\mu\text{m}$  filter, and degas.

*Solvent 2*—Mix 1 mL of trifluoroacetic acid with 1 L of acetonitrile.

**Solution A**—Prepare a mixture of *Solvent 1* and *Solvent 2* (95:5).

**Solution B**—Prepare a mixture of *Solvent 2* and *Solvent 1* (60:40).

**Chromatographic system** (see *Chromatography* <621>)—The HPLC is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is approximately 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	91	9	initial
0–25	91→45	9→55	linear
25	45→91	55→9	return to initial
25–30	91	9	re-equilibrium

#### SYSTEM 2—

**Mobile phase**—Add 47 mL of phosphoric acid and 55 mL of triethylamine to 4 L of water, and adjust with phosphoric acid or triethylamine to a pH of 2.5, as appropriate. Pass through a 0.45-μm filter, and degas. Add acetonitrile to obtain a 13% (v/v) concentration of acetonitrile.

**Chromatographic system** (see *Chromatography* <621>)—The HPLC is equipped with a 215-nm detector and a 4.6-mm × 10-cm column that contains 5-μm packing L1. The flow rate is approximately 1.5 mL per minute using isocratic elution and having a run time of 50 minutes.

Using both *System 1* and *System 2* chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*. The *Standard solution* is used only to identify the gonadorelin acetate peak. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between gonadorelin acetate and gonadorelin acetate related compound A is not less than 2.0; the column efficiency is not less than 75,000 theoretical plates for *System 1* and not less than 3000 theoretical plates for *System 2*; the tailing factor is not more than 2.0 for both *System 1* and *System 2*; and the relative standard deviation for five replicate injections is not more than 2.0%.

**Procedure**—Inject equal volumes (about 20 μL) of each of the *Standard solution*, the *System suitability solution*, and the *Test solution*, followed by a co-injection of the *Test solution* with the *Standard solution*, into both *System 1* and *System 2*. Include blank injections between the different solutions. Integrate all peaks in order to obtain a baseline similar to that in the blank chromatograms, disregarding any peaks due to the solvent, counter-ion, and baseline artifacts. Using peak areas, and including all peaks greater than 0.05%, calculate the percentage of each impurity in the portion of Gonadorelin Acetate taken: not more than 1% of any single impurity is found, and not more than 2% of total impurities is found.

**Amino acid analysis**—Proceed as directed in the *Assay*. Express the content of each amino acid in μmoles, and calculate the total number of μmoles of Gonadorelin Acetate in the test sample as directed in the *Assay*. By dividing the number of μmoles of each amino acid by the total number of μmoles of Gonadorelin Acetate in the test sample, the relative proportions of amino acids are found: serine, 0.7 to 1.05; glutamic acid, 0.95 to 1.05; proline, 0.95 to 1.05; glycine, 1.9 to 2.1; leucine, 0.9 to 1.1; tyrosine, 0.7 to 1.05; histidine, 0.95 to 1.05; and arginine, 0.95 to 1.05. Isoleucine and lysine are absent; not more than traces of other amino acids except tryptophan are detected.

**Assay**—(see *Biotechnology-Derived Articles—Amino Acid Analysis* <1052>). [NOTE—The following method is given for informational purposes; any validated amino acid analysis method can be used.]

Standardize the instrument with a mixture containing equal molar per volume amounts (except for L-cystine which is half the molar amount) of glycine and the L-form of the

following amino acids: lysine, threonine, alanine, leucine, histidine, serine, valine, tyrosine, arginine, glutamic acid, methionine, phenylalanine, aspartic acid, proline, isoleucine, tryptophan, and cystine.

**Assay preparation** (see *Protein Hydrolysis, Method 1* <1052>)—Accurately weigh out between 0.4 and 1.0 mg of Gonadorelin Acetate in glass ampuls. Add a minimum of 1.0 mL of *Hydrolysis Solution* containing 4% phenol, freeze the sample ampul, and flame seal under vacuum. Hydrolyze at 110° for about 22 hours. After hydrolysis, dry the test sample under vacuum to remove any residual acid. To the ampul add 2 mL of a buffer solution that is suitable for the amino acid analyzer, and pass through a filter having a 0.45-μm porosity.

**Procedure**—Prepare a co-injection of the *Standard solution* and the test sample. Inject a suitable volume into the amino acid analyzer, and record and measure the responses for each amino acid peak. Express the content of each amino acid in μmoles. The total number of μmoles of gonadorelin acetate in the test sample is calculated by summing the number of μmoles for glutamic acid, proline, glycine, leucine, tyrosine, histidine, and arginine, and dividing by eight. Calculate the percentage of C<sub>55</sub>H<sub>75</sub>N<sub>17</sub>O<sub>13</sub> in the portion of Gonadorelin Acetate taken by the formula:

$$118.23(N/W)$$

in which *N* is the total number of μmoles of gonadorelin acetate; and *W* is the weight of the sample in mg.

## Gonadorelin Hydrochloride

C<sub>55</sub>H<sub>75</sub>N<sub>17</sub>O<sub>13</sub> · 2HCl 1255.21  
Gonadorelin dihydrochloride [51952-41-1].

» Gonadorelin Hydrochloride is a synthetic polypeptide hormone having the property of stimulating the release of the luteinizing hormone from the hypothalamus. It contains not less than 94.0 percent and not more than 104.0 percent of C<sub>55</sub>H<sub>75</sub>N<sub>17</sub>O<sub>13</sub> · 2HCl, calculated on the anhydrous basis.

**NOTE**—Gonadorelin Hydrochloride is extremely hygroscopic. Protect from exposure to moisture, and store in a desiccator.

**Packaging and storage**—Preserve in tight, well-sealed containers.

**USP Reference standards** <11>—  
USP Gonadorelin Hydrochloride RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Specific rotation** (781S): between −57° and −63°, calculated on the anhydrous and chloride-free basis.

**Test solution**: 10 mg per mL, in water.

**Water**—[NOTE—Dry all glassware used in the following procedure at 105° for a minimum of 1 hour, and cool in a desiccator at room temperature. Store in a desiccator. Perform as many operations as possible in a low-humidity glove box.]

**Anhydrous methanol**—Wash about 150 g of 8- to 17-mesh type 3A molecular sieve with several 100-mL portions of methanol to remove the fine particles. Place the washed molecular sieve in a shallow glass dish, heat in an oven at 350° for 2 hours, and cool in a desiccator. Transfer the dry molecular sieve to a 1-L glass container, add about 700 mL

of methanol, insert a stopper, mix, and allow to stand in a desiccator for not less than 48 hours before using.

**Standard solutions**—Prepare solutions in *Anhydrous methanol* containing 0.4, 0.8, and 1.2 mg of distilled water per mL.

**Test solution**—[NOTE—Prepare immediately prior to use.] Transfer about 20 mg of Gonadorelin Hydrochloride, accurately weighed, to a vial, place a cap on the vial, add 800  $\mu$ L of *Anhydrous methanol* by means of a 1000- $\mu$ L gas-tight syringe, and swirl to mix.

**Chromatographic system** (see *Chromatography* <621>)—The gas chromatograph is equipped with a thermal conductivity detector and a 2-mm  $\times$  180-cm glass column packed with 80- to 100-mesh support S3. The column temperature is maintained at about 100°, and the injection port and detector temperatures are maintained at 130°. Helium is used as the carrier gas at a flow rate of about 30 mL per minute. Chromatograph the *Standard solution* containing 1.2 mg per mL, record the chromatograms, and measure the peak responses as directed for *Procedure*: the elution order is water, followed by a broad methanol peak; the retention time of the water peak is between 0.5 and 3 minutes; and the relative standard deviation for not less than three replicate injections is not more than 2.5%.

**Procedure**—Separately inject equal volumes (1 to 3  $\mu$ L) of each of the *Standard solutions*, *Test solution*, and *Anhydrous methanol* into the chromatograph, and measure the responses for the first (water) and second (methanol) major peaks, correcting the peak areas obtained from the *Test solution* and the *Standard solutions* against the *Anhydrous methanol* blank. Plot the responses of the water peaks versus concentration, in mg per mL, of water in each of the *Standard solutions*, and determine the regression line using the least-squares method. The coefficient of variation from the regression line is not more than 3.0%. From the graph so obtained, determine the concentration, *C*, in mg per mL, of water in the *Test solution*. Calculate the percentage of water in the portion of Gonadorelin Hydrochloride taken by the formula:

$$80C/W$$

in which *W* is the weight, in mg, of Gonadorelin Hydrochloride in the *Test solution*: not more than 7.0% is found.

#### Limit of acetate—

**Mobile phase**—To 500 mL of water in a 1-L volumetric flask, add 1 mL of sulfuric acid. Dilute with water to volume, mix, and pass through a membrane filter having a 0.45- $\mu$ m or finer porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Acetate standard solutions**—Dissolve an accurately weighed quantity of sodium acetate trihydrate in *Mobile phase* to obtain a stock solution having a known concentration of about 0.5 mg per mL. Quantitatively dilute accurately measured volumes of this stock solution with *Mobile phase* to obtain *Standard solutions* having known concentrations of about 100, 10, and 1  $\mu$ g of sodium acetate trihydrate per mL.

**Test solution**—Transfer about 50 mg of Gonadorelin Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 205-nm detector and a 6.5-mm  $\times$  30-cm column that contains packing L17. The flow rate is about 0.5 mL per minute. [NOTE—Do not allow the flow rate to exceed 0.6 mL per minute. Condition the column for about 60 minutes until a stable baseline is obtained.] Chromatograph the *Acetate standard solution* containing 100  $\mu$ g of sodium acetate trihydrate per mL, and record the peak responses as directed for *Procedure*: the retention time of the acetate peak is between 10 and 16 minutes; the column efficiency is not less than 2000 theoretical

plates; the tailing factor is not more than 2; and the relative standard deviation for not less than three replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 100  $\mu$ L) of each *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. [NOTE—If more than five specimens are analyzed, reinject the *Standard solutions* before injecting further specimens of the *Test solution*.] Plot the responses of the *Standard solutions* versus concentration, in  $\mu$ g of sodium acetate trihydrate per mL, and determine the regression line, using the least-squares method. The coefficient of variation from the regression line is not more than 3.0%. From the graph so obtained, determine the concentration, *C*, in  $\mu$ g per mL, of sodium acetate trihydrate in the *Test solution*. Calculate the percentage of acetate ( $C_2H_3O_2$ ) in the portion of Gonadorelin Hydrochloride taken by the formula:

$$(59.03/136.08)(5C/W)$$

in which 59.03 and 136.08 are the molecular weights of acetate and sodium acetate trihydrate, respectively; and *W* is the weight, in mg, of Gonadorelin Hydrochloride in the *Test solution*: not more than 1.0% is found.

**Chromatographic purity**—[NOTE—Perform all procedures in a low-humidity glove box. The *Test solution* may be stored at room temperature for up to 20 minutes, or at 4° for up to 8 hours.]

**Solution A**—Dissolve 13.6 g of monobasic potassium phosphate in water, dilute with water to 2000 mL, and mix. Filter and degas. Adjust with 1 N potassium hydroxide to a pH of 6.5. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Solution B**—Use acetonitrile.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*.

**Standard solutions**—Dissolve an accurately weighed quantity of USP Gonadorelin Hydrochloride RS in and dilute quantitatively with *Solution A* to obtain a stock solution having a known concentration of about 1 mg per mL. Quantitatively dilute accurately measured volumes of this stock solution with *Solution A* to obtain *Standard solutions* having known concentrations of about 40, 5, and 1.5  $\mu$ g per mL.

**Test solution**—Dissolve an accurately weighed quantity of Gonadorelin Hydrochloride in *Solution A* to obtain a solution having a concentration of 1 mg per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm UV detector and a 4.6-mm  $\times$  15-cm column containing 5- $\mu$ m packing L1, and is programmed to provide variable mixtures of *Solution A* and *Solution B*, beginning with 100% of *Solution A*, changing after 3 minutes to a mixture of 82% *Solution A* and 18% *Solution B*, maintained at that composition for the next 17 minutes, then changed linearly over the next 10 minutes so that it consists of a mixture of 30% *Solution A* and 70% *Solution B* at 30 minutes, and maintained at that composition for the next 5 minutes, then changed linearly over the next 3 minutes so that the composition at 38 minutes is again 100% *Solution A*. Pump *Solution A* through the column at a flow rate of about 1 mL per minute for about 30 minutes or until a stable baseline is obtained, then inject 100  $\mu$ L of *Solution A*, and run the gradient elution program to completion to condition the column. Again inject 100  $\mu$ L of *Solution A*, and run the gradient elution program to completion. Chromatograph the *Standard solution* containing 40  $\mu$ g per mL, and record the peak responses as directed for *Procedure*: the retention time for gonadorelin is between 24 and 30 minutes; the column efficiency is not less than 5000 theoretical plates; and the tailing factor is not more than 2.0. If necessary, adjust the flow rate (to between 0.8 and 2 mL per minute) or, alternatively, change (by not more

than 3%) the percentages of *Solution A* and *Solution B* at 3 minutes and at 20 minutes.

**Procedure**—Separately inject equal volumes (about 100  $\mu$ L) of *Solution A*, each of the *Standard solutions*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Correct the peak responses, using the chromatogram of *Solution A* as a blank. Plot the corrected responses of the *Standard solutions*, and determine the regression line, using the least-squares method. The coefficient of variation from the regression line is not more than 3.0%. From the graph so obtained, determine the concentration of each impurity in the *Test solution*: not more than 3.0% of any individual impurity is found, and not more than 5.0% of total impurities is found.

**Content of chloride**—Dissolve 25 mg of Gonadorelin Hydrochloride, accurately weighed, in 1 mL of methanol. Add 10 mL of water and 1 drop of glacial acetic acid, and titrate with 0.01 N silver nitrate VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.01 N silver nitrate is equivalent to 0.3545 mg of chloride: the chloride content is between 4.0% and 6.0%.

**Assay**—[NOTE—Perform all manipulations involving the weighing of the Gonadorelin Hydrochloride and the Reference Standard in a low-humidity glove box.]

**Buffer solution**—Dissolve 6.8 g of monobasic potassium phosphate in water, and dilute with water to 1000 mL. Adjust with 1 N potassium hydroxide to a pH of 6.5.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (82:18). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparations**—Quantitatively dissolve accurately weighed quantities of USP Gonadorelin Hydrochloride RS in *Mobile phase* to obtain solutions having known concentrations of about 0.08 mg per mL, 0.10 mg per mL, and 0.12 mg per mL. [NOTE—These *Standard preparations* may be stored in a refrigerator for 2 months. Remove suitable portions and warm to room temperature before use.]

**Assay preparation**—Dissolve an accurately weighed quantity of Gonadorelin Hydrochloride in *Mobile phase* to obtain a solution containing 0.10 mg per mL.

**Identification solution**—Mix equal volumes of the *Assay preparation* and the *Standard preparation* containing 0.10 mg per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm  $\times$  15-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 1.5 mL per minute. [NOTE—Condition the column with *Mobile phase* until a stable baseline is obtained.] Chromatograph about 20  $\mu$ L of the *Identification solution*: the ratio,  $R_r$ , of the retention times of the gonadorelin peaks obtained from the *Assay preparation* and the *Standard preparation* is  $1.00 \pm 0.05$ . Chromatograph the *Standard preparation* containing 0.08 mg per mL, and record the peak responses as directed for *Procedure*: the retention time for gonadorelin is between 8 and 11 minutes; the column efficiency is not less than 900 theoretical plates; the tailing factor is not more than 2.5; and the relative standard deviation for not fewer than three replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of each of the *Standard preparations* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. [NOTE—If more than five specimens are analyzed, reinject the *Standard preparations* before injecting further specimens of the *Assay preparation*.] Plot the responses of the gonadorelin peaks versus concentration, in mg per mL, of gonadorelin in each of the *Standard preparations*, and determine the regression line, using the least-squares method. The coefficient of vari-

ation from the regression line is not more than 3.0%. From the graph so obtained, determine the concentration,  $C$ , of gonadorelin in the *Assay preparation*. Calculate the percentage of  $C_{55}H_{75}N_{17}O_{13} \cdot 2HCl$  in the portion of Gonadorelin Hydrochloride taken by the formula:

$$100C.$$

## Gonadorelin for Injection

» Gonadorelin for Injection is a sterile mixture of Gonadorelin Hydrochloride with suitable diluents. It contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of gonadorelin ( $C_{55}H_{75}N_{17}O_{13}$ ).

**Packaging and storage**—Preserve in tight, well-sealed containers.

**USP Reference standards** <11>—

USP Endotoxin RS

USP Gonadorelin Hydrochloride RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* <1>.

**Bacterial endotoxins** <85>—It contains not more than 3.60 USP Endotoxin Units per  $\mu$ g.

**pH** <791>: between 4.0 and 8.0, in a solution constituted as directed in the labeling.

**Other requirements**—It meets the requirements for *Sterility Tests* <71> and for *Labeling* under *Injections* <1>.

**Assay**—

*Buffer solution*, *Mobile phase*, *Standard preparations*, *Chromatographic system*, and *Identification solution*—Proceed as directed in the *Assay* under *Gonadorelin Hydrochloride*.

**Assay preparation**—Separately dissolve the contents of not less than 5 vials of Gonadorelin for Injection in *Mobile phase* to obtain a concentration of 100  $\mu$ g of gonadorelin per mL. Place the vials in an ultrasonic bath for 5 minutes, and allow to cool at room temperature. Combine the solutions in the vials to obtain the *Assay preparation*.

**Procedure**—Proceed as directed in the *Assay* under *Gonadorelin Hydrochloride*. Plot the responses of the gonadorelin peaks versus concentration, in mg per mL, of gonadorelin in each of the *Standard preparation*. Calculate the quantity of gonadorelin ( $C_{55}H_{75}N_{17}O_{13}$ ) in the Gonadorelin for Injection taken for the *Assay preparation* by the formula:

$$(1182.33 / 1255.4)(C)(V + 0.06)$$

in which 1182.33 and 1255.4 are the molecular weights of gonadorelin and gonadorelin hydrochloride, respectively;  $C$  is the concentration of gonadorelin in the *Assay preparation* as obtained from the regression line;  $V$  is the volume, in mL, of *Mobile phase* used to prepare the *Assay preparation*; and 0.06 is the correction factor for the volume created by the dissolved test specimen.

## Goserelin Acetate

$C_{59}H_{84}N_{18}O_{14} \cdot xC_2H_4O_2$

Luteinizing hormone-releasing factor (pig), 6-[O-(1,1-dimethylethyl)-D-serine]-10-deglycinamide-, 2-(amino-carbonyl)hydrazide, acetate (salt) [145781-92-6].  
1-(5-Oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosyl-O-tert-butyl-D-seryl-L-leucyl-L-arginyl-L-prolyl)semicarbazide (Goserelin) 1269.41  
[65807-02-5].

### DEFINITION

Goserelin Acetate is a synthetic nonapeptide analog of the hypothalamic decapeptide, gonadorelin. It is obtained by chemical synthesis and is available as an acetate salt. It contains NLT 94.5% and NMT 103.0% of goserelin ( $C_{59}H_{84}N_{18}O_{14}$ ), calculated on the anhydrous and acetic acid-free basis.

### IDENTIFICATION

- A.** The retention time of the goserelin peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Mobile phase:** Prepare a filtered and degassed mixture of water, acetonitrile, and trifluoroacetic acid (1600:400:1).

**Standard solution:** 1 mg/mL of USP Goserelin Acetate RS in water

**Diluted standard solution:** Transfer 1 mL of the *Standard solution* to a 10-mL volumetric flask, and dilute with water to volume.

**Resolution solution:** Dissolve the contents of a vial of USP Goserelin Related Compound A RS in water to obtain a concentration of 0.1 mg/mL, and mix with an equal volume of *Diluted standard solution*.

**System suitability solution:** Dissolve the contents of a vial of USP Goserelin System Suitability Mixture RS with 1 mL of water.

**Sample solution:** 1 mg/mL of Goserelin Acetate in water

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 15-cm; 3.5-μm packing L1

**Column temperature:** 50°–55°

**Flow rate:** 1 mL/min

**Injection size:** 10 μL

#### System suitability

**Samples:** *Standard solution*, *Resolution solution*, and *System suitability solution*.

#### Suitability requirements

[NOTE—Two minor peaks are visible prior to the elution of the principal peak, *System suitability solution*.]

**Resolution:** NLT 7.0 between the goserelin and goserelin related compound A (4-D-ser-goserelin) peaks, *Resolution solution*

**Retention time:** 40–50 min for the goserelin peak, *Resolution solution*

**Relative standard deviation:** NMT 2.0% for the goserelin peak, from replicate injections, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of goserelin ( $C_{59}H_{84}N_{18}O_{14}$ ) in the portion of Goserelin Acetate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 94.5%–103.0% of goserelin ( $C_{59}H_{84}N_{18}O_{14}$ ) on the anhydrous, acetic acid-free basis

### OTHER COMPONENTS

#### LIMIT OF ACETIC ACID

**Mobile phase:** Transfer 49.04 g of sulfuric acid to a 1000-mL volumetric flask, dilute with water to volume, and mix. Accurately transfer 20 mL of this solution to a 2000-mL volumetric flask, dilute with water to volume, mix, filter, and degas.

**Standard stock solution:** Transfer 2.0 mL of glacial acetic acid to a 500-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Standard solution:** Transfer 5.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Sample solution:** Dissolve about 20 mg of Goserelin Acetate, accurately weighed, in 2–3 mL of *Mobile phase*. Connect a 1-mL cartridge containing packing L44 to a 1-mL cartridge containing packing L2, which is then attached to a suitable vacuum apparatus. With the vacuum applied, wash the cartridge combination with 2 mL of methanol followed by 15 mL of *Mobile phase*, and discard the washings. Quantitatively apply the solution containing the sample to the cartridge combination, and wash through the cartridge system with several small volumes of *Mobile phase*. Collect the solution and washings in a 10-mL volumetric flask, and dilute with *Mobile phase* to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

[NOTE—Condition the column for about 24 h until a stable baseline is obtained.]

**Mode:** LC

**Detector:** UV 206 nm

**Column:** 7.8-mm × 30-cm; packing L17

**Column temperature:** 65°

**Flow rate:** 0.8 mL/min

**Injection size:** 100 μL

#### System suitability:

**Sample:** *Standard solution*

[NOTE—The retention time of the acetic acid peak is about 11 min.]

#### Suitability requirements

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 3.1%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of acetic acid in the portion of Goserelin Acetate taken by the formula:

$$\text{Result} = (r_U/r_S) \times (1/W) \times (1.049/5)$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$W$  = sample weight of Goserelin Acetate taken to prepare the *Sample solution* (g) and corrected (for the purposes of the calculation) to eliminate the water content, which is determined immediately prior to the test

1.049 = weight of glacial acetic acid (g/mL)

Acceptance criteria: 4.5%–15.0%

## IMPURITIES

### • ORGANIC IMPURITIES: RELATED COMPOUNDS

Mobile phase, Standard solution, Diluted standard solution, Resolution solution, System suitability solution, Sample solution, and Chromatographic system: Prepare as directed in the Assay.

**Diluted sample solution:** Transfer 1 mL of the Sample solution into a 100-mL volumetric flask, and dilute with water to volume.

#### System suitability

**Samples:** Resolution solution and System suitability solution

[NOTES—The retention time for the goserelin peak is between 40 and 50 min, Resolution solution. See Table 1 for the relative retention times, Resolution solution. Two peaks, corresponding to decarbamoylgoserelin and 2-D-his-goserelin, eluting prior to the principal peak, are visible, System suitability solution.]

Table 1

Name	Relative Retention Time
4-D-ser-Goserelin	0.67
Decarbamoylgoserelin	0.89
5-D-tyr-Goserelin	0.92
2-D-his-Goserelin	0.94
Goserelinare	1.0

**Resolution:** NLT 7.0, Resolution solution

**Column efficiency:** NLT 2000 theoretical plates, System suitability solution

**Tailing factor:** NMT 2.0, System suitability solution

**Relative standard deviation:** NMT 2.0%, System suitability solution

#### Analysis

**Samples:** Sample solution and Diluted sample solution  
Calculate the percentage of goserelin-related impurities in the portion of Goserelin Acetate taken:

$$\text{Result} = r_i/r_u$$

$r_i$  = peak response for any individual impurity in the Sample solution

$r_u$  = peak response of the main goserelin peak in the Diluted sample solution

**Acceptance criteria:** NMT 1.0% of decarbamoylgoserelin is found, NMT 0.5% of any other impurity is found, and NMT 2.5% of total impurities is found.

## SPECIFIC TESTS

### • AMINO ACID CONTENT, Nuclear Magnetic Resonance (761)

[NOTE—Concentrations of goserelin in both the Standard solution and the Sample solution must be the same (within 5% of each other) but can be adjusted based on the quality of the  $^{13}\text{C}$  spectrum obtained. The spectra must be acquired under the same conditions for both the Standard solution and the Sample solution. The spectra obtained are of sufficient quality to allow quantification of the integrals of the resonances specified below to be obtained. Integrals and spectra of both the Standard solution and the Sample solution can be repeated and averaged.]

**Standard solution:** Dissolve USP Goserelin Acetate RS in deuterium oxide to obtain a solution having a known concentration of about 10% w/v, and adjust with deuterated acetic acid-d4 to a pH of 4.

**Sample solution:** Prepare a 10% w/v solution of Goserelin Acetate in deuterium oxide, and adjust with deuterated acetic acid-d4 to a pH of 4.

**Analysis:** Obtain a  $^{13}\text{C}$ , proton-decoupled NMR spectrum of both the Standard solution and the Sample solution. The spectra from both solutions are qualitatively similar, and all the resonances from the spectrum of the

Standard solution are present in the spectrum of the Sample solution and have the same chemical shift values ( $\pm 0.1$  ppm for goserelin,  $\pm 0.5$  ppm for acetate). Identify any other resonances in the spectrum of the Sample solution. The relative amino acid ratio between the Standard solution and the Sample solution can be calculated as follows. Integrate the resonances at the approximate ppm corresponding to each amino acid in Table 2.

Table 2

Amino Acids	Resonances (ppm)
Azo-glycine	162.2
Histidine	118.4
Tyrosine	116.7
<i>tert</i> -Butyl serine	62.5
Serine	62.2
Tryptophan	55.7
Arginine	41.8
Pyroglutamic acid	26.3
Proline	26.0
Leucine	23.5

Calculate the ratio of each of the amino acids from the integrals of the Standard solution and the Sample solution by the formula:

$$\text{Result} = r_u/r_s$$

$r_u$  = integral of the resonance of a designated amino acid from the Sample solution

$r_s$  = integral of the resonance of a designated amino acid from the Standard solution

**Acceptance criteria:** The resulting ratios fall within the following limits: histidine, tyrosine, *tert*-butyl serine, serine, tryptophan, arginine, pyroglutamic acid, proline, and leucine 0.9–1.1; azo-glycine 0.8–1.2.

### • OPTICAL ROTATION, Specific Rotation (781S)

**Sample solution:** 2 mg/mL, in water, calculated on the anhydrous and acetic acid-free basis

**Acceptance criteria:** Between  $-52^\circ$  and  $-56^\circ$

### • BACTERIAL ENDOTOXINS TEST (85):

It contains NMT 16 USP Endotoxin Units/mg of goserelin, if intended for use in the manufacture of parenteral dosage forms without a further, appropriate procedure for the removal of bacterial endotoxins.

### • WATER DETERMINATION, Method I (921):

NMT 10.0%

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store in a refrigerator.

### • USP REFERENCE STANDARDS (11)

USP Goserelin Acetate RS

USP Goserelin Related Compound A RS

USP Goserelin System Suitability Mixture RS

## Chorionic Gonadotropin

» Chorionic Gonadotropin is a gonad-stimulating polypeptide hormone obtained from the urine of pregnant women. Its potency is not less than 1500 USP Chorionic Gonadotropin Units in each mg, and not less than 80.0 percent and not more than 125.0 percent of the potency stated on the label.

**Packaging and storage—**Preserve in tight containers, preferably of Type I glass, in a refrigerator.

**USP Reference standards** <11>—

USP Endotoxin RS

USP Human Chorionic Gonadotropin RS

**Bacterial endotoxins** <85>—It contains not more than 0.03 USP Endotoxin Unit per USP Chorionic Gonadotropin Unit.**Sterility** <71> (Where it is labeled as sterile): meets the requirements.**Acute toxicity**—Select five healthy mice, weighing between 18 g and 22 g. Prepare a test solution as directed in the test for *Pyrogen*, but containing 2000 USP Chorionic Gonadotropin Units per mL. Inject intravenously a dose of 0.5 mL of the test solution into each of the mice. Observe the animals over the 48 hours following the injection. If, at the end of 48 hours, all of the animals survive and not more than one of the animals shows outward symptoms of a toxic reaction, the requirements of the test are met. If more than one of the animals show outward signs of a toxic reaction or if not more than two of the animals die, repeat the test on ten additional, similar animals: if all of the animals of the repeat test survive for 48 hours and show no symptoms of a toxic reaction, the requirements of the test are met.**Water, Method I** <921>: not more than 5.0%.**Estrogenic activity**—Dissolve a suitable quantity in saline TS to obtain a test solution containing the equivalent of 1000 USP Chorionic Gonadotropin Units per mL. Into each of five rats that have been ovariectomized not less than 2 weeks previously, inject subcutaneously 0.25 mL of the test solution in the forenoon and in the afternoon of two successive days. On each of the three following days, take a vaginal smear from each animal: the requirements of the test are met if the cellular elements in the smears consist mainly of leucocytes, and a few nucleated epithelial cells, but no cornified epithelial cells.**Assay**—**Standard preparations**—Dissolve a suitable quantity of USP Human Chorionic Gonadotropin RS in a diluent consisting of saline TS, freshly prepared to contain 1 mg per mL of bovine serum albumin and adjusted with sodium hydroxide TS to a pH between 6.9 and 8.0, to obtain a solution having a known concentration of 10 USP Chorionic Gonadotropin Units in each mL. Using the same diluent, prepare three *Standard preparations* such that the respective concentrations of chorionic gonadotropin constitute a geometric series such as 1:1.2:1.44 or 1:2:4 and such that the activity in each mL lies within the range of 0.1 to 1.0 Unit.**Assay preparations**—Following the procedure outlined for the *Standard preparations*, prepare solutions of Chorionic Gonadotropin to obtain three *Assay preparations* corresponding to those of the *Standard*.**The animals**—Select 20- to 23-day-old female rats, but restrict the selection so that no rat is more than 30% heavier than the lightest. House the animals under uniform conditions of temperature, lighting, feeding, and watering. Mark the animals for identification, and divide them at random into groups of the same number but not fewer than 10 animals. Assign one group to each of the three *Standard preparations* and three *Assay preparations*, respectively.**Procedure**—Inject each rat subcutaneously in the dorsal area with 0.20 mL of the solution to which it was assigned, at approximately the same time on each of three consecutive days. On the afternoon of the fifth day, sacrifice the animals, and excise the uterus from each animal by cutting through the cervix, stripping off the surrounding tissue, and severing at the utero-tubal junction. Gently press out the uterine fluid on moistened absorbent paper, and weigh the uterus to the nearest 0.2 mg, using a suitable balance.**Calculation**—Tabulate the observed uterine weight for each rat, designated by the symbol  $y$ , for each dosage group of  $f$  rats. Proceed as directed in the *Assay* under Cor-*ticotropin Injection*, beginning with "If the data from one or more rats." Compute the log confidence interval  $L$  (see *Confidence Intervals for Individual Assay* <111>). If the confidence interval is more than 0.1938, which corresponds at  $P = 0.95$  to confidence limits of 80% and 125% of the computed potency, repeat the assay until the combined data of two or more assays, redetermined as described under *Combination of Independent Assays* <111>, meet this limit.

---

**Chorionic Gonadotropin for Injection**

---

» Chorionic Gonadotropin for Injection is a sterile, dry mixture of Chorionic Gonadotropin with suitable diluents and buffers. Its potency is not less than 80.0 percent and not more than 125.0 percent of the potency stated on the label in USP Chorionic Gonadotropin Units. It may contain an antimicrobial agent.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* <1>.**Labeling**—Label it to indicate the expiration date.**USP Reference standards** <11>—

USP Endotoxin RS

USP Human Chorionic Gonadotropin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* <1>.**Bacterial endotoxins** <85>—It contains not more than 0.03 USP Endotoxin Unit per USP Chorionic Gonadotropin Unit.**Uniformity of dosage units** <905>—Open 10 containers and weigh accurately each individual container and its contents, taking care to preserve the identity of each container. Remove the contents of each container by rinsing thoroughly with water, dry at 105° to constant weight, and reweigh. Calculate for each container the net weight of its contents by subtracting the weight of the dry, empty container from its initial gross weight. Determine the average weight of the contents and the relative standard deviation (see *Calculation of the Relative Standard Deviation* under *Uniformity of Dosage Units* <905>). The requirements are met if the weight of the contents of each container does not deviate from the average weight by more than 5.0% and the relative standard deviation of the 10 containers is not greater than 3.0%. If the requirements of the test are not met, test 20 additional containers. The requirements are met if the net weight of not more than 1 container of the 30 deviates by more than 7.5% from the average weight of the contents of the 30 containers and the relative standard deviation of the 30 containers is not greater than 3.3%.**pH** <791>—The pH of the solution prepared for the test for *Estrogenic activity* is between 6.0 and 8.0.**Estrogenic activity**—When constituted as directed in the labeling, it meets the requirements of the test for *Estrogenic activity* under *Chorionic Gonadotropin*.**Other requirements**—It meets the requirements for *Sterility Tests* <71> and *Labeling* under *Injections* <1>.**Assay**—Proceed with Chorionic Gonadotropin for Injection as directed in the *Assay* under *Chorionic Gonadotropin*, using an *Assay preparation* obtained by diluting a portion of the solution prepared for the test for *Estrogenic activity* quantitatively and stepwise with the specified diluent.

## Graftskin

» Graftskin<sup>1</sup> is a living, bilayered skin substitute derived from neonatal foreskins manufactured under Class 100 sterile conditions. The upper, epidermal layer is formed by human keratinocytes and has a well-differentiated stratum corneum. The inner, dermal layer is composed of human fibroblasts in a bovine Type I collagen lattice. Graftskin does not contain Langerhans cells, melanocytes, macrophages, lymphocytes, blood vessels, hair follicles, or any other epidermally derived components. The fibroblast and keratinocyte cell banks from which Graftskin is derived test negative for human and animal viruses, retroviruses, bacteria, fungi, yeast, mycoplasma, and tumorigenicity. The cell banks are also tested for normal human karyology and isoenzymes. The final product is tested for morphology, cell viability, and physical container integrity. Used tissue culture media are tested for mycoplasma and sterility. All materials derived from bovine sources originate from countries free of bovine spongiform encephalopathy.

**Packaging and storage**—Graftskin is aseptically packaged in a Class 100 environment in single-use containers that preserve cell viability and product integrity. Store at controlled room temperature for no longer than 5 days, and do not subject to freezing temperatures. The atmosphere within the package contains air enriched with 10% carbon dioxide. The device is translucent and off-white in color. The upper, epidermal surface is dull with small irregularities resulting from the cornification of keratinocytes, while the bottom surface is smooth and shiny in appearance. The device is packaged so that the dermal layer (glossy layer) is closest to the agarose-based nutrient medium. The packaging permits easy observation of the medium and provides ready access to the Graftskin when needed. The medium contains all of the required nutrients for the living cell components of Graftskin, plus an appropriate, nontoxic, pH-sensitive dye to indicate package breaches or microbial contamination. The medium should appear pink (pH 6.8–7.7) when compared to the enclosed pH color chart.

**Labeling**—Label it to indicate the dimensions of the enclosed Graftskin, the expiry date, the required storage conditions, and the lot number. The label indicates that the enclosed Graftskin and surrounding medium are to be examined for signs of contamination or deterioration. The label also contains a pH color code to be used for determination of the acceptability of the pH of the Graftskin medium. The label cautions that Graftskin is not to be used if the package shows signs of damage or microbial contamination.

<sup>1</sup>Four tests for Graftskin are specified: *Histological characterization*, *Gene expression profile*, *Barrier integrity assessment*, and *Metabolic activity assessment*. The histological examination of the 3-dimensional organotypic structure demonstrates control of the Graftskin manufacturing process and shows a bilayered construct with a dermal matrix, differentiated epidermis, and developed stratum corneum. Reference photomicrographs, representing examples of both passing and failing Graftskin units, are specified to assist in ascertaining quality. PCR analysis of the gene expression profile of a finished Graftskin unit demonstrates that its keratinocytes and fibroblasts are producing cytokines that have been documented to influence wound healing. The test also demonstrates cell purity. Graftskin is positive for the gene expression of *Interleukin-1α*, *Platelet-derived growth factor*, and *Transforming growth factor-β1*. Graftskin is negative for the gene expression of *Interleukin-4*, which is produced neither by fibroblasts nor by keratinocytes. *Glyceraldehyde-3-phosphate dehydrogenase* is run with this assay as a housekeeping gene, and Graftskin is positive for the expression of this gene. The *Barrier integrity assessment* demonstrates the presence of a stratum corneum and the functionality of the epithelium in Graftskin. The purpose of the *Metabolic activity assessment* is to demonstrate cellular viability of the article.

Label it to indicate that sterile techniques are to be used in handling Graftskin and that cytotoxic agents are not to be used. Label it to indicate the time frame for use after package opening.

**USP Authentic Visual References** (11)—*USP Graftskin Reference Photomicrographs*. [NOTE—These 10 photomicrographs represent examples of both passing and failing Graftskin units. They are specified to assist in ascertaining histological quality.]

### Histological characterization—

#### SOLUTION PREPARATIONS—

**2.0 M Monobasic potassium phosphate**—Dissolve 13.61 g of anhydrous monobasic potassium phosphate in 50 mL of water.

**2.0 M Dibasic potassium phosphate**—Dissolve 17.42 g of anhydrous dibasic potassium phosphate in 50 mL of water.

**Phosphate-buffered saline solution (pH 7.1–7.5)**—Combine 3.6 mL of 2.0 M Monobasic potassium phosphate, 16.4 mL of 2.0 M Dibasic potassium phosphate, 8 g of sodium chloride, and 1 L of water. Mix thoroughly.

**0.3% Acid alcohol**—To 100 mL of 70% alcohol, add 0.3 mL of hydrochloric acid, and mix.

**Hematoxylin-alcohol solution**—Dissolve 2.5 g of hematoxylin in 25.0 mL of dehydrated alcohol, with heating.

**Potassium alum solution**—Dissolve 50.0 g of potassium alum in 500 mL of water, with heating.

**Hematoxylin staining solution**—Mix Hematoxylin-alcohol solution and Potassium alum solution, and heat to boiling as rapidly as possible with constant stirring. Do not heat for more than 1 minute. Slowly add 0.185 g of sodium iodate, and reheal to a simmer until the solution becomes a deep purple. Remove from the heat, and quickly cool. Filter daily before use.

**Bluing agent**—Dissolve 200 mg of sodium bicarbonate and 40 mg of lithium carbonate in 63 mL of water and 37 mL of methanol, and mix.

**Eosin solution**—Dissolve 1 g of eosin Y in 100 mL of alcohol. Filter daily before use.

**TISSUE PREPARATION**—Remove three 2-cm diameter circular sections from every 30-cm<sup>2</sup> section of Graftskin (not less than 30% of the total unit area), using the appropriate size biopsy punch. Cut with a circular rocking motion to prevent crushing the tissue. Immerse the sections in 3.7% dimethoxymethane for 30 minutes, using a gentle rocking motion. Remove the sections, and lay on a cutting surface, dermal side (glossy side) down. Cut an approximately 3-mm-wide strip through the center of the specimen, using a new, single-edged razor blade. Place the strips in a histological microwave cassette, using suitable biopsy pads premoistened with Phosphate-buffered saline solution (pH 7.1–7.5) to hold the strips in place. Insert the cassette into a histological microwave processing rack, place the rack inside a suitable microwave container, and add sufficient Phosphate-buffered saline solution (pH 7.1–7.5) to completely cover the rack. Place the container in a microwave oven suitable for histological work,<sup>2</sup> and heat for 4 minutes at 55°. Remove the Phosphate-buffered saline solution (pH 7.1–7.5), and add enough dehydrated alcohol to completely cover the rack. Return the container to the microwave oven, and heat for 4 minutes at 67°. Remove the alcohol, and add enough dehydrated isopropyl alcohol to completely cover the rack. Return the container to the microwave oven, and heat for 4 minutes at 74°. Remove the isopropyl alcohol, and add enough suitable grade paraffin<sup>3</sup> that has been melted and held at 84° prior to use, to completely cover the rack. Return the container to the microwave oven, and heat for 7 minutes at 84°. Remove the histological microwave cassette from the container and

<sup>2</sup>A microwave oven suitable for histological preparation can be obtained from Energy Beam Sciences, Inc., 11 Bowles Road, P.O. Box 468, Agawam, MA.

<sup>3</sup>A suitable paraffin for use is Accumate™ Tissue Embedding/Infiltration Medium, which can be obtained from Sigma Diagnostics, 545 S. Ewing Ave., St. Louis, MO 63103.

rack while the paraffin is still melted, and disassemble, discarding the biopsy pads. Fill preheated embedding molds with molten paraffin<sup>4</sup> heated to 60°, and place on top of a preheated warming platform that is designed for histological work. Using forceps, remove the Graftskin specimens from the cassette, and place the specimens in individual molds. Orient the specimens in the molds to enable cutting of a cross-or longitudinal section. Cool the paraffin by sliding the mold down the platform to its cool side until the paraffin has solidified. Maintain the specimen orientation with forceps during cooling, removing the forceps when the paraffin becomes translucent. Slide the paraffin block onto a histological cold plate to rapidly cool the block. Trim the paraffin block with a new single-edged razor blade to form a rectangle or slight trapezoid to within 5 mm of the tissue mass, if necessary. Cool the block at 4° for 15 to 30 minutes, and clamp the paraffin block into the block holder of the microtome. Fill a histological tissue-flotation water bath with fresh water, add an appropriate amount of a suitable histological adhesive,<sup>5</sup> and heat to a temperature 5° lower than the melting point of the paraffin. Properly mount the paraffin block into a microtome, adjusting as necessary. Set the microtome to make 5- $\mu$ m thick cuts with a blade angle of  $5 \pm 2^\circ$ . Insert into the knife holder a sharp stainless steel microtome knife that has been properly honed or a new disposable microtome knife, and cut a ribbon that contains 6 to 10 sections of Graftskin. Pick up the ribbon with forceps, and stretch it across the tissue-flotation water bath. Separate 2 to 3 adjacent sections from the ribbon on the water bath. The selected sections should not be compressed, wrinkled, or scratched. Pick up the selected sections by dipping a microscope slide into the water bath under the floating sections, and gently lift the slide out of the water. Allow the mounted sections to air-dry completely, or dry the slide in a 60° oven for 1 hour. The microscope slide with affixed tissue is sequentially immersed in 3 changes of a suitable histological, aliphatic xylene substitute,<sup>6</sup> 5 minutes per step, followed by two changes of dehydrated alcohol, 3 minutes per step. Sequentially immerse the slide in alcohol (for 3 minutes), running water rinse (3 minutes), *Hematoxylin staining solution* (6 minutes), running water rinse (7 minutes), 0.3% *Acid alcohol* (6 seconds), running water rinse (5 minutes), *Bluing agent* (1 second), running water rinse (5 minutes), *Eosin solution* (2 minutes), 2 changes of alcohol (3 minutes each step), 4 changes of dehydrated alcohol (3 minutes each step), and 4 changes of a suitable histological xylene substitute (3 minutes each step). Adjust the above immersion times as needed to suitably stain the tissue. Remove the slide from the last histological xylene substitute wash, and blot dry the back of the slide. Do not allow the tissue to dry. Affix a coverslip over the tissue, using a suitable coverslip mountant.

**MICROSCOPIC SPECIFICATIONS**—A light microscope with 4 $\times$ , 10 $\times$ , 20 $\times$ , and 40 $\times$  objectives installed in a revolving nose-piece; a 10 $\times$  widefield ocular with 10 to 19 mm per 100 microdisk reticle installed; and a 10 $\times$  widefield ocular with grid reticle installed.

**MICROSCOPIC AND MORPHOLOGICAL CHARACTERISTICS**—Score the 3 Graftskin sections for epidermal and dermal aspects, using the light microscope. Evaluate the slides from each of the sections taken. Average the aspect values for each section ( $n = 3$ ) to determine the overall aspect score for the Graftskin unit. When examined microscopically, Graftskin shows a bilayered construct resembling the epidermal and dermal layers of human skin. Using *USP Graftskin Reference Photomicrographs* of passing and failing articles for comparison, Graftskin meets the requirements for epidermal aspects, in-

cluding epidermal coverage, epidermal development, and keratinocyte aspect, and meets the requirements for dermal aspects, including dermal matrix thickness, fibroblast density, and matrix aspect, as described below.

**Epidermal aspects** (see *USP Graftskin Reference Photomicrograph 1* for an example of a passing unit)—

**Epidermal coverage**—Ninety-five percent or more of the dermal matrix present on the slide is covered with epidermal keratinocytes.

**Epidermal development**—Seventy percent or more of the Graftskin epithelium is composed of 3 distinct cell layers (see *USP Graftskin Reference Photomicrograph 2* for an example of a failing unit). The basal cell layer of the epithelium is at least 1 cell thick, consisting of keratinocytes with a cuboidal-columnar shape (see *USP Graftskin Reference Photomicrograph 3* for an example of a failing unit). The suprabasal layer is composed of stratified cells and is at least 5 cells thick. Suprabasal cells closest to the basal layer are cuboidal in shape; cells become progressively stratified the closer they are to the uppermost, squamous cell layer. The squamous cell layer on the apical surface is cornified and at least 1 cell thick (see *USP Graftskin Reference Photomicrograph 4* for an example of a failing unit). The uppermost cell layer of the epithelium is analogous to the stratum corneum of human skin and is composed of one or more rows of flat, scaly cells that are nonliving and keratinized (see *USP Graftskin Reference Photomicrograph 5* for an example of a failing unit).

**Keratinocyte aspect**—Ninety-five percent or more of the basal keratinocytes have basophilic cytoplasm that neither has distinct vacuoles nor is necrotic (see *USP Graftskin Reference Photomicrograph 6* for an example of a failing unit). Eighty percent or more of suprabasal cells (excluding those in the upper 20% of the cell layer closest to the squamous layer) have basophilic cytoplasm. Furthermore, these basophilic suprabasal cells do not have distinct vacuoles and are neither necrotic nor keratinized (see *USP Graftskin Reference Photomicrographs 7 and 8* for examples of failing units).

**Dermal aspects** (see *USP Graftskin Reference Photomicrograph 1* for an example of a passing unit)—Five randomly selected fields per slide will be evaluated for dermal matrix thickness and fibroblast density. The 5 fields will be averaged to obtain the final value for each section.

**Dermal matrix thickness**—The Graftskin dermal layer is not less than 40  $\mu$ m thick and is composed of several rows of flat dermal cells.

**Fibroblast density**—The dermal matrix contains an average of at least 4 nonpyknotic nuclei present per microscopic field (field = 20 grid squares of reticle when using the 10 $\times$  widefield ocular and 40 $\times$  objective).

**Matrix aspect**—At least 95% of the dermal matrix collagen stains uniformly with no large holes or inclusions present (see *USP Graftskin Reference Photomicrographs 9 and 10* for examples of failing units).

**Gene expression profile**—

**RNA extraction solution**—Use an aqueous phenol and guanidine isothiocyanate solution suitable for RNA extraction.<sup>7</sup>

**DEPC-treated water**—Add 0.2 mL of diethylpyrocarbonate (DEPC) to 100 mL of sterile Purified Water, shake vigorously, and allow to stand for at least 12 hours. Autoclave the resulting solution for 15 minutes, using the liquid cycle, to inactivate residual DEPC. Prepare fresh as needed.

**5X Reaction buffer**—Prepare a solution of potassium chloride, magnesium chloride, and tris(hydroxymethyl)amino-methane hydrochloride having concentrations of 375 mM, 15 mM, and 250 mM, respectively. Adjust to a pH of 8.3.

**10X Reaction buffer**—Prepare a solution of potassium chloride and tris(hydroxymethyl)aminomethane hydrochloride

<sup>4</sup> A suitable paraffin for use is Paraplast® X-Tra Tissue Embedding Medium ASTM, melting point 50° to 54°, which can be obtained from Fisher Scientific, 200 Park Ln., Pittsburgh, PA 15275.

<sup>5</sup> A suitable histological adhesive for use is Histoslide® Adhesive, which can be obtained from Poly Scientific R & D Corp., 70 Cleveland Ave., Bay Shore, NY 11706-1282.

<sup>6</sup> A suitable histological xylene substitute can be obtained from Shandon, Inc., 171 Industry Drive, Pittsburgh, PA 15275.

**Glyceraldehyde-3-phosphate dehydrogenase—**

G3PDH-3'	cat gtg ggc cat gag gtc cac cac
G3PDH-5'	tga agg tcg gag tca acg gat ttg gt

**DNA polymerase solution**—Prepare a solution containing 5 units of deoxyribonucleic acid polymerase per mL of a solution of potassium chloride, edetate disodium, dithiothreitol, polyoxyethylene (20) sorbitan monolaurate, nonylphenol polyoxyethylene ether, glycerin, and tris(hydroxymethyl)aminomethane hydrochloride, having concentrations of 100 mM, 0.1 mM, 1 mM, 0.5%, 0.5%, 50%, and 20 mM, respectively. Adjust to a pH of 8.0.

**RNA extraction procedure**—Remove three 2-cm diameter circular sections from every 30 cm<sup>2</sup> of Graftskin (not less than 30% of the total unit area), using the appropriate size biopsy punch. Transfer each piece of tissue to individual polypropylene microcentrifuge tubes. Add 1.0 mL of *RNA extraction solution* to each tube, homogenize by repetitive pipetting, and incubate the samples for 5 minutes at room temperature. To each tube add 0.2 mL of chloroform, mix on a vortex mixer, and centrifuge at 12,000 *g* for 15 minutes at 2° to 8°. Transfer the upper, aqueous phase to a second tube, add 0.5 mL of isopropanol, and incubate for 30 minutes to overnight at -20°. Centrifuge at 12,000 *g* for 15 minutes, discard the supernatants by aspiration, and add 75% alcohol to each pellet. Mix the sample on a vortex mixer, centrifuge at 12,000 *g* for 2 minutes, and discard the supernatants by aspiration without disturbing the RNA pellets. Recentrifuge at 12,000 *g* for 2 minutes, and remove the remaining supernatants with a small-volume (20  $\mu\text{L}$  or smaller capacity) micropipet. Air-dry the pellets for 5 minutes at room temperature by keeping the microcentrifuge cap off, and resuspend each pellet in 50  $\mu\text{L}$  of *DEPC-treated water*. Bring absorbance into linear range by diluting 5  $\mu\text{L}$  of each suspension with 195  $\mu\text{L}$  of *DEPC-treated water*. Transfer the samples to suitable quartz microplates or cuvettes and determine the absorbance of the RNA solution at wavelengths of 260 and 280 nm, using a spectrophotometer and *DEPC-treated water* as the blank. The ratio of the absorbance at 260 versus 280 nm should be greater than or equal to 1.65. If this ratio is less than 1.65, mix the resuspended pellet by repetitive pipetting, and repeat the dilution step and absorbance measurement. If this fails to raise the absorbance ratio, repeat the RNA extraction for that sample by adding 1 mL of *RNA extraction solution*, and proceed as above, beginning with "incubate the sample for 5 minutes at room temperature". Determine the concentration of RNA, in  $\mu\text{g}$  per mL, using the following equation:

$$40AD$$

in which *A* is the absorbance at 260 nm, and *D* is the dilution factor. Adjust the volume of the RNA solutions with additional *DEPC-treated water* to bring the concentration of RNA to about 80  $\mu\text{g}$  per mL. If the absorbance at 260 nm is less than 0.05, discard the sample, and repeat the RNA extraction on a fresh sample.

**Synthesis of cDNA**—To separate, individual thin-walled polymerase chain reaction (PCR) tubes add 12.5  $\mu\text{L}$  of the RNA solution from samples 1, 2, and 3 (3 reaction tubes total). Add 1  $\mu\text{L}$  of *Oligo-deoxythymidine solution* to each tube, and incubate at 72° for 2 minutes to anneal the oligo-deoxythymidine to the mRNA. Place the tubes in an ice bath, and to each tube add 4  $\mu\text{L}$  of *5X Reaction buffer*, 1  $\mu\text{L}$  of *dNTP solution I*, 0.5  $\mu\text{L}$  of *Ribonuclease inhibitor solution*, and 1  $\mu\text{L}$  of *Reverse transcriptase solution*. Incubate at 42° for 1 hour to synthesize cDNA, and then incubate at 94° for 5 minutes to inactivate the reverse transcriptase. To each tube add 80  $\mu\text{L}$  of *DEPC-treated water*, and mix.

**Polymerase chain reaction amplification of cDNA**—For each of the five *DNA primer pairs*, label five individual centrifuge tubes (five tubes total). Add the following to each centrifuge tube: *DEPC-treated water*, 135.8  $\mu\text{L}$ ; *dNTP solution II*, 10.5  $\mu\text{L}$ ; *10X Reaction buffer*, 21  $\mu\text{L}$ ; the appropriate 5' primer, 3.5  $\mu\text{L}$ ; the appropriate 3' primer, 3.5  $\mu\text{L}$ ; and 25 mM magnesium chloride, 12.6  $\mu\text{L}$ . Close, mix on a vortex mixer, and pulse spin in a microcentrifuge. Add 2.1  $\mu\text{L}$  of *DNA polymerase solution* to each centrifuge tube, and mix by repetitive pipetting. For each primer pair, transfer 27  $\mu\text{L}$  of the resulting solution to five thin-walled PCR tubes. There should be a total of 25 PCR tubes. Add the following to the PCR tubes of each primer set:

<sup>8</sup>A suitable buffer can be obtained from the RT-for-PCR Kit, BD Biosciences Clontech, 1020 East Meadow Circle, Palo Alto, CA 94303-4230.

<sup>9</sup>Suitable DNA primer pairs can be obtained from BD Biosciences Clontech, 1020 East Meadow Circle, Palo Alto, CA 94303-4230.

PCR tube number	
1	3 $\mu$ L Graftskin sample 1 cDNA
2	3 $\mu$ L Graftskin sample 2 cDNA
3	3 $\mu$ L Graftskin sample 3 cDNA
4	3 $\mu$ L cDNA positive control <sup>10</sup>
5 Negative control	3 $\mu$ L DEPC-treated water

Repeat for the remaining primer pairs. The positive control contains authentic cDNA of *Transforming growth factor  $\beta$* , *Interleukin-1 $\alpha$* , *Interleukin-4*, *Platelet-derived growth factor A*, and *Glyceraldehyde-3-phosphate dehydrogenase*, as appropriate for each primer set. Pulse spin the PCR tubes in a microcentrifuge to mix, and place the tubes in a single PCR thermal cycler. Cycling conditions are as follows.

Melting temperature	94°
Melting time	45 seconds
Anneal temperature	58°
Anneal time	45 seconds
Elongation temperature	72°
Elongation time	2 minutes
Number of cycles	30
Final elongation temperature	72°
Final elongation time	2 minutes

Terminate the PCR amplification by heating each tube to 72° for 7 minutes.

#### ELECTROPHORESIS IDENTIFICATION—

**Tris-boric acid buffer**—Prepare a solution containing 89 mM of tris(hydroxymethyl) aminomethane, 89 mM of boric acid, and 2 mM of edetate disodium per L.

**6X Loading buffer**—Prepare a solution containing 15% of a branched polymeric sucrose (400 kDa), 0.25% bromophenol blue, and 0.25% xylene cyanole FF.

**Ethidium bromide solution**—Prepare a solution of ethidium bromide in *Tris-boric acid buffer* having a concentration of 10 mg per mL.

**Agarose gel**—Prepare a horizontal 2% agarose<sup>11</sup> gel in *Tris-boric acid buffer*. Once the gel is set, remove the comb, and place the gel into the electrophoresis chamber with the comb end of the gel situated closest to the cathode terminal. Fill the electrophoresis chamber with *Tris-boric acid buffer* until the buffer reaches 3 to 5 mm over the surface of the gel.

**100-bp DNA ladder markers**—Prepare a solution containing 10 DNA fragments covering the range of 100 to 1000 base pairs (bp) in 100-bp increments, with a total DNA content of approximately 100 ng per  $\mu$ L (15–20 ng of DNA per band) in an appropriate buffer.<sup>12</sup>

**Procedure**—Dilute the 25 PCR samples prepared in the *Polymerase chain reaction amplification of cDNA with 6X Loading buffer* so that the final concentration of the buffer is one-sixth of its original concentration. Load 5  $\mu$ L of the *100-bp DNA ladder markers* in the first lane of the agarose gel. Load 10  $\mu$ L of each PCR sample into each gel well, and attach the cathode to the terminal close to the loaded wells. Attach the anode to the terminal farthest from the loaded wells, and apply 120 V to the gel. Run the gel until the bromophenol blue is about two-thirds the length of the gel. Remove the gel from the electrophoresis apparatus, and place it in a tray containing enough *Ethidium bromide solution* to cover the gel. Slowly agitate the gel on a shaker table for 30 minutes. Completely remove the *Ethidium bromide solution* from the tray, add an equal amount of *Tris-*

*boric acid buffer*, and slowly agitate the gel on a shaker table for 60 minutes. Place the gel on a 312-nm UV light source, photograph the gel, and inspect the image for bands that have migrated from each individual well. If a band appears, it is verified for size in base pairs by comparing it to the lane for the 100-bp DNA ladder marker. If a band appears and it is of the appropriate size, it is considered positive. The analysis is considered valid if the positive controls show the appropriately sized cDNA–PCR products, no PCR product bands appear in the negative controls, and all bands are observed to be visually discrete. The lanes of the agarose gel that correspond to Graftskin show cDNA bands for *Interleukin-1 $\alpha$*  (expected PCR product band size of 491 base pairs, limit of detection not less than  $9.6 \times 10^{-21}$  moles); *Platelet-derived growth factor* (expected PCR product band size of 304 base pairs, limit of detection not less than  $1.5 \times 10^{-20}$  moles); *Transforming growth factor- $\beta$ 1* (expected PCR product band size of 161 base pairs, limit of detection not less than  $1.5 \times 10^{-20}$  moles); and *Glyceraldehyde-3-phosphate dehydrogenase* (expected PCR product band size of 983 base pairs); but not *Interleukin-4* (expected PCR product band size of 344 base pairs, limit of detection not less than  $1.5 \times 10^{-22}$  moles). If one of the replicates tested yields results discordant with the other two replicates, repeat the assay, and accept only if all 3 replicates are concordant.

#### Barrier integrity assessment—

**Ham's F-12 tissue culture medium**—Prepare a solution that contains the following:

Component	mg per mL
L-Alanine	8.91
L-Arginine hydrochloride	210.7
L-Asparagine monohydrate	15.01
L-Aspartic acid	13.30
L-Cysteine hydrochloride monohydrate	35.12
L-Glutamic acid	14.70
L-Glutamine	146.2
Aminoacetic acid	7.51
L-Histidine hydrochloride monohydrate	20.96
L-Isoleucine	3.94
L-Leucine	13.12
L-Lysine hydrochloride	36.54
L-Methionine	4.48
L-Phenylalanine	4.96
L-Proline	34.53
L-Serine	10.51
L-Threonine	11.91
L-Tryptophan	2.04
L-Tyrosine disodium	6.71
L-Valine	11.71
Calcium chloride	44.00
Cupric sulfate, pentahydrate	0.0025
Ferric sulfate, heptahydrate	0.834
Potassium chloride	223.7
Magnesium chloride	57.22
Sodium chloride	7599.0
Sodium phosphate, dibasic	142.0
Zinc sulfate, heptahydrate	0.863
D-Biotin	0.0073
D-Calcium pantothenate	0.238
Choline chloride	13.96
Folic acid	1.30
Hypoxanthine	4.04
Inositol	18.02
Niacinamide	0.0366
Pyridoxine hydrochloride	0.0617

<sup>10</sup>A suitable cDNA positive control can be obtained from BD Biosciences Clontech, 1020 East Meadow Circle, Palo Alto, CA 94303-4230.

<sup>11</sup>An agarose suitable for electrophoresis analysis of Graftskin cytokine PCR product is SeaKem® GTG agarose and can be obtained from BioWhittaker Molecular Applications, Inc., 191 Thomaston St., Rockland, ME 04841.

<sup>12</sup>A suitable buffered solution of *100-bp DNA ladder markers* can be obtained from BioWhittaker Molecular Applications, Inc., 191 Thomaston St., Rockland, ME 04841.

Component	mg per mL
Riboflavin	0.0376
Thiamine hydrochloride	0.337
Thymidine	0.727
Cyanocobalamin	1.36
$\alpha$ -Lipoic acid	0.206
Linoleic acid	0.0841
Dextrose	1801.6
Phenol red, sodium	1.30
Sodium pyruvate	110.0
Putrescine dihydrochloride	0.161
Sodium bicarbonate	1176.0

*Tritiated water*: 2.0  $\mu$ Ci/mL (see *Radioactivity* <821>).

*Percutaneous absorption apparatus*—Prepare the apparatus as described below.<sup>13</sup>

**Six-well cell culture plate**—The dimensions are inner diameter, about 35 mm; depth, about 18 mm.

**Cell culture well insert**—Each well is a plastic cylinder with inner length, about 15 mm; inner diameter, about 24 mm; outer diameter, about 27 mm, with a flanged end extending about 4 mm from the outer diameter. The inner diameter opposite the flanged end is covered by a taut polycarbonate membrane having a porosity of 3  $\mu$ m. The flange should allow the *Cell culture well insert* to be suspended in the well of a *Six-well cell culture plate*, leaving a 3-mm space between the bottom of the *Cell culture well insert* and the inner bottom surface of the *Six-well cell culture plate*.

*Percutaneous absorption insert*—Use a polytetrafluoroethylene cylinder having the following dimensions: length, about 20 mm; inner diameter, about 20 mm; outer diameter, about 23 mm with a flanged end extending about 3 mm from the outer diameter. Ten mm from the flanged end of the cylinder, the inner diameter begins to funnel so that the inner diameter at about 10 mm from the flanged end is about 20 mm, and the inner diameter at about 15 mm from the flanged end is about 8 mm. From about 15 mm to about 20 mm from the flanged end, the inner diameter remains at 8 mm. The outer diameter of the cylinder remains constant at about 23 mm. The flanged end is considered to be the top of the component.

*Silicon grease*—Use high-vacuum silicon grease suitable for glass.<sup>14</sup>

**Procedure**—Fill each well of the *Six-well cell culture plate* with 1.5 mL of *Ham's F-12 tissue culture medium*. Remove two 2-cm circular sections from every 30 cm<sup>2</sup> of *Graftskin* (not less than 20% of the total unit area), using the appropriate size biopsy punch. Transfer each excised section to a separate *Cell culture well insert*, dermal side down on the polycarbonate membrane. Using forceps, gently smooth out the section to remove any wrinkles. Apply a narrow ring of *Silicon grease* to the underside of the *Percutaneous absorption insert*, and place the insert into the *Cell culture well insert*, grease side down, onto the epidermal surface of the *Graftskin* biopsy, with slight pressure to form a tight seal. Do not allow any grease to enter the 8-mm diameter exposed area of the *Graftskin* surface. Place the *Cell culture well insert* containing the *Percutaneous absorption insert* into one of the wells of the *Six-well cell culture plate* containing 1.5 mL of *Ham's F-12 tissue culture medium*. Apply 1.0 mL of *Tritiated water* to the exposed surface of the *Graftskin* unit in the *Percutaneous absorption insert*, and incubate at ambient temperature for 6 hours. At the end of each hour, transfer the *Cell culture well insert* containing the *Percutaneous absorption*

*insert* to a new well within the *Six-well cell culture plate* containing 1.5 mL of fresh *Ham's F-12 tissue culture medium*. After the 6-hour incubation, remove the *Cell culture well insert*. Remove a 0.5-mL aliquot of *Ham's F-12 tissue culture medium* from each well of the *Six-well cell culture plate*, and transfer into individual scintillation vials. Dispense 0.5 mL of *Tritiated water* to a separate scintillation vial as a control; to each scintillation vial add 4.5 mL of a suitable scintillation cocktail,<sup>15</sup> and gently mix. Place the scintillation vials into a liquid scintillation counter, and count the emissions in the tritium spectrum for 60 seconds. Average the counts for each of the six time points (punch average) and duplicate sections (unit average). Determine the percent penetration per hour by the formula:

$$150(C_S/C_C)$$

in which  $C_S$  are the counts per minute of the 0.5-mL aliquot of the *Ham's F-12 tissue culture medium* taken at the end of the incubation period; and  $C_C$  are the counts per minute in the 0.5-mL aliquot of *Tritiated water*. Not more than 1.97% penetration is found.

#### Metabolic activity assessment—

*Dulbecco's modified Eagle's tissue culture medium*—Prepare a solution that contains the following components.

Component	mg per L
Calcium chloride	264.9
Ferric nitrate, nonahydrate	0.10
Potassium chloride	400.0
Magnesium sulfate, heptahydrate	200.0
Sodium chloride	6,400.0
Sodium bicarbonate	3,700.0
Sodium phosphate, monobasic (monohydrate)	125.0
Dextrose	4,500.0
Phenol red	15.0
Sodium pyruvate	110.0
L-Arginine hydrochloride	84.0
L-Cystine	48.0
Aminoacetic acid	30.0
L-Histidine hydrochloride monohydrate	42.0
L-Isoleucine	104.8
L-Leucine	104.8
L-Lysine hydrochloride	146.2
L-Methionine	30.0
L-Phenylalanine	66.0
L-Serine	42.0
L-Threonine	95.2
L-Tryptophan	16.0
L-Tyrosine	72.0
L-Valine	93.6
D-Calcium pantothenate	4.0
Choline chloride	4.0
Folic acid	4.0
Inositol	7.0
Nicotinamide	4.0
Pyridoxine hydrochloride	4.0
Riboflavin	0.40
Thiamine hydrochloride	4.0

**MTT solution**—Dissolve 0.33 g of (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl tetrazolium bromide in 1 L of *Dulbecco's modified Eagle's tissue culture medium*, with constant stirring. Pass the solution through a suitable size filter having a 0.2- $\mu$ m porosity.

<sup>13</sup>A suitable *Percutaneous absorption apparatus*, not including the *Percutaneous absorption insert*, is a Costar® 6-well culture cluster, flat bottom with lid, and a Costar® Transwell®, 24 mm in a 6-well cluster plate with lid and can be obtained from Corning Life Sciences, 45 Nagog Park, Acton, MA 01720.

<sup>14</sup>A suitable *Silicon grease* is High Vacuum Silicon Lubricant for Glass and can be obtained from Dow Corning Corporation, P.O. Box 0994, Midland, MI 48686-0994.

<sup>15</sup>A suitable scintillation cocktail is Optiphase®, Supermix®, Perkin-Elmer Life Sciences, Inc., 549 Albany St., Boston, MA 02118.

**0.04 N Acidified isopropyl alcohol**—Add 3.45 mL of hydrochloric acid to 1 L of isopropyl alcohol, and mix thoroughly. Store at room temperature no longer than 6 months.

**Procedure**—Immerse the Graftskin in separate 40.0-mL portions of *MTT solution*, making sure that about 20 mL of *MTT solution* is under the test article, and 20 mL of *MTT solution* is on the surface. Take care not to produce any bubbles. Incubate for 3 hours at 37°, in an environment of air enriched with 10% carbon dioxide. After incubation, remove from the 37°, 10% carbon dioxide-enriched air environment. Transfer the Graftskin to a suitable cutting surface, and, using an appropriate biopsy punch, remove three 8-mm diameter circular sections from every 30 cm<sup>2</sup> of Graftskin (5% of unit area). Transfer each punch to individual snap-top test tubes. Add 0.9 mL of *0.04 N Acidified isopropyl alcohol* to each tube, making sure that the tissue is completely submerged. If not submerged, use forceps to place the sample into the *0.04 N Acidified isopropyl alcohol*. Cap each tube tightly, place on an orbital shaker, and shake for 1 hour at a moderate setting. After 1 hour, remove the tubes from the orbital shaker, and mix each tube on a vortex mixer. Inspect the tubes to make sure that the tissue samples continue to be submerged. If not, use forceps or another device to resubmerge the tissues. Return the tubes to the orbital shaker, and continue to shake for an additional 1 hour. Remove the tubes from the orbital shaker, mix the tubes on a vortex mixer, and transfer a 0.2-mL aliquot to a suitable 96-well flat-bottom plate. Read the absorbance of each sample at 570 nm, using 0.2 mL of *0.04 N Acidified isopropyl alcohol* as the blank. The average absorbance value is  $\geq 0.237$ .

## Gramicidin

Gramicidin.

Gramicidin [1405-97-6].

» Gramicidin is an antibacterial substance produced by the growth of *Bacillus brevis* Dubos (Fam. Bacillaceae). It may be obtained from tyrothricin. It has a potency of not less than 900 µg of gramicidin per mg, calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Gramicidin RS

**Identification, Ultraviolet Absorption** (197U)—

*Solution:* 50 µg per mL.

*Medium:* alcohol.

**Melting temperature, Class Ia** (741): not lower than 229°, determined after drying.

**Crystallinity** (695): meets the requirements.

**Loss on drying** (731)—Dry about 100 mg in a capillary-stoppered bottle in vacuum at 60° for 3 hours: it loses not more than 3.0% of its weight.

**Residue on ignition** (281): not more than 1.0%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid.

**Assay**—Proceed with Gramicidin as directed under *Antibiotics—Microbial Assays* (81).

## Granisetron Hydrochloride

$C_{18}H_{24}N_4O \cdot HCl$  348.87

1*H*-Indazole-3-carboxamide, 1-methyl-*N*-(9-methyl-9-azabicyclo[3.3.1]non-3-yl)-, monohydrochloride, *endo*-. 1-Methyl-*N*-(9-methyl-*endo*-9-azabicyclo[3.3.1]non-3-yl)-1*H*-indazole-3-carboxamide monohydrochloride [107007-99-8].

» Granisetron Hydrochloride contains not less than 97.0 percent and not more than 102.0 percent of  $C_{18}H_{24}N_4O \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers, protected from light. Store at room temperature.

**USP Reference standards** (11)—

USP Granisetron Hydrochloride RS

USP Granisetron Related Compound A RS

(2-Methyl-*N*-[(1*R*,3*r*,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-2*H*-indazole-3-carboxamide).

USP Granisetron Related Compound B RS

(*N*-[(1*R*,3*r*,5*S*)-9-Methyl-9-azabicyclo[3.3.1]non-3-yl]-1*H*-indazole-3-carboxamide).

USP Granisetron Related Compound E RS

((1*R*,3*r*,5*S*)-9-Methyl-9-azabicyclo[3.3.1]nonan-3-amine, acetate salt).

**Identification**—

**A:** *Infrared Absorption* (197M).

**B:** It meets the requirements of the test for *Chloride* (191).

**pH** (791): between 4.0 and 6.5, in a solution in carbon dioxide-free water, containing 10 mg per mL.

**Loss on drying** (731)—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): not more than 20 ppm.

**Limit of granisetron related compound E**—

*Adsorbent:* 0.25-mm layer of chromatographic silica gel mixture.

*Diluent:* a mixture of acetonitrile and water (80:20).

*Test solution*—Transfer 250 mg of Granisetron Hydrochloride to a 5-mL volumetric flask, and dissolve in and dilute with *Diluent* to volume.

*Standard solution*—Dissolve an accurately weighed quantity of USP Granisetron Related Compound E RS in *Diluent* to obtain a solution containing 0.25 mg per mL. [NOTE—USP Granisetron Related Compound E RS is the acetate salt of (1*R*,3*r*,5*S*)-9-methyl-9-azabicyclo[3.3.1]nonan-3-amine. Use the correction factor stated on the label of the USP Reference Standard to calculate the concentration, as appropriate.]

*Application volume:* 2 µL.

*Developing solvent system*—A mixture of ethyl acetate, isopropyl alcohol, and ammonium hydroxide (50:30:6.5).

**Procedure**—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621), and develop the chromatogram until the solvent front has moved about half of the length of the plate. Dry the plate in air, and expose it to

iodine vapor for 30 minutes. Any spot corresponding to granisetron related compound E obtained from the *Test solution* is not more intense than the corresponding spot obtained from the *Standard solution* (0.5%).

#### Related compounds—

[NOTE—Protect all solutions containing granisetron hydrochloride from light.]

*Mobile phase* and *System suitability solution*—Proceed as directed in the *Assay*.

*Standard solution*—Dissolve an accurately weighed quantity of USP Granisetron Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.005 mg per mL.

*Identification solution*—Prepare a solution in *Mobile phase* containing 0.01 mg per mL of USP Granisetron Related Compound A RS and 0.005 mg per mL of USP Granisetron Related Compound B RS.

*Test solution*—Use the *Assay preparation*, prepared as directed in the *Assay*.

*Chromatographic system* (see *Chromatography* <621>)—Prepare as directed in the *Assay*. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between granisetron related compound C and granisetron is not less than 3.5; and the tailing factor for the granisetron peak is not more than 2.0. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 10%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution*, the *Identification solution*, and the *Test solution* into the chromatograph, record the chromatograms for about two times the retention time of granisetron, identify the peaks on the basis of their relative retention times as given in *Table 1*, and measure the peak responses. Calculate the percentage of each impurity in the portion of Granisetron Hydrochloride taken by the formula:

$$100(1 / F)(C_S / C_T)(r_U / r_S)$$

in which  $F$  is the relative response factor given in *Table 1*;  $C_S$  and  $C_T$  are the concentrations, in mg per mL, of granisetron hydrochloride in the *Standard solution* and the *Test solution*, respectively;  $r_U$  is the peak response for each impurity obtained from the *Test solution*; and  $r_S$  is the peak response for granisetron obtained from the *Standard solution*: in addition to not exceeding the limits in *Table 1*, not more than 1.0% of total impurities is found. Disregard any peak observed in the blank. The reporting level for impurities is 0.05%.

#### Assay—

*Mobile phase*—Dilute 1.6 mL of phosphoric acid with water to 800 mL, add 200 mL of acetonitrile, and mix. Add 1.0 mL of hexylamine, and mix. Adjust with triethylamine to

a pH of  $7.5 \pm 0.05$  (about 4 mL is needed). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Granisetron Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL.

*System suitability solution*—Transfer 2 mL of a solution in *Mobile phase* containing about 1.0 mg of Granisetron Hydrochloride per mL to a colorless glass vial, stopper it, and either expose the solution to sunlight for 4 hours or place it under a UV lamp for 16 hours (granisetron undergoes partial degradation to granisetron related compound C). A degradation of at least about 0.3% of granisetron to granisetron related compound C must be obtained, as shown by the appearance of a corresponding peak in the chromatogram. If it is not obtained, again expose the solution to sunlight or place it under a UV lamp.

*Assay preparation*—Transfer about 50 mg of Granisetron Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 305-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L1. The column temperature is maintained at 40°. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between granisetron related compound C and granisetron is not less than 3.5; and the tailing factor for the granisetron peak is not more than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of  $C_{18}H_{24}N_4O \cdot HCl$  in the portion of Granisetron Hydrochloride taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  and  $C_U$  are the concentrations, in mg per mL, of granisetron hydrochloride in the *Standard preparation* and the *Assay preparation*, respectively; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Table 1

Name	Relative Retention Time	Relative Response Factor ( $F$ )	Limit (%)
Granisetron related compound D <sup>1</sup>	0.4	1.0	0.1
Granisetron related compound B <sup>2</sup>	0.5	0.59	0.5
Granisetron related compound A <sup>3</sup>	0.7	1.0	1.0
Granisetron related compound C <sup>4</sup>	0.8	1.0	0.2
Granisetron	1.0	n/a	n/a
Any other individual impurity	n/a	1.0	0.1

<sup>1</sup>1-Methyl-1H-indazole-3-carboxylic acid.

<sup>2</sup>N-[(1R,3R,5S)-9-Methyl-9-azabicyclo[3.3.1]non-3-yl]-1H-indazole-3-carboxamide.

<sup>3</sup>2-Methyl-N-[(1R,3R,5S)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-2H-indazole-3-carboxamide.

<sup>4</sup>N-[(1R,3R,5S)-9-Azabicyclo[3.3.1]non-3-yl]-1-methyl-1H-indazole-3-carboxamide.

## Granisetron Hydrochloride Injection

» Granisetron Hydrochloride Injection is a sterile solution of Granisetron Hydrochloride in Water for Injection. It contains the equivalent of not less than 93.0 percent and not more than 107.0 percent of the labeled amount of granisetron ( $C_{18}H_{24}N_4O$ ). It may contain suitable preservatives.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, protected from light, and store at controlled room temperature.

**Labeling**—It meets the requirements for *Labeling* under *Injections* (1). Label it to indicate the name and the quantity of any added preservative.

### USP Reference standards (11)—

USP Endotoxin RS

USP Granisetron Hydrochloride RS

USP Granisetron Related Compound B RS

(*N*-[(1*R*,3*r*,5*S*)-9-Methyl-9-azabicyclo[3.3.1]non-3-yl]-1*H*-indazole-3-carboxamide).

USP Granisetron Related Compound C RS

*N*-[(1*R*,3*r*,5*S*)-9-Azabicyclo[3.3.1]non-3-yl]-1-methyl-1*H*-indazole-3-carboxamide.

USP Granisetron Related Compound D RS

1-Methyl-1*H*-indazole-3-carboxylic acid.

### Identification—

**A:** *Thin-Layer Chromatographic Identification Test* (201)—

*Developing solvent*—Prepare a mixture of methylene chloride, alcohol, water, and ammonium hydroxide (60:40:5:2).

*Standard solution*—Dissolve an accurately weighed quantity of USP Granisetron Hydrochloride RS in water or alcohol to obtain a solution having a concentration of granisetron that matches the concentration of granisetron in the *Test solution*. To calculate the concentration of granisetron in the *Standard solution*, use the molecular weights of granisetron (312.41) and granisetron hydrochloride (348.87).

*Test solution*—Use the undiluted Injection.

*Procedure*—Separately apply equal volumes of the *Standard solution* and the *Test solution*, equivalent to about 4 to 5 µg of granisetron, to a suitable thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture, dry the spots under a current of warm air for about 5 minutes, and develop the plate in a paper-lined chromatographic chamber equilibrated with *Developing solvent* prior to use. Allow the chromatogram to develop until the solvent front has moved about 15 cm. Remove the plate, dry the plate under a current of warm air, and examine the plate under short-wavelength UV light: the principal spot from the *Test solution* corresponds in appearance and  $R_f$  value to that of the *Standard solution*.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 25 USP Endotoxin Units per mg of granisetron.

**Sterility** (71): meets the requirements.

**pH** (791): between 4.0 and 6.0.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Related compounds**—[NOTE—Perform the determination under subdued light, and use amber autosampler vials and low-actinic glassware.]

*Buffer solution pH 2.0*, *Mobile phase*, *System suitability preparation*, and *Chromatographic system*—Prepare as directed in the *Assay*.

*Standard solution*—Use the *Standard preparation* prepared as directed in the *Assay*.

*Test solution*—Use the undiluted Injection.

*Procedure*—Separately inject equal volumes (about 15/L µL), where *L* is the labeled amount, in mg, of granisetron per mL of Injection of the *Standard solution* and the *Test solution*, into the chromatograph. Record the chromatograms for at least three times the retention time of the granisetron peak, identify the impurities listed in *Table 1*, and measure the peak responses. Calculate the percentage of each impurity relative to the labeled content of granisetron in the portion of Injection taken by the formula:

$$100(1/F)(312.41/348.87)(C_S/C_T)(r_i/r_S)$$

in which *F* is the relative response factor as listed in *Table 1*; 312.41 and 348.87 are the molecular weights of granisetron and granisetron hydrochloride, respectively;  $C_S$  is the concentration, in mg per mL, of granisetron hydrochloride in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of granisetron in the *Test solution*, based on the label claim;  $r_i$  is the peak response of each impurity obtained from the *Test solution*; and  $r_S$  is the peak response of the granisetron peak, obtained from the *Standard solution*. Disregard the peak due to granisetron related compound A that elutes at the relative retention time of about 0.5–0.6 as this impurity is controlled in the drug substance monograph. Not more than 0.7% of granisetron related compound C is found, not more than 1.3% of total specified impurities is found, and not more than 0.5% of any unspecified impurity is found. The reporting level for impurities is 0.1%.

Table 1

Name	Relative Retention Time	Relative Response Factor ( <i>F</i> )
Granisetron related compound A <sup>1</sup>	0.5–0.6	—
Granisetron related compound B <sup>2</sup>	0.7	0.8
Granisetron	1.0	—
Granisetron related compound C <sup>3</sup>	1.2	1.0
Granisetron related compound D <sup>4</sup>	2.1–2.3	1.5

<sup>1</sup> 2-Methyl-*N*-[(1*R*,3*r*,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-2*H*-indazole-3-carboxamide.

<sup>2</sup> *N*-[(1*R*,3*r*,5*S*)-9-Methyl-9-azabicyclo[3.3.1]non-3-yl]-1*H*-indazole-3-carboxamide.

<sup>3</sup> *N*-[(1*R*,3*r*,5*S*)-9-Azabicyclo[3.3.1]non-3-yl]-1-methyl-1*H*-indazole-3-carboxamide.

<sup>4</sup> 1-Methyl-1*H*-indazole-3-carboxylic acid.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—[NOTE—Perform the determination under subdued light, and use amber autosampler vials and low-actinic glassware.]

*Buffer solution pH 2.0*—Dissolve 15.6 g of monobasic sodium phosphate dihydrate in 900 mL of water, adjust with phosphoric acid to a pH of 2.0, and dilute with water to 1000 mL.

*Mobile phase*—Prepare a mixture of *Buffer solution pH 2.0*, methanol, and tetrahydrofuran (75:24:1.1), mix, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability preparation*—Dissolve suitable quantities of USP Granisetron Hydrochloride RS, USP Granisetron Related Compound B RS, USP Granisetron Related Compound C RS, and USP Granisetron Related Compound D RS in a mixture of water and methanol (75:25), to obtain a solution containing about 0.1 mg of each component per mL. Dilute with water to obtain a solution containing about *L* µg

of each component per mL, where *L* is the labeled amount, in mg, of granisetron per mL of Injection.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Granisetron Hydrochloride RS in water to obtain a solution having a known concentration of about  $(0.11 \times L)$  mg of granisetron hydrochloride per mL, where *L* is the labeled amount, in mg, of granisetron per mL of Injection.

**Assay preparation**—Use the Injection diluted 1:10 with water.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 300-nm detector and a 4.6-mm  $\times$  15-cm column that contains 4- $\mu$ m polar endcapped packing L1. The flow rate is about 1.2 mL per minute. Chromatograph the *System suitability preparation*, and identify the components based on the information listed in *Table 1*. Record the peak responses as directed for *Procedure*: the resolution, *R*, between the granisetron and granisetron related compound C peaks is not less than 2. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing for the granisetron peak is not more than 3; and the relative standard deviation for a minimum of six replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 15/*L*  $\mu$ L), where *L* is the labeled amount, in mg, of granisetron per mL of Injection, of the *Standard preparation* and the *Assay preparation* into the chromatograph. Record the chromatograms for at least three times the retention time of the granisetron peak, and measure the responses for the major peaks. Calculate the percentage of the labeled amount of granisetron ( $C_{18}H_{24}N_4O$ ) in each mL of the Injection by the formula:

$$100(312.41 / 348.87)(C/L)(r_U / r_S)$$

in which 312.41 and 348.87 are the molecular weights of granisetron and granisetron hydrochloride, respectively; *C* is the concentration, in mg per mL, of granisetron hydrochloride in the *Standard preparation*; *L* is as defined above; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Granisetron Hydrochloride Oral Suspension

### DEFINITION

Granisetron Hydrochloride Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled content of granisetron hydrochloride ( $C_{18}H_{24}N_4O \cdot HCl$ ). Prepare Granisetron Hydrochloride Oral Suspension (0.056 mg/mL) equivalent to 0.05 mg of Granisetron per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>).

Granisetron (as Hydrochloride)	5 mg (5.6 mg)
Vehicle: A mixture of Vehicle for Oral Solution, NF, and Vehicle for Oral Suspension, NF, (1:1), a sufficient quantity to make	100 mL

Calculate the required quantity of each ingredient for the total amount to be prepared. If using tablets, place the required number of tablets in a suitable mortar, and comminute the tablets to a fine powder with a pestle, or add *Granisetron Hydrochloride* powder. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a *Granisetron Hydrochloride* suspension that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough *Vehicle* to bring to final volume, and mix well.

### ASSAY

#### PROCEDURE

**Mobile phase:** Acetonitrile and 50 mM monobasic sodium dihydrogen phosphate (3:17). Adjust with phosphoric acid to a pH of 7.0. Make adjustments if necessary (see *Chromatography* <621>, *System Suitability*.)

**Standard stock solution:** 1.0 mg/mL USP Granisetron Hydrochloride RS

**Standard solution:** Transfer 2.5 mL of *Standard stock solution* to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution containing 25  $\mu$ g/mL of granisetron hydrochloride.

**Sample solution:** Shake the Oral Suspension thoroughly by hand. Pipet 5.0 mL into a 10-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix to obtain a nominal concentration of 25  $\mu$ g of granisetron hydrochloride/mL.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 300 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L10

**Flow rate:** 1.0 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

[NOTE—The retention time of the granisetron peak is 7.0 min.]

#### Suitability requirements

**Relative standard deviation:** NMT 2.0% for the replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of  $C_{18}H_{24}N_4O \cdot HCl$  in the volume of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

*r<sub>U</sub>* = peak response from the *Sample solution*

*r<sub>S</sub>* = peak response from the *Standard solution*

*C<sub>S</sub>* = concentration of granisetron hydrochloride in the *Standard solution* ( $\mu$ g/mL)

*C<sub>U</sub>* = nominal concentration of granisetron hydrochloride in the *Sample solution* ( $\mu$ g/mL)

**Acceptance criteria:** 90.0%–110.0%

### SPECIFIC TESTS

• **pH** <791>: 4.0–4.5

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature or controlled cold temperature.
- **LABELING:** Label it to state that it is to be well shaken before use, and to state the *Beyond-Use Date*.
- **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded when stored at controlled room temperature or when stored at controlled cold temperature
- **USP REFERENCE STANDARDS** <11>  
USP Granisetron Hydrochloride RS

## Granisetron Hydrochloride Tablets

» Granisetron Hydrochloride Tablets contain an amount of Granisetron Hydrochloride equivalent to not less than 92.0 percent and not more than 108.0 percent of the labeled amount of granisetron ( $C_{18}H_{24}N_4O$ ).

**Packaging and storage**—Preserve in well-closed containers, protected from light. Store at controlled room temperature.

**USP Reference standards** (11)—

USP Granisetron Hydrochloride RS

USP Granisetron Related Compound B RS

(N-[(1*R*,3*r*,5*S*)-9-Methyl-9-azabicyclo[3.3.1]non-3-yl]-1*H*-indazole-3-carboxamide).

USP Granisetron Related Compound C RS

N-[(1*R*,3*r*,5*S*)-9-Azabicyclo[3.3.1]non-3-yl]-1-methyl-1*H*-indazole-3-carboxamide.

USP Granisetron Related Compound D RS

1-Methyl-1*H*-indazole-3-carboxylic acid.

**Identification**—

**A:** *Thin-Layer Chromatographic Identification Test* (201)—

*Developing solvent*—Prepare a mixture of methylene chloride, alcohol, water, and ammonium hydroxide (60:40:5:2).

*Standard solution*—Dissolve an accurately weighed quantity of USP Granisetron Hydrochloride RS in 0.1 N hydrochloric acid to obtain a solution containing 0.44 mg of granisetron hydrochloride per mL.

*Test solution*—Transfer a number of Tablets, equivalent to about 2 mg of granisetron, to a suitable container, add 5.0 mL of 0.1 N hydrochloric acid, and sonicate for about 3 minutes. Pass through a 0.45-μm filter.

*Procedure*—Separately apply 20 μL each of the *Standard solution* and the *Test solution* to a suitable thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture, dry the spots under a current of warm air for about 5 minutes, and develop the plate in a paper-lined chromatographic chamber equilibrated with *Developing solvent*. Allow the chromatogram to develop until the solvent front has moved about 15 cm. Remove the plate, dry the plate under a cold air stream for about 10 minutes, and examine the plate under short-wavelength UV light: the principal spot from the *Test solution* corresponds in appearance and *R<sub>f</sub>* value to that of the *Standard solution*.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

*Medium:* pH 6.5 phosphate buffer, prepared by dissolving 6.8 g of monobasic potassium phosphate in 800 mL of water, adjusting to pH 6.5 with 1 N sodium hydroxide, and diluting to 1 L with water; 500 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

*Buffer solution pH 2.0, Mobile phase, Diluent, System suitability preparation, and Standard preparation*—Prepare as directed in the *Assay*.

*Standard solution*—Transfer 5.0 mL of the *Standard preparation* to a 250-mL volumetric flask, and dilute with *Diluent* to volume.

*Test solution*—Pass a portion of the solution under test through a 0.45-μm filter. If necessary, further dilute 5 mL of this solution with *Diluent* to (5 × *L*) mL, where *L* is the Tablet label claim, in mg.

*Chromatographic system* (see *Chromatography* (621))—Prepare as directed in the *Assay*. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not less than 0.8 and not more than 1.5; and the relative standard deviation for a minimum of six replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 100 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and meas-

ure the peak responses. Calculate the amount of C<sub>18</sub>H<sub>24</sub>N<sub>4</sub>O dissolved by the formula:

$$(312.41 / 348.87)(r_U \times C_S \times 500 \times D \times 100) / (r_S \times L)$$

in which 312.41 and 348.87 are the molecular weights of granisetron and granisetron hydrochloride, respectively; *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses for the *Test solution* and the *Standard solution*, respectively; *C<sub>S</sub>* is the concentration, in mg per mL, of the *Standard solution*; 500 is the volume, in mL, of the *Medium*; *D* is the dilution factor of the *Test solution*; 100 is the conversion factor to percentage; and *L* is the Tablet label claim, in mg.

*Tolerances*—Not less than 75% (Q) of the labeled amount of C<sub>18</sub>H<sub>24</sub>N<sub>4</sub>O is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Related compounds**—[NOTE—Perform the determination under subdued light and use amber autosampler vials and low-actinic glassware.]

*Buffer solution pH 2.0, Mobile phase, Diluent, System suitability preparation, and Chromatographic system*—Prepare as directed in the *Assay*.

*Standard solution*—Use the *Standard preparation*, prepared as directed in the *Assay*.

*Test solution*—Use the *Assay preparation*, prepared as directed in the *Assay*.

*Procedure*—Separately inject equal volumes (about 20 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for at least three times the retention time of the granisetron peak, identify the impurities listed in *Table 1*, and measure the peak responses. Calculate the percentage of each impurity relative to the labeled content of granisetron in the portion of Tablets taken by the formula:

$$100(1 / F)(312.41 / 348.87)(C_S / C_U)(r_i / r_S)$$

in which *F* is the relative response factor as listed in *Table 1*; 312.41 and 348.87 are the molecular weights of granisetron and granisetron hydrochloride, respectively; *C<sub>S</sub>* is the concentration, in mg per mL, of granisetron hydrochloride in the *Standard solution*; *C<sub>U</sub>* is the concentration, in mg per mL, of granisetron in the *Test solution*, based on the label claim; *r<sub>i</sub>* is the peak response of each impurity obtained from the *Test solution*; and *r<sub>S</sub>* is the peak response of the granisetron peak, obtained from the *Standard solution*. Disregard the peak due to granisetron related compound A that elutes at the relative retention time of about 0.5–0.6, as this impurity is controlled in the drug substance monograph. Not more than 0.7% of granisetron related compound C is found, not more than 1.3% of total specified impurities is found, and not more than 0.5% of any unspecified impurity is found. The reporting level for impurities is 0.1%.

**Table 1**

Name	Relative Retention Time	Relative Response Factor ( <i>F</i> )
Granisetron related compound A <sup>1</sup>	0.5–0.6	—
Granisetron related compound B <sup>2</sup>	0.7	0.8
Granisetron	1.0	—

<sup>1</sup> 2-Methyl-N-[(1*R*,3*r*,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-2*H*-indazole-3-carboxamide.

<sup>2</sup> N-[(1*R*,3*r*,5*S*)-9-Methyl-9-azabicyclo[3.3.1]non-3-yl]-1*H*-indazole-3-carboxamide.

<sup>3</sup> N-[(1*R*,3*r*,5*S*)-9-Azabicyclo[3.3.1]non-3-yl]-1-methyl-1*H*-indazole-3-carboxamide.

<sup>4</sup> 1-Methyl-1*H*-indazole-3-carboxylic acid.

Table 1 (Continued)

Name	Relative Retention Time	Relative Response Factor (F)
Granisetron related compound C <sup>3</sup>	1.2	1.0
Granisetron related compound D <sup>4</sup>	2.1–2.3	1.5

<sup>1</sup> 2-Methyl-N-[(1*R*,3*r*,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-2*H*-indazole-3-carboxamide.

<sup>2</sup> N-[(1*R*,3*r*,5*S*)-9-Methyl-9-azabicyclo[3.3.1]non-3-yl]-1*H*-indazole-3-carboxamide.

<sup>3</sup> N-[(1*R*,3*r*,5*S*)-9-Azabicyclo[3.3.1]non-3-yl]-1-methyl-1*H*-indazole-3-carboxamide.

<sup>4</sup> 1-Methyl-1*H*-indazole-3-carboxylic acid.

**Assay**—[NOTE—Perform the determination under subdued light and use amber autosampler vials and low-actinic glassware.]

**Buffer solution pH 2.0**—Dissolve 15.6 g of monobasic sodium phosphate dihydrate in 900 mL of water, adjust with phosphoric acid to a pH of 2.0, and dilute with water to 1000 mL.

**Mobile phase**—Prepare a mixture of **Buffer solution pH 2.0**, methanol, and tetrahydrofuran (75:24:1.1), mix, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Use **Buffer solution pH 2.0**.

**System suitability preparation**—Dissolve suitable amounts of USP Granisetron Hydrochloride RS, USP Granisetron Related Compound B RS, USP Granisetron Related Compound C RS, and USP Granisetron Related Compound D RS in **Diluent**, to obtain a solution having about 0.1 mg of granisetron hydrochloride per mL and about 0.01 mg of each of granisetron related compounds B, C, and D.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Granisetron Hydrochloride RS in **Diluent** to obtain a solution having a known concentration of about 0.11 mg of granisetron hydrochloride per mL.

**Assay preparation**—Prepare a solution containing about 0.1 mg of granisetron (base) per mL, based on the label claim, using the following procedure: fill a suitable volumetric flask with **Diluent**, add 5 Tablets and sonicate for approximately 20 minutes until the Tablets disintegrate completely. Pass a portion of this solution through a 0.45-μm membrane filter, discarding the first few mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 300-nm detector, and 4.6-mm × 15-cm column that contains 4-μm polar endcapped packing L1. The flow rate is about 1.2 mL per minute. Chromatograph the *System suitability preparation*, and identify the components based on the information listed in *Table 1*. Record the peak responses as directed for *Procedure*: the column efficiency, determined from the granisetron peak, is not less than 1200 theoretical plates; the tailing factor for the granisetron peak is not less than 0.8 and not more than 1.5; the resolution, *R*<sub>s</sub>, between the granisetron and granisetron related compound C peaks is not less than 2. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for a minimum of six replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and measure the responses for the major peaks. Calculate the percentage of the labeled amount of granisetron (C<sub>18</sub>H<sub>24</sub>N<sub>4</sub>O) in each Tablet taken by the formula:

$$100(312.41 / 348.87)(CV / NL)(r_U / r_S)$$

in which 312.41 and 348.87 are the molecular weights of granisetron and granisetron hydrochloride, respectively; C is

the concentration, in mg per mL, of granisetron hydrochloride in the *Standard preparation*; V is the volume, in mL, of the *Assay preparation*; N is the number of Tablets taken to prepare the *Assay preparation*; L is the Tablet label claim, in mg; and *r*<sub>U</sub> and *r*<sub>S</sub> are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Green Soap

» Green Soap is a potassium soap made by the saponification of suitable vegetable oils, excluding coconut oil and palm kernel oil, without the removal of glycerin.

Green Soap may be prepared as follows:

The Vegetable Oil . . . . .	380 g
Oleic Acid . . . . .	20 g
Potassium Hydroxide (total alkali 85 percent) . . . . .	91.7 g
Glycerin . . . . .	50 mL
Purified Water, a sufficient quantity to make about . . . . .	1000 g

Mix the oil and the Oleic Acid, and heat the mixture to about 80°. Dissolve the Potassium Hydroxide in a mixture of the Glycerin and 100 mL of Purified Water, and add the solution, while it is still hot, to the hot oil. Stir the mixture vigorously until emulsified, then heat while continuing the stirring, until the mixture is homogeneous and a test portion will dissolve to give a clear solution in hot water. Add hot purified water to make the product weigh 1000 g, continuing the stirring until the Soap is homogeneous.

**Packaging and storage**—Preserve in well-closed containers.

**Water**—Place about 5 g of Soap, quickly weighed to the nearest centigram, in the distilling flask of the apparatus for *Moisture Method by Toluene Distillation* (921). (The Soap is most conveniently weighed in a boat of metal foil, of a size that will just pass through the neck of the flask.) Place 250 mL of toluene and 10 g of anhydrous barium chloride in the flask, connect the flask through a ground-glass joint to the distilling apparatus, fill the receiving tube with toluene, and determine the water as directed, beginning with "Heat the flask gently." The volume of water found corresponds to not more than 52.0% by weight of the Soap taken.

**Alcohol-insoluble substances**—Dissolve about 5 g of Soap, rapidly and accurately weighed, in 100 mL of hot neutralized alcohol, collect the residue, if any, on a tared filter, thoroughly wash it with hot neutralized alcohol, and dry at 105° for 1 hour: the weight of the residue so obtained is not more than 3.0% of the weight of the Soap taken. Retain the solution for the test for *Free alkali hydroxides*, and retain the residue for the test for *Alkali carbonates*.

**Free alkali hydroxides**—To the combined filtrate and washings obtained in the test for *Alcohol-insoluble substances* add 0.5 mL of phenolphthalein TS. If a pink color is produced, titrate the solution with 0.1 N sulfuric acid VS until the pink color is just discharged. Each mL of 0.1 N sulfuric acid is equivalent to 5.611 mg of KOH. The volume of 0.1 N sulfuric acid VS consumed corresponds to not more than 0.25% of KOH.

**Alkali carbonates**—Wash the filter containing the *Alcohol-insoluble substances* with 50 mL of boiling water, cool, add methyl orange TS, and titrate the filtrate with 0.1 N sulfuric acid VS. Not more than 0.5 mL of 0.10 N sulfuric acid per g of Soap originally taken is required (0.35% as  $K_2CO_3$ ).

**Unsaponified matter**—A solution of Soap in hot water (1 in 20) is nearly clear.

**Characteristics of the liberated fatty acids**—Dissolve about 30 g of Soap in 300 mL of hot water in a beaker, add gradually 60 mL of 2 N sulfuric acid, and heat on a steam bath until the liberated acids form a transparent layer. Decant the fatty acids into a separator, and wash them with 50-mL portions of hot water until the last washing, when cool, is neutral to methyl orange TS. Transfer the fatty acids to a dry beaker, and allow them to stand in a warm oven until any water that may be present has separated. Then filter the acids through a dry filter in the warm oven. Determine the *Acid Value* (see *Fats and Fixed Oils* (401)) of about 1 g, accurately weighed, of the fatty acids: it is not more than 205. Determine the *Iodine Value* (see *Fats and Fixed oils* (401)) of 150 to 200 mg, accurately weighed, of the fatty acids: it is not less than 85.

## Green Soap Tincture

» Prepare Green Soap Tincture as follows:

Green Soap .....	650 g
Suitable essential oil(s) Alcohol .....	316 mL
Purified Water, a sufficient quantity to make .....	1000 mL

Mix the oil(s) and Alcohol, dissolve in this the Green Soap by stirring or by agitation, set the solution aside for 24 hours, filter through paper, and add water to make 1000 mL.

**Packaging and storage**—Preserve in tight containers.

**Identification**—Transfer 10 mL to a flask containing 10 mL of water, and carefully add 1 mL of sulfuric acid: fatty material separates.

**Alcohol content, Method II** (611): between 28.0% and 32.0% of  $C_2H_5OH$ .

## Griseofulvin

$C_{17}H_{17}ClO_6$  352.77

Spiro[benzofuran-[2](3*H*),1'-2cyclohexene]-3,4'-dione, 7-chloro-2',4,6-trimethoxy-6'-methyl-, (1'*S*-trans)-, 7-Chloro-2',4,6-trimethoxy-6' $\beta$ -methylspiro[benzofuran-2(3*H*), 1'-[2]cyclohexene]-3,4'-dione [126-07-8].

» Griseofulvin has a potency of not less than 900  $\mu$ g of  $C_{17}H_{17}ClO_6$  per mg.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Griseofulvin RS

USP Griseofulvin Permeability Diameter RS

**Identification**—

**A:** *Infrared Absorption* (197M).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Melting range** (741): between 217° and 224°.

**Specific rotation** (781S): between +348° and +364°.

*Test solution:* 10 mg per mL, in dimethylformamide.

**Crystallinity** (695): meets the requirements.

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Permeability diameter**—Determine the apparent particle size in  $\mu$ m by the air-permeation method, using a suitable subsieve sizer. Weigh  $1.819 \pm 0.001$  g of Griseofulvin, and transfer to the compression tube of the apparatus. Compact with moderate pressure so that a uniform porosity is achieved. Pass dry compressed air through the tube, and measure the air pressure with a water manometer. Read the porosity, and calculate the apparent particle size from the instrument equation. Repeat the porosity readings at successively higher degrees of compaction until the apparent particle size reaches a minimum value. Calculate the observed permeability diameter, in square meters per g, taken by the formula:

$$6 / (1.455MF)$$

in which  $M$  is the minimum apparent particle size; and  $F$  is a factor, obtained from the accompanying table, interpolation being used if necessary, to correct the apparent particle size to the true particle size at a given porosity reading.

Porosity Reading	$F$	Porosity Reading	$F$
0.80	1.3771	0.56	1.7353
0.76	1.4142	0.52	1.8528
0.72	1.4573	0.48	2.0076
0.68	1.5082	0.44	2.2203
0.64	1.5690	0.40	2.5298
0.60	1.6432		

Concomitantly determine the observed permeability diameter of a similar preparation of USP Griseofulvin Permeability Diameter RS. Calculate the permeability diameter of the Griseofulvin taken by the formula:

$$O_U (A_5 / O_5)$$

in which  $O_U$  is the observed permeability diameter of the specimen,  $A_5$  is the assigned permeability diameter of USP Griseofulvin Permeability Diameter RS, and  $O_5$  is the observed permeability diameter of USP Griseofulvin Permeability Diameter RS: it is between 1.3 and 1.7 square meters per g.

**Heavy metals, Method II** (231): 0.0025%.

**Assay**—

*Mobile phase*—Prepare a suitable filtered mixture of water, acetonitrile, and tetrahydrofuran (60:35:5). Degas for 5 minutes before use, and stir continuously during use. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Griseofulvin RS in methanol to obtain a solution having a known concentration of about 1.25 mg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains about 0.125 mg of USP Griseofulvin RS in each mL.

**Assay preparation**—Transfer about 62 mg of Griseofulvin, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The flow rate is about 1 mL per minute. The relative standard deviation for replicate injections of *Standard preparation* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and measure the peak responses for the major peaks. Calculate the quantity, in µg of C<sub>17</sub>H<sub>17</sub>ClO<sub>6</sub>, in each mg of the Griseofulvin taken by the formula:

$$500(CP / W_U)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Griseofulvin RS in the *Standard preparation*; P is the content, in µg of C<sub>17</sub>H<sub>17</sub>ClO<sub>6</sub> per mg, of USP Griseofulvin RS; W<sub>U</sub> is the quantity, in mg, of Griseofulvin taken; and r<sub>U</sub> and r<sub>S</sub> are the griseofulvin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Griseofulvin Capsules

» Griseofulvin Capsules contain not less than 90.0 percent and not more than 115.0 percent of the labeled amount of griseofulvin (C<sub>17</sub>H<sub>17</sub>ClO<sub>6</sub>).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—The label indicates that the griseofulvin contained is known as griseofulvin (microsize).

**USP Reference standards** <11>—  
USP Griseofulvin RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** <711>—

*Medium*: water containing 5.4 mg of sodium lauryl sulfate per mL; 1000 mL.

*Apparatus 2*: 50 rpm.

*Time*: 30 minutes.

**Procedure**—Determine the amount of C<sub>17</sub>H<sub>17</sub>ClO<sub>6</sub> dissolved from UV absorbances at the wavelength of maximum absorbance at about 291 nm of filtered portions of the solution under test, suitably diluted with a solution of methanol and water (4:1), if necessary, in comparison with a *Standard solution* having a known concentration of USP Griseofulvin RS in the same medium.

**Tolerances**—Not less than 80% (Q) of the labeled amount of C<sub>17</sub>H<sub>17</sub>ClO<sub>6</sub> is dissolved in 30 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Procedure for content uniformity**—Transfer the contents of 1 Capsule to a suitable container, add an accurately measured volume of methanol sufficient to yield a concentration of griseofulvin not greater than 1 mg per mL, shake by me-

chanical means for 1 hour, or longer if necessary to disperse the specimen completely, and sonicate for 1 minute. Centrifuge a portion of this solution, and quantitatively dilute an accurately measured volume of the clear supernatant to obtain a test solution containing about 10 µg of griseofulvin per mL. Concomitantly determine the absorbances of the test solution and a *Standard solution* of USP Griseofulvin RS in methanol having a known concentration of about 10 µg per mL at the wavelength of maximum absorbance at about 292 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg, of griseofulvin (C<sub>17</sub>H<sub>17</sub>ClO<sub>6</sub>) in the Capsule taken by the formula:

$$(CL / D)(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Griseofulvin RS in the *Standard solution*; L is the labeled quantity, in mg, of griseofulvin in the Capsule; D is the concentration, in µg per mL, of griseofulvin in the test solution, based on the labeled quantity per Capsule and the extent of dilution; and A<sub>U</sub> and A<sub>S</sub> are the absorbances of the test solution and the *Standard solution*, respectively.

**Loss on drying** <731>—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours; it loses not more than 1.0% of its weight.

**Assay**—

*Mobile phase*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Griseofulvin*.

**Assay preparation**—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and weigh accurately. Mix, and transfer an accurately weighed portion of the powder, equivalent to about 125 mg of griseofulvin, to a 100-mL volumetric flask. Add about 70 mL of methanol, shake by mechanical means for 30 minutes, dilute with methanol to volume, and mix. Filter a portion of this solution, discarding the first 5 mL of the filtrate. Transfer 5.0 mL of the clear filtrate to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Griseofulvin*. Calculate the quantity, in mg, of griseofulvin (C<sub>17</sub>H<sub>17</sub>ClO<sub>6</sub>) in the portion of Capsules taken by the formula:

$$PC(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Griseofulvin RS in the *Standard preparation*, and the other terms are as defined therein.

## Griseofulvin Oral Suspension

» Griseofulvin Oral Suspension contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of griseofulvin (C<sub>17</sub>H<sub>17</sub>ClO<sub>6</sub>). It contains one or more suitable colors, diluents, flavors, preservatives, and wetting agents.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—The label indicates that the griseofulvin contained is known as griseofulvin (microsize).

**USP Reference standards** <11>—  
USP Griseofulvin RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Uniformity of dosage units** (905)—

FOR SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698): meets the requirements.

**pH** (791): between 5.5 and 7.5.

**Assay**—

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under *Griseofulvin*.

*Sodium chloride solution*—Dissolve a suitable quantity of sodium chloride in water to obtain a solution containing about 0.1 g per mL.

*Assay preparation*—Transfer an accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, equivalent to about 125 mg of griseofulvin, to a glass-stoppered, 50-mL centrifuge tube. Add 20 mL of *Sodium chloride solution* and 20 mL of methylene chloride. Insert the stopper into the tube, and mix by rotating the tube for 10 minutes. Separate the phases by centrifugation, carefully remove the lower methylene chloride layer with a needle and syringe, and filter through methylene chloride-pretreated anhydrous sodium sulfate into a 100-mL volumetric flask. Repeat the extraction with two additional 20-mL portions of methylene chloride, combining the extracts in the volumetric flask. Dilute with methylene chloride to volume, and mix. Transfer 5.0 mL of the resulting solution to a 50-mL volumetric flask, and evaporate on a steam bath under a stream of nitrogen to dryness. Transfer 4.0 mL of *Mobile phase* to the flask, swirl to dissolve the residue, dilute with *Mobile phase* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Griseofulvin*. Calculate the quantity, in mg, of griseofulvin ( $C_{17}H_{17}ClO_6$ ) in each mL of the Oral Suspension taken by the formula:

$$(PC / V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Griseofulvin RS in the *Standard preparation*; V is the volume, in mL, of Oral Suspension taken; and the other terms are as defined therein.

---

**Griseofulvin Tablets**

---

» Griseofulvin Tablets contain not less than 90.0 percent and not more than 115.0 percent of the labeled amount of griseofulvin ( $C_{17}H_{17}ClO_6$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—The label indicates that the griseofulvin contained is known as griseofulvin (microsize).

**USP Reference standards** (11)—

USP Griseofulvin RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the Assay.

**Dissolution** (711)—

*Medium*: water containing 40.0 mg of sodium lauryl sulfate per mL; 1000 mL.

*Apparatus 2*: 75 rpm.

*Time*: 90 minutes.

*Procedure*—Determine the amount of  $C_{17}H_{17}ClO_6$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 291 nm of filtered portions of the solution under test, suitably diluted with a solution of methanol and water (4:1), if necessary, in comparison with a Standard

solution having a known concentration of USP Griseofulvin RS in the same medium.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{17}H_{17}ClO_6$  is dissolved in 90 minutes.

**Uniformity of dosage units** (905): meet the requirements.

*Procedure for content uniformity*—Transfer 1 Tablet to a suitable container, add an accurately measured volume of methanol sufficient to yield a concentration of griseofulvin not greater than 1 mg per mL, shake by mechanical means for 1 hour, or longer if necessary to disperse the specimen completely, and sonicate for 1 minute. Centrifuge a portion of this solution, and quantitatively dilute an accurately measured volume of the clear supernatant to obtain a test solution containing about 10 µg of griseofulvin per mL. Concomitantly determine the absorbances of the test solution and a Standard solution of USP Griseofulvin RS in methanol having a known concentration of about 10 µg per mL at the wavelength of maximum absorbance at about 292 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg, of griseofulvin ( $C_{17}H_{17}ClO_6$ ) in the Tablet taken by the formula:

$$(CL / D)(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Griseofulvin RS in the Standard solution; L is the labeled quantity, in mg, of griseofulvin in the Tablet; D is the concentration, in µg per mL, of griseofulvin in the test solution, based on the labeled quantity per Tablet and the extent of dilution; and  $A_U$  and  $A_S$  are the absorbances of the test solution and the Standard solution, respectively.

**Loss on drying** (731)—Dry about 100 mg of finely ground Tablets, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 5.0% of its weight.

**Assay**—

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under *Griseofulvin*.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets, and proceed as directed for *Assay preparation* in the Assay under *Griseofulvin Capsules*, beginning with "transfer an accurately weighed portion."

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Griseofulvin*. Calculate the quantity, in mg, of griseofulvin ( $C_{17}H_{17}ClO_6$ ) in the portion of Tablets taken by the formula:

$$PC(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Griseofulvin RS in the *Standard preparation*, and the other terms are as defined therein.

---

**Ultramicronsize Griseofulvin Tablets**

---

» Ultramicronsize Griseofulvin Tablets are composed of ultramicronsize crystals of Griseofulvin dispersed in Polyethylene Glycol 6000 or dispersed by other suitable means. They contain not less than 90.0 percent and not more than 115.0 percent of the labeled amount of griseofulvin ( $C_{17}H_{17}ClO_6$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Griseofulvin RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** <711>—

*Medium*: water containing 5.4 mg of sodium lauryl sulfate per mL; 1000 mL.

*Apparatus 2*: 75 rpm.

*Time*: 45 minutes.

*Procedure*—Determine the amount of  $C_{17}H_{17}ClO_6$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 291 nm of filtered portions of the solution under test, suitably diluted with a solution of methanol and water (4:1), if necessary, in comparison with a Standard solution having a known concentration of USP Griseofulvin RS in the same medium.

*Tolerances*—Not less than 80% (Q) of the labeled amount of  $C_{17}H_{17}ClO_6$  is dissolved in 45 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

*Procedure for content uniformity*—Proceed as directed for *Procedure for content uniformity* in the test for *Uniformity of dosage units* under *Griseofulvin Tablets*.

**Loss on drying** <731>—Dry about 100 mg of finely ground Tablets, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 5.0% of its weight.

**Assay**—

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Griseofulvin*.

*Assay preparation*—Weigh and finely powder not less than 20 Tablets and proceed as directed for *Assay preparation* in the *Assay* under *Griseofulvin Capsules*, beginning with “transfer an accurately weighed portion.”

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Griseofulvin*. Calculate the quantity, in mg, of griseofulvin ( $C_{17}H_{17}ClO_6$ ) in the portion of Tablets taken by the formula:

$$PC(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Griseofulvin RS in the *Standard preparation*, and the other terms are as defined therein.

## Guaifenesin

$C_{10}H_{14}O_4$  198.22

1,2-Propanediol, 3-(2-methoxyphenoxy)-, (±)-.  
(±)-3-(o-Methoxyphenoxy)-1,2-propanediol [93-14-1].

» Guaifenesin contains not less than 98.0 percent and not more than 102.0 percent of  $C_{10}H_{14}O_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Guaifenesin RS

USP Guaiacol RS

**Identification**—

**A: Infrared Absorption** <197K>—

**B: Ultraviolet Absorption** <197U>—

*Solution*: 40 µg per mL.

*Medium*: methanol.

**C**: Mix about 5 mg with 1 drop of formaldehyde and a few drops of sulfuric acid: a deep cherry red to purple color is produced.

**Melting range** <741>: between 78° and 82°, but the range between beginning and end of melting does not exceed 3°.

**Loss on drying** <731>—Dry it in vacuum, but at a pressure not below 10 mm of mercury, at 60° to constant weight: it loses not more than 0.5% of its weight.

**Heavy metals, Method I** <231>—The limit is 0.0025%.

**Chromatographic purity**—

*Solution A, Solution B, and Mobile phase*—Proceed as directed in the *Assay*.

*Chromatographic system*—Proceed as directed in the *Assay*. To evaluate the system suitability requirements, use the *Resolution solution* and the *Standard preparation* prepared as directed in the *Assay*.

*Test solution*—Dissolve about 20 mg of Guaifenesin in 10 mL of *Solution B*.

*Diluted test solution*—Transfer 1.0 mL of the *Test solution* to a 100-mL volumetric flask, dilute with *Solution B* to volume, and mix.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Test solution* and the *Diluted test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. All of the peaks are baseline resolved. Calculate the percentage of each impurity in the portion of Guaifenesin taken by the formula:

$$F(r_i / r_S)$$

in which *F* is a response factor equal to 0.63 for the guaiaicol peak, having a relative retention time of 1.4, and 1.0 for all other impurities; *r<sub>i</sub>* is the area of each peak, other than that of the main guaifenesin peak, obtained from the *Test solution*; and *r<sub>S</sub>* is the area of the main peak obtained from the *Diluted test solution*: not more than 1.5% of 2-(2-methoxyphenoxy)-1,3-propanediol (guaifenesin β-isomer), the peak for which occurs at a relative retention time of about 0.9, is found; not more than 0.03% of guaiaicol is found; not more than 0.5% of any other individual impurity is found; and not more than 1.0% of total impurities, excluding guaifenesin β-isomer and guaiaicol, is found.

**Assay**—

*Solution A*—Prepare a mixture of water and glacial acetic acid (990:10).

*Solution B*—Use acetonitrile.

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Resolution solution*—Prepare a solution in *Solution B* containing about 0.5 mg of USP Guaifenesin RS and 0.02 mg of USP Guaiaicol RS in each mL.

*Standard preparation*—Prepare a solution of USP Guaifenesin RS in *Solution B* having a known concentration of about 0.5 mg per mL.

*Assay preparation*—Transfer about 25 mg of Guaifenesin, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Solution B* to volume, and mix.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 276-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–32	80→50	20→50	linear gradient
32–35	50→80	50→20	linear gradient

Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.9 for guaifenesin  $\beta$ -isomer, 1.0 for guaifenesin, and 1.3 for guaiaicol; and the resolution,  $R$ , between guaifenesin and guaiaicol is not less than 3. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity of  $C_{10}H_{14}O_4$  in the portion of Guaifenesin taken by the formula:

$$50C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Guaifenesin RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the percentage of  $C_{10}H_{14}O_4$  in the portion of Guaifenesin taken. To this value, add the percentage of guaifenesin  $\beta$ -isomer found in the test for *Chromatographic purity*.

## Guaifenesin Capsules

» Guaifenesin Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of guaifenesin ( $C_{10}H_{14}O_4$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Guaifenesin RS

**Identification**—

**A:** Triturate a portion of the contents of Capsules, equivalent to about 100 mg of guaifenesin, with 10 mL of chloroform, filter, and evaporate 1 mL of the filtrate on a watch glass. Mix the residue with 1 drop of formaldehyde and a few drops of sulfuric acid: a deep cherry-red to purple color is produced.

**B:** The retention time of the guaifenesin peak in the chromatogram of the *Assay preparation* corresponds to that of the guaifenesin peak in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Dissolution**, *Procedure for a Pooled Sample* <711>—

*Medium:* water; 900 mL.

*Apparatus 1:* 100 rpm.

*Time:* 45 minutes.

**Procedure**—Determine the amount of  $C_{10}H_{14}O_4$  dissolved, employing the procedure set forth in the *Assay*, making any necessary modifications.

**Tolerances**—Not less than 75% ( $Q$ ) of the labeled amount of  $C_{10}H_{14}O_4$  is dissolved in 45 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Assay**—

*Mobile phase*, *Benzoic acid solution*, *Resolution solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Guaifenesin Tablets*.

*Assay preparation*—Transfer, as completely as possible, the contents of not less than 20 Capsules to a suitable tared

container, and determine the average content weight per Capsule. Mix the combined contents, and transfer an accurately weighed portion, equivalent to about 200 mg of guaifenesin, to a 100-mL volumetric flask. Proceed as directed for *Assay preparation* in the *Assay* under *Guaifenesin Tablets*, beginning with “add about 60 mL of water.”

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Guaifenesin Tablets*. Calculate the quantity, in mg, of guaifenesin ( $C_{10}H_{14}O_4$ ) in the portion of Capsule contents taken by the formula:

$$5C(r_U / r_S)$$

in which the terms are as defined therein.

## Guaifenesin for Injection

» Guaifenesin for Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of guaifenesin ( $C_{10}H_{14}O_4$ ).

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, and store at controlled room temperature.

**Labeling**—It meets the requirements for *Labeling* under *Injections* <1>. Label it to indicate that it is for veterinary use only. The label states that it is intended for injection only by the intravenous route in horses.

**USP Reference standards** <11>—

USP Endotoxin RS

USP Guaifenesin RS

**Identification**, *Infrared Absorption* <197K>.

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* <1>.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Bacterial endotoxins** <85>—It contains not more than 0.05 Endotoxin Unit per mg of guaifenesin.

**Assay**—

*Standard preparation*—Dissolve an accurately weighed quantity of USP Guaifenesin RS in chloroform to obtain a solution having a known concentration of about 40  $\mu$ g per mL.

*Assay preparation*—Constitute a container of Guaifenesin for Injection with a volume of warm (30° to 35°) water, accurately measured, corresponding to the volume of solvent specified in the labeling. Transfer an accurately measured volume of the constituted solution, equivalent to about 100 mg of guaifenesin, to a 250-mL separator containing 10 mL of a saturated solution of sodium bicarbonate. Extract with four 25-mL portions of chloroform, combining the chloroform extracts in a second 250-mL separator. Wash the combined chloroform extracts with 5 mL of 1 N hydrochloric acid. Filter the washed chloroform extracts through chloroform-moistened filter paper, collecting the filtrate in a 100-mL volumetric flask. Dilute with chloroform to volume, and mix. Transfer 4.0 mL of this solution to a second 100-mL volumetric flask, dilute with chloroform to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* at the wavelength of maximum absorbance at about 276 nm, using chloroform to zero the instrument. Calculate the quantity, in mg, of guaifenesin ( $C_{10}H_{14}O_4$ ) in each mL of the

constituted solution of Guaifenesin for Injection taken by the formula:

$$2.5(C/V)(A_U/A_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Guaifenesin RS in the *Standard preparation*,  $V$  is the volume, in mL, of constituted solution taken to prepare the *Assay preparation*, and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Guaifenesin Oral Solution

» Guaifenesin Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of guaifenesin ( $\text{C}_{10}\text{H}_{14}\text{O}_4$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Guaifenesin RS

**Identification**—The retention time of the guaifenesin peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Uniformity of dosage units** (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 2.3 and 3.0.

**Alcohol content**, *Method I* (611) (if present): between 90.0% and 115.0% of the labeled amount of  $\text{C}_2\text{H}_5\text{OH}$ .

**Assay**—

*Mobile phase*, *Benzoic acid solution*, *Resolution solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Guaifenesin Tablets*.

*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 200 mg of guaifenesin, to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, add 45 mL of methanol, dilute with water to volume, and mix.

*Procedure*—Proceed as directed in the *Assay* under *Guaifenesin Tablets*. Calculate the quantity, in mg, of guaifenesin ( $\text{C}_{10}\text{H}_{14}\text{O}_4$ ) in each mL of the Oral Solution taken by the formula:

$$5C/V(r_U/r_S)$$

in which  $V$  is the volume, in mL, of Oral Solution taken; and the other terms are as defined therein.

## Guaifenesin Tablets

» Guaifenesin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of guaifenesin ( $\text{C}_{10}\text{H}_{14}\text{O}_4$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Guaifenesin RS

**Identification**—

**A:** Triturate a quantity of finely powdered Tablets, equivalent to about 100 mg of guaifenesin, with 10 mL of chloroform, filter, and evaporate 1 mL of the filtrate on a watch glass. Mix the residue with 1 drop of formaldehyde and a few drops of sulfuric acid: a deep cherry-red to purple color is produced.

**B:** The retention time of the guaifenesin peak in the chromatogram of the *Assay preparation* corresponds to that of the guaifenesin peak in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Dissolution**, *Procedure for a Pooled Sample* (711)—

*Medium:* water; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 45 minutes.

*Procedure*—Determine the amount of  $\text{C}_{10}\text{H}_{14}\text{O}_4$  dissolved in filtered portions of the solution under test from UV absorbances at the wavelength of maximum absorbance at about 274 nm in comparison with a *Standard solution* having a known concentration of USP Guaifenesin RS in the same medium.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $\text{C}_{10}\text{H}_{14}\text{O}_4$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

*Mobile phase*—Prepare a suitable filtered and degassed mixture of water, methanol, and glacial acetic acid (60:40:1.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Benzoic acid solution*—Dissolve a suitable quantity of benzoic acid in methanol to obtain a solution containing about 2 mg per mL.

*Resolution solution*—Dissolve a suitable quantity of guaifenesin in water, with shaking, to obtain a solution containing about 2 mg per mL. Transfer 2.0 mL of this solution and 5.0 mL of *Benzoic acid solution* to a 100-mL volumetric flask, add 40 mL of methanol, dilute with water to volume, and mix to obtain a solution containing about 40  $\mu\text{g}$  of guaifenesin and 100  $\mu\text{g}$  of benzoic acid per mL.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Guaifenesin RS quantitatively in water, with shaking, to obtain a solution having a known concentration of about 2 mg per mL. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, add 45 mL of methanol, dilute with water to volume, and mix to obtain a *Standard preparation* having a known concentration of about 40  $\mu\text{g}$  per mL.

*Assay preparation*—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 200 mg of guaifenesin, to a 100-mL volumetric flask, add about 60 mL of water, and shake for about 15 minutes. Dilute with water to volume, filter if necessary to obtain a clear solution, and mix. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, add 45 mL of methanol, dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 276-nm detector and a 4.6-mm  $\times$  25-cm column that contains 10- $\mu\text{m}$  packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed under *Procedure*: the resolution,  $R$ , between the guaifenesin and benzoic acid peaks is not less than 3.0 (the relative retention times are about 0.7 for guaifenesin and 1.0 for benzoic acid). Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 2.5%.

*Procedure*—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and meas-

ure the responses for the major peaks. Calculate the quantity, in mg, of guaifenesin ( $C_{10}H_{14}O_4$ ) in the portion of Tablets taken by the formula:

$$5C(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Guaifenesin RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Guaifenesin and Codeine Phosphate Oral Solution

» Guaifenesin and Codeine Phosphate Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of guaifenesin ( $C_{10}H_{14}O_4$ ) and codeine phosphate ( $C_{18}H_{21}NO_4 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, at controlled room temperature.

**USP Reference standards** (11)—

USP Codeine Phosphate RS

USP Guaifenesin RS

**Identification**—

**A:** The retention time of the codeine peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for codeine phosphate*.

**B:** The retention time of the guaifenesin peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for guaifenesin*.

**Uniformity of dosage units** (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 2.3 and 3.0 if it contains alcohol, 5.0 to 5.5 if it does not contain alcohol.

**Alcohol content** (if present)—

*Standard stock solution*—Dilute 10.0 mL of dehydrated alcohol with water to 100.0 mL.

*Internal standard solution*—Dilute 10 mL of acetone with water to 100 mL.

*Standard preparation*—Transfer 10.0 mL of *Standard stock solution* and 8.0 mL of *Internal standard solution* to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 250-mL volumetric flask, dilute with water to volume, and mix. This solution contains 0.02% (v/v) of alcohol.

*Test preparation*—Transfer 25/ $k$  mL of Oral Solution ( $k$  being the labeled percentage [v/v] of  $C_2H_5OH$  in the Oral Solution), accurately measured, to a 25-mL volumetric flask, add 2.0 mL of *Internal standard solution*, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 250-mL volumetric flask, dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm  $\times$  1.8-m column that contains 5% liquid phase G16 on 100- to 120-mesh support S1A, and is programmed to maintain the column temperature at 50° for 5 minutes after injection, to increase to 100° at the rate of

20° per minute, to maintain the temperature at 100° for 2 minutes, and then to return to 50° before the next injection. The injection port is maintained at about 200°, and the detector block is maintained at about 250°. The carrier gas is dry helium flowing at a rate of about 30 mL per minute. Chromatograph the *Standard preparation*, and record the chromatogram as directed for *Procedure*: the relative retention times are about 0.3 for acetone and 1.0 for alcohol ( $C_2H_5OH$ ); the resolution,  $R$ , between the acetone and alcohol peaks is not less than 2; the tailing factors for the acetone and alcohol peaks are not more than 1.5; and the relative standard deviation for replicate injections is not more than 2%.

*Procedure*—Separately inject equal volumes (about 2  $\mu\text{L}$ ) of the *Test preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage (v/v) of alcohol ( $C_2H_5OH$ ) in the portion of Oral Solution taken by the formula:

$$(1250P/V)(R_U / R_S)$$

in which  $P$  is the percentage (v/v) of alcohol ( $C_2H_5OH$ ) in the *Standard preparation*;  $V$  is the volume, in mL, of Oral Solution taken to prepare the *Test preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of alcohol to that of acetone obtained from the *Test preparation* and the *Standard preparation*, respectively: between 90.0% and 115.0% of the labeled amount of alcohol ( $C_2H_5OH$ ) is found.

**Assay for codeine phosphate**—

*Internal standard solution*—Place about 45 mg of hydrocodone bitartrate in a flask containing about 5 mL of water, add 1 mL of 0.5 N sodium hydroxide and 50 mL of chloroform, insert the stopper into the flask, and shake by mechanical means for about 20 minutes. Allow the layers to separate, and filter the chloroform layer.

*Standard preparation*—Prepare a Standard stock solution of USP Codeine Phosphate RS in 0.1 N hydrochloric acid having a known concentration of about 2 mg per mL. Transfer 5.0 mL of this Standard stock solution to a suitable flask. Add 2 mL of 2.5 N sodium hydroxide, 8.0 mL of *Internal standard solution*, and 40 mL of chloroform, insert the stopper, and shake by mechanical means for 1 hour. Allow the layers to separate, and collect the chloroform layer.

*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 10 mg of codeine phosphate, to a 200-mL flask containing about 5 mL of water, and swirl. Add 2 mL of 2.5 N sodium hydroxide, 8.0 mL of *Internal standard solution*, and 40 mL of chloroform, insert the stopper, and shake by mechanical means for 1 hour. Allow the layers to separate, and collect the chloroform layer.

*Chromatographic system* (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm  $\times$  0.6-m column that contains 3% liquid phase G3 on 100- to 120-mesh support S1A, and is stabilized for isothermal operation. The column temperature is maintained at about 210°, the injection port temperature at about 250°, and the detector block temperature at about 300°. The carrier gas is dry helium flowing at a rate of about 25 mL per minute. Chromatograph the *Standard preparation*, and record the chromatogram as directed for *Procedure*: the relative retention times are about 0.75 for codeine and 1.0 for hydrocodone; the resolution,  $R$ , between the codeine and hydrocodone peaks is not less than 1; and the relative standard deviation for replicate injections is not more than 2%.

*Procedure*—Separately inject equal volumes (about 2  $\mu\text{L}$ ) of the *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot$

$\text{H}_3\text{PO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ ) in each mL of the Oral Solution taken by the formula:

$$(406.37/397.37)(5C/V)(R_U/R_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively;  $C$  is the concentration, in mg per mL, of USP Codeine Phosphate RS in the Standard stock solution used to prepare the *Standard preparation*;  $V$  is the volume, in mL, of Oral Solution taken to prepare the *Assay preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of the codeine peak to the hydrocodone peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for guaifenesin—

**Internal standard solution**—Prepare a solution of dipropyl phthalate in chloroform containing about 12.5 mg per mL.

**Standard preparation**—Prepare a Standard stock solution of USP Guaifenesin RS in 0.1 N hydrochloric acid having a known concentration of about 4 mg per mL. Transfer 5.0 mL of this Standard stock solution to a suitable glass-stoppered flask, add 2 mL of 2.5 N sodium hydroxide, 8.0 mL of *Internal standard solution*, and 40 mL of chloroform, insert the stopper, and shake by mechanical means for 1 hour. Allow the layers to separate, and collect the chloroform layer. Extract the aqueous layer with two 20-mL portions of chloroform, and combine the three chloroform extracts. Transfer 5.0 mL of the combined chloroform extracts to a suitable glass-stoppered flask, add 1 mL of trifluoroacetic anhydride, and allow to stand for not less than 1 hour.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 20 mg of guaifenesin, to a 200-mL flask containing about 5 mL of water, and swirl. Add 2 mL of 2.5 N sodium hydroxide, 8.0 mL of *Internal standard solution*, and 40 mL of chloroform, insert the stopper, and shake by mechanical means for 1 hour. Allow the layers to separate, and collect the chloroform layer. Extract the aqueous layer with two 20-mL portions of chloroform, and combine the three chloroform extracts. Transfer 5.0 mL of the combined chloroform extracts to a suitable glass-stoppered flask, add 1 mL of trifluoroacetic anhydride, and allow to stand for not less than 1 hour.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 4-mm  $\times$  1.2-m column that contains 3% liquid phase G6 on 100- to 120-mesh support S1A. The column temperature is maintained at about 170°, the injection port temperature is maintained at about 250°, and the detector block temperature is maintained at about 300°. The carrier gas is dry helium flowing at a rate of about 45 mL per minute. Chromatograph the *Standard preparation*, and record the chromatogram as directed for *Procedure*: the relative retention times are about 0.6 for the trifluoroacetyl derivative of guaifenesin and 1.0 for the trifluoroacetyl derivative of dipropyl phthalate; the resolution,  $R$ , between the guaifenesin and dipropyl phthalate peaks is not less than 1; and the relative standard deviation for replicate injections is not more than 2%.

**Procedure**—Separately inject equal volumes (about 1  $\mu\text{L}$ ) of the *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of guaifenesin ( $\text{C}_{10}\text{H}_{14}\text{O}_4$ ) in the portion of Oral Solution taken by the formula:

$$(W/V)(R_U/R_S)$$

in which  $W$  is the quantity, in mg, of USP Guaifenesin RS taken to prepare the *Standard preparation*;  $V$  is the volume, in mL, of Oral Solution taken to prepare the *Assay preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of the guaifenesin peak to the dipropyl phthalate peak obtained

from the *Assay preparation* and the *Standard preparation*, respectively.

## Guaifenesin and Pseudoephedrine Hydrochloride Capsules

» Guaifenesin and Pseudoephedrine Hydrochloride Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of guaifenesin ( $\text{C}_{10}\text{H}_{14}\text{O}_4$ ) and pseudoephedrine hydrochloride ( $\text{C}_{10}\text{H}_{15}\text{NO} \cdot \text{HCl}$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards (11)—

USP Guaifenesin RS

USP Pseudoephedrine Hydrochloride RS

#### Identification—

**A:** The retention time of the guaifenesin peak relative to that of the benzoic acid peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay for guaifenesin*.

**B:** The retention time of the pseudoephedrine peak in the chromatogram of the *Assay preparation* relative to that of the dextromethorphan peak corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay for pseudoephedrine hydrochloride*.

#### Uniformity of dosage units (905)—

**Procedure for content uniformity of pseudoephedrine hydrochloride**—Proceed as directed in the *Assay for pseudoephedrine hydrochloride*, preparing the *Assay preparation* as follows. Transfer 1 Capsule to a 100-mL volumetric flask, add about 50 mL of water, heat on a steam bath for about 5 minutes, and allow to cool. Add 5.0 mL of *Internal standard solution*, dilute with water to volume, and mix.

#### Assay for guaifenesin—

**Mobile phase**—Prepare a mixture of water, methanol, and glacial acetic acid (60:40:1.5). Make any necessary adjustments (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Prepare a solution of benzoic acid in methanol containing about 2 mg per mL.

**Standard stock solution**—Prepare a solution in water having known concentrations of about 20 mg of USP Guaifenesin RS and 20J mg of USP Pseudoephedrine Hydrochloride RS per mL,  $J$  being the ratio of the labeled amount, in mg, of pseudoephedrine hydrochloride to the labeled amount, in mg, of guaifenesin per Capsule.

**Standard preparation**—Transfer 10.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution and 5.0 mL of *Internal standard solution* to a second 100-mL volumetric flask, add about 40 mL of methanol, dilute with water to volume, and mix. Each mL of this solution contains about 0.1 mg of USP Guaifenesin RS, 0.1J mg of USP Pseudoephedrine Hydrochloride RS, and 0.1 mg of benzoic acid.

**Assay preparation**—Transfer an accurately counted number of Capsules, equivalent to about 2000 mg of guaifenesin, to a 100-mL volumetric flask, add about 50 mL of water, and heat on a steam bath for about 15 minutes. Allow to cool, dilute with water to volume, and mix. Transfer 10.0 mL of this stock solution to a second 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution and 5.0 mL of *Internal standard solution* to a third 100-mL volumetric flask, add about 40 mL of methanol, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 276-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.65 for guaifenesin and 1.0 for benzoic acid; the resolution,  $R$ , between the guaifenesin peak and the benzoic acid peak is not less than 3.0; the tailing factors for the guaifenesin peak and the benzoic acid peak are not more than 2.5; and the relative standard deviation for replicate injections is not more than 2.5%.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of guaifenesin ( $C_{10}H_{14}O_4$ ) in each Capsule taken by the formula:

$$20,000(C / N)(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Guaifenesin RS in the *Standard preparation*;  $N$  is the number of Capsules taken; and  $R_U$  and  $R_S$  are the ratios of the guaifenesin peak response to the benzoic acid peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for pseudoephedrine hydrochloride—

**Mobile phase**—To 3.5 g of docusate sodium add 500 mL of methanol, 350 mL of water, 145 mL of tetrahydrofuran, and 5 mL of glacial acetic acid, mix, and pass through a filter having a porosity of 0.5  $\mu$ m or less. Make any necessary adjustments (see *System Suitability* under *Chromatography* <621>).

**Internal standard solution**—Prepare a solution of dextromethorphan hydrobromide in methanol containing about 1.2 mg per mL.

**Standard stock solution**—Prepare as directed in the *Assay for guaifenesin*.

**Standard preparation**—Transfer 10.0 mL of *Standard stock solution* and 5.0 mL of *Internal standard solution* to a 100-mL volumetric flask, dilute with water to volume, and mix. Each mL of this solution contains about 2 mg of USP Guaifenesin RS, 2/ mg of USP Pseudoephedrine Hydrochloride RS, and 0.06 mg of dextromethorphan hydrobromide.

**Assay preparation**—Transfer 10.0 mL of the stock solution used to prepare the *Assay preparation* in the *Assay for guaifenesin* and 5.0 mL of *Internal standard solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 263-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.55 for pseudoephedrine and 1.0 for dextromethorphan; the resolution,  $R$ , between the pseudoephedrine peak and the dextromethorphan peak is not less than 1.5; the tailing factors for the pseudoephedrine peak and the dextromethorphan peak are not more than 1.5 and 2.5, respectively; and the relative standard deviation for replicate injections determined for the pseudoephedrine peak is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the

quantity, in mg, of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in each Capsule taken by the formula:

$$1000(C / N)(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the *Standard preparation*;  $N$  is the number of Capsules taken; and  $R_U$  and  $R_S$  are the ratios of the pseudoephedrine peak area response to the dextromethorphan peak area response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Guaifenesin, Pseudoephedrine Hydrochloride, and Dextromethorphan Hydrobromide Capsules

» Guaifenesin, Pseudoephedrine Hydrochloride, and Dextromethorphan Hydrobromide Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of guaifenesin ( $C_{10}H_{14}O_4$ ), pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ), and dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards <11>—

USP Dextromethorphan Hydrobromide RS

USP Guaifenesin RS

USP Pseudoephedrine Hydrochloride RS

#### Identification—

**A:** The retention time of the guaifenesin peak relative to that of the benzoic acid peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay for guaifenesin*.

**B:** The retention times of the pseudoephedrine and dextromethorphan peaks in the chromatogram of the *Assay preparation* relative to that of the brompheniramine peak correspond to those in the chromatogram of the *Standard preparation* as obtained in the *Assay for pseudoephedrine hydrochloride and dextromethorphan hydrobromide*.

#### Uniformity of dosage units <905>—

**Procedure for content uniformity of pseudoephedrine hydrochloride and dextromethorphan hydrobromide**—Proceed as directed in the *Assay for pseudoephedrine hydrochloride and dextromethorphan hydrobromide*, preparing the *Assay preparation* as follows. Transfer 1 Capsule to a 100-mL volumetric flask, add about 50 mL of water, heat on a steam bath for about 15 minutes, and allow to cool. Add 5.0 mL of *Internal standard solution*, dilute with water to volume, and mix.

#### Assay for guaifenesin—

**Mobile phase, Internal standard solution, Standard stock solution, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay for guaifenesin* under *Guaifenesin and Pseudoephedrine Hydrochloride Capsules*.

**Assay preparation**—Transfer an accurately counted number of Capsules, equivalent to about 2000 mg of guaifenesin, to a 100-mL volumetric flask, add about 50 mL of water, and heat on a steam bath for about 15 minutes. Allow to cool, dilute with water to volume, and mix (stock solution). Transfer 10.0 mL of this stock solution to a second 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution and 5.0 mL of *Internal standard solution* to a third 100-mL volumetric flask, add about 40 mL of methanol, dilute with water to volume, and mix.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of guaifenesin ( $C_{10}H_{14}O_4$ ) in each Capsule taken by the formula:

$$20,000(C / N)(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Guaifenesin RS in the *Standard preparation*, *N* is the number of Capsules taken, and  $R_U$  and  $R_S$  are the ratios of the guaifenesin peak area response to the benzoic acid peak area response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for pseudoephedrine hydrochloride and dextromethorphan hydrobromide—

**Mobile phase**—To 3.5 g of docusate sodium add 500 mL of methanol, 350 mL of water, 145 mL of tetrahydrofuran, and 5 mL of glacial acetic acid, mix, and pass through a filter having a porosity of 0.5  $\mu$ m or less. Make any necessary adjustments (see *System Suitability* under *Chromatography* <621>).

**Internal standard solution**—Prepare a solution of brompheniramine maleate in methanol containing about 0.3 mg per mL.

**Standard stock solution**—Prepare a solution in water having known concentrations of about 20 mg of USP Guaifenesin RS, 20/ mg of USP Pseudoephedrine Hydrochloride RS per mL, and 20/ mg of USP Dextromethorphan Hydrobromide RS per mL, *I* being the ratio of the labeled amount, in mg, of pseudoephedrine hydrochloride to the labeled amount, in mg, of guaifenesin per Capsule, and *I'* being the ratio of the labeled amount, in mg, of dextromethorphan hydrobromide to the labeled amount, in mg, of guaifenesin per Capsule.

**Standard preparation**—Transfer 10.0 mL of *Standard stock solution* and 5.0 mL of *Internal standard solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Assay preparation**—Transfer 10.0 mL of the stock solution used to prepare the *Assay preparation* in the *Assay for guaifenesin* and 5.0 mL of *Internal standard solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 263-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.4 for pseudoephedrine, 0.75 for dextromethorphan, and 1.0 for brompheniramine; the resolution, *R*, between the peaks is not less than 1.5; the tailing factors for the pseudoephedrine peak, the dextromethorphan peak, and the brompheniramine peak are not more than 1.5, 2.5, and 3.0, respectively; and the relative standard deviation for replicate injections determined for the pseudoephedrine peak is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in each Capsule taken by the formula:

$$1000(C / N)(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the *Standard preparation*; *N* is the number of Capsules taken; and  $R_U$  and  $R_S$  are the ratios of the pseudoephedrine peak area response to the brompheniramine peak area response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Calculate the quantity, in mg, of dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) in each Capsule taken by the formula:

$$1000(370.33 / 352.31)(C / N)(R_U / R_S)$$

in which 370.33 and 352.31 are the molecular weights of dextromethorphan hydrobromide and anhydrous dextromethorphan hydrobromide, respectively; *C* is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS in the *Standard preparation*; *N* is the number of Capsules taken; and  $R_U$  and  $R_S$  are the ratios of the dextromethorphan peak area response to the brompheniramine peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Guanabenz Acetate

$C_8H_8Cl_2N_4 \cdot C_2H_4O_2$  291.13

Hydrazinecarboximidamide, 2-[(2,6-dichlorophenyl)methylene]-, monoacetate.

[(2,6-Dichlorobenzylidene)amino]guanidine monoacetate [23256-50-0].

» Guanabenz Acetate contains not less than 98.0 percent and not more than 101.5 percent of the labeled amount of  $C_{10}H_{12}N_4O_2Cl_2$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** <11>—

USP Guanabenz Acetate RS

**Identification, Infrared Absorption** <197K>.

**pH** <791>: between 5.5 and 7.0, in a solution (7 in 1000).

**Loss on drying** <731>—Dry it in vacuum at 60° for 2 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** <281>: not more than 0.2%.

**Limit of 2,6-dichlorobenzaldehyde**—

**Internal standard solution 1**—Dissolve 100 mg of *p*-chlorobenzaldehyde in 100 mL of chloroform, and mix.

**Internal standard solution 2**—Dilute 1.0 mL of *Internal standard solution 1* to 10.0 mL with chloroform, and mix.

**Standard solution**—Prepare a solution of 2,6-dichlorobenzaldehyde in chloroform containing 1.0 mg per mL.

**Standard preparation**—Transfer 4.0 mL of *Standard solution* and 1.0 mL of *Internal standard solution 1* to a 10-mL volumetric flask, dilute with chloroform to volume, and mix.

**Test preparation**—Transfer 200 mg of Guanabenz Acetate to a 30-mL glass-stoppered centrifuge tube. Add 10 mL of 0.1 N hydrochloric acid, shake to dissolve, add 1.0 mL of *Internal standard solution 2*, and shake. Centrifuge, and transfer a portion of the lower layer to a stoppered container. [NOTE—The lower layer must be removed within 10 minutes of adding the acid to the centrifuge tube.]

**Chromatographic system** (see *Chromatography* <621>)—The gas chromatograph is equipped with a flame-ionization detector and a 1.8-m  $\times$  3-mm column packed with 20% phase G1 on 80- to 100-mesh support S1A. The column is maintained at a temperature of about 190°, the injection port at about 225°, and the detector at about 250°. Nitrogen is used as the carrier gas at a flow rate of about 30 mL per minute.

**Procedure**—Separately inject 2- $\mu$ L portions of the *Standard preparation* and the *Test preparation*, successively, into the gas chromatograph. The resolution between 2,6-dichlorobenzaldehyde and *p*-chlorobenzaldehyde is not less than 3.0, and the relative retention time for *p*-chlorobenzaldehyde is 0.5 and for 2,6-dichlorobenzaldehyde is 1.0. The relative peak response ratio obtained from the *Test preparation* does not exceed that obtained from the *Standard preparation* (0.2%).

#### Chromatographic purity—

**Methanolic formic acid**—Prepare a mixture of formic acid and methanol (1 in 2000).

**Aminoguanidine bicarbonate solution**—Transfer 100 mg of aminoguanidine bicarbonate to a test tube, add 0.05 mL of formic acid, and warm gently to effect solution. Quantitatively transfer the contents of the test tube to a 10-mL volumetric flask, dilute with methanol to volume, and mix.

**Standard solution A**—Transfer 10 mg of USP Guanabenz Acetate RS to a 100-mL volumetric flask, and dissolve in 50 mL of *Methanolic formic acid*. Add 1.0 mL of the *Aminoguanidine bicarbonate solution*, dilute with *Methanolic formic acid* to volume, and mix.

**Standard solution B**—Transfer 5.0 mL of *Standard solution A* to a 10-mL volumetric flask, dilute with *Methanolic formic acid* to volume, and mix.

**Standard solution C**—Transfer 2.0 mL of *Standard solution A* to a 10-mL volumetric flask, dilute with *Methanolic formic acid* to volume, and mix.

**Test solution**—Prepare a solution of guanabenz acetate containing 10 mg per mL in *Methanolic formic acid*.

**Procedure**—Prepare a chromatographic chamber containing a mixture of chloroform, methanol, and ammonium hydroxide (60:40:1) as the developing solvent, and allow it to equilibrate for at least 30 minutes before use. Prewash a plate coated with a 0.25-mm layer of chromatographic silica gel mixture (see *Chromatography* (621)) by placing it in the chromatographic chamber, allowing the solvent front to rise to the top of the plate, drying it in air and activating it by heating at 105° for 20 minutes. Within 30 minutes after preparation, separately apply 10- $\mu$ L portions of *Standard solutions A, B, and C, the Test solution, and Methanolic formic acid*. Allow the spots to dry, and place the plate in the chromatographic chamber. When the solvent has moved about three-fourths of the length of the plate, remove the plate and allow it to air-dry for about 30 minutes. Examine the plate under short-wavelength UV light. Estimate the amount of any secondary spots (other than any secondary spot with the same  $R_f$  as the *Methanolic formic acid*) observed in the chromatogram of the *Test solution* by comparison with the *Standard solutions*. Place the plate in a chamber saturated with iodine vapors for about 10 minutes. Remove and examine the plate. Estimate the amount of any spot in the chromatogram of the *Test solution* that has an  $R_f$  corresponding to the  $R_f$  of the spot produced by the aminoguanidine bicarbonate by comparison with the *Standard solutions*. No individual secondary spot is greater in size or intensity than the spot produced by *Standard solution B* (0.5%), and the total of any such spots observed is not more than 1%.

**Assay**—Dissolve about 200 mg of Guanabenz Acetate, accurately weighed, in 50 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination (see *Titrimetry* (541)), and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 29.12 mg of  $C_{10}H_{12}N_4O_2Cl_2$ .

## Guanabenz Acetate Tablets

» Guanabenz Acetate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of guanabenz ( $C_8H_8N_4Cl_2$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards (11)—

USP Guanabenz Acetate RS

**Identification**—Transfer an amount of powdered Tablets, equivalent to about 8 mg of guanabenz, to a 60-mL separator. Add 10 mL of 0.1 N hydrochloric acid, and shake to disperse the powder. Shake the mixture with three 10-mL portions of chloroform, discarding the chloroform phase each time. Add 5 mL of 1 N sodium hydroxide, and extract with two 25-mL portions of ether, filtering the ether extracts. Evaporate the combined extracts with the aid of a current of air to dryness: the IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima at the same wavelengths as that of a similar preparation of USP Guanabenz Acetate RS.

#### Dissolution (711)—

**Medium:** water; 1000 mL.

**Apparatus 2:** 50 rpm.

**Time:** 60 minutes.

**Procedure**—Determine the amount of  $C_8H_8N_4Cl_2$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 272 nm of filtered portions of the solution under test, suitably diluted with *Medium*, in comparison with a *Standard solution* having a known concentration of USP Guanabenz Acetate RS in the same medium.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_8H_8N_4Cl_2$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Chromatographic purity—

*Extracting solvent, Mobile phase, Standard preparation I, System suitability solution, Chromatographic system, and Assay preparation*—Proceed as directed in the Assay.

**Standard preparation II**—Pipet 2 mL of *Standard preparation I* into a 100-mL volumetric flask, dilute with *Extracting solvent* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the Assay, except to substitute *Standard preparation II* for *Standard preparation I*. Calculate the quantity of any impurity observed having a relative retention time corresponding to the component eluting before guanabenz obtained from the *System suitability solution*. The amount of any such impurity observed is not more than 2%.

#### Assay—

**Extracting solvent**—Dissolve 8.2 g of sodium acetate in 20 mL of water, add 5.7 mL of glacial acetic acid, dilute to 1 L with methanol, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of water, methanol, and phosphoric acid (57:43:0.3), making adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation I**—Transfer about 25 mg of USP Guanabenz Acetate RS, accurately weighed, to a 250-mL volumetric flask. Add 25 mL of water, shake to dissolve the solids, dilute with *Extracting solvent* to volume, and mix.

**Assay preparation**—Transfer 10 Tablets to a 500-mL volumetric flask. Add 50 mL of water, stir by mechanical means until the solids are well dispersed, add 400 mL of *Extracting solvent*, and stir for 45 minutes. Dilute with *Extracting solvent* to volume, mix, and centrifuge a portion of the mixture

until a clear supernatant is obtained. If necessary, dilute a portion of the supernatant quantitatively with a mixture of *Extracting solvent* and water (9:1) to obtain a solution containing about 0.08 mg of guanabenz per mL.

**System suitability solution**—Transfer about 30 mg of guanabenz acetate to a 100-mL stoppered flask. Add about 50 mL of 0.1 N hydrochloric acid, heat on a steam bath for 60 minutes, and allow the solution to cool.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 245-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph replicate injections of *Standard preparation I* and record the peak responses as directed for *Procedure*; the relative standard deviation is not more than 2.0%. Inject a volume (about 20 µL) of the *System suitability solution* into the chromatograph and record the chromatogram: the resolution between guanabenz and the peak eluting before it is not less than 1.6.

**Procedure**—Separately inject equal volumes (about 20 µL) of *Standard preparation I* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_8H_8N_4Cl_2$  in the portion of Tablets taken by the formula:

$$(231.08 / 291.13)(CD)(r_U / r_S)$$

in which 231.08 and 291.13 are the molecular weights of guanabenz and guanabenz acetate, respectively; C is the concentration, in mg per mL, of USP Guanabenz Acetate RS in *Standard preparation I*; D is the *Assay preparation* dilution factor, in mL per Tablet; and  $r_U$  and  $r_S$  are the peak responses of the *Assay preparation* and *Standard preparation I*, respectively.

## Guanadrel Sulfate

$(C_{10}H_{19}N_3O_2)_2 \cdot H_2SO_4$  524.63  
Guanidine (1,4-dioxaspiro[4.5]dec-2-ylmethyl)-, sulfate (2:1).  
(1,4-Dioxaspiro[4.5]dec-2-ylmethyl)guanidine sulfate (2:1)  
[22195-34-2].

» Guanadrel Sulfate contains not less than 97.0 percent and not more than 103.0 percent of  $(C_{10}H_{19}N_3O_2)_2 \cdot H_2SO_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—  
USP Guanadrel Sulfate RS

**Identification**—The IR absorption spectrum of a mineral oil dispersion of it exhibits maxima only at the same wavelengths as that of a similar preparation of USP Guanadrel Sulfate RS.

**Loss on drying** <731>—Dry it at room temperature at a pressure not exceeding 5 mm of mercury for 16 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Heavy metals, Method II** <31>: 0.002%.

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of 530 mL of water and 470 mL of methanol containing about

6.35 g of *dl*-10-camphorsulfonic acid sodium salt and 0.8 g of ammonium nitrate. Adjust with glacial acetic acid, if necessary, to a pH of between 5.0 and 5.5. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Guanadrel Sulfate RS in *Mobile phase* to obtain a solution having a known concentration of about 10 mg per mL.

**Assay preparation**—Transfer about 100 mg of Guanadrel Sulfate, accurately weighed, to a container, add 10.0 mL of *Mobile phase*, and mix.

**Resolution solution**—Dissolve suitable quantities of USP Guanadrel Sulfate RS and ethylparaben in *Mobile phase* to obtain a solution having known concentrations of about 10 mg and 12 mg, respectively, in each mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a refractive index detector and a 4- to 4.6-mm × 25- to 30-cm stainless steel column containing packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between guanadrel and ethylparaben is not less than 1.6, and the relative retention times are about 0.8 for guanadrel and 1.0 for ethylparaben. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.5%.

**Procedure**—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $(C_{10}H_{19}N_3O_2)_2 \cdot H_2SO_4$  in the portion of Guanadrel Sulfate taken by the formula:

$$10C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Guanadrel Sulfate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Guanadrel Sulfate Tablets

» Guanadrel Sulfate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of guanadrel sulfate  $[(C_{10}H_{19}N_3O_2)_2 \cdot H_2SO_4]$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** <11>—  
USP Guanadrel Sulfate RS

**Identification**—To a portion of 1 finely powdered Tablet, equivalent to about 4 mg of guanadrel sulfate, add 2 mL of a 1% aqueous alkaline solution of 1-naphthol (containing 6 g of sodium hydroxide and 16 g of sodium carbonate per 100 mL of water) and 1 mL of 2,3-butanedione solution (1 in 2000), and mix. Allow to stand at room temperature: an intense, pinkish-red color develops.

**Dissolution** <711>—

**Medium**: pH 6.8 phosphate buffer (see under *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 2**: 50 rpm.

**Time**: 20 minutes.

**Standard solution**—Dissolve an accurately weighed quantity of USP Guanadrel Sulfate RS in *Medium* to obtain a solu-

tion having a known concentration of about 0.5 mg per mL. Transfer 5.0 mL of this solution to a 200-mL volumetric flask, dilute with *Medium* to volume, and mix.

**Working color reagent preparation**—Transfer 50.0 mL of the *Color reagent preparation*, prepared as directed for *Procedure for content uniformity* in *Uniformity of dosage units*, to a 500-mL volumetric flask, dilute with water to volume, and mix.

**Color reagent blank**—[NOTE—Prepare this solution concurrently with the preparation of the *Standard solution* and the solution under test.] Transfer 40.0 mL of *Medium* to a container, add 8.0 mL of *Working color reagent preparation*, and mix.

**Procedure**—After 20 minutes, withdraw a portion of the solution under test, and filter immediately. For Tablets containing less than 25 mg per Tablet, transfer 20.0 mL of the filtered solution to a container. For Tablets containing 25 mg or more, transfer 10.0 mL of the filtered solution and 10.0 mL of *Medium* to a container. Transfer 20.0 mL of the *Standard solution* to another, similar container. Separately add 4.0 mL of *Working color reagent preparation* to the solution of the test specimen and the *Standard solution*, and mix. Using a suitable spectrophotometer, determine the absorbances of the solutions obtained from the test specimen and the *Standard solution*, in 5-cm cells, at the wavelength of maximum absorbance at about 494 nm, using the *Color reagent blank* in the reference cell. [NOTE—Once the *Working color reagent preparation* has been added to the filtered dissolution specimens and mixed, determine the absorbances so that none of the solutions stands for less than 20 minutes or more than 80 minutes.] Calculate the amount of  $(C_{10}H_{19}N_3O_2)_2 \cdot H_2SO_4$  dissolved by comparison of the absorbances obtained with the solutions obtained from the *Standard solution* and the solution under test.

**Tolerances**—Not less than 70% (Q) of the labeled amount of  $(C_{10}H_{19}N_3O_2)_2 \cdot H_2SO_4$  is dissolved in 20 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Procedure for content uniformity**—

**Color reagent preparation**—Prepare separately sodium nitroferricyanide solution (1 in 10), potassium ferricyanide solution (1 in 10), and sodium hydroxide solution (1 in 10), and store in separate amber-colored bottles. Mix an equal and sufficient volume of each of these solutions, in the order listed, and allow to stand for about 15 minutes. The solution changes from a deep red-black to a yellow-green color. Prepare a 1 in 10 dilution of the solution in water to obtain the *Color reagent preparation*. [NOTE—Prepare this *Color reagent preparation* on the day of use. The 10% aqueous solutions are stable for about 2 months.]

**Standard preparation**—Dissolve an accurately weighed quantity of USP Guanadrel Sulfate RS in water to obtain a solution having a known concentration of about 0.1 mg per mL. Transfer 10.0 mL of this solution to a container, and proceed as directed under *Procedure*.

**Test preparation**—Transfer 1 Tablet to a 100-mL volumetric flask, dilute with water to volume, and shake the flask vigorously for about 4 minutes. Transfer not less than 25 mL of the solution to a vial, and centrifuge for 10 minutes. Transfer an accurately measured volume of this solution, equivalent to 1 mg of guanadrel sulfate, to another container, and dilute, if necessary, with an accurately measured volume of water to a volume of 10.0 mL. Mix, and proceed as directed under *Procedure*.

**Procedure**—Separately add 4.0 mL of the *Color reagent preparation* to the *Standard preparation*, the *Test preparation*, and 10.0 mL of water to provide the blank. Mix the solutions, and allow to stand for 10 minutes. Within 5 minutes, determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 494 nm, with a suitable spectrophotometer, against the reagent

blank. Calculate the quantity, in mg, of  $(C_{10}H_{19}N_3O_2)_2 \cdot H_2SO_4$  in the Tablet taken by the formula:

$$(TC / D)(A_U / A_S)$$

in which *T* is the labeled quantity, in mg, of guanadrel sulfate in the Tablet; *C* is the concentration, in mg per mL, of USP Guanadrel Sulfate RS in the *Standard preparation*; *D* is the concentration, in mg per mL, of guanadrel sulfate in the *Test preparation*, based upon the labeled quantity per Tablet and the extent of dilution; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solutions from the solution under test and the *Standard preparation*, respectively.

#### Assay—

**Mobile phase, Standard preparation, Resolution solution, and Chromatographic system**—Proceed as directed in the Assay under *Guanadrel Sulfate*.

**Assay preparation**—Transfer a number of Tablets, equivalent to about 100 mg of guanadrel sulfate, to a container. Add an accurately measured volume of *Mobile phase* to obtain a final concentration of about 10 mg of guanadrel sulfate per mL of *Mobile phase*, shake by mechanical means for 20 minutes, and centrifuge if necessary.

**Procedure**—Proceed as directed for *Procedure* in the Assay under *Guanadrel Sulfate*. Calculate the quantity, in mg, of guanadrel sulfate  $[(C_{10}H_{19}N_3O_2)_2 \cdot H_2SO_4]$  in the Tablets taken by the formula:

$$VC(r_U / r_S)$$

in which *V* is the volume, in mL, of *Mobile phase* added to the Tablets, and the other terms are as defined in the Assay under *Guanadrel Sulfate*.

## Guanethidine Monosulfate

$C_{10}H_{22}N_4 \cdot H_2SO_4$  296.39

Guanidine, [2-(hexahydro-1(2*H*)-azocinyl)ethyl]-, sulfate (1:1).

[2-(Hexahydro-1(2*H*)-azocinyl)ethyl]guanidine sulfate (1:1) [645-43-2].

» Guanethidine Monosulfate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{10}H_{22}N_4 \cdot H_2SO_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Guanethidine Monosulfate RS

**Identification**—

**A: Infrared Absorption** (197M).

**B:** Dissolve 2.5 mg in 10 mL of water. Add 2 mL of a solution prepared by dissolving 500 mg of 1-naphthol, 3 g of sodium hydroxide, and 8 g of sodium carbonate in water to make 50 mL, and 1 mL of a solution of 2,3-butanedione (1 in 2000). Allow to stand at room temperature: an intense, pinkish-red color develops.

**pH** (791): between 4.7 and 5.7, in a solution containing 20 mg per mL.

**Loss on drying** (731)—Dry it at 105° to constant weight: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Heavy metals, Method II** (231): 0.001%.

**Assay—**

*Sodium nitroferricyanide–potassium ferricyanide solution—*Dissolve 1 g of sodium nitroferricyanide and 1 g of potassium ferricyanide in water to make 100 mL, and mix.

*Standard preparation—*Dissolve a suitable quantity of USP Guanethidine Monosulfate RS, accurately weighed, in 1 N sulfuric acid to obtain a solution having a known concentration of about 1 mg per mL.

*Assay preparation—*Transfer about 50 mg of Guanethidine Monosulfate, accurately weighed, to a 50-mL volumetric flask, dissolve in 1 N sulfuric acid, add 1 N sulfuric acid to volume, and mix.

*Procedure—*Pipet 2 mL each of the *Assay preparation* and the *Standard preparation*, and 2 mL of 1 N sulfuric acid to provide the blank, into separate glass-stoppered, 40-mL centrifuge tubes. Add 10.0 mL of water to each tube, and mix. To each tube add 10.0 mL of *Sodium nitroferricyanide–potassium ferricyanide solution*, mix, add 4.0 mL of 1 N sodium hydroxide, mix, and allow to stand for 20 minutes, accurately timed. Concomitantly determine the absorbances of both solutions in 1-cm cells against the blank at the wavelength of maximum absorbance at about 500 nm, with a suitable spectrophotometer. Calculate the quantity, in mg, of  $C_{10}H_{22}N_4 \cdot H_2SO_4$  in the Guanethidine Monosulfate taken by the formula:

$$50C(A_U / A_S)$$

in which C is the concentration, in mg per mL, of USP Guanethidine Monosulfate RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Guanethidine Monosulfate Tablets

» Guanethidine Monosulfate Tablets contain an amount of guanethidine monosulfate ( $C_{10}H_{22}N_4 \cdot H_2SO_4$ ) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of guanethidine sulfate [ $(C_{10}H_{22}N_4)_2 \cdot H_2SO_4$ ].

**Packaging and storage—**Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Guanethidine Monosulfate RS

**Identification, Infrared Absorption** (197M)—Obtain the test specimen as follows. Transfer a quantity of powdered Tablets, equivalent to about 120 mg of guanethidine monosulfate, to a glass-stoppered flask, add 20 mL of water, shake by mechanical means for 30 minutes, and filter, discarding the first few mL of the filtrate. Transfer 10 mL of the filtrate to a separator, add 2 mL of 0.1 N sodium hydroxide and 2 mL of a saturated solution of picric acid in 0.1 N sodium hydroxide, and mix. Extract with 20 mL of chloroform, filter the chloroform extract through cotton, and collect in a beaker. Evaporate the chloroform extract with the aid of a stream of nitrogen to dryness.

**Dissolution** (711)—

*Medium:* water; 500 mL.

*Apparatus 1:* 100 rpm.

*Time:* 45 minutes.

*Procedure—*Determine the amount of  $(C_{10}H_{22}N_4)_2 \cdot H_2SO_4$  dissolved, employing the procedure set forth in the *Assay* and making any necessary modifications.

*Tolerances—*Not less than 75% (Q) of the labeled amount of  $(C_{10}H_{22}N_4)_2 \cdot H_2SO_4$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay—**

*Borate solution—*Transfer 12.4 g of boric acid to a 1000-mL volumetric flask, dissolve in 100 mL of 1.0 N sodium hydroxide, dilute with water to volume, and mix.

*Borate buffer—*Mix 400 mL of *Borate solution* with 600 mL of 0.1 N sodium hydroxide, and adjust with 1.0 N sodium hydroxide or 1.0 N hydrochloric acid to a pH of  $12.3 \pm 0.1$ .

*Picrate reagent—*Transfer 15 g of picric acid to a 1000-mL volumetric flask, dissolve in 750 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix.

*Standard preparation—*Prepare a solution in 0.1 N sulfuric acid having a known concentration of about 0.3 mg of USP Guanethidine Monosulfate RS per mL.

*Assay preparation—*Finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of guanethidine sulfate, to a 200-mL volumetric flask, add 150 mL of 0.1 N sulfuric acid, shake by mechanical means for 30 minutes, dilute with 0.1 N sulfuric acid to volume, and mix. Filter, and discard the first 25 mL of the filtrate.

*Procedure—*Pipet 5 mL each of the *Standard preparation* and the *Assay preparation* into separate 125-mL separators. To each separator add 20 mL of *Borate buffer* and 20 mL of *Picrate reagent*. Extract with three 20-mL portions of chloroform, filtering the extracts through chloroform-pretreated cotton, and collect the extracts in low-actinic 100-mL volumetric flasks. Rinse the cotton with 20 mL of chloroform, adding the rinsings to the volumetric flasks, dilute with chloroform to volume, and mix. Concomitantly determine the absorbances of the solutions at the wavelength of maximum absorbance at about 412 nm, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg, of guanethidine sulfate [ $(C_{10}H_{22}N_4)_2 \cdot H_2SO_4$ ] in the portion of Tablets taken by the formula:

$$(247.35 / 296.39)(200)(C)(A_U / A_S)$$

in which 247.35 is one-half the molecular weight of guanethidine sulfate; 296.39 is the molecular weight of guanethidine monosulfate; C is the concentration, in mg per mL, of USP Guanethidine Monosulfate RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Guanfacine Hydrochloride

$C_9H_9Cl_2N_3O \cdot HCl$  282.55

Benzeneacetamide, *N*-(aminoiminomethyl)-2,6-dichloro-, monohydrochloride.

*N*-Amidino-2-(2,6-dichlorophenyl)acetamide monohydrochloride [29110-48-3].

» Guanfacine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $C_9H_9Cl_2N_3O \cdot HCl$ , calculated on the dried basis. [Caution—Guanfacine Hydrochloride is a potent antihypertensive drug. Minimize flying dust, and avoid all bodily and respiratory contact with this substance.]

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Guanfacine Hydrochloride RS

**Identification**—

**A: Infrared Absorption** (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Loss on drying** (731)—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.002%.

NOTE—Prepare all solutions in the tests for *Related compounds* and *Chromatographic purity* immediately prior to use, and apply to plates as quickly as possible.

**Related compounds**—

*Spray reagent*—[Caution—Avoid contact with *o*-tolidine. Prepare and use this *Spray reagent* in a well-ventilated hood.] Dissolve 50 mg of *o*-tolidine in 100 mL of alcohol, and mix.

*Chlorine chamber*—Transfer 1.5 g of potassium permanganate to a 100-mL beaker, dissolve in and dilute with water to volume, and mix. Transfer 25 mL of this solution to a beaker, and place the beaker inside a chromatographic chamber. Pipet 10 mL of hydrochloric acid into the beaker, and cover the chamber.

*Developing solvent system*—Prepare a fresh mixture of ethyl acetate, glacial acetic acid, and acetonitrile (70:25:3).

*Standard solutions*—Dissolve accurately weighed quantities of USP Guanfacine Hydrochloride RS and guanidine hydrochloride in methanol to obtain a solution having a known concentration of 0.4 mg each of USP Guanfacine Hydrochloride RS and guanidine hydrochloride per mL. Quantitatively dilute this solution with methanol to obtain *Standard solutions* having the following compositions:

Standard Solution	Dilution	Concentration (µg RS and Guanidine Hydrochloride per mL)	Percentage (% for Comparison with Test Specimen)
1	(undiluted)	400	2.0
2	(1 in 2)	200	1.0
3	(1 in 4)	100	0.5
4	(1 in 8)	50	0.25

*Test solution*—Dissolve an accurately weighed quantity of Guanfacine Hydrochloride in methanol to obtain a solution having a concentration of about 20 mg per mL.

*Procedure*—Use a thin-layer chromatographic plate (see *Chromatography* (621) coated with a 0.25-mm layer of chromatographic silica gel. Prewash the plates by placing in a chromatographic chamber saturated with *Developing solvent system*. Remove the plates from the chamber, and allow to dry. Separately apply 10 µL each of the *Standard solutions* and the *Test solution* to the chromatographic plate. Allow the spots to dry, and develop the chromatogram in *Developing solvent* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the plate to air-dry for about 1 hour. Examine the plate under short-wavelength UV light. Place the dried plate in the *Chlorine chamber* for 15 minutes, remove, and allow the excess chlorine to evaporate by air drying for 5 minutes. Spray the plate with *Spray reagent*, and examine: any spot due to guanidine hydrochloride observed in the chromatogram of the *Test solution* is not greater in size or intensity than the guanidine hydrochloride spot obtained from *Standard solution* 3 (0.5%); no other individual impurity spot observed in the

chromatogram of the *Test solution* is greater in size or intensity than the guanfacine hydrochloride spot obtained from *Standard solution* 4 (0.25%); and the sum of all impurities found, including guanidine hydrochloride, is not more than 1.0%.

**Chromatographic purity**—

*Spray reagent 1*—Prepare a mixture of tertiary butyl alcohol and water (9:1).

*Spray reagent 2*—Dissolve 5 g of 4,4'-tetramethyldiaminodiphenylmethane in 20 mL of glacial acetic acid, add 10 mL of water, and mix (*Solution 1*). Dissolve 6 g of potassium iodide in 120 mL of water, and mix (*Solution 2*). Dissolve 0.3 g of ninhydrin in 10 mL of glacial acetic acid, dilute with water to 100 mL, and mix (*Solution 3*). Mix *Solution 1* and *Solution 2*, and add 9 mL of *Solution 3*.

*Developing solvent system*—Prepare a fresh mixture of hexanes, diisopropyl ether, toluene, and glacial acetic acid (60:30:5:3).

*Reference solutions*—Dissolve an accurately weighed quantity of 2,6-dichlorophenylacetic acid in a mixture of methanol and water (9:1) to obtain a solution having a concentration of 1 mg per mL (*Reference solution 1*). Quantitatively dilute this solution with a mixture of methanol and water (9:1) to obtain *Reference solution 2* and *Reference solution 3* having known concentrations of 0.5 and 0.25 mg per mL of 2,6-dichlorophenylacetic acid, respectively.

*Test solution*—Prepare a solution of Guanfacine Hydrochloride in a mixture of methanol and water (9:1), containing 100 mg per mL.

*Procedure*—Use a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Prewash the plates by placing in a chromatographic chamber saturated with *Developing solvent system*. Remove the plates from the chamber, and allow to dry. Separately apply 25 µL of each of the *Reference solutions* and the *Test solution* to the chromatographic plate. Allow the spots to dry, and develop the chromatograms in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the plate to air-dry for 30 minutes. Examine the plate under short-wavelength UV light. Spray the plate with *Spray reagent 1*, wait for 1 minute, and then spray with *Spray reagent 2*. Place the wet plate under short-wavelength UV light for 10 minutes, remove, and observe under white light: no spot observed in the chromatogram of the *Test solution*, other than that due to guanfacine hydrochloride, is greater in size or intensity than the principal spot obtained from *Reference solution 2* (0.5%); and the sum of all impurities found is not more than 1.0%.

**Assay**—

*Dilute phosphoric acid*—Prepare a mixture of water and phosphoric acid (4:1).

*Buffer solution*—Dissolve 68 g of monobasic potassium phosphate in water, dilute with water to 1000 mL, and mix. Dilute 100 mL of this solution with water to 1000 mL, add 5 mL of triethylamine, mix, and adjust with *Dilute phosphoric acid* to a pH of 3.0.

*Mobile phase*—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (79:21). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Guanfacine Hydrochloride RS in a mixture of acetonitrile and water (3:1) to obtain a solution having a known concentration of about 1 mg of USP Guanfacine Hydrochloride RS per mL. Transfer 2.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Assay preparation*—Transfer an accurately weighed quantity of about 50 mg of Guanfacine Hydrochloride to a 50-mL volumetric flask, dissolve in and dilute with a mixture

of acetonitrile and water (3:1) to volume, and mix. Transfer 2.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the capacity factor,  $k'$ , is between 2 and 5; the column efficiency is not less than 1500 theoretical plates; the tailing factor is not more than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of  $C_9H_9Cl_2N_3O \cdot HCl$  in the portion taken by the formula:

$$1.25C(r_U/r_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Guanfacine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the guanfacine hydrochloride peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Guanfacine Tablets

» Guanfacine Tablets contain an amount of Guanfacine Hydrochloride ( $C_9H_9Cl_2N_3O \cdot HCl$ ) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of guanfacine ( $C_9H_9Cl_2N_3O$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** <11>—

USP Guanfacine Hydrochloride RS

**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* as obtained in the *Assay*.

**B:** It responds to the *Thin-Layer Chromatographic Identification Test* (201), the test solution and the *Standard solution* being prepared at a concentration of 2 mg per mL in methanol, and a solvent system consisting of a mixture of ethyl acetate, glacial acetic acid, and water (5:2:2) being used.

**Dissolution** <711>—

*Medium:* water; 500 mL.

*Apparatus 2:* 50 rpm.

*Time:* 45 minutes.

**Procedure**—Determine the amount of  $C_9H_9Cl_2N_3O$  dissolved, employing the procedure set forth in the *Assay* and making any necessary modifications.

**Tolerances**—Not less than 75% ( $Q$ ) of the labeled amount of  $C_9H_9Cl_2N_3O$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**pH 2.5 Diethylamine phosphate solution**—Add 10.3 mL of diethylamine to about 70 mL of water. Adjust with phosphoric acid to a pH of 2.5, dilute with water to 100 mL, and mix.

**Reagent solution**—Dissolve an accurately weighed quantity of 2,6-dichlorophenylacetic acid in *Mobile phase*, and

dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 18 µg per mL.

**Mobile phase**—Dissolve 600 mg of monobasic potassium phosphate and 3 mL of pH 2.5 Diethylamine phosphate solution in 480 mL of water, and mix. Adjust with 0.2 N sodium hydroxide to a pH of 4.0. While swirling, add 520 mL of acetonitrile. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Internal standard solution**—Prepare a solution of butylparaben in *Mobile phase* containing 0.5 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Guanfacine Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.23 mg per mL. Transfer 5.0 mL of this solution to a 25-mL volumetric flask, and add 5.0 mL each of the *Reagent solution* and the *Internal standard solution*. Dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg of guanfacine, to a 100-mL volumetric flask. Add 50 mL of *Mobile phase*, and heat on a steam bath for 5 minutes. Cool to room temperature, dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of this solution to a 25-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.4 for guanfacine, 0.6 for 2,6-dichlorophenylacetic acid, and 1.0 for butylparaben; the resolution,  $R$ , between guanfacine and 2,6-dichlorophenylacetic acid is not less than 1.5, and the resolution,  $R$ , between 2,6-dichlorophenylacetic acid and butylparaben is not less than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of guanfacine ( $C_9H_9Cl_2N_3O$ ) in the portion of Tablets taken by the formula:

$$(246.09/282.55)(0.25C)(R_U/R_S)$$

in which 246.09 and 282.55 are the molecular weights of guanfacine and guanfacine hydrochloride, respectively;  $C$  is the concentration, in µg per mL, of USP Guanfacine Hydrochloride RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of guanfacine to butylparaben obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Gutta Percha

» Gutta Percha is the coagulated, dried, purified latex of the trees of the genera *Palaquium* and *Payena* and most commonly *Palaquium gutta* (Hooker) Baillon (Fam. Sapotaceae).

**Packaging and storage**—Preserve under water in well-closed containers, protected from light.

**Residue on ignition** (281): not more than 1.7%.

## Halazone

$C_7H_5Cl_2NO_4S$  270.09  
Benzoic acid, 4-[(dichloroamino)sulfonyl]-;  
*p*-(Dichlorosulfamoyl)benzoic acid [80-13-7].

### DEFINITION

Halazone contains NLT 91.5% and NMT 100.5% of  $C_7H_5Cl_2NO_4S$ , calculated on the dried basis.

### IDENTIFICATION

#### • PROCEDURE

**Sample:** 100 mg

**Analysis:** Add the *Sample* to 5 mL of a sodium bromide solution (1 in 10).

**Acceptance criteria:** Bromine is liberated from the mixture.

### ASSAY

#### • PROCEDURE

**Sample:** 150 mg

**Analysis:** Add the *Sample* to 10 mL of 2.5 N sodium hydroxide in a 250-mL iodine flask, and stir well to dissolve. Add 75 mL of water, then promptly add 15 mL of potassium iodide solution (1 in 10), and mix. Acidify with 10 mL of 6 N acetic acid, and titrate immediately with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium thiosulfate is equivalent to 6.752 mg of  $C_7H_5Cl_2NO_4S$ .

**Acceptance criteria:** 91.5%–100.5% on the dried basis

### IMPURITIES

#### Organic Impurities

#### • PROCEDURE: READILY CARBONIZABLE SUBSTANCES TEST (271)

**Sample:** 100 mg

**Analysis:** Dissolve the *Sample* in 0.5 mL of sulfuric acid.

**Acceptance criteria:** No blackening occurs, although some effervescence may take place.

### SPECIFIC TESTS

• **LOSS ON DRYING (731):** Dry a sample over phosphorus pentoxide for 4 h: it loses NMT 0.5% of its weight.

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

## Halazone Tablets for Solution

» Halazone Tablets for Solution contain not less than 90.0 percent and not more than 135.0 percent of the labeled amount of  $C_7H_5Cl_2NO_4S$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—Label the Halazone Tablets for Solution to indicate that they are not intended to be swallowed.

**Identification**—Finely powder a number of Halazone Tablets for Solution, equivalent to about 150 mg of halazone: a portion of the powder, equivalent to about 100 mg of halazone, responds to the *Identification* test under *Halazone*.

**Disintegration (701):** 10 minutes.

**Uniformity of dosage units (905):** meet the requirements, except that if the average value of the dosage units tested is between 100.0 percent and 135.0 percent, *Criterion (B) (3)* applies.

**pH (791):** not less than 7.0, in a solution of 1 Halazone Tablet for Solution, containing 4 mg of halazone, in 200 mL of water.

**Assay**—Transfer a counted number of Halazone Tablets for Solution, equivalent to about 160 mg of halazone, to a suitable container, and proceed as directed in the *Assay* under *Halazone*. Each mL of 0.1 N sodium thiosulfate is equivalent to 6.752 mg of  $C_7H_5Cl_2NO_4S$ .

## Halcinonide

$C_{24}H_{32}ClFO_5$  454.96

Pregn-4-ene-3,20-dione, 21-chloro-9-fluoro-11-hydroxy-16,17-[(1-methylethylidene)bis(oxy)]-, (11 $\beta$ ,16 $\alpha$ )-.

21-Chloro-9-fluoro-11 $\beta$ ,16 $\alpha$ ,17-trihydroxypregn-4-ene-3,20-dione cyclic 16,17-acetal with acetone [3093-35-4].

» Halcinonide contains not less than 97.0 percent and not more than 102.0 percent of  $C_{24}H_{32}ClFO_5$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards (11)**—

USP Halcinonide RS

**Identification, Infrared Absorption (197K).**

**Specific rotation (781S):** between +150° and +160°.

*Test solution:* 20 mg per mL, in chloroform.

**Loss on drying (731)**—Dry it in vacuum at 100° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition (281):** not more than 0.2%.

**Chromatographic purity**—Prepare the test solution by dissolving 50 mg of Halcinonide in 5.0 mL of a mixture of chloroform and methanol (1:1). Divide the area of a suitable thin-layer chromatographic plate (see *Chromatography (621)*) coated with a 0.25-mm layer of chromatographic silica gel mixture, into three equal sections, the first two sections to be used for the test solution and the third section for the blank. Apply 100  $\mu$ L of the test solution to appropriate sections of the plate, drying each solution as it is applied with a current of warm air. Using a continuous elution chromatographic chamber, develop the chromatogram in a solvent system consisting of a mixture of chloroform and ethyl acetate (5:1) for about 2 hours. Remove the plate from the developing chamber, dry in an oven at 90° for 15 minutes, and locate the bands by viewing under short-wavelength UV light. Mark the principal band and any secondary bands. Quantitatively remove the silica gel containing these bands, including a corresponding blank segment, and transfer to separate glass-stoppered, 50-mL centrifuge tubes, combining the impurities if more than one impurity is present. Add 30.0 mL of dehydrated alcohol to the tubes containing the principal band and the corresponding blank, and add 10.0 mL of dehydrated alcohol to the tubes containing the combined impurities and the corresponding blank. Insert stoppers in the tubes, and shake gently on a reciprocating shaker for about 60 minutes. Centrifuge, dilute the principal band eluate and its corresponding blank eluate with an

equal volume of dehydrated alcohol, and mix. Determine the absorbances of the clear supernatant eluates in 1-cm cells at the wavelength of maximum absorbance at about 239 nm, with a suitable spectrophotometer, using dehydrated alcohol as the blank. Calculate the percentage of chromatographic impurities by the formula:

$$100A_i / (A_i + 6A_u)$$

in which  $A_i$  is the absorbance of the combined impurity bands eluate, corrected for the corresponding blank; and  $A_u$  is the absorbance of the principal band eluate, corrected for the corresponding blank. Not more than 3.0% is found.

#### Assay—

**Standard preparation**—Dissolve an accurately weighed quantity of USP Halcinonide RS in methanol, and dilute quantitatively and stepwise with methanol to obtain a solution having a known concentration of about 15 µg per mL.

**Assay preparation**—Weigh accurately about 30 mg of Halcinonide, transfer to a 100-mL volumetric flask, dissolve in methanol, dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a second 100-mL volumetric flask, dilute with methanol to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* in 1-cm cells at the wavelength of maximum absorbance at about 239 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg, of  $C_{24}H_{32}ClFO_5$  in the portion of Halcinonide taken by the formula:

$$2C(A_u / A_s)$$

in which  $C$  is the concentration, in µg per mL, of USP Halcinonide RS in the *Standard preparation*; and  $A_u$  and  $A_s$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Halcinonide Cream

» Halcinonide Cream is Halcinonide in a suitable cream base. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{24}H_{32}ClFO_5$ .

**Packaging and storage**—Preserve in well-closed containers.

#### USP Reference standards (11)—

USP Halcinonide RS

**Identification**—Transfer a quantity of Cream, equivalent to about 2 mg of halcinonide, to a glass-stoppered, 50-mL centrifuge tube, add 15 mL of warm water, and shake for 2 minutes to disperse. Add 20 mL of chloroform, and shake for 5 minutes. Cool in an ice bath, then centrifuge. Transfer the chloroform layer to a conical flask. Repeat the extraction with an additional 15 mL of chloroform, and combine the chloroform extracts. Evaporate the chloroform extracts on a steam bath under a current of air nearly to dryness, and dissolve the residue in 10.0 mL of chloroform. Apply 20 µL of this solution and 20 µL of a solution of USP Halcinonide RS in chloroform having a concentration of 0.2 mg per mL to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of chloroform and ethyl acetate (5:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate, air-dry, and view the chromatogram under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the test

solution corresponds to that obtained from the Standard solution.

**Microbial enumeration tests (61) and Tests for specified microorganisms (62)**—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill (755):** meets the requirements.

#### Assay—

**Solvent A**—On the day of use, prepare a mixture of acetonitrile and water (2:1).

**Mobile phase**—Mix approximately equal volumes of acetonitrile and water, adjusting the composition as necessary to achieve acceptable chromatography.

**Internal standard solution**—Transfer 15 mg of Progesterone to a 100-mL volumetric flask. Dissolve in hexanes-saturated *Solvent A*, dilute with hexanes-saturated *Solvent A* to volume, and mix.

**Standard preparation**—Transfer about 20 mg of USP Halcinonide RS, accurately weighed, to a 100-mL volumetric flask, dissolve in *Solvent A*, dilute with *Solvent A* to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask. Add 4.0 mL of *Internal standard solution*, dilute with hexanes-saturated *Solvent A* to volume, and mix.

**Assay preparation**—Transfer an accurately weighed quantity of Cream, equivalent to about 0.5 mg of halcinonide, to a glass-stoppered, 50-mL centrifuge tube, add 12 mL of hexanes-saturated *Solvent A* and 20 mL of hexanes, and shake for 1 minute. Place in a heated ultrasonic bath at  $58 \pm 2^\circ$  for 20 minutes, initially shaking for 1 to 2 minutes to ensure dispersion, and at about 5-minute intervals thereafter, on a vibratory mixer. Cool, centrifuge, and transfer the lower layer to a 25-mL volumetric flask. Add 5 mL of hexanes-saturated *Solvent A* to the tube, mix for 1 minute, then centrifuge. Transfer the lower layer to the volumetric flask, and repeat the extraction with an additional 5 mL of hexanes-saturated *Solvent A*, combining the extracts in the flask. Add 2.0 mL of *Internal standard solution* to the flask, dilute with hexanes-saturated *Solvent A* to volume, and mix. If necessary, clarify a portion of the solution by centrifugation.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the resolution,  $R$ , between the analyte and internal standard peaks is not less than 1.5, and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 1.2 for progesterone and 1.0 for halcinonide. Calculate the quantity, in mg, of  $C_{24}H_{32}ClFO_5$  in the portion of Cream taken by the formula:

$$25C(R_u / R_s)$$

in which  $C$  is the concentration, in mg per mL, of USP Halcinonide RS in the *Standard preparation*; and  $R_u$  and  $R_s$  are the ratios of the peak responses of halcinonide to internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Halcinonide Ointment

» Halcinonide Ointment is Halcinonide in a suitable ointment base. It contains not less than

90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{24}H_{32}ClFO_5$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Halcinonide RS

**Identification**—It responds to the *Identification* test under *Halcinonide Cream*.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** (755): meets the requirements.

**Assay**—

**Mobile phase**—Mix approximately equal volumes of acetonitrile and water, adjusting the ratio of solvents as necessary to achieve acceptable chromatography.

**Internal standard solution**—Dissolve Butylparaben in acetonitrile to obtain a solution having a concentration of 6  $\mu$ g per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Halcinonide RS in *Internal standard solution* to obtain a solution having a known concentration of about 0.04 mg per mL. Mix 5.0 mL of this solution with 5.0 mL of the *Mobile phase*. Each mL of the *Standard preparation* has a known concentration of about 0.02 mg of USP Halcinonide RS.

**Assay preparation**—Transfer an accurately weighed quantity of Ointment, equivalent to about 1 mg of halcinonide, to a glass-stoppered, 50-mL centrifuge tube, and add 25.0 mL of *Internal standard solution* and 5.0 mL of hexane. Place in a water bath at  $58 \pm 2^\circ$  for 3 minutes, then mix in a vortex mixer for about 1 minute until the specimen is well dispersed. Repeat the above-specified heating and mixing step one more time. Cool in an ice-methanol bath for 15 minutes or until the two phases separate, centrifuging if necessary. Transfer 5.0 mL of the lower layer into a 15-mL centrifuge tube, add 5.0 mL of *Mobile phase*, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the resolution,  $R$ , between the analyte and internal standard peaks is not less than 2.0, and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.6 for butylparaben and 1.0 for halcinonide. Calculate the quantity, in mg, of  $C_{24}H_{32}ClFO_5$  in the portion of Ointment taken by the formula:

$$50C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Halcinonide RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses of halcinonide to internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Halcinonide Topical Solution

» Halcinonide Topical Solution is Halcinonide in a suitable aqueous vehicle. It contains not less than

90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{24}H_{32}ClFO_5$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Halcinonide RS

**Identification**—It responds to the *Identification* test under *Halcinonide Cream*.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Assay**—

**Mobile phase**—Mix approximately equal volumes of acetonitrile and water, adjusting the ratio of solvents as necessary to achieve acceptable chromatography.

**Internal standard solution**—Transfer 15 mg of Progesterone to a 50-mL volumetric flask. Dissolve in *Mobile phase*, dilute with *Mobile phase* to volume, and mix.

**Standard preparation**—Transfer about 20 mg of USP Halcinonide RS, accurately weighed, to a 100-mL volumetric flask, dissolve in *Mobile phase*, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, add 2.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Transfer an accurately measured quantity of Topical Solution, equivalent to about 1 mg of halcinonide, to a 50-mL volumetric flask, add 2.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system and Procedure**—Proceed as directed in the *Assay* under *Halcinonide Cream*. Calculate the quantity, in mg, of  $C_{24}H_{32}ClFO_5$  in the portion of Topical Solution taken by the formula:

$$50C(R_U / R_S)$$

in which the terms are as defined therein.

## Halobetasol Propionate

$C_{25}H_{31}ClF_2O_5$  484.96  
Pregna-1,4-diene-3,20-dione, 21-chloro-6,9-difluoro-11-hydroxy-16-methyl-17-(1-oxopropoxy)-, (6 $\alpha$ ,11 $\beta$ ,16 $\beta$ )-; 21-Chloro-6 $\alpha$ ,9-difluoro-11 $\beta$ ,17-dihydroxy-16 $\beta$ -methylpregna-1,4-diene-3,20-dione 17-propionate [66852-54-8].

### DEFINITION

Halobetasol Propionate contains NLT 98.0% and NMT 102.0% of  $C_{25}H_{31}ClF_2O_5$ , calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Solution A:** Acetonitrile and water (9:11)

**Solution B:** Acetonitrile

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2	64.5	35.5
22	64.5	35.5
23	100	0
30	100	0

**Standard solution:** 0.2 mg/mL of USP Halobetasol Propionate RS in acetonitrile

**Sample solution:** 0.2 mg/mL of Halobetasol Propionate in acetonitrile

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Column temperature:** 40°

**Flow rate:** 0.8 mL/min

**Injection size:** 20 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>25</sub>H<sub>31</sub>ClF<sub>2</sub>O<sub>5</sub> in the portion of Halobetasol Propionate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

**IMPURITIES****Inorganic Impurities**

• **RESIDUE ON IGNITION** <281>: NMT 0.2%

• **HEAVY METALS**, *Method II* <231>: NMT 20 ppm

C<sub>25</sub>H<sub>31</sub>ClF<sub>2</sub>O<sub>5</sub> 484.96

**Haloperidol**

C<sub>21</sub>H<sub>23</sub>ClFNO<sub>2</sub> 375.86

1-Butanone, 4-[4-(4-chlorophenyl)-4-hydroxy-1-piperidinyl]-1-(4-fluorophenyl)-.

4-[4-(p-Chlorophenyl)-4-hydroxypiperidino]-4'-fluorobutyrophenone [52-86-8].

» Haloperidol contains not less than 98.0 percent and not more than 102.0 percent of  $C_{21}H_{23}ClFNO_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Haloperidol RS

USP Haloperidol Related Compound A RS

4,4'-Bis[4-*p*-chlorophenyl]-4-hydroxypiperidino]butyrophenone.

$C_{32}H_{36}Cl_2N_2O_3$  567.56

**Identification**—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 20 µg per mL.

*Medium:* dilute hydrochloric acid (1 in 100) in isopropyl alcohol (1 in 9).

Absorptivities at 245 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Melting range** (741): between 149° and 155°, determined after drying in vacuum at 60° for 3 hours.

**Loss on drying** (731)—Dry it in vacuum at 60° for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Limit of haloperidol related compound A**—

*Test solution*—Dissolve about 80 mg of Haloperidol, accurately weighed, in 80 mL of isopropyl alcohol in a 100-mL volumetric flask. Add 10 mL of dilute hydrochloric acid (1 in 100), dilute with isopropyl alcohol to volume, and mix.

*Standard solution*—Prepare a solution containing 800 µg per mL of USP Haloperidol RS and 8 µg per mL of USP Haloperidol Related Compound A RS in isopropyl alcohol containing 10 mL of dilute hydrochloric acid (1 in 100) in each 100 mL of solution.

*Procedure*—Concomitantly determine the absorbances of the *Test solution* and the *Standard solution* at the wavelength of maximum absorbance at about 335 nm, with a suitable spectrophotometer, using isopropyl alcohol containing 10 mL of dilute hydrochloric acid (1 in 100) in each 100 mL of solution as the blank. The absorbance of the *Test solution* is not greater than that of the *Standard solution*, corresponding to not more than 1.0%.

**Assay**—Dissolve about 125 mg of Haloperidol, accurately weighed, in 25 mL of glacial acetic acid, add 3 drops of *p*-naphtholbenzein TS, and titrate with 0.05 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.05 N perchloric acid is equivalent to 18.79 mg of  $C_{21}H_{23}ClFNO_2$ .

## Haloperidol Injection

### DEFINITION

Haloperidol Injection is a sterile solution of Haloperidol in Water for Injection, prepared with the aid of Lactic Acid. It contains NLT 90.0% and NMT 110.0% of the labeled amount of haloperidol ( $C_{21}H_{23}ClFNO_2$ ). It may contain a suitable preservative.

### IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### • PROCEDURE

**Buffer solution:** 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 4.0.

**Mobile phase:** Methanol and *Buffer solution* (55:45)

**Standard stock solution:** 1 mg/mL of USP Haloperidol RS in methanol. Sonicate to aid in dissolution.

**Standard solution:** 0.2 mg/mL of USP Haloperidol RS in *Mobile phase* from the *Standard stock solution*

**Sample solution:** Nominally, 0.2 mg/mL of haloperidol in *Mobile phase* from a volume of Injection

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 247 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L1

**Flow rate:** 0.8 mL/min

**Injection size:** 10 µL

**Run time:** 2.5 times the retention time of haloperidol

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of haloperidol ( $C_{21}H_{23}ClFNO_2$ ) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Haloperidol RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of haloperidol in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### SPECIFIC TESTS

- BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 71.4 USP Endotoxin Units/mg of haloperidol.
- PH (791):** 3.0–3.8
- OTHER REQUIREMENTS:** It meets the requirements under *Injections* (1).

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light. Store at controlled room temperature.
- USP REFERENCE STANDARDS (11)**  
USP Endotoxin RS  
USP Haloperidol RS

## Haloperidol Oral Solution

### DEFINITION

Haloperidol Oral Solution is a solution of Haloperidol in Water, prepared with the aid of Lactic Acid. It contains NLT 90.0% and NMT 110.0% of the labeled amount of haloperidol ( $C_{21}H_{23}ClFNO_2$ ).

### IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY****• PROCEDURE**

**Buffer solution:** 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 4.0.

**Mobile phase:** Methanol and *Buffer solution* (55:45)

**Standard stock solution:** 1 mg/mL of USP Haloperidol RS in methanol. Sonicate to aid in dissolution.

**Standard solution:** 0.2 mg/mL of USP Haloperidol RS in *Mobile phase* from the *Standard stock solution*

**Sample solution:** Nominally, 0.2 mg/mL of haloperidol in *Mobile phase* from a volume of Haloperidol Oral Solution. Filter a portion to use in the analysis.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 247 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Flow rate:** 0.8 mL/min

**Injection size:** 10 μL

**Run time:** 2.5 times the retention time of haloperidol

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of haloperidol ( $C_{21}H_{23}ClFNO_2$ ) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Haloperidol RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of haloperidol in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

- DELIVERABLE VOLUME** <698>: Meets the requirements for oral solution packaged in multiple-unit containers
- UNIFORMITY OF DOSAGE UNITS** <905>: Meets the requirements for oral solution packaged in single-unit containers

**SPECIFIC TESTS**

- PH** <791>: 2.75–3.75

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature.
- USP REFERENCE STANDARDS** <11>  
USP Haloperidol RS

---

**Haloperidol Tablets**

---

**DEFINITION**

Haloperidol Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of haloperidol ( $C_{21}H_{23}ClFNO_2$ ).

**IDENTIFICATION**

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****• PROCEDURE**

**Mobile phase:** Methanol and 0.05 M monobasic potassium phosphate buffer (60:40). Adjust with 1 N sodium hydroxide or phosphoric acid to a pH of 4.0.

**Standard solution:** 0.1 mg/mL of USP Haloperidol RS in *Mobile phase*

**Sample solution:** Nominally 0.1 mg/mL of Haloperidol prepared as follows. Transfer an equivalent of about 10 mg of haloperidol from NLT 20 finely powdered Tablets to a 100-mL volumetric flask. Add 60 mL of *Mobile phase*, sonicate for 10 min, and shake by mechanical means for about 1 h. Dilute with *Mobile phase* to volume, mix, and filter, discarding the first 20 mL of the filtrate.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm × 25-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 15 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of haloperidol ( $C_{21}H_{23}ClFNO_2$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of the *Sample solution*

$r_S$  = peak response of the *Standard solution*

$C_S$  = concentration of USP Haloperidol RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of haloperidol in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS****• DISSOLUTION** <711>

**Medium:** Simulated gastric fluid TS without enzyme; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 60 min

**Mobile phase:** Prepare as directed in the *Assay*.

**Standard solution:** A known concentration of USP Haloperidol RS in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary, to a concentration that is similar to that of the *Standard solution*.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

## Halothane

C<sub>2</sub>HBrClF<sub>3</sub> 197.38  
 Ethane, 2-bromo-2-chloro-1,1,1-trifluoro-, (±)-;  
 (±)-2-Bromo-2-chloro-1,1,1-trifluoroethane [151-67-7].

### DEFINITION

Halothane contains NLT 0.008% and NMT 0.012% of thymol, by weight, as a stabilizer.

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197S)

**Sample solution:** 1 in 25

**Medium:** Carbon disulfide

**Acceptance criteria:** Meets the requirements

### OTHER COMPONENTS

#### • THYMOL CONTENT

**Buffer:** Use pH 8.0 Alkaline Borate Buffer (see *Reagents, Indicators, and Solutions—Solutions*).

**Chlorimide solution:** 4 mg/mL of 2,6-dibromoquinonechlorimide in dehydrated alcohol. [NOTE—Prepare a fresh solution for each assay.]

**Standard thymol solution:** 0.1 mg/mL of thymol in 0.25 N sodium hydroxide

**Standard solution A:** Pipet 1 mL of *Standard thymol solution* into a 100-mL volumetric flask, and add 0.25 N sodium hydroxide to make the final volume 5 mL. Add 10 mL of *Buffer*, mix by gentle swirling, and add 1 mL of *Chlorimide solution*. Allow to stand for 15 min, accurately timed. Add 3 mL of 0.25 N sodium hydroxide, and dilute with water to volume.

**Standard solution B:** Pipet 3 mL of *Standard thymol solution* into a 100-mL volumetric flask. Proceed as directed for *Standard solution A*, beginning with "add 0.25 N sodium hydroxide..."

**Standard solution C:** Pipet 5 mL of *Standard thymol solution* into a 100-mL volumetric flask. Proceed as directed for *Standard solution A*, beginning with "Add 10 mL of *Buffer*..."

**Sample solution:** Place 2 mL of Halothane in a 100-mL volumetric flask containing 5 mL of 0.25 N sodium hydroxide, and mix by gentle swirling. Evaporate the halothane under a stream of nitrogen, and add 10 mL of *Buffer* and 1 mL of *Chlorimide solution*. Swirl gently, and allow to stand for 15 min, accurately timed. Add 3 mL of 0.25 N sodium hydroxide, and add water to volume.

**Blank solution:** Pipet 5.0 mL of 0.25 N sodium hydroxide into a 100-mL volumetric flask. Add 10 mL of *Buffer*, mix by gentle swirling, and add 1 mL of *Chlorimide solution*. Allow to stand for 15 min, accurately timed. Add 3 mL of 0.25 N sodium hydroxide, and dilute with water to volume.

### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Vis

**Analytical wavelength:** 590 nm

### Analysis

**Samples:** *Standard solution A*, *Standard solution B*, *Standard solution C*, *Sample solution*, and *Blank solution*  
 Measure the absorbances of *Standard solution A*, *Standard solution B*, and *Standard solution C* relative to the *Blank solution*. Plot the readings, and draw the curve of best fit. Read the absorbance of the *Sample solution*, and by reference to the *Standard thymol curve*, calculate the percentage of thymol in the weight of Halothane taken.

Acceptance criteria: 0.008%–0.012%, by weight

## IMPURITIES

### • LIMIT OF NONVOLATILE RESIDUE

**Analysis:** Evaporate 50 mL in a tared dish on a steam bath to dryness, dry the residue at 105° for 2 h, and weigh.

**Acceptance criteria:** NMT 1 mg of the residue remains.

### • CHLORIDE AND BROMIDE

**Analysis:** Shake 25 mL with 25 mL of water for 5 min, and allow the liquids to separate completely. Draw off the water layer, and to 10 mL add 1 drop of nitric acid and 5 drops of silver nitrate TS.

**Acceptance criteria:** No opalescence is produced.

### • ORGANIC IMPURITIES

**Standard solution:** Add 1.0 µL of 1,1,2-trichloro-1,2,2-trifluoroethane to 20.0 mL of Halothane.

**Sample solution:** Halothane

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 3-m × 2-mm stainless steel; 20% G24 on support S1AB

**Temperatures**

**Column:** 60°

**Injection port:** 200°

**Detector:** 200°

**Carrier gas:** Nitrogen

**Flow rate:** 15 mL/min

**Injection volume:** 2 µL

**System suitability**

**Sample:** *Standard solution*

[NOTE—The retention times for 1,1,2-trichloro-1,2,2-trifluoroethane and halothane are 5 and 13 min, respectively.]

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

**Acceptance criteria:** 0.005%; the total area of all peaks (except that of halothane) recorded from the *Sample solution* does not exceed that due to the added 1,1,2-trichloro-1,2,2-trifluoroethane in the *Standard solution*.

## SPECIFIC TESTS

### • ACIDITY OR ALKALINITY

**Analysis:** Shake 20 mL with 20 mL of carbon dioxide-free water for 3 min, and allow the layers to separate.

**Acceptance criteria:** The aqueous layer requires NMT 0.1 mL of 0.010 N sodium hydroxide or NMT 0.6 mL of 0.010 N hydrochloric acid for neutralization, using bromocresol purple TS as the indicator.

### • DISTILLING RANGE, *Method II* <721>: NLT 95% distills within a 1° range between 49° and 51°, and NLT 100% distills between 49° and 51°, a correction factor of 0.040°/mm being applied as necessary.

### • REFRACTIVE INDEX <831>: 1.369–1.371 at 20°

### • SPECIFIC GRAVITY <841>: 1.872–1.877 at 20°

### • WATER DETERMINATION, *Method I* <921>: NMT 0.03%

## ADDITIONAL REQUIREMENTS

### • PACKAGING AND STORAGE: Preserve in tight, light-resistant containers, preferably of Type NP glass, and avoid exposure to excessive heat. Dispense it only in the original container.

### • USP REFERENCE STANDARDS <11>

USP Halothane RS

» Helium contains not less than 99.0 percent, by volume, of He.

**Packaging and storage**—Preserve in cylinders.

**NOTE**—Reduce the container pressure by means of a regulator. Measure the gases with a gas volume meter downstream from the detector tube in order to minimize contamination or change of the specimens.

**Identification**—The flame of a burning splinter of wood is extinguished when inserted into an inverted test tube filled with Helium. [NOTE—Use caution.] A small balloon filled with Helium shows decided buoyancy.

**Odor**—Carefully open the container valve to produce a moderate flow of gas. Do not direct the gas stream toward the face, but deflect a portion of the stream toward the nose: no appreciable odor is discernible.

**Carbon monoxide**—Pass 1000 ± 50 mL through a carbon monoxide detector tube (see under *Reagents* in the section *Reagents, Indicators, and Solutions*) at the rate specified for the tube: the indicator change corresponds to not more than 0.001%.

**Air**—Not more than 1.0% of air is present, determined as directed in the *Assay*.

**Assay**—Introduce a specimen of Helium into a gas chromatograph by means of a gas sampling valve. Select the operating conditions of the gas chromatograph such that the standard peak signal resulting from the following procedure corresponds to not less than 70% of the full-scale reading. Preferably, use an apparatus corresponding to the general type in which the column is 6 m in length and 4 mm in inside diameter and is packed with porous polymer beads, which permits complete separation of nitrogen and oxygen from Helium, although the nitrogen and oxygen may not be separated from each other. Use industrial grade helium (99.99%) as the carrier gas, with a thermal-conductivity detector, and control the column temperature: the peak response produced by the assay specimen exhibits a retention time corresponding to that produced by an air-helium certified standard (see under *Reagents* in the section *Reagents, Indicators, and Solutions*), and indicates not more than 1.0% of air when compared to the peak response of the air-helium certified standard, and not less than 99.0%, by volume, of He.

## Heparin Lock Flush Solution

### DEFINITION

Heparin Lock Flush Solution is a sterile preparation of Heparin Sodium Injection with sufficient Sodium Chloride to make it isotonic with blood. Its potency is NLT 90.0% and NMT 120.0% of the potency stated on the label in terms of USP Heparin Units. It contains NMT 1.00% of sodium chloride (NaCl). It may contain a suitable preservative.

### ASSAY

#### • ANTI-FACTOR IIa POTENCY

**pH 8.4 buffer:** Dissolve 6.10 g of tris(hydroxymethyl)aminomethane, 10.20 g of sodium chloride, 2.80 g of edetate sodium, and, if suitable, between 0 and 10.00 g of polyethylene glycol 6000 and/or 2.00 g of bovine serum albumin in 800 mL of water. [NOTE—2.00 g of human albumin may be substituted for 2.00 g of bovine serum albumin.] Adjust with hydrochloric acid to a pH of 8.4, and dilute with water to 1000 mL.

**Antithrombin solution:** Reconstitute a vial of antithrombin (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a solution of 5 Anti-thrombin IU/mL. Dilute this solution with pH 8.4 buffer to obtain a solution having a concentration of 0.125 Anti-thrombin IU/mL.

## Helium

He 4.00

Helium.

Helium [7440-59-7].

**Thrombin human solution:** Reconstitute thrombin human (factor IIa) (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to give 20 Thrombin IU/mL, and dilute with *pH 8.4 buffer* to obtain a solution having a concentration of 5 Thrombin IU/mL. [NOTE—The thrombin should have a specific activity of NLT 750 IU/mg.]

**Chromogenic substrate solution:** Prepare a solution of a suitable chromogenic thrombin substrate for amidolytic test (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a concentration of 1.25 mM.

**Stopping solution:** 20% (v/v) solution of acetic acid

**Standard solutions:** Reconstitute the entire contents of an ampule of USP Heparin Sodium for Assays RS with water, and dilute with *pH 8.4 buffer* to obtain at least four dilutions in the concentration range between 0.005 and 0.03 USP Heparin Unit/mL.

**Sample solutions:** Proceed as directed for *Standard solutions* to obtain concentrations of Heparin Lock Flush Solution similar to those obtained for the *Standard solutions*.

#### Analysis

[NOTE—The procedure can also be performed using alternative platforms.]

For each dilution of the *Standard solutions* and the *Sample solutions*, at least duplicate samples should be tested. Label a suitable number of tubes, depending on the number of replicates to be tested. For example, if five blanks are to be used: B1, B2, B3, B4, and B5 for the blanks; T1, T2, T3, and T4 each at least in duplicate for the dilutions of the *Sample solutions*; and S1, S2, S3, and S4 each at least in duplicate for the dilutions of the *Standard solutions*. Distribute the blanks over the series in such a way that they accurately represent the behavior of the reagents during the experiments. [NOTE—Treat the tubes in the order B1, S1, S2, S3, S4, B2, T1, T2, T3, T4, B3, T1, T2, T3, T4, B4, S1, S2, S3, S4, B5.] Note that after each addition of a reagent, the incubation mixture should be mixed without allowing bubbles to form. Add twice the volume (100–200  $\mu$ L) of *Anti-thrombin solution* to each tube containing one volume (50–100  $\mu$ L) of either the *pH 8.4 buffer* or an appropriate dilution of the *Standard solutions* or the *Sample solutions*. Mix, but do not allow bubbles to form. Incubate at 37° for at least 1 min. Add to each tube 25–50  $\mu$ L of *Thrombin human solution*, and incubate for at least 1 min. Add 50–100  $\mu$ L of *Chromogenic substrate solution*. Please note that all reagents, *Standard solutions*, and *Sample solutions* should be prewarmed to 37° just before use. Two different types of measurements can be recorded:

1. Endpoint measurement: Stop the reaction after at least 1 min with 50–100  $\mu$ L of *Stopping solution*. Measure the absorbance of each solution at 405 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* <851>). The RSD over the blank readings is less than 10%.
2. Kinetic measurement: Follow the change in absorbance for each solution over 1 min at 405 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* <851>). Calculate the change in absorbance/min ( $\Delta$ OD/min). The blanks for kinetic measurement are also expressed as  $\Delta$ OD/min and should give the highest values because they are carried out in the absence of heparin. The RSD over the blank readings is less than 10%.

**Calculations:** The statistical models for *Slope ratio assay* or *Parallel-line assay* can be used, depending on which model best describes the correlation between concentration and response.

**Parallel-line assay:** For each series, calculate the regression of the absorbance or change in absorbance/min against log concentrations of the *Standard solutions* and the *Sample solutions*, and calculate the potency of Heparin Lock Flush Solution in USP Units/mL using statistical methods for parallel-line assays.

ar in Lock Flush Solution in USP Units/mL using statistical methods for parallel-line assays.

**Slope ratio assay:** For each series, calculate the regression of the log absorbance or the log change in absorbance/min against concentrations of the *Standard solutions* and the *Sample solutions*, and calculate the potency of Heparin Lock Flush Solution in USP Units/mL using statistical methods for slope ratio assays.

**Acceptance criteria:** 90.0%–120.0%

#### • SODIUM CHLORIDE

**Sample solution:** Pipet 10 mL of Solution into a suitable container, dilute with water to about 150 mL, and add 1.5 mL of potassium chromate TS.

**Analysis:** Titrate with 0.1 N silver nitrate. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of NaCl.

#### SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST** <85>: NMT 0.5 USP Endotoxin Unit/mL
- **PARTICULATE MATTER IN INJECTIONS** <788>: Meets the requirements for small-volume injections
- **pH** <791>: 5.0–7.5
- **OTHER REQUIREMENTS:** It meets the requirements for *Injections* <1>.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose, prefilled syringes or containers, or in multiple-dose containers, preferably of Type I glass.
- **LABELING:** Label it to indicate the volume of the total contents and to indicate the potency in terms of USP Heparin Units only per mL, except that single unit-dose containers may be labeled additionally to indicate the single unit-dose volume and the total number of USP Heparin Units. Where it is labeled with total content, the label states clearly that the entire contents are to be used or, if not, any remaining portion is to be discarded. Label it to indicate the organ and species from which the heparin sodium is derived. The label states also that the Solution is intended for maintenance of patency of intravenous injection devices only, and that it is not to be used for anticoagulant therapy. The label states also that in the case of the Solution having a concentration of 10 USP Heparin Units/mL, it may alter, and that in the case of higher concentrations, it will alter, the results of blood coagulation tests.
- **USP REFERENCE STANDARDS** <11>  
USP Endotoxin RS  
USP Heparin Sodium for Assays RS

## Heparin Sodium

### DEFINITION

Heparin Sodium is the sodium salt of sulfated glycosaminoglycans present as a mixture of heterogeneous molecules varying in molecular weights that retains a combination of activities against different factors of the blood clotting cascade. It is present in mammalian tissues and is usually obtained from the intestinal mucosa or other suitable tissues of domestic mammals used for food by man. The sourcing of heparin material must be specified in compliance with applicable regulatory requirements. The manufacturing process should be validated to demonstrate clearance and inactivation of relevant infectious and adventitious agents (e.g., viruses, TSE agents). See *Viral Safety Evaluation of Biotechnology Products Derived from Cell Lines of Human or Animal Origin* (1050) for general guidance on viral safety evaluation. It is composed of polymers of alternating derivatives of  $\alpha$ -D-glucosamido (*N*-sulfated, *O*-sulfated, or *N*-acetylated) and *O*-sulfated uronic acid ( $\alpha$ -L-iduronic acid or  $\beta$ -D-glucuronic acid). The component activities of the mixture are in ratios corresponding to

those shown by USP Heparin Sodium for Assays RS. Some of these components have the property of prolonging the clotting time of blood. This occurs mainly through the formation of a complex of each component with the plasma proteins antithrombin and heparin cofactor II to potentiate the inactivation of thrombin (factor IIa). Other coagulation proteases in the clotting sequence, such as activated factor X (factor Xa), are also inhibited. The ratio of anti-factor Xa activity to anti-factor IIa potency is between 0.9 and 1.1. The potency of Heparin Sodium, calculated on the dried basis, is NLT 180 USP Heparin Units in each mg.

## IDENTIFICATION

### A. <sup>1</sup>H NMR SPECTRUM

(See *Nuclear Magnetic Resonance* <761>.)

**Standard solution:** NLT 20 mg/mL of USP Heparin Sodium Identification RS in deuterium oxide with 0.02% (w/v) deuterated trimethylsilylpropionic (TSP) acid sodium salt

**System suitability solution:** Prepare 1% (w/w) USP Oversulfated Chondroitin Sulfate RS in *Standard solution*.

**Sample solution:** NLT 20 mg/mL of Heparin Sodium in deuterium oxide with 0.02% (w/v) deuterated TSP

#### Spectrometric conditions

(See *Nuclear Magnetic Resonance* <761>.)

**Mode:** NMR, pulsed (Fourier transform)

**Frequency:** NLT 500 MHz (for <sup>1</sup>H)

**Temperature:** 25°

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

Using a pulsed (Fourier transform) NMR spectrometer operating at NLT 500 MHz for <sup>1</sup>H, acquire a free induction decay (FID) using NLT 16 scans using a 90° pulse and 20-s delay. Record the <sup>1</sup>H NMR spectra of the *Standard solution* and *System suitability solution* at 25°. Collect the <sup>1</sup>H NMR spectrum with a spectral window of at least 10 to -2 ppm and without spinning. The number of transients should be adjusted until the signal-to-noise ratio of the *N*-acetyl heparin signal in the *Standard solution* is at least 1000/1 in the region near 2 ppm. The *Standard solution* shall be run at least daily when *Sample solutions* are being run. For all samples, the TSP methyl signal should be set to 0.00 ppm. The chemical shift for the *N*-acetyl resonance of heparin and oversulfated chondroitin sulfate in the *System suitability solution* should be observed at 2.05 ± 0.02 and 2.16 ± 0.03 ppm, respectively. Record the <sup>1</sup>H NMR spectrum of the *Sample solution* at 25°. Draw a baseline from 8.00 ppm to 0.10 ppm. The ppm values for H1 of GlcNAc/GlcNS, 6S (signal 1), H1 of IdoA2S (signal 2), the H2 of GlcNS (signal 3), and the methyl of GlcNAc (signal 4) of heparin are present at 5.42, 5.21, 3.28 (doublet centered at 3.28 ppm), and 2.05 ppm, respectively.<sup>1</sup> The ppm values of these signals do not differ by more than ±0.03 ppm. Measure the signal heights above the baseline of signal 1 and signal 2, and calculate the mean of these signal heights. Other signals of variable heights and ppm values, attributable to heparin and HOD, may be seen between signal 2 and 4.55 ppm. Residual solvent signals may be observed in the 0.10–3.00 range. Heparin Sodium must meet the requirements stated in *Residual Solvents* <467>.

#### Suitability requirements

**Number of transients:** Adjust until the signal-to-noise ratio of the *N*-acetyl heparin signal in the *Standard solution* is at least 1000/1 in the region near 2 ppm.

**Chemical shift:** The TSP methyl signal should be set to 0.00 ppm for all samples.

**Chemical shifts** (for the *N*-acetyl resonance of heparin and oversulfated chondroitin sulfate): Should be ob-

served at 2.05 ± 0.02 and 2.16 ± 0.03 ppm, respectively, *System suitability solution*

#### Analysis

**Sample:** *Sample solution*

**Acceptance criteria:** No unidentified signals greater than 4% of the mean of signal height of 1 and 2 are present in the following ranges: 0.10–2.00, 2.10–3.20, and 5.70–8.00 ppm. No signals greater than 200% signal height of the mean of the signal height of 1 and 2 are present in the 3.35–4.55 ppm for porcine heparin.

### B. CHROMATOGRAPHIC IDENTITY

**Solution A:** Dissolve 0.8 g of monobasic sodium phosphate dihydrate in 2 L of water and adjust with phosphoric acid to a pH of 3.0. Pass the solution through a filter membrane with pore sizes of 0.45 µm and degas before use.

**Solution B:** Dissolve 0.8 g of monobasic sodium phosphate dihydrate and 280 g of sodium perchlorate monohydrate in 2 L of water and adjust with phosphoric acid to a pH of 3.0. Pass the solution through a filter membrane with pore sizes of 0.45 µm and degas before use.

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)	Elution
0	80	20	Equilibration
60	10	90	Linear gradient
61	80	20	Linear gradient
75	80	20	Re-equilibration

**Standard solution:** NLT 20 mg/mL of USP Heparin Sodium Identification RS in water

**System suitability solution:** Prepare 1% (w/w) USP Oversulfated Chondroitin Sulfate RS and 1% (w/w) USP Dermatan Sulfate RS in *Standard solution*.

**Sample solution:** NLT 20 mg/mL of Heparin Sodium in water

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 202 nm

**Column:** 2-mm × 25-cm; packing L61

**Guard column:** 2-mm × 50-mm; packing L61

**Column temperature:** Maintain columns at 40°

**Flow rate:** 0.22 mL/min

**Injection size:** 10 µL

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The retention times for dermatan sulfate, heparin, and oversulfated chondroitin sulfate are about 20, 30, and 50 min, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.0 between the dermatan sulfate and the heparin peaks, and NLT 1.5 between the heparin and the oversulfated chondroitin sulfate

**Relative standard deviation:** NMT 2% for the heparin peak determined from three replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Record the chromatograms, and measure the retention times for the major peaks.

**Acceptance criteria:** The retention time of the major peak from the *Sample solution* corresponds to that from the *Standard solution*.

### C. ANTI-FACTOR Xa TO ANTI-FACTOR IIa RATIO

#### Anti-factor Xa activity

**pH 8.4 buffer:** Dissolve amounts of tris(hydroxymethyl)aminomethane, edetic acid, and sodium chloride in water containing 0.1% of polyethylene glycol 6000 to obtain a solution having concentrations of 0.050, 0.0075, and 0.175 M, respectively. Adjust, if necessary, with hydrochloric acid or sodium hydroxide solution to a pH of 8.4.

<sup>1</sup> GlcNAc, *N*-acetylated glucosamine; GlcNS, *N*-sulfated glucosamine; S, sulfate; IdoA, iduronic acid; GlcN, glucosamine; GalN, galactosamine.

**Antithrombin solution:** Reconstitute a vial of antithrombin (see *Reagents, Indicators, and Solutions—Reagent Specifications*) as directed by the manufacturer, and further dilute with *pH 8.4 buffer* to obtain a solution having a concentration of 1.0 Antithrombin IU/mL.

**Factor Xa solution:** Reconstitute bovine factor Xa as directed by the manufacturer (see *Factor Xa* in *Reagents, Indicators, and Solutions—Reagent Specifications*), and further dilute in *pH 8.4 buffer* to obtain a solution that gives an absorbance value between 0.65 and 1.25 at 405 nm when assayed as described below but using 30  $\mu$ L of *pH 8.4 buffer* instead of 30  $\mu$ L of the *Standard solutions* or the *Sample solutions*. [NOTE—*Factor Xa solution* contains about 3 nanokatalytic units/mL, but can vary depending upon the manufacturer of factor Xa or the substrate used.]

**Chromogenic substrate solution:** Prepare a solution of a suitable chromogenic substrate for amidolytic test (see *Reagents, Indicators, and Solutions—Reagent Specifications*) specific for factor Xa in water to obtain a concentration of 1 mM.

**Stopping solution:** 20% (v/v) solution of acetic acid

**Standard solutions:** Reconstitute the entire contents of an ampule of USP Heparin Sodium for Assays RS with water, and dilute with *pH 8.4 buffer* to obtain at least five dilutions in the concentration range between 0.03 and 0.375 USP Heparin Units/mL.

**Sample solutions:** Dissolve or dilute a measured quantity of Heparin Sodium in *pH 8.4 buffer*, and dilute with the same buffer to obtain solutions having activities approximately equal to those of the *Standard solutions*.

#### Analysis

[NOTE—The procedure can also be performed using alternative platforms. Perform the test with each *Standard solution* and *Sample solution* in duplicate.]

To each of a series of suitable plastic tubes placed in a water bath set at 37°, transfer 120  $\mu$ L of *pH 8.4 buffer*. Then separately transfer 30  $\mu$ L of the different dilutions of the *Standard solutions* or the *Sample solutions* to the tubes. Add 150  $\mu$ L of *Antithrombin solution*, prewarmed at 37° for 15 min, to each tube, mix, and incubate for 2 min. Add 300  $\mu$ L of *Factor Xa solution*, prewarmed at 37° for 15 min, to each tube, mix, and incubate for 2 min. Add 300  $\mu$ L of *Chromogenic substrate solution*, prewarmed at 37° for 15 min, to each tube, mix, and incubate for exactly 2 min. Add 150  $\mu$ L of *Stopping solution* to each tube, and mix. Prepare a blank for zeroing the spectrophotometer by adding the reagents in reverse order, starting with the *Stopping solution* and ending with the addition of 150  $\mu$ L of *pH 8.4 buffer*, and excluding the *Standard solutions* or the *Sample solutions*. Record the absorbance at 405 nm against the blank.

**Calculations:** Plot the log of the absorbance values of the *Standard solutions* and the *Sample solutions* versus the heparin concentrations in USP Units. Calculate the activity of Heparin Sodium in USP Units/mg using statistical methods for slope ratio assays. Calculate the anti-factor Xa activity of Heparin Sodium:

$$\text{Result} = A \times (S_T/S_S)$$

A = potency of USP Heparin Sodium for Assays RS

$S_T$  = slope of the line for the *Sample solutions*

$S_S$  = slope of the line for the *Standard solutions*

Express the anti-factor Xa activity of the *Sample solution* as USP Heparin Units/mg, calculated on the dried basis. Calculate the ratio of anti-factor Xa activity against anti-factor IIa potency (see the Assay):

Result = anti-factor Xa activity/anti-factor IIa potency

**Acceptance criteria:** 0.9–1.1

- **D. IDENTIFICATION TESTS—GENERAL, Sodium (191):** It meets the requirements of the flame test for sodium.

#### ASSAY

##### • ANTI-FACTOR IIa POTENCY

**pH 8.4 buffer:** Dissolve 6.10 g of tris(hydroxymethyl)aminomethane, 10.20 g of sodium chloride, 2.80 g of edetate sodium, and, if suitable, between 0 and 10.00 g of polyethylene glycol 6000 and/or 2.00 g of bovine serum albumin in 800 mL of water. [NOTE—2.00 g of human albumin may be substituted for 2.00 g of bovine serum albumin.] Adjust with hydrochloric acid to a pH of 8.4, and dilute with water to 1000 mL.

**Antithrombin solution:** Reconstitute a vial of antithrombin (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a solution of 5 Antithrombin IU/mL. Dilute this solution with *pH 8.4 buffer* to obtain a solution having a concentration of 0.125 Antithrombin IU/mL.

**Thrombin human solution:** Reconstitute thrombin human (factor IIa) (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to give 20 Thrombin IU/mL, and dilute with *pH 8.4 buffer* to obtain a solution having a concentration of 5 Thrombin IU/mL. [NOTE—The thrombin should have a specific activity of NLT 750 IU/mg.]

**Chromogenic substrate solution:** Prepare a solution of a suitable chromogenic thrombin substrate for amidolytic test (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a concentration of 1.25 mM.

**Stopping solution:** 20% (v/v) solution of acetic acid

**Standard solutions:** Reconstitute the entire contents of an ampule of USP Heparin Sodium for Assays RS with water, and dilute with *pH 8.4 buffer* to obtain at least four dilutions in the concentration range between 0.005 and 0.03 USP Heparin Unit/mL.

**Sample solutions:** Proceed as directed for *Standard solutions* to obtain concentrations of Heparin Sodium similar to those obtained for the *Standard solutions*.

#### Analysis

[NOTE—The procedure can also be performed using alternative platforms.]

For each dilution of the *Standard solutions* and the *Sample solutions*, at least duplicate samples should be tested. Label a suitable number of tubes, depending on the number of replicates to be tested. For example, if five blanks are to be used: B1, B2, B3, B4, and B5 for the blanks; T1, T2, T3, and T4 each at least in duplicate for the dilutions of the *Sample solutions*; and S1, S2, S3, and S4 each at least in duplicate for the dilutions of the *Standard solutions*. Distribute the blanks over the series in such a way that they accurately represent the behavior of the reagents during the experiments. [NOTE—Treat the tubes in the order B1, S1, S2, S3, S4, B2, T1, T2, T3, T4, B3, T1, T2, T3, T4, B4, S1, S2, S3, S4, B5.] Note that after each addition of a reagent, the incubation mixture should be mixed without allowing bubbles to form. Add twice the volume (100–200  $\mu$ L) of *Antithrombin solution* to each tube containing one volume (50–100  $\mu$ L) of either the *pH 8.4 buffer* or an appropriate dilution of the *Standard solutions* or the *Sample solutions*. Mix, but do not allow bubbles to form. Incubate at 37° for at least 1 min. Add to each tube 25–50  $\mu$ L of *Thrombin human solution*, and incubate for at least 1 min. Add 50–100  $\mu$ L of *Chromogenic substrate solution*. Please note that all reagents, *Standard solutions*, and *Sample solutions* should be prewarmed to 37° just before use. Two different types of measurements can be recorded:

1. Endpoint measurement: Stop the reaction after at least 1 min with 50–100  $\mu$ L of *Stopping solution*. Measure the absorbance of each solution at 405 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)). The RSD over the blank readings is less than 10%.
2. Kinetic measurement: Follow the change in absorbance for each solution over 1 min at 405 nm using a

suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)). Calculate the change in absorbance/min ( $\Delta OD/min$ ). The blanks for kinetic measurement are also expressed as  $\Delta OD/min$  and should give the highest values because they are carried out in the absence of heparin. The RSD over the blank readings is less than 10%.

**Calculations:** The statistical models for *Slope ratio assay* or *Parallel-line assay* can be used, depending on which model best describes the correlation between concentration and response.

**Parallel-line assay:** For each series, calculate the regression of the absorbance or change in absorbance/min against log concentrations of the *Standard solutions* and the *Sample solutions*, and calculate the potency of Heparin Sodium in USP Units/mL using statistical methods for parallel-line assays. Express the potency of Heparin Sodium/mg, calculated on the dried basis.

**Slope ratio assay:** For each series, calculate the regression of the log absorbance or the log change in absorbance/min against concentrations of the *Standard solutions* and the *Sample solutions*, and calculate the potency of Heparin Sodium in USP Units/mL using statistical methods for slope ratio assays. Express the potency of Heparin Sodium/mg, calculated on the dried basis.

**Acceptance criteria:** The potency of Heparin Sodium, calculated on the dried basis, is NLT 180 USP Heparin Units in each mg.

#### OTHER COMPONENTS

- NITROGEN DETERMINATION, Method I (461):** 1.3%–2.5%, calculated on the dried basis, using the procedure for *Nitrates and Nitrites Absent*

#### IMPURITIES

##### Inorganic Impurities

- RESIDUE ON IGNITION (281):** 28.0%–41.0%
- HEAVY METALS, Method II (231):** NMT 30 ppm

##### Organic Impurities

##### PROCEDURE 1: LIMIT OF GALACTOSAMINE IN TOTAL HEX-

**OSAMINE** (a measure of dermatan sulfate and other galactosamine containing impurities)

**Mobile phase:** 14 mM potassium hydroxide

**Glucosamine standard solution:** 1.6 mg/mL of USP

Glucosamine Hydrochloride RS in 5 N hydrochloric acid

**Galactosamine standard solution:** 16  $\mu$ g/mL of USP Galactosamine Hydrochloride RS in 5 N hydrochloric acid

**Standard solution:** Mix equal volumes of *Glucosamine standard solution* and *Galactosamine standard solution*.

**Hydrolyzed standard solution:** Transfer 5 mL of the *Standard solution* to a 7-mL screw-cap test tube, cap, and heat for 6 h at 100°. Cool to room temperature, quantitatively transfer the solution to a 500-mL volumetric flask, and dilute with water to volume.

**Sample solution:** Transfer 12 mg of Heparin Sodium to a 7-mL screw-cap test tube, dissolve in 5 mL of 5 N hydrochloric acid, and cap.

**Hydrolyzed sample solution:** Heat the *Sample solution* for 6 h at 100°. Cool to room temperature, and dilute with water (1 in 100).

##### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** HPLC

**Detector:** Pulsed amperometric detector, set to the following waveform:

Step	Time (s)	Potential (V)	Integration
1	0.00	+0.1	—
2	0.20	+0.1	Begins
3	0.40	+0.1	Ends

Step	Time (s)	Potential (V)	Integration
4	0.41	−2.0	—
5	0.42	−2.0	—
6	0.43	+0.6	—
7	0.44	−0.1	—
8	0.50	−0.1	—

**Column:** 3-mm  $\times$  30-mm amino acid trap column in series with a 3-  $\times$  30-mm guard column and a 3-mm  $\times$  15-cm column that contains packing L69

**Column temperature:** Maintain columns at 30°.

**Flow rate:** 0.5 mL/min

**Pre-equilibration:** At least 60 min with *Mobile phase*

**Injection size:** 10  $\mu$ L

**Elution:** 10 min with *Mobile phase*

**Column cleaning:** At least 10 min with 100 mM potassium hydroxide

**Equilibration:** At least 10 min with *Mobile phase* before each injection

##### System suitability

**Sample:** *Hydrolyzed standard solution*

##### Suitability requirements

**Resolution:** NLT 2 between the galactosamine and glucosamine peaks

**Column efficiency:** NLT 2000 theoretical plates for glucosamine

**Tailing factor:** Between 0.8 and 2.0 for the galactosamine and glucosamine peaks

##### Analysis

**Samples:** *Hydrolyzed standard solution* and *Hydrolyzed sample solution*

Record the chromatograms, and measure the responses for the peaks at the retention time of galactosamine and glucosamine. Calculate the response ratio of galactosamine to glucosamine ( $GalN_R$ ) in the *Hydrolyzed standard solution*:

$$\text{Result} = (GalN_B / GalN_W) \times (GlcN_W / GlcN_B)$$

$GalN_B$  = galactosamine peak area from the *Hydrolyzed standard solution*

$GalN_W$  = weight of galactosamine for the *Standard solution*

$GlcN_W$  = weight of glucosamine for the *Standard solution*

$GlcN_B$  = glucosamine peak area from the *Hydrolyzed standard solution*

Calculate the percentage of galactosamine in the portion of total hexosamine taken:

$$\text{Result} = \{[(GalN_U / GalN_R)] / [(GalN_U / GalN_R) + GlcN_U]\} \times 100$$

$GalN_U$  = galactosamine peak area from the *Hydrolyzed sample solution*

$GalN_R$  = galactosamine response ratio

$GlcN_U$  = glucosamine peak area from the *Hydrolyzed sample solution*

**Acceptance criteria:** The percent galactosamine peak area of the total hexosamine of the *Hydrolyzed sample solution* must be NMT 1%.

##### PROCEDURE 2: NUCLEOTIDIC IMPURITIES

(See *Biotechnology-Derived Articles—Total Protein Assay* (1057), *Method 1*, with the following modifications.)

**Analysis:** Dissolve 40 mg of Heparin Sodium in 10 mL of water. Measure the absorbance of this solution at 260 nm using the light-scattering correction procedure of *Biotechnology-Derived Articles—Total Protein Assay* (1057), *Method 1*.

**Acceptance criteria:** The absorbance of this solution at 260 nm is NMT 0.20.

• **PROCEDURE 3: ABSENCE OF OVERSULFATED CHONDROITIN SULFATE**

**A:** Proceed as directed in *Identification* test A. No features associated with oversulfated chondroitin sulfate are found between 2.12 and 3.00 ppm.

**B:** Proceed as directed in *Identification* test B. No peaks corresponding to oversulfated chondroitin sulfate should be detected eluting after the heparin peak.

• **PROCEDURE 4: PROTEIN IMPURITIES**

**Standard stock solution:** 0.100 mg/mL of bovine serum albumin in water

**Standard solutions:** Dilute portions of the *Standard stock solution* with water to obtain NLT 5 standard solutions having concentrations between 0.005 and 0.100 mg/mL of bovine serum albumin, the concentrations being evenly spaced.

**Sample solution:** 5 mg/mL of Heparin Sodium in water. Prepare in triplicate.

**Blank:** Water

**Lowry reagent A:** Prepare a solution of 10 g/L of sodium hydroxide in water and a solution of 50 g/L of sodium carbonate in water. Mix equal volumes (2V:2V) of each solution, and dilute with water to 5V.

**Lowry reagent B:** Prepare a solution of 29.8 g/L of disodium tartrate dihydrate in water. Prepare a solution of 12.5 g/L of cupric sulfate in water. Mix equal volumes of both solutions (2V:2V), and dilute with water to 5V.

**Lowry reagent C:** Mix 50 volumes of *Lowry reagent A* with 1 volume of *Lowry reagent B*.

**Diluted Folin–Ciocalteu’s phenol reagent:** Dilute Folin–Ciocalteu’s phenol reagent 2–4 times with water. The dilution should be chosen such that the pH of the samples (i.e., *Standard solution* and *Sample solution* after addition of *Lowry reagent C* and the *Diluted Folin–Ciocalteu’s phenol reagent*) is  $10.25 \pm 0.25$ .

**Analysis**

**Samples:** *Standard solutions*, *Sample solution*, and *Blank*

To 1 mL each of *Standard solution*, *Sample solution*, and *Blank*, add 5 mL of *Lowry reagent C*. Allow to stand at room temperature for 10 min. Add 0.5 mL of *Diluted Folin–Ciocalteu’s phenol reagent* to each solution, mix immediately, and allow to stand at room temperature for 30 min. Determine the absorbance as directed in *Biotechnology-Derived Articles—Total Protein Assay* (1057), Method 2.

**Calculations:** See *Biotechnology-Derived Articles—Total Protein Assay* (1057), Method 2.

**Acceptance criteria:** NMT 1.0% (w/w) is found.

**SPECIFIC TESTS**

- **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 0.03 USP Endotoxin Unit/USP Heparin Unit.
- **LOSS ON DRYING (731):** Dry a sample in a vacuum at 60° for 3 h: it loses NMT 5.0% of its weight.
- **pH (791):** 5.0–7.5, in a solution (1 in 100)
- **STERILITY TESTS (71):** Where it is labeled as sterile, it meets the requirements.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store below 40°, preferably at room temperature.
- **LABELING:** Label it to indicate the tissue and the animal species from which it is derived.

## Heparin Sodium Injection

**DEFINITION**

Heparin Sodium Injection is a sterile solution of Heparin Sodium in Water for Injection. It exhibits a potency NLT 90.0% and NMT 110.0% of the potency stated on the label in terms of USP Heparin Units/mL.

**ASSAY**

• **ANTI-FACTOR IIa POTENCY**

**pH 8.4 buffer:** Dissolve 6.10 g of tris(hydroxymethyl)aminomethane, 10.20 g of sodium chloride, 2.80 g of edetate sodium, and, if suitable, between 0 and 10.00 g of polyethylene glycol 6000 and/or 2.00 g of bovine serum albumin in 800 mL of water. [NOTE—2.00 g of human albumin may be substituted for 2.00 g of bovine serum albumin.] Adjust with hydrochloric acid to a pH of 8.4, and dilute with water to 1000 mL.

**Antithrombin solution:** Reconstitute a vial of antithrombin (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a solution of 5 Anti-thrombin IU/mL. Dilute this solution with *pH 8.4 buffer* to obtain a solution having a concentration of 0.125 Antithrombin IU/mL.

**Thrombin human solution:** Reconstitute thrombin human (factor IIa) (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to give 20 Thrombin IU/mL, and dilute with *pH 8.4 buffer* to obtain a solution having a concentration of 5 Thrombin IU/mL. [NOTE—The thrombin should have a specific activity of NLT 750 IU/mg.]

**Chromogenic substrate solution:** Prepare a solution of a suitable chromogenic thrombin substrate for amidolytic test (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a concentration of 1.25 mM.

**Stopping solution:** 20% (v/v) solution of acetic acid

**Standard solutions:** Reconstitute the entire contents of an ampule of USP Heparin Sodium for Assays RS with water, and dilute with *pH 8.4 buffer* to obtain at least four dilutions in the concentration range between 0.005 and 0.03 USP Heparin Unit/mL.

**Sample solutions:** Proceed as directed for *Standard solutions* to obtain concentrations of Heparin Sodium similar to those obtained for the *Standard solutions*.

**Analysis**

[NOTE—The procedure can also be performed using alternative platforms.] For each dilution of the *Standard solutions* and the *Sample solutions*, at least duplicate samples should be tested. Label a suitable number of tubes, depending on the number of replicates to be tested: for example, if five blanks are to be used: B1, B2, B3, B4, and B5 for the blanks; T1, T2, T3, and T4 each at least in duplicate for the dilutions of the *Sample solutions*; and S1, S2, S3, and S4 each at least in duplicate for the dilutions of the *Standard solutions*. Distribute the blanks over the series in such a way that they accurately represent the behavior of the reagents during the experiments. [NOTE—Treat the tubes in the order B1, S1, S2, S3, S4, B2, T1, T2, T3, T4, B3, T1, T2, T3, T4, B4, S1, S2, S3, S4, B5.] Note that after each addition of a reagent, the incubation mixture should be mixed without allowing bubbles to form. Add twice the

volume (100–200  $\mu\text{L}$ ) of *Antithrombin solution* to each tube containing one volume (50–100  $\mu\text{L}$ ) of either the *pH 8.4 buffer* or an appropriate dilution of the *Standard solutions* or the *Sample solutions*. Mix, but do not allow bubbles to form. Incubate at 37° for at least 1 min. Add to each tube 25–50  $\mu\text{L}$  of *Thrombin human solution*, and incubate for at least 1 min. Add 50–100  $\mu\text{L}$  of *Chromogenic substrate solution*. Please note that all reagents, *Standard solutions*, and *Sample solutions* should be prewarmed to 37° just before use. Two different types of measurements can be recorded:

1. Endpoint measurement: Stop the reaction after at least 1 min with 50–100  $\mu\text{L}$  of *Stopping solution*. Measure the absorbance of each solution at 405 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)). The RSD over the blank readings is less than 10%.
2. Kinetic measurement: Follow the change in absorbance for each solution over 1 min at 405 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)). Calculate the change in absorbance/min ( $\Delta\text{OD}/\text{min}$ ). The blanks for kinetic measurement are also expressed as  $\Delta\text{OD}/\text{min}$  and should give the highest values because they are carried out in the absence of heparin. The RSD over the blank readings is less than 10%.

**Calculations:** The statistical models for *Slope ratio assay* or *Parallel-line assay* can be used, depending on which model best describes the correlation between concentration and response.

**Parallel-line assay:** For each series, calculate the regression of the absorbance or change in absorbance/min against log concentrations of the *Standard solutions* and the *Sample solutions*, and calculate the potency of Heparin Sodium in USP Units/mL using statistical methods for parallel-line assays. Express the potency of Heparin Sodium/mg, calculated on the dried basis.

**Slope ratio assay:** For each series, calculate the regression of the log absorbance or the log change in absorbance/min against concentrations of the *Standard solutions* and the *Sample solutions*, and calculate the potency of Heparin Sodium in USP Units/mL using statistical methods for slope ratio assays. Express the potency of Heparin Sodium/mg, calculated on the dried basis.

**Acceptance criteria:** 90.0%–110.0%

#### SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST (85):** NMT 0.03 USP Endotoxin Unit/USP Heparin Unit
- **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements for small-volume injections
- **pH (791):** 5.0–7.5
- **OTHER REQUIREMENTS:** Meets the requirements for *Injections* (1)

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass, and store at a temperature below 40°, preferably at room temperature.
- **LABELING:** Label it to indicate the volume of the total contents and the potency in terms of USP Heparin Units only per mL, except that single-dose containers may be labeled additionally to indicate the single unit-dose volume and the total number of USP Heparin Units. Where it is labeled with total content, the label states also that the entire contents are to be used or, if not, any remaining portion is to be discarded. Label it to indicate also the tissue and the animal species from which it is derived.

USP Heparin Sodium for Assays RS

## Anticoagulant Heparin Solution

### DEFINITION

Anticoagulant Heparin Solution is a sterile solution of Heparin Sodium in Sodium Chloride Injection. Its potency is NLT 90.0% and NMT 110.0% of the potency stated on the label in terms of USP Heparin Units. It contains NLT 0.85% and NMT 0.95% of sodium chloride (NaCl). It may be buffered. It contains no antimicrobial agents. Prepare Anticoagulant Heparin Solution as follows.

Heparin Sodium	75,000 Units
Sodium Chloride Injection, sufficient quantity to make	1000 mL

Add the Heparin Sodium, in solid form or in solution, to the Sodium Chloride Injection, mix, filter if necessary, and sterilize.

### ASSAY

#### • ANTI-FACTOR IIa POTENCY

**pH 8.4 buffer:** Dissolve 6.10 g of tris(hydroxymethyl)aminomethane, 10.20 g of sodium chloride, 2.80 g of edetate sodium, and, if suitable, between 0 and 10.00 g of polyethylene glycol 6000 and/or 2.00 g of bovine serum albumin in 800 mL of water. [NOTE—2.00 g of human albumin may be substituted for 2.00 g of bovine serum albumin.] Adjust with hydrochloric acid to a pH of 8.4, and dilute with water to 1000 mL.

**Antithrombin solution:** Reconstitute a vial of antithrombin (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a solution of 5 Anti-thrombin IU/mL. Dilute this solution with *pH 8.4 buffer* to obtain a solution having a concentration of 0.125 Antithrombin IU/mL.

**Thrombin human solution:** Reconstitute thrombin human (factor IIa) (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to give 20 Thrombin IU/mL, and dilute with *pH 8.4 buffer* to obtain a solution having a concentration of 5 Thrombin IU/mL. [NOTE—The thrombin should have a specific activity of NLT 750 IU/mg.]

**Chromogenic substrate solution:** Prepare a solution of a suitable chromogenic thrombin substrate for amidolytic test (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a concentration of 1.25 mM.

**Stopping solution:** 20% (v/v) solution of acetic acid

**Standard solutions:** Reconstitute the entire contents of an ampule of USP Heparin Sodium for Assays RS with water, and dilute with *pH 8.4 buffer* to obtain at least four dilutions in the concentration range between 0.005 and 0.03 USP Heparin Unit/mL.

**Sample solutions:** Proceed as directed for *Standard solutions* to obtain concentrations of Anticoagulant Heparin Solution similar to those obtained for the *Standard solutions*.

#### Analysis

[NOTE—The procedure can also be performed using alternative platforms.]

For each dilution of the *Standard solutions* and the *Sample solutions*, at least duplicate samples should be tested. Label a suitable number of tubes, depending on the number of replicates to be tested. For example, if five blanks are to be used: B1, B2, B3, B4, and B5 for the blanks; T1, T2, T3, and T4 each at least in duplicate for the dilutions of the *Sample solutions*; and S1, S2, S3,

and S4 each at least in duplicate for the dilutions of the *Standard solutions*. Distribute the blanks over the series in such a way that they accurately represent the behavior of the reagents during the experiments. [NOTE—Treat the tubes in the order B1, S1, S2, S3, S4, B2, T1, T2, T3, T4, B3, T1, T2, T3, T4, B4, S1, S2, S3, S4, B5.] Note that after each addition of a reagent, the incubation mixture should be mixed without allowing bubbles to form. Add twice the volume (100–200  $\mu$ L) of *Anti-thrombin solution* to each tube containing one volume (50–100  $\mu$ L) of either the *pH 8.4 buffer* or an appropriate dilution of the *Standard solutions* or the *Sample solutions*. Mix, but do not allow bubbles to form. Incubate at 37° for at least 1 min. Add to each tube 25–50  $\mu$ L of *Thrombin human solution*, and incubate for at least 1 min. Add 50–100  $\mu$ L of *Chromogenic substrate solution*. Please note that all reagents, *Standard solutions*, and *Sample solutions* should be prewarmed to 37° just before use. Two different types of measurements can be recorded:

1. Endpoint measurement: Stop the reaction after at least 1 min with 50–100  $\mu$ L of *Stopping solution*. Measure the absorbance of each solution at 405 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)). The RSD over the blank readings is less than 10%.
2. Kinetic measurement: Follow the change in absorbance for each solution over 1 min at 405 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)). Calculate the change in absorbance/min ( $\Delta$ OD/min). The blanks for kinetic measurement are also expressed as  $\Delta$ OD/min and should give the highest values because they are carried out in the absence of heparin. The RSD over the blank readings is less than 10%.

**Calculations:** The statistical models for *Slope ratio assay* or *Parallel-line assay* can be used, depending on which model best describes the correlation between concentration and response.

**Parallel-line assay:** For each series, calculate the regression of the absorbance or change in absorbance/min against log concentrations of the *Standard solutions* and the *Sample solutions*, and calculate the potency of Anticoagulant Heparin Solution in USP Units/mL using statistical methods for parallel-line assays.

**Slope ratio assay:** For each series, calculate the regression of the log absorbance or the log change in absorbance/min against concentrations of the *Standard solutions* and the *Sample solutions*, and calculate the potency of Anticoagulant Heparin Solution in USP Units/mL using statistical methods for slope ratio assays.

**Acceptance criteria:** 90.0%–110.0% of the potency stated on the label in terms of USP Heparin Units.

#### • SODIUM CHLORIDE

**Sample solution:** Solution and potassium chromate TS (5:1)

**Analysis:** Titrate with 0.1 N silver nitrate VS. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of NaCl.

#### SPECIFIC TESTS

- **pH (791):** Between 5.0 and 7.5
- **BACTERIAL ENDOTOXINS (85):** It contains NMT 2.5 USP Endotoxin Units/mL.
- **INJECTIONS (1):** Meets the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose containers, of colorless, transparent Type I or Type II glass, or of a suitable plastic material (see *Transfusion and Infusion Assemblies and Similar Medical Devices* (161)).
- **LABELING:** Label it in terms of USP Heparin Units, and to indicate the number of mL of Solution required per 100 mL of whole blood.

#### • USP REFERENCE STANDARDS (11)

USP Endotoxin RS

USP Heparin Sodium for Assays RS

### Hepatitis B Immune Globulin

» Hepatitis B Immune Globulin conforms to the regulations of the FDA concerning biologics (see *Biologics* (1041)). It is a sterile, nonpyrogenic solution free from turbidity, consisting of globulins derived from the blood plasma of human donors who have high titers of antibodies against hepatitis B surface antigen. It contains not less than 10.0 g and not more than 18.0 g of protein per 100 mL, of which not less than 80 percent is monomeric immunoglobulin G, having no ultracentrifugally detectable fragments, nor aggregates having a sedimentation coefficient greater than 12S. It contains 0.3 M glycine as a stabilizing agent, and it contains a suitable preservative. It has a potency per mL not less than that of the U.S. Reference Hepatitis B Immune Globulin tested by an approved radioimmunoassay for the detection and measurement of antibody to hepatitis B surface antigen. It has a pH between 6.4 and 7.2, measured in a solution diluted to contain 1 percent of protein with 0.15 M sodium chloride. It meets the requirements of the test for heat stability.

**Packaging and storage—**Preserve at a temperature between 2° and 8°.

**Expiration date—**Its minimum expiration date is not later than 1 year after the date of manufacture, such date being that of the first valid potency test of the product.

**Labeling—**Label it to state that it is not for intravenous injection.

### Hexachlorophene

$C_{13}H_6Cl_6O_2$  406.90

Phenol, 2,2'-methylenebis[3,4,6-trichloro-2,2'-Methylenebis[3,4,6-trichlorophenol] [70-30-4].

» Hexachlorophene contains not less than 98.0 percent and not more than 100.5 percent of  $C_{13}H_6Cl_6O_2$ , calculated on the dried basis.

**Packaging and storage—**Preserve in tight, light-resistant containers.

**USP Reference standards (11)—**

USP Hexachlorophene RS

**Identification—**

**A:** *Infrared Absorption* (197K).

**B:** To a solution of about 5 mg in 5 mL of alcohol add 1 drop of ferric chloride TS: a transient purple color is produced immediately.

**Melting range** (741): between 161° and 167°.

**Loss on drying** (731)—Dry it at 105° for 4 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Limit of 2,3,7,8-tetrachlorodibenzo-*p*-dioxin**—[*Cautions*—Since 2,3,7,8-tetrachlorodibenzo-*p*-dioxin is an extremely toxic substance, exercise all necessary precautions in the conduct of this procedure.] Dissolve 10.0 g of Hexachlorophene in 50 mL of methanol, transfer to a 1-Liter separator with the aid of 25 mL of methanol, add 25 mL of 2.5 N lithium hydroxide and 225 mL of water, and extract with two 200-mL portions of freshly distilled *n*-hexane. Dry the combined *n*-hexane extracts over anhydrous sodium sulfate, filter, and evaporate to a volume of about 15 mL on a rotary evaporator at a bath temperature not exceeding 40°. Transfer this solution in portions to a 12-mL centrifuge tube, concentrating each time to a volume of 1 mL in a gentle stream of nitrogen in a warm water bath. Rinse the flask with 15 mL of *n*-hexane, and evaporate similarly. Wash down the walls of the tube with 10 mL of *n*-hexane, and again evaporate to a volume of 1.0 mL. Cool, and transfer to a micro-column that has been prepared in the following manner. Place a small plug of glass wool in a 5- × 15-mm pipet, add a small amount of sand and 1.0 g of basic alumina, tap several times to pack down the alumina, and heat in a vacuum oven at 110° for 3 hours. Store under vacuum.

Elute the column with 10 mL of a mixture of *n*-hexane and methylene chloride (9:1), using a portion to rinse the tube. Collect the eluate in a 12-mL graduated centrifuge tube, and concentrate in a gentle stream of nitrogen in a warm water bath to a volume of 1.0 mL.

Inject 2.0 µL of the concentrated eluate into a suitable gas chromatograph connected to a mass spectrograph equipped with a multiple-ion detector (see *Chromatography* (621) and *Mass Spectrometry* (736)). The gas chromatograph is fitted with a 2-mm × 1-m glass column containing liquid phase G1 on support S1. The carrier gas is helium, flowing at the rate of 40 mL per minute. The column temperature is maintained at 250° and the injection port is maintained at 300°. Similarly inject 2.0 µL of a Standard solution of 2,3,7,8-tetrachlorodibenzo-*p*-dioxin containing 0.01 µg per mL.\*

The sum of the peak heights at mass values of 320, 322, and 324 obtained from the solution under test is not greater than the sum of the peak heights at the same mass values obtained from the Standard solution. The limit is 1 ppb.

**Assay**—Accurately weigh about 1.5 g of Hexachlorophene, dissolve in 25 mL of alcohol, and titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium hydroxide is equivalent to 40.69 mg of C<sub>13</sub>H<sub>6</sub>Cl<sub>6</sub>O<sub>2</sub>.

**Packaging and storage**—Preserve in tight, light-resistant, non-metallic containers.

**USP Reference standards** (11)—

USP Hexachlorophene RS

**Identification**—Place a volume of Emulsion, equivalent to about 150 mg of hexachlorophene, in a glass-stoppered, 25-mL graduated cylinder, dilute with a mixture of equal volumes of chloroform and methanol to volume, mix, and allow to stand for about 5 minutes. Apply 10 µL of this solution and 10 µL of a solution of USP Hexachlorophene RS in the same chloroform and methanol mixture containing 6 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of silica gel. Develop the chromatogram in a solvent system consisting of a mixture of toluene and glacial acetic acid (9:1) until the solvent moves to about 10 cm above the point of application. Remove the plate, mark the solvent front and evaporate the solvent in a current of warm air. Spray the plate with dilute nitric acid (1 in 5), and warm on a hot plate until yellow spots appear: the *R<sub>f</sub>* value of the principal spot obtained from the solution under test corresponds to that obtained from the Standard solution.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**pH** (791)—Place 20 mL of the well-shaken Emulsion and 10 mL of water in a glass-stoppered, 50-mL graduated cylinder, mix, and determine the pH in a suitable pH meter, using a glass electrode and preferably a sleeve-type calomel electrode: the pH is between 5.0 and 6.0.

**Assay—**

**Standard preparation**—Weigh accurately about 50 mg of USP Hexachlorophene RS into a 50-mL volumetric flask, add 10 mL of methanol, shake until dissolved, add methanol to volume, and mix. Pipet 3 mL of this solution into a 100-mL volumetric flask, add 1 mL of dilute hydrochloric acid (1 in 10), add methanol to volume, and mix.

**Assay preparation**—Transfer an accurately weighed portion of Emulsion, equivalent to about 30 mg of hexachlorophene, to a 100-mL volumetric flask, add methanol to volume, and mix. Filter the solution through paper, taking adequate precautions to prevent evaporation. Pipet a 10-mL aliquot of the filtrate into a 100-mL volumetric flask, add 1 mL of dilute hydrochloric acid (1 in 10), and add methanol to volume.

**Procedure**—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* in 1-cm cells at the wavelength of maximum absorbance at about 299 nm, with a suitable spectrophotometer, using a mixture of 99 volumes of methanol and 1 volume of hydrochloric acid as the blank. Calculate the quantity, in mg, of C<sub>13</sub>H<sub>6</sub>Cl<sub>6</sub>O<sub>2</sub> in the portion of Emulsion taken by the formula:

$$C(A_U / A_S)$$

in which *C* is the concentration, in µg per mL, of USP Hexachlorophene RS in the *Standard preparation*; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Hexachlorophene Cleansing Emulsion

» Hexachlorophene Cleansing Emulsion is Hexachlorophene in a suitable aqueous vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>13</sub>H<sub>6</sub>Cl<sub>6</sub>O<sub>2</sub>. It contains no coloring agents.

\* A solution in anisole is available commercially from KOR Isotopes, Div. of ECO, Inc., 56 Rogers St., Cambridge, Mass. 02142. This solution may be diluted with a mixture of *n*-hexane and methylene chloride (9:1) to the required concentration.

## Hexachlorophene Liquid Soap

» Hexachlorophene Liquid Soap is a solution of Hexachlorophene in a 10.0 to 13.0 percent solution of a potassium soap. It contains, in each 100 g, not less than 225 mg and not more than

260 mg of  $C_{13}H_6Cl_6O_2$ . It may contain suitable water hardness controls.

**NOTE**—The inclusion of nonionic detergents in Hexachlorophene Liquid Soap in amounts greater than 8 percent on a total weight basis may decrease the bacteriostatic activity of the Soap.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—Solutions of higher concentrations of hexachlorophene and potassium soap, in which the ratios of these components are consistent with the official limits, may be labeled "For the preparation of Hexachlorophene Liquid Soap, USP," provided that the label indicates also that the soap is a concentrate, and provided that directions are given for dilution to the official strength.

**USP Reference standards** (11)—

USP Hexachlorophene RS

**Identification**—

**A:** Pour about 2 g into a beaker, and add, with stirring, dilute hydrochloric acid (1 in 100) until the mixture is just acid to litmus. To 10 mL of the mixture, in a beaker, add 10 mL of chloroform, and mix. Add 3 or 4 drops of ferric chloride TS, mix, and allow to stand: the chloroform layer becomes purple.

**B:** To 2 mL of the mixture prepared in *Identification* test A, in a test tube, add 2 mL of acetone, and mix. Add 1 mL of titanium trichloride solution (1 in 5), and shake vigorously: a yellow oil separates.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Water**—Place about 5 g, quickly weighed to the nearest centigram, in the distilling flask of the apparatus for *Water Determination—Azeotropic Method* (921). (The Soap is most conveniently weighed in a boat of metal foil, of a size that will just pass through the neck of the flask.) Place 250 mL of toluene and 10 g of anhydrous barium chloride in the flask, connect the flask through a ground-glass joint to the distilling apparatus, fill the receiving tube with toluene, and determine the water as directed, beginning with "Heat the flask gently." The volume of water found corresponds to between 86.5% and 90.0% by weight of the portion of Soap taken.

**Alcohol-insoluble substances**—Dissolve about 5 g, rapidly and accurately weighed, in 100 mL of hot neutralized alcohol, collect the residue, if any, on a tared filter, thoroughly wash it with hot neutralized alcohol, and dry at 105° for 1 hour: the weight of the residue obtained does not exceed 3.0% of the weight of Soap taken. Retain the solution and the residue.

**Free alkali hydroxides**—To the combined filtrate and washings obtained in the test for *Alcohol-insoluble substances*, add 0.5 mL of phenolphthalein TS. If a pink color is produced, titrate the solution with 0.1 N sulfuric acid VS until the pink color is just discharged. Each mL of 0.1 N sulfuric acid is equivalent to 5.61 mg of KOH. The volume of 0.1 N sulfuric acid consumed corresponds to not more than 0.05% of KOH.

**Alkali carbonates**—Wash the filter containing the *Alcohol-insoluble substances* with 50 mL of boiling water, cool, add methyl orange TS, and titrate the filtrate with 0.1 N sulfuric acid VS. Not more than 0.5 mL of 0.1 N sulfuric acid per g of Soap originally taken is required (0.35% calculated as  $K_2CO_3$ ).

**Assay for hexachlorophene**—

*Alkaline buffer*—Dissolve 6.07 g of tris(hydroxymethyl)aminomethane in 900 mL of methanol. Add 25.0 mL of dilute hydrochloric acid (1 in 10), dilute with water to 1 liter, and mix.

*Standard preparation*—Place about 50 mg of USP Hexachlorophene RS, accurately weighed, in a 100-mL volumetric flask, dissolve in 10 mL of alcohol, and dilute with *Alkaline buffer* to volume. Preserve in a tight container.

*Standard hexachlorophene graph*—To 50-mL volumetric flasks add, by pipet and in duplicate, 2-, 3-, 4-, 5-, 6-, and 7-mL portions of the *Standard preparation*. To one flask of each pair of duplicates, add to volume acidified 90 percent methanol containing, in each 100 mL, 5 mL of acetic acid and 0.3 mL of hydrochloric acid, and mix. To the second flask of each pair, add *Alkaline buffer* to volume.

Arrange the two series of standard hexachlorophene solutions in pairs according to their hexachlorophene content, and determine the absorbances of the alkaline solutions at 312 nm, with a suitable spectrophotometer, using the corresponding acid solution as the blank. Plot the observed absorbance on the ordinate scale against the corresponding concentration of hexachlorophene, in mg per 100 mL, on the abscissa scale.

*Procedure*—Accurately weigh a portion of Soap, containing the equivalent of about 100 mg of hexachlorophene, and transfer to a 100-mL volumetric flask. Add alcohol to volume, and mix. Transfer 25.0 mL of this solution to a 100-mL volumetric flask, add 90 percent methanol to volume, mix, and filter if necessary. Add 10.0 mL of this solution to each of two 50-mL volumetric flasks, and fill one flask to volume with 0.3 M acetic acid in 90 percent methanol containing 0.1% of hydrochloric acid, and mix. Fill the other flask to volume with *Alkaline buffer*, and mix. Determine the absorbance of the alkaline solution at 312 nm with the same spectrophotometer used in preparing the *Standard hexachlorophene graph*, using the control as the blank. From the observed absorbance, calculate the weight of hexachlorophene in the Soap taken.

## Hexylresorcinol

$C_{12}H_{18}O_2$  194.27  
1,3-Benzenediol, 4-hexyl-  
4-Hexylresorcinol [136-77-6].

» Hexylresorcinol, dried over silica gel for 4 hours, contains not less than 98.0 percent and not more than 100.5 percent of  $C_{12}H_{18}O_2$ .

**Caution**—Hexylresorcinol is irritating to the oral mucosa and respiratory tract and to the skin, and its solution in alcohol has vesicant properties.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Identification**—

**A:** To 1 mL of a saturated solution of it add 1 mL of nitric acid: a light red color appears.

**B:** To 1 mL of a saturated solution of it add 1 mL of bromine TS: a yellow, flocculent precipitate is formed. Add 2 mL of 6 N ammonium hydroxide: the precipitate dissolves, producing a yellow solution.

**Melting range**, *Class I* (741): between 62° and 67°.

**Acidity**—Dissolve 250 mg in 500 mL of water, add methyl red TS, and titrate with 0.020 N sodium hydroxide: no more than 1.0 mL is required for neutralization.

**Residue on ignition** (281): not more than 0.1%.

**Mercury**—[NOTE—Select all reagents for this test to have as low a content of mercury as practicable, and store all rea-

gent solutions in containers of borosilicate glass. Glassware used in this test shall be specially cleaned by being soaked in warm 8 N nitric acid for 30 minutes and rinsed with water. Keep flasks for this determination separate from other flasks, and use only for mercury determinations.]

**Standard preparation**—Transfer 34.0 mg of mercuric chloride to a 250-mL volumetric flask. Add 1 drop of hydrochloric acid, add water to dissolve, and dilute with water to volume. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, add 1 drop of hydrochloric acid, and dilute with water to volume. Transfer 1.0 mL of this solution to a 500-mL volumetric flask, add 1 drop of hydrochloric acid, and dilute with water to volume.

**Test preparation**—Transfer 134 mg to a 250-mL beaker, and cautiously add 10 mL of 11 N nitric acid and 10 mL of 18 N sulfuric acid. Digest, with the aid of heat, in a well-ventilated hood until the evolution of brown fumes ceases. Cautiously add an additional 10 mL of 11 N nitric acid, and continue heating until no more fumes are evolved. Cool, transfer to a 200-mL volumetric flask, and dilute with water to volume.

**Procedure**—Transfer 100 mL of *Standard preparation* to a 300-mL mercury analysis reaction vessel, add 2 drops of potassium permanganate solution (1 in 20), and mix (the solution should be purple; add additional permanganate solution dropwise, if necessary). Add 5 mL of 11 N nitric acid, stir, and allow to stand for not less than 15 seconds. Add 5 mL of 18 N sulfuric acid, stir, and allow to stand for not less than 45 seconds. Add 5 mL of hydroxylamine hydrochloride solution (3 in 200), stir, and allow to stand until the solution turns light yellow or colorless. Add 5 mL of stannous chloride solution (1 in 10) [NOTE—Disregard the presence of insoluble matter in this solution; mix prior to use], immediately insert the aerator connected to the air pump, and determine the maximum absorbance of the treated *Standard preparation* at the mercury resonance line of 253.65 nm, with a suitable atomic absorption spectrophotometer equipped with a mercury hollow-cathode lamp and an absorption cell that permits the flameless detection of mercury. Connect in a closed system with a circulating air pump, a calcium chloride drying tube, and an aerator inserted in a 300-mL reaction vessel so that air passed through the treated preparation contained in the reaction vessel evaporates any metallic mercury present. In a similar manner, treat 100 mL of the *Test preparation* and 100 mL of water (reagent blank), and determine the maximum absorbances at the same wavelength [NOTE—Check the zero setting of the instrument frequently]. The absorbance of the solution from the *Test preparation* does not exceed that of the solution from the *Standard preparation* (3 ppm).

**Resorcinol and other phenols**—Shake about 1 g with 50 mL of water for a few minutes, filter, and to the filtrate add 3 drops of ferric chloride TS: no red or blue color is produced.

**Assay**—Dissolve 70 mg to 100 mg of Hexylresorcinol, previously dried over silica gel for 4 hours and accurately weighed, in 10 mL of methanol in a 250-mL iodine flask. Add 30.0 mL of 0.1 N bromine VS, then add quickly 5 mL of hydrochloric acid, and insert the stopper in the flask immediately. Cool the flask under running water to room temperature, shake vigorously for 5 minutes, then set aside for 5 minutes. Add 6 mL of potassium iodide TS around the stopper, cautiously loosen the stopper, again insert the stopper tightly, and swirl gently. Add 1 mL of chloroform, and titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination (see *Residual Titrations under Titrimetry* (541)). Each mL of 0.1 N bromine is equivalent to 4.857 mg of  $C_{12}H_{18}O_2$ .

## Hexylresorcinol Lozenges

» Hexylresorcinol Lozenges contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{12}H_{18}O_2$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Hexylresorcinol RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**Mobile phase**—Dissolve 3.4 g of monobasic potassium phosphate in about 850 mL of water, adjust with phosphoric acid to a pH of  $3.0 \pm 0.05$ , dilute with water to 1000 mL, mix, and pass through a suitable filter having a 0.5- $\mu$ m or finer porosity. Prepare a mixture of methanol and this solution (650:350), and degas. Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

**Internal standard solution**—Prepare a solution in *Mobile phase* containing about 0.25 mg of hexanophenone per mL.

**Standard preparation**—Transfer about 40 mg of USP Hexylresorcinol RS, accurately weighed, to a 100-mL volumetric flask, dissolve in *Mobile phase*, dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of this solution and 10.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains about 0.08 mg of USP Hexylresorcinol RS per mL.

**Assay preparation**—Weigh and pulverize not fewer than 20 Lozenges. Transfer an accurately weighed portion of the powder, equivalent to about 4 mg of hexylresorcinol, to a 50-mL volumetric flask, add 10.0 mL of *Internal standard solution* and 20 mL of *Mobile phase*, and shake until dissolved. Dilute with *Mobile phase* to volume, and mix. Filter a portion of this solution through a suitable filter of 0.5  $\mu$ m or finer porosity, and use the filtrate as the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L7 and is maintained at  $37 \pm 2^\circ$ . The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.6 for hexylresorcinol and 1.0 for hexanophenone, the tailing factor is not less than 0.9 and not more than 1.4, the column efficiency is not less than 1500 theoretical plates, and the relative standard deviation for replicate injections is not more than 2.0%. Inject the *Assay preparation*, and record the peak responses as directed under *Procedure*: the resolution,  $R$ , between the hexylresorcinol peak and the nearest adjacent peak is not less than 1.2.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{12}H_{18}O_2$  in the portion of Lozenges taken by the formula:

$$50C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Hexylresorcinol RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the responses of the hexylresorcinol peak

and the hexanophenone peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Histamine Phosphate

$C_5H_9N_3 \cdot 2H_3PO_4$  307.14

1*H*-Imidazole-4-ethanamine, phosphate (1:2).

Histamine phosphate (1:2) [51-74-1].

» Histamine Phosphate contains not less than 98.0 percent and not more than 101.0 percent of  $C_5H_9N_3 \cdot 2H_3PO_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

### Identification—

**A:** Dissolve 0.10 g in a mixture of 7 mL of water and 3 mL of 1 N sodium hydroxide, and add the solution to a mixture of 50 mg of sulfanilic acid, 10 mL of water, 2 drops of hydrochloric acid, and 2 drops of sodium nitrite solution (1 in 10): a deep red color is produced.

**B:** Dissolve 50 mg in 5 mL of hot water, add a hot solution of 50 mg of picrolonic acid in 10 mL of alcohol, and allow to crystallize. Filter the crystals with suction, wash with a small amount of ice-cold water, and dry at 105° for 1 hour: the crystals so obtained melt between 250° and 254°, with decomposition.

**C:** A solution (1 in 10) responds to the tests for *Phosphate* (191).

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 3.0% of its weight.

**Assay**—Dissolve about 150 mg, accurately weighed, of Histamine Phosphate in 10 mL of water. Add 5 mL of chloroform and 25 mL of alcohol, then add 10 drops of thymolphthalein TS, and titrate with 0.2 N sodium hydroxide VS. Each mL of 0.2 N sodium hydroxide is equivalent to 15.36 mg of  $C_5H_9N_3 \cdot 2H_3PO_4$ .

## Histamine Phosphate Injection

» Histamine Phosphate Injection is a sterile solution of Histamine Phosphate in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_5H_9N_3 \cdot 2H_3PO_4$ .

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

### USP Reference standards (11)—

USP Endotoxin RS

USP Histamine Dihydrochloride RS

### Identification—

**A:** Evaporate a volume of Injection, equivalent to about 2 mg of histamine phosphate, on a steam bath to dryness, dissolve the residue in 0.5 mL of water, and add 0.5 mL of 1 N sodium hydroxide. Add 2 drops of sodium nitrite solution (1 in 10), and add 1 mL of a solution prepared by mixing 50 mg of sulfanilic acid with 10 mL of water containing 2 drops of hydrochloric acid: an orange-red color is produced.

**B:** To 1 mL of Injection, equivalent to not less than 1 mg of histamine phosphate (concentrate a larger volume by evaporation, if necessary), add ammonium molybdate TS dropwise: a yellow precipitate, which is soluble in ammonia TS, is formed.

**Bacterial endotoxins** (85)—It contains not more than 125.0 USP Endotoxin Units per mg of histamine phosphate.

**pH** (791): between 3.0 and 6.0.

**Other requirements**—It meets the requirements under *Injections* (1).

### Assay—

**Standard preparation**—Dissolve an accurately weighed quantity of USP Histamine Dihydrochloride RS in water, and quantitatively dilute with water to obtain a solution having a known concentration of 20 µg per mL, equivalent to 33.4 µg of histamine phosphate.

**Assay preparation**—Dilute an accurately measured volume of Injection, equivalent to about 1.65 mg of histamine phosphate, with water in a 50-mL volumetric flask to volume, and mix.

If *phenol* is present, prepare the *Assay preparation* as follows. Dilute an accurately measured volume of Injection, equivalent to about 1.65 mg of histamine phosphate, with water to about 25 mL. Heat the solution on a steam bath until the odor of phenol is no longer perceptible, adding water as required to maintain a volume of about 15 mL. Transfer to a 50-mL volumetric flask, cool, dilute with water to volume, and mix.

**Procedure**—Pipet 5 mL each of the *Standard preparation* and the *Assay preparation* into separate, 10-mL volumetric flasks, to each add 1 mL of sodium borate solution (1 in 100), followed by 1 mL of a freshly prepared solution of 50 mg of β-naphthoquinone-4-sodium sulfonate in 10 mL of water. Place the flasks in boiling water for 10 minutes, then immerse them for 5 minutes in water maintained between 5° and 10°. To each flask, add 1 mL of acid-formaldehyde (made by adding 0.5 mL of formaldehyde TS to a mixture of 45 mL of 1 N hydrochloric acid and 10 mL of glacial acetic acid and diluting with water to 80 mL), mix, add 1 mL of 0.1 N sodium thiosulfate, then dilute with water to volume, and mix. Concomitantly and immediately determine the absorbances of both solutions at the wavelength of maximum absorbance at about 460 nm, with a suitable spectrophotometer, against a reagent blank. Calculate the quantity, in mg, of  $C_5H_9N_3 \cdot 2H_3PO_4$  in each mL of the Injection taken by the formula:

$$C(0.0835 / V)(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Histamine Dihydrochloride RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Histidine

$C_6H_9N_3O_2$   
L-Histidine [71-00-1].

155.15

### DEFINITION

Histidine contains NLT 98.5% and NMT 101.5% of L-histidine ( $C_6H_9N_3O_2$ ), calculated on the dried basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K): The *Sample* and USP L-Histidine RS are previously recrystallized from 80% alcohol.

**ASSAY**• **PROCEDURE**

**Sample:** 150 mg of Histidine

**Blank:** Mix 3 mL of formic acid and 50 mL of glacial acetic acid.

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid VS

**Endpoint detection:** Potentiometric

**Analysis:** Dissolve the *Sample* in 3 mL of formic acid and 50 mL of glacial acetic acid. Titrate very slowly with the *Titrant*. Perform the *Blank* determination.

Calculate the percentage of histidine (C<sub>6</sub>H<sub>9</sub>N<sub>3</sub>O<sub>2</sub>) in the *Sample* taken:

$$\text{Result} = \{(V_s - V_b) \times N \times F\} / W \times 100$$

$V_s$  = *Titrant* volume consumed by the *Sample* (mL)

$V_b$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = actual normality of the *Titrant* (mEq/mL)

$F$  = equivalency factor, 155.2 mg/mEq

$W$  = *Sample* weight (mg)

**Acceptance criteria:** 98.5%–101.5% on the dried basis

**IMPURITIES**

- **RESIDUE ON IGNITION** (281): NMT 0.4%
- **CHLORIDE AND SULFATE**, *Chloride* (221)  
**Standard solution:** 0.50 mL of 0.020 N hydrochloric acid  
**Sample:** 0.73 g of Histidine  
**Acceptance criteria:** NMT 0.05%
- **CHLORIDE AND SULFATE**, *Sulfate* (221)  
**Standard solution:** 0.10 mL of 0.020 N sulfuric acid  
**Sample:** 0.33 g of Histidine  
**Acceptance criteria:** NMT 0.03%
- **IRON** (241): NMT 30 ppm
- **HEAVY METALS**, *Method I* (231): NMT 15 ppm
- **RELATED COMPOUNDS**

**System suitability solution:** 0.4 mg/mL each of USP L-Histidine RS and USP L-Proline RS

**Standard solution:** 0.05 mg/mL of USP L-Histidine RS in water. [NOTE—This solution has a concentration equivalent to 0.5% of the *Sample solution*.]

**Sample solution:** 10 mg/mL of Histidine in water

**Chromatographic system**

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 5  $\mu$ L

**Developing solvent system:** Butyl alcohol, glacial acetic acid, and water (3:1:1)

**Spray reagent:** 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)

**System suitability**

**Suitability requirements:** The chromatogram of the *System suitability solution* exhibits two clearly separated spots.

**Analysis**

**Samples:** *System suitability solution*, *Standard solution*, and *Sample solution*  
After air-drying the plate, spray with *Spray reagent*, and heat between 100° and 105° for 15 min. Examine the plate under white light.

**Acceptance criteria:** Any secondary spot of the *Sample solution* is not larger or more intense than the principal spot of the *Standard solution*.

**Individual impurities:** NMT 0.5%

**Total impurities:** NMT 2.0%

**SPECIFIC TESTS**

- **OPTICAL ROTATION**, *Specific Rotation* (781S)  
**Sample solution:** 110 mg/mL in 6 N hydrochloric acid  
**Acceptance criteria:** +12.6° to +14.0°
- **pH** (791)  
**Sample solution:** 20 mg/mL solution  
**Acceptance criteria:** 7.0–8.5
- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 0.2% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)  
USP L-Histidine RS  
USP L-Proline RS

**Homatropine Hydrobromide**

C<sub>16</sub>H<sub>21</sub>NO<sub>3</sub> · HBr 356.25

Benzeneacetic acid,  $\alpha$ -hydroxy-, 8-methyl-8-azabicyclo[3.2.1]oct-3-yl ester, hydrobromide, *endo*-(±)-. 1 $\alpha$ H,5 $\alpha$ H-Tropan-3 $\alpha$ -ol mandelate (ester) hydrobromide [51-56-9].

» Homatropine Hydrobromide contains not less than 98.0 percent and not more than 102.0 percent of C<sub>16</sub>H<sub>21</sub>NO<sub>3</sub> · HBr, calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Homatropine Hydrobromide RS  
USP Scopolamine Hydrobromide RS

**Identification**—

**A: Infrared Absorption** (197K).

**B:** It responds to the tests for *Bromide* (191).

**pH** (791): between 5.7 and 7.0, in a solution (1 in 50).

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 1.5% of its weight.

**Residue on ignition** (281): not more than 0.25%.

**Limit of tropine**—

**Adsorbent:** 0.2-mm layer of chromatographic silica gel mixture.

**Diluent**—Prepare a mixture of methanol and water (9:1).

**Test solution**—Transfer about 0.2 g of Homatropine Hydrobromide to a 5-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

**Standard solution**—Dilute 0.5 mL of the *Test solution* with *Diluent* to 100.0 mL.

**Tropine reference solution**—Prepare a solution of tropine having a concentration of about 0.4 mg per mL.

**Application volume:** 1  $\mu$ L.

**Developing solvent system:** a mixture of ethyl acetate, anhydrous formic acid, and water (67:16.5:16.5).

**Procedure**—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621), applying the *Test solu-*

tion, the *Standard solution*, and the *Tropine reference solution*. Spray the plate with Dragendorff's reagent, followed by hydrogen peroxide TS, and immediately cover with a glass plate of the same size. Examine the plate no later than 5 to 10 minutes after spraying. In the chromatogram obtained from the *Test solution*, identify the spot corresponding to the principal spot in the chromatogram of the *Tropine reference solution*: this spot is not more intense than the spot obtained from the *Standard solution*: not more than 0.5% of tropine is found.

#### Chromatographic purity—

*Buffer solution*, *Mobile phase*, *System suitability solution*, and *Chromatographic system*—Proceed as directed in the Assay.

*Standard solution*—Use the *Standard preparation*, prepared as directed in the Assay.

*Test solution*—Use the *Assay preparation*, prepared as directed in the Assay.

*Procedure*—Separately inject a volume (about 7  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the responses for the major peaks. Continue the elution for 2.2 times the retention time of the homatropine peak. Disregard the peak for the bromide ion, which appears close to the solvent peak. Calculate the percentage of each impurity in the portion of Homatropine Hydrobromide taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  and  $r_s$  are the peak response for each impurity and the sum of all peak responses, respectively, obtained from the *Test solution*. In addition to not exceeding the limits for each impurity in Table 1, not more than 0.1% of any other individual impurity is found; and not more than 1.0% of total impurities is found.

Table 1

Impurity	Relative Retention Time	Limit (%)
Mandelic acid	0.3	0.1
Dehydrohomatropine	0.9	0.5
Scopolamine	1.1	0.1
Atropine	1.9	0.1

#### Assay—

*Buffer solution*—Dissolve 6.8 g of monobasic potassium phosphate and 7.0 g of sodium 1-heptanesulfonate monohydrate in 1000 mL of water, adjust with 3 M phosphoric acid to a pH of 2.7, and mix.

*Mobile phase*—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (67:33).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Homatropine Hydrobromide RS in *Mobile phase* to obtain a solution having a concentration of about 2 mg per mL.

*System suitability solution*—Prepare a solution of USP Scopolamine Hydrobromide RS having a concentration of about 0.1 mg per mL. Transfer 10 mL of this solution to a 100-mL volumetric flask, add 0.5 mL of the *Standard preparation*, and dilute with *Mobile phase* to volume.

*Assay preparation*—Transfer about 100 mg of Homatropine Hydrobromide, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm  $\times$  10-cm column that contains 3- $\mu$ m packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 40°. Chromatograph the *Stan-*

*dard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.0%. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution between homatropine and scopolamine peaks is not less than 1.5.

*Procedure*—Separately inject equal volumes (about 7  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{16}H_{21}NO_3 \cdot HBr$  in the portion of Homatropine Hydrobromide taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Homatropine Hydrobromide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Homatropine Hydrobromide Ophthalmic Solution

» Homatropine Hydrobromide Ophthalmic Solution is a sterile, buffered, aqueous solution of Homatropine Hydrobromide. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_{16}H_{21}NO_3 \cdot HBr$ . It may contain suitable antimicrobial agents.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—  
USP Homatropine Hydrobromide RS

#### Identification—

**A:** Proceed with Ophthalmic Solution as directed under *Identification*—*Organic Nitrogenous Bases* <181>. The specified results are obtained.

**B:** It responds to the tests for *Bromide* <191>.

**Sterility** <71>: meets the requirements.

**pH** <791>: between 2.5 and 5.0.

#### Assay—

*Standard preparation*—Accurately weigh about 50 mg of USP Homatropine Hydrobromide RS, dissolve in water, and dilute with water in a volumetric flask to 100 mL. Dilute 10.0 mL of this solution with water to 50.0 mL to obtain a solution having a known concentration of about 100  $\mu$ g per mL. Prepare this solution fresh.

*Assay preparation*—Transfer a portion of Ophthalmic Solution, equivalent to 50 mg of homatropine hydrobromide, to a 100-mL volumetric flask, and dilute with water to volume. Dilute 10.0 mL of this solution with water to 50.0 mL.

*Procedure*—Transfer duplicate 2-mL portions of the *Standard preparation* and of the *Assay preparation* to separate glass-stoppered, 40-mL centrifuge tubes. To one set of two tubes add 3 mL of water and 1 mL of sodium hydroxide solution (1 in 100). Heat these tubes in a boiling water bath for 20 minutes, and allow to cool to room temperature. To the remaining set of tubes, which serve as blanks for the *Standard preparation* and the *Assay preparation*, respectively, add 4 mL of water. To each tube, add 2 mL of approximately 0.2 M ceric sulfate in diluted sulfuric acid (prepared by dissolving 12.6 g of ceric ammonium sulfate in 50 mL of water and 3 mL of sulfuric acid, and diluting with water to 100 mL) and 20.0 mL of isooctane. Shake by mechanical means for 15 minutes, allow the layers to separate, and remove the isooctane from each tube. Concomitantly deter-

mine the absorbances of the isooctane solutions from the hydrolyzed aliquots in 1-cm cells at the wavelength of maximum absorbance at about 242 nm, with a suitable spectrophotometer, against the respective blanks. Calculate the quantity, in mg, of  $C_{16}H_{21}NO_3 \cdot HBr$  in the portion of Ophthalmic Solution taken by the formula:

$$0.5C(A_U / A_S)$$

in which C is the concentration, in  $\mu g$  per mL, of USP Homatropine Hydrobromide RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Homatropine Methylbromide

$C_{17}H_{24}BrNO_3$  370.28  
8-Azoniabicyclo[3.2.1]octane, 3-(hydroxyphenylacetyl)oxy-8,8-dimethyl-, bromide, *endo*-(±)-;  
3 $\alpha$ -Hydroxy-8-methyl-1 $\alpha$ H,5 $\alpha$ H-tropanium bromide mandelate;  
(1*R*,3*S*,5*S*)-3-[[*(2R)*-2-Hydroxy-2-phenylacetyl]oxy]-8,8-dimethyl-8-azoniabicyclo[3.2.1]octane bromide [80-49-9].

### DEFINITION

Homatropine Methylbromide contains NLT 98.0% and NMT 102.0% of  $C_{17}H_{24}BrNO_3$ , calculated on the dried basis.

### IDENTIFICATION

#### A. INFRARED ABSORPTION <197K>

[NOTE—If differences are observed, dissolve the specimen and the Reference Standard separately in methanol, and recrystallize by adding dioxane to each solution.]

#### B. IDENTIFICATION TESTS—GENERAL, Bromide <191>

**Sample solution:** 50 mg/mL in water

**Acceptance criteria:** Meets the requirements

### ASSAY

#### Procedure

**Solution A:** 3.4 g/L of monobasic potassium phosphate and 5 g/L of 1-pentanesulfonic acid sodium salt in water. Adjust with a 330-g/L solution of phosphoric acid to a pH of 3.0.

**Solution B:** Acetonitrile and *Solution A* (3:2)

**Diluent:** Acetonitrile and *Solution A* (9:41)

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	70	30
2	70	30
15	30	70
15.1	70	30
20	70	30

**System suitability solution:** 0.01 mg/mL each of USP Homatropine Methylbromide RS and USP Homatropine Hydrobromide RS in *Diluent*

**Standard solution:** 2.0 mg/mL of USP Homatropine Methylbromide RS in *Diluent*

**Sample solution:** 2.0 mg/mL of Homatropine Methylbromide in *Diluent*

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  15-cm; 3- $\mu m$  packing L1

**Flow rate:** 1.4 mL/min

**Injection size:** 5  $\mu L$

### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for homatropine methylbromide and homatropine hydrobromide are 1.0 and 1.14, respectively.]

### Suitability requirements

**Resolution:** NLT 2.5 between homatropine methylbromide and homatropine hydrobromide, *System suitability solution*

**Tailing factor:** NMT 1.5 for homatropine methylbromide peak, *System suitability solution*

**Relative standard deviation:** NMT 1%, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{17}H_{24}BrNO_3$  in the portion of Homatropine Methylbromide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of Homatropine Methylbromide from the *Sample solution*

$r_S$  = peak response of homatropine methylbromide from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

### IMPURITIES

#### Inorganic Impurities

• **RESIDUE ON IGNITION** <281>: NMT 0.1%

#### Organic Impurities

#### PROCEDURE

**Solution A, Solution B, Diluent, Mobile phase, System suitability solution, and Sample solution:** Proceed as directed in the *Assay*.

**Standard solution:** 0.01 mg/mL of USP Homatropine Methylbromide RS in *Diluent*

**Chromatographic system:** Proceed as directed in the *Assay*, except for injection size.

**Injection size:** 10  $\mu L$

### System suitability

**Sample:** *System suitability solution*

### Suitability requirements

**Resolution:** NLT 2.5 between homatropine methylbromide and homatropine hydrobromide

**Tailing factor:** NMT 1.5 for the homatropine methylbromide peak

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of any individual impurity in the portion of Homatropine Methylbromide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of homatropine methylbromide from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)  
[NOTE—Reporting level for impurities is 0.05%.]

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 1.0%

[NOTE—Disregard the peak due to the bromide ion that elutes close to the solvent peak at about 1 min.]

**Impurity Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Methyldehydrohomatropine bromide <sup>a</sup>	0.94	0.5
Homatropine methylbromide	1.0	—
Homatropine hydrobromide	1.1	0.5
Any other individual impurity	—	0.1

<sup>a</sup> (1*R*,3*S*,5*S*)-3-[[[(2*R*)-2-Hydroxy-2-phenylacetyl]oxy]-8,8-dimethyl-8-azoniabicyclo[3.2.1]oct-6-ene.

#### SPECIFIC TESTS

##### • pH (791)

**Sample solution:** 50 mg/mL in carbon dioxide-free water

**Acceptance criteria:** 4.5–6.5

##### • Loss on Drying (731):

Dry a sample at 105° to constant weight: it loses NMT 0.5% of its weight.

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at room temperature.

##### • USP REFERENCE STANDARDS (11)

USP Homatropine Methylbromide RS

USP Homatropine Hydrobromide RS

## Homatropine Methylbromide Tablets

» Homatropine Methylbromide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{17}H_{24}BrNO_3$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards (11)—

USP Homatropine Methylbromide RS

**Identification**—Shake a quantity of finely powdered Tablets, equivalent to about 10 mg of homatropine methylbromide, with 15 mL of a mixture of equal volumes of methanol and water for 10 minutes, and filter. Evaporate the filtrate on a steam bath to dryness, and dry at 105° for 1 hour. The residue of homatropine methylbromide so obtained melts between 190° and 198° (see *Class I* under *Melting Range or Temperature* (741)), the temperature at which distinct liquefaction of the specimen is first observed being taken as the beginning of melting.

#### Dissolution (711)—

**Medium:** water; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 45 minutes.

**Procedure**—Determine the amount of  $C_{17}H_{24}BrNO_3$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 258 nm of filtered portions of the solu-

tion under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Homatropine Methylbromide RS in the same medium.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{17}H_{24}BrNO_3$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Procedure for content uniformity**—

**Standard preparation**—Transfer about 25 mg of USP Homatropine Methylbromide RS, accurately weighed, to a 50-mL volumetric flask, add water to volume, and mix. Transfer 10.0 mL of this solution to a second 50-mL volumetric flask, dilute with water to volume, and mix. The concentration of USP Homatropine Methylbromide RS in the *Standard preparation* is about 100 µg per mL.

**Test preparation**—Transfer 1 finely powdered Tablet to a volumetric flask, suitably sized such that when the specimen is diluted to volume, the concentration is equivalent to about 100 µg of homatropine methylbromide per mL. Add water to about one-half of the volume of the flask, shake for 10 minutes, dilute with water to volume, mix, and filter, discarding the first 10 mL of filtrate. Use the subsequent filtrate as directed in the *Procedure*.

**Procedure**—Transfer 2.0 mL each of the *Standard preparation* and the *Test preparation* to separate glass-stoppered, 50-mL flasks. To each flask, add 0.1 mL of sodium hydroxide solution (1 in 10), and heat in a water bath at 80° for 15 minutes. Cool to room temperature, add 2.0 mL of 0.2 M ceric ammonium sulfate in 1 N sulfuric acid, and mix. To each flask, add 20.0 mL of *n*-hexane, and shake for 15 minutes. Decant the hexane layers into separate 1-cm cells, and concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 242 nm, with a suitable spectrophotometer, using *n*-hexane as the blank. Calculate the quantity, in mg, of  $C_{17}H_{24}BrNO_3$  in the Tablet by the formula:

$$(TC/D)(A_U/A_S)$$

in which *T* is the labeled quantity, in mg, of homatropine methylbromide in the Tablet; *C* is the concentration, in µg per mL, of USP Homatropine Methylbromide RS in the *Standard preparation*; *D* is the concentration, in µg per mL, of the *Test preparation*, based upon the labeled quantity per Tablet and the extent of dilution; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively.

#### Assay—

**Standard preparation**—Transfer about 25 mg of USP Homatropine Methylbromide RS, accurately weighed, to a 50-mL volumetric flask, dissolve in water, dilute with water to volume, and mix.

**Assay preparation**—Weigh and finely powder not less than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 12.5 mg of homatropine methylbromide, and shake with 10 mL of water at frequent intervals during 30 minutes. Filter under reduced pressure through a sintered-glass crucible into a test tube placed in the suction flask under the filtering funnel, and wash under suction with several small portions of water. Transfer the contents of the test tube to a 25-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Transfer 10.0 mL each of the *Standard preparation* and the *Assay preparation* to separate test tubes, to each add 1 mL of 5 N sulfuric acid and 2 mL of ammonium reineckate TS, shake gently but well, and allow to stand for 1 hour. Filter through a sintered-glass crucible with suction, using portions of the filtrate to transfer the precipitate completely to the filter, and wash it with three 2-mL portions of ice-cold water. Completely dissolve the precipitate by pouring over it 1-mL portions of acetone with the application of suction, receiving the solution in a 10-mL volumetric flask,

add acetone to volume, and mix. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 525 nm, with a suitable spectrophotometer, using acetone as the blank. Calculate the quantity, in mg, of  $C_{17}H_{24}BrNO_3$  in the portion of Tablets taken by the formula:

$$0.025C(A_U / A_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP Homatropine Methylbromide RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Homosalate

$C_{16}H_{22}O_3$  262.34  
Benzoic acid, 2-hydroxy, 3,3,5-trimethylcyclohexyl ester;  
3,3,5-Trimethylcyclohexyl salicylate [118-56-9].

### DEFINITION

Homosalate contains NLT 90.0% and NMT 110% of  $C_{16}H_{22}O_3$ , calculated on the as-is basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197F>

### ASSAY

#### • PROCEDURE

**Standard solution:** 5.0 mg/mL of USP Homosalate RS in chloroform

**Sample solution:** 5.0 mg/mL of Homosalate in chloroform

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.53-mm  $\times$  30-m column coated with a 1- $\mu\text{m}$  film of G27

**Temperature**

**Injector:** 270°

**Detector:** 270°

**Column:** See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	6	220	5

**Carrier gas:** Hydrogen

**Flow rate:** 6 mL/min

**Injection size:** 1  $\mu\text{L}$

**Split ratio:** 1:10

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for the *cis*-isomer and the *trans*-isomer are about 0.98 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.0 between the *cis*-isomer and the *trans*-isomer

**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of homosalate ( $C_{16}H_{22}O_3$ ) in the portion of Homosalate taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = sum of the peak responses for the *cis*- and *trans*-isomers from the *Sample solution*

$r_S$  = sum of the peak responses for the *cis*- and *trans*-isomers from the *Standard solution*

$C_S$  = concentration of USP Homosalate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Homosalate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110% on the as-is basis

### SPECIFIC TESTS

- **SPECIFIC GRAVITY** <841>: 1.049–1.053
- **REFRACTIVE INDEX** <831>: 1.516–1.519 at 20°

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** <11>  
USP Homosalate RS

## Hyaluronidase Injection

» Hyaluronidase Injection is a sterile solution of dry, soluble enzyme product, prepared from mammalian testes and capable of hydrolyzing mucopolysaccharides of the type of hyaluronic acid, in Water for Injection. It contains not less than 90.0 percent of the labeled amount of USP Hyaluronidase Units. Hyaluronidase Injection contains not more than 0.25  $\mu\text{g}$  of tyrosine for each USP Hyaluronidase Unit. It may contain suitable stabilizers.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, and store in a refrigerator.

#### USP Reference standards <11>—

USP Endotoxin RS

USP Hyaluronidase RS

USP L-Tyrosine RS

**Bacterial endotoxins** <85>—It contains not more than 2.30 USP Endotoxin Units per USP Hyaluronidase Unit.

**pH** <791>: between 6.4 and 7.4.

**Limit of tyrosine**—Transfer an accurately measured volume, equivalent to about 120 USP Hyaluronidase Units, to a 15-mL centrifuge tube calibrated at 6 mL, and evaporate at 105° to dryness. Proceed as directed in *Limit of tyrosine under Hyaluronidase for Injection*, beginning with “Add 200  $\mu\text{L}$  of 6 N sodium hydroxide,” except to read Hyaluronidase Injection for Hyaluronidase for Injection in the second paragraph. Calculate the quantity, in  $\mu\text{g}$ , of tyrosine in the volume of Injection taken by the formula:

$$45(A_U / A_S)$$

in which  $A_U$  and  $A_S$  are the absorbances of the solution from the Injection and the Standard solution, respectively: not more than 0.25  $\mu\text{g}$  of tyrosine is found for each USP Hyaluronidase Unit.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay—**

*Acetate buffer solution, Phosphate buffer solution, Hydrolyzed gelatin, Diluent for hyaluronidase solutions, Serum stock solution, Serum solution, Potassium hyaluronate stock solution, Hyaluronate solution, and Standard solution*—Prepare as directed in the Assay under *Hyaluronidase for Injection*.

*Assay preparation*—Quantitatively dilute an accurately measured volume of Injection with cold *Diluent for hyaluronidase solutions*, on the basis of trial or experience, so that the observed absorbances with the three dilutions of the Injection fall on the upper, linear part of the standard curve prepared as directed in the *Procedure*.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Hyaluronidase for Injection*. The potency, in USP Hyaluronidase Units, of the portion of Injection taken is the average of the six activity values read from the standard curve.

## Hyaluronidase for Injection

» Hyaluronidase for Injection is a sterile, dry, soluble enzyme product prepared from mammalian testes and capable of hydrolyzing mucopolysaccharides of the type of hyaluronic acid. Its potency, in USP Hyaluronidase Units, is not less than the labeled potency. Hyaluronidase for Injection contains not more than 0.25 µg of tyrosine for each USP Hyaluronidase Unit. It may contain a suitable stabilizer.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1), preferably of Type I or Type III glass, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Hyaluronidase RS

USP L-Tyrosine RS

**Sterility** (71): meets the requirements.

**Bacterial endotoxins** (85)—It contains not more than 2.30 USP Endotoxin Units per USP Hyaluronidase Unit.

**Limit of tyrosine**—Dissolve the entire contents of 1 or more containers of Hyaluronidase for Injection in sufficient water, accurately measured, to give a concentration of about 60 USP Hyaluronidase Units per mL. Transfer 2.0 mL of the solution to a 15-mL centrifuge tube calibrated at 6 mL, and evaporate at 105° to dryness. Add 200 µL of 6 N sodium hydroxide, and heat with steam under pressure at 121° for 3 hours. Add 300 µL of 7 N sulfuric acid, then add 1.5 mL of water and 1.5 mL of a 15 in 100 solution of mercuric sulfate in 5 N sulfuric acid. Heat on a steam bath for 10 minutes, and cool to room temperature. Add 1 mL of 7 N sulfuric acid and 1 mL of sodium nitrite solution (1 in 500), with shaking. Add water to make 6 mL, mix, centrifuge, and decant the supernatant. Twenty minutes after diluting to 6 mL, determine the absorbance of the supernatant at 540 nm, with a suitable spectrophotometer.

Repeat the preceding test, using the same quantities of the same reagents and in the same manner but omitting the Hyaluronidase for Injection and replacing the 1.5 mL of water with 1.5 mL of a solution of USP L-Tyrosine RS in 0.4 N sulfuric acid containing 30 µg in each mL.

Calculate the quantity, in µg, of tyrosine in the 2-mL aliquot of the solution of Hyaluronidase for Injection taken by the formula:

$$45(A_U / A_S)$$

in which  $A_U$  and  $A_S$  are the absorbances of the solution from Hyaluronidase for Injection and the Standard solution, re-

spectively: not more than 0.25 µg of tyrosine is found for each USP Hyaluronidase Unit.

**Assay—**

*Acetate buffer solution*—Dissolve 14 g of potassium acetate and 20.5 mL of glacial acetic acid in water to make 1000 mL.

*Phosphate buffer solution*—Dissolve 2.5 g of monobasic sodium phosphate, 1.0 g of anhydrous dibasic sodium phosphate, and 8.2 g of sodium chloride in water to make 1000 mL.

*Hydrolyzed gelatin*—Dissolve 50 g of bacteriological gelatin in 1000 mL of water, heat in an autoclave at 121° for 90 minutes, and freeze-dry the solution.

*Diluent for hyaluronidase solutions*—Mix 250 mL of *Phosphate buffer solution* with 250 mL of water and, within 2 hours before use, dissolve 330 mg of *Hydrolyzed gelatin* in the mixture.

*Serum stock solution*—Constitute dried horse serum with water to its original volume, and dilute it with 9 volumes of *Acetate buffer solution*. Adjust with 4 N hydrochloric acid to a pH of 3.1, and allow the solution to stand at room temperature for 18 to 24 hours. Store the solution at 0° to 4°, and use within 30 days.

*Serum solution*—On the day of the assay, dilute 1 volume of *Serum stock solution* with 3 volumes of *Acetate buffer solution*, and adjust to room temperature.

*Potassium hyaluronate stock solution*—Prepare a stock solution to contain, in each mL, 500 µg of potassium hyaluronate, previously dried in vacuum over phosphorus pentoxide for 48 hours. Do not keep the hyaluronate over phosphorus pentoxide indefinitely. The use of a weighing bottle is desirable. Store the solution at a temperature not exceeding 5°, and use within 30 days.

*Hyaluronate solution*—On the day of the assay, dilute 1 volume of *Potassium hyaluronate stock solution* with 1 volume of *Phosphate buffer solution*.

*Standard solution*—Dissolve a suitable quantity of USP Hyaluronidase RS, accurately weighed, in cold *Diluent for hyaluronidase solutions* to obtain a solution having a known concentration of about 1.5 USP Hyaluronidase Units in each mL. Prepare this solution immediately before use in the assay.

*Assay solution*—Dissolve the contents of 1 container of Hyaluronidase for Injection by adding cold *Diluent for hyaluronidase* directly to the container. On the basis of trial or experience, dilute the solution so prepared with cold *Diluent for hyaluronidase* so that the observed absorbances with the three dilutions of Hyaluronidase for Injection fall on the upper, linear part of the standard curve prepared as directed below.

*Procedure*—Prepare a standard concentration-response curve by adding to each of twelve 16- × 100-mm test tubes 500 µL of *Hyaluronate solution*. To each of two of the tubes add, respectively, 500, 400, 300, 200, 100, and 0 µL of *Diluent for hyaluronidase solutions*. If quantities of *Standard solution* other than those indicated below are used, change the above-specified quantities of *Diluent for hyaluronidase solutions* so that the final volume of solution in each tube, after the addition of the *Standard solution*, is 1.00 mL.

At 30-second intervals, accurately timed, add to each of two tubes 0, 100, 200, 300, 400, and 500 µL, respectively, of *Standard solution*. Mix the contents by gentle shaking, and place each tube in a water bath maintained at 37 ± 0.2°. After 30 ± 0.25 minutes, remove each tube, in order, from the water bath at 30-second intervals, and immediately add 4.0 mL of *Serum solution*. Shake the tube, and allow to stand at room temperature for 30 ± 2 minutes. Again shake the tube, and determine the absorbance at 640 nm, with a suitable spectrophotometer. Perform a blank determination but omit the hyaluronate, and make any necessary correction. Plot the average absorbance value for each

level against the hyaluronidase activity expressed in Units, and draw the smooth curve that best fits the plotted points.

Concurrently, to six test tubes add 500  $\mu$ L of *Hyaluronate solution* and sufficient *Diluent for hyaluronidase solutions* so that the final volume, after the addition of the *Assay solution*, is 1.00 mL. Add, at 30-second intervals, sufficient *Assay solution* so that duplicate tubes contain about 0.30, 0.50, and 0.70 Unit, respectively. Shake each tube gently, and treat as directed in the preceding paragraph for the *Standard solution*, beginning with "place each tube in a water bath." Measure the absorbances in the spectrophotometer, and make any necessary correction for the blank. The potency of Hyaluronidase for Injection is the average of the six activity values read from the standard curve.

## Hydralazine Hydrochloride

$C_8H_8N_4 \cdot HCl$  196.64  
Phthalazine, 1-hydrazino-, monohydrochloride.  
1-Hydrazinophthalazine monohydrochloride [304-20-1].

» Hydralazine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $C_8H_8N_4 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** (11)—  
USP Hydralazine Hydrochloride RS

### Identification—

**A:** Infrared Absorption (197M).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 1 in 100,000.

*Medium:* water.

Absorptivities at 260 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** A solution (1 in 4000) responds to the tests for *Chloride* (191).

**pH** (791): between 3.5 and 4.2, in a solution (1 in 50).

**Loss on drying** (731)—Dry it at 110° for 15 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Water-insoluble substances**—Transfer 2.0 g to a 250-mL conical flask, add 100 mL of water, and shake by mechanical means for about 30 minutes. Filter the solution through a tared sintered-glass crucible, and wash into the crucible any undissolved residue remaining in the flask. Wash the residue with three 10-mL portions of water, dry at 105° for 3 hours, cool, and weigh: the weight of the residue does not exceed 10 mg (0.5%).

**Heavy metals, Method II** (231): 0.002%.

### Limit of hydrazine—

**Benzaldehyde solution**—Transfer 1.0 mL of benzaldehyde to a 100-mL volumetric flask, dilute with a mixture of methanol and water (9:1) to volume, and mix.

**Acetonitrile solution**—Transfer 300 mL of water to a 1000-mL volumetric flask, dilute with acetonitrile to volume, and mix.

**Phosphate buffer**—Dissolve 5.82 g of dibasic sodium phosphate and 3.81 g of monobasic potassium phosphate in

1000 mL of water, and adjust with either 1 N sodium hydroxide or 1 N phosphoric acid to a pH of  $7.0 \pm 0.1$ .

**Mobile phase**—Dissolve 300 mg of edetate disodium in 300 mL of water in a 1000-mL volumetric flask. Dilute with acetonitrile to volume, mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Transfer about 65 mg of hydrazine dihydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix to obtain a solution having a known concentration of about 0.65 mg per mL. Dilute this solution quantitatively, and stepwise if necessary, with water to obtain a *Standard solution* having a known concentration of about 0.325  $\mu$ g of hydrazine dihydrochloride per mL. Transfer 1.0 mL of the *Standard solution* to a 10-mL reaction vessel. Add 4.0 mL of *Benzaldehyde solution*, and shake by mechanical means for 20 minutes. Transfer 2.0 mL of this solution to a 5-mL volumetric flask, dilute with *Acetonitrile solution* to volume, and mix.

**Test solution**—[NOTE—Condition the extraction column specified in this procedure in the following manner. Wash the column with two 2.0-mL portions of hexanes, and dry with the aid of vacuum for two minutes. Wash the column with two 2.0-mL portions of methanol, two 2.0-mL portions of water, and two 2.0-mL portions of pH 7.0 phosphate buffer. At no time after the hexanes wash should the column be allowed to dry out.] Transfer about 20 mg of Hydralazine Hydrochloride, accurately weighed, to a 10-mL reaction vessel, and dissolve in 1.0 mL of water. Add 4.0 mL of *Benzaldehyde solution*, and shake by mechanical means for 20 minutes. Pipet 2.0 mL of this solution into a freshly conditioned solid phase extraction column containing benzenesulfonic acid strong cation-exchange packing with a sorbent-mass to column volume ratio of 500 mg per 3 mL, or equivalent, and elute into a 5-mL volumetric flask. Wash the column with two 1.5-mL portions of *Acetonitrile solution*, collecting the washings with the eluate, dilute with *Acetonitrile solution* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 310-nm detector and a 4.0-mm  $\times$  25-cm column that contains 10- $\mu$ m packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for hydralazine derivative and 1.5 for hydrazine derivative; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the solution from the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of hydrazine in the portion of Hydralazine Hydrochloride taken by the formula:

$$(32.05/104.97)(0.1C/W)(r_U/r_S)$$

in which 32.05 and 104.97 are the molecular weights of hydrazine and hydrazine dihydrochloride, respectively; C is the concentration, in  $\mu$ g per mL, of hydrazine dihydrochloride in the *Standard solution*; W is the weight, in mg, of Hydralazine Hydrochloride taken for the *Test solution*; and  $r_U$  and  $r_S$  are the hydrazine peak responses obtained from the *Test solution* and from the solution from the *Standard solution*, respectively: not more than 0.001% of hydrazine is found.

### Chromatographic purity—

**Mobile phase and Resolution solution**—Prepare as directed in the Assay.

**Test solution**—Transfer about 25 mg of Hydralazine Hydrochloride, accurately weighed, to a 50-mL volumetric flask. Add about 30 mL of 0.1 N acetic acid, and sonicate to

dissolve. Cool, dilute with 0.1 N acetic acid to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 230-nm detector and a 4.0-mm × 25-cm column that contains 10-μm packing L10. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.65 for phthalazine and 1.0 for hydralazine hydrochloride; and the resolution,  $R$ , between the phthalazine peak and the hydralazine peak is not less than 4.0.

**Procedure**—Inject about 20 μL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each peak, other than the solvent peak and the hydralazine peak, in the portion of Hydralazine Hydrochloride taken by the same formula:

$$100r_i / r_t$$

in which  $r_i$  is the response of each peak; and  $r_t$  is the sum of the responses of all the peaks, excluding that of the solvent peak: not more than 1.0% total impurities is found.

#### Assay—

**Mobile phase**—Dissolve 1.44 g of sodium dodecyl sulfate and 0.75 g of tetrabutylammonium bromide in 770 mL of water, and add 230 mL of acetonitrile. Adjust with 0.1 N sulfuric acid to a pH of 3.0, mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Hydralazine Hydrochloride RS in 0.1 N acetic acid to obtain a solution having a known concentration of about 0.4 mg per mL. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with 0.1 N acetic acid to volume, and mix to obtain a solution having a known concentration of about 40 μg per mL.

**Resolution solution**—Prepare a solution in 0.1 N acetic acid containing about 0.25 mg of USP Hydralazine Hydrochloride RS and 0.05 mg of phthalazine per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with 0.1 N acetic acid to volume, and mix to obtain a solution containing about 25 μg of USP Hydralazine Hydrochloride RS and 5 μg of phthalazine per mL.

**Assay preparation**—Transfer about 100 mg of Hydralazine Hydrochloride, accurately weighed, to a 250-mL volumetric flask. Dissolve in and dilute with 0.1 N acetic acid to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with 0.1 N acetic acid to volume, mix, and filter, discarding the first 10 mL of the filtrate.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 230-nm detector and a 4.0-mm × 25-cm column that contains 10-μm packing L10. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.65 for phthalazine and 1.0 for hydralazine hydrochloride; and the resolution,  $R$ , between the phthalazine and hydralazine peaks is not less than 4.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 25 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_8H_8N_4 \cdot HCl$  in the portion of Hydralazine Hydrochloride taken by the formula:

$$(2.5C)(r_U / r_S)$$

in which  $C$  is the concentration, in μg per mL, of USP Hydralazine Hydrochloride RS in the *Standard preparation*;

and  $r_U$  and  $r_S$  are the hydralazine hydrochloride peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydralazine Hydrochloride Injection

» Hydralazine Hydrochloride Injection is a sterile solution of Hydralazine Hydrochloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of hydralazine hydrochloride ( $C_8H_8N_4 \cdot HCl$ ).

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

#### USP Reference standards <11>—

USP Hydralazine Hydrochloride RS

USP Endotoxin RS

**Identification**—Mix a volume of Injection, equivalent to about 60 mg of hydralazine hydrochloride, with an amount of 1 N hydrochloric acid sufficient to prepare 25 mL of solution. Place 20 mL of this solution in a separator, wash with 10 mL of methylene chloride, and discard the methylene chloride washing. Mix the aqueous solution in the separator with 2 mL of sodium nitrite solution (14 in 1000), add 10 mL of methylene chloride, shake by mechanical means for 5 minutes, and allow the layers to separate. Pass the methylene chloride layer through a filter of anhydrous sodium sulfate that previously has been washed with methylene chloride, and collect the solution in a 50-mL beaker. Evaporate with the aid of gentle heat and a stream of dry nitrogen to dryness: the IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of USP Hydralazine Hydrochloride RS similarly treated and prepared.

**Bacterial endotoxins** <85>—It contains not more than 1.45 USP Endotoxin Units per mg of hydralazine hydrochloride.

**pH** <791>: between 3.4 and 4.4.

**Particulate matter** <788>: meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay**—Transfer to a 250-mL iodine flask an accurately measured volume of Injection, equivalent to about 100 mg of hydralazine hydrochloride. Add 20 mL of hydrochloric acid, cool to room temperature, add 5 mL of chloroform, and titrate with 0.02 M potassium iodate VS until the purple color of iodine disappears from the chloroform, adding the last portion of the potassium iodate solution dropwise and agitating the mixture vigorously and continuously. Each mL of 0.02 M potassium iodate is equivalent to 3.933 mg of hydralazine hydrochloride ( $C_8H_8N_4 \cdot HCl$ ).

## Hydralazine Hydrochloride Oral Solution

#### DEFINITION

Hydralazine Hydrochloride Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of hydralazine hydrochloride ( $C_8H_8N_4 \cdot HCl$ ).

Prepare Hydralazine Hydrochloride Oral Solution of the designated percentage strength as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>).

Hydralazine Hydrochloride	
For 0.1% Oral Solution	100 mg
For 1.0% Oral Solution	1.0 g
Sorbitol Solution (70%)	40 g
Methylparaben	65 mg
Propylparaben	35 mg
Propylene Glycol	10 g
Aspartame	50 mg
Purified Water, a sufficient quantity to make	100 mL

Dissolve the *Hydralazine Hydrochloride* in 30 mL of *Purified Water*, add the *Aspartame*, and shake or stir until the solids have dissolved. Add the *Sorbitol Solution*. In a separate container, dissolve an aliquot portion of an intimate homogeneous mixture of accurately weighed quantities of *Methylparaben* and *Propylparaben* in the *Propylene Glycol*, and, with stirring, add this mixture to the solution containing the *Hydralazine Hydrochloride*. Add sufficient *Purified Water* to make the preparation measure 100 mL, and mix.

[NOTE—Hydralazine reacts with many flavors; do not add flavors when compounding.]

#### SPECIFIC TESTS

- **PH** (791): 3.0–5.0

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in a suitable light-resistant glass or plastic bottle, with a child-resistant closure. Store in a refrigerator.
- **LABELING:** Label it to state, as part of the official title, the amount of hydralazine hydrochloride, expressed as a percentage and parenthetically (mg/5 mL). Label it to state that it is to be stored in a refrigerator. The label indicates that patients may mix the appropriate dose with fruit juice or apple sauce just before administration. [Precaution—Phenylketonurics: It contains 1.4 mg/5 mL of phenylalanine.]
- **BEYOND-USE DATE:** NMT 30 days after the date on which it was compounded

### Hydralazine Hydrochloride Tablets

» Hydralazine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydralazine hydrochloride ( $C_8H_8N_4 \cdot HCl$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards (11)—

USP Hydralazine Hydrochloride RS

#### Identification—

**A:** *Infrared Absorption* (197K)—

*Test specimen*—Transfer a quantity of finely powdered Tablets, equivalent to about 100 mg of hydralazine hydrochloride, to a glass-stoppered flask. Add 40 mL of 1 N hydrochloric acid, shake by mechanical means for 5 minutes, and filter, discarding the first few mL of the filtrate. Place 20 mL of the filtrate in a separator, wash with 10 mL of methylene chloride, and discard the methylene chloride washing. Mix the aqueous solution in the separator with 2 mL of sodium nitrite solution (14 in 1000), add 10 mL of methylene chloride, shake by mechanical means for 5 minutes, and allow the layers to separate. Pass the methylene chloride layer through a filter of anhydrous sodium sulfate that previously has been washed with methylene chloride, and collect the solution in a 50-mL beaker. Evaporate with

the aid of gentle heat and a stream of dry nitrogen to dryness.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Dissolution (711)—

*Medium:* 0.01 N hydrochloric acid; 900 mL.

*Apparatus 1:* 100 rpm.

*Time:* 45 minutes.

*Procedure*—Determine the amount of  $C_8H_8N_4 \cdot HCl$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 260 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, in comparison with a Standard solution having a known concentration of USP Hydralazine Hydrochloride RS in the same *Medium*.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_8H_8N_4 \cdot HCl$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Prepare as directed in the *Assay* under *Hydralazine Hydrochloride*.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of hydralazine hydrochloride, to a 250-mL volumetric flask, dissolve in and dilute with 0.1 N acetic acid to volume, and centrifuge. Pipet 10 mL of the clear liquid into a 100-mL volumetric flask, dilute with 0.1 N acetic acid to volume, mix, and filter.

*Procedure*—Proceed as directed in the *Assay* under *Hydralazine Hydrochloride*. Calculate the quantity, in mg, of hydralazine hydrochloride ( $C_8H_8N_4 \cdot HCl$ ) in the portion of Tablets taken by the formula:

$$2.5C(r_U / r_S)$$

in which the terms are as defined therein.

#### Add the following:

### Hydrochloric Acid Injection

#### DEFINITION

Hydrochloric Acid Injection contains NLT 328 mg and NMT 401 mg of hydrochloric acid (HCl) in 100 mL.

Prepare Hydrochloric Acid Injection, 0.1 N, as follows (see *Pharmaceutical Compounding—Sterile Preparations* (797)).

Hydrochloric Acid, 1.0 N	10 mL
Sodium Chloride Injection, 0.45% or 0.9%, a sufficient quantity to make	100 mL

Prepare *1.0 N Hydrochloric Acid* by adding Hydrochloric Acid, NF, to Purified Water in an appropriate volumetric flask with continuous stirring. Allow the solution to cool to room temperature, add sufficient Purified Water to bring to final volume, and continue mixing for 1 min. Pass through a compatible filter of 0.45-μm pore size to reduce particulate matter load. Accurately measure the nonsterile *1.0 N Hydrochloric Acid* with an appropriate glass or plastic device, and accurately dilute to final volume with 0.45% or 0.9% Sodium Chloride Injection. Sterilize the solution by passing through a sterile acid-com-

patible membrane filter of 0.2- $\mu$ m pore size into a sterile intravenous polypropylene container in an ISO Class 5 environment. [NOTE—This is a High-Risk Level Compounded Sterile Preparation (CSP) that shall be prepared according to *Pharmaceutical Compounding—Sterile Preparations* <797>.]

**ASSAY****• PROCEDURE**

**Sample:** 25 mL

**Blank:** 25 mL water

**Titrimetric system**

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** 0.5 N sodium hydroxide VS

**Endpoint detection:** Visual

**Analysis:** Place *Sample* in a conical flask, add methyl red TS, and titrate with *Titrant*.

Calculate the weight of hydrochloric acid in 100 mL:

$$\text{Result} = [(V_S - V_B) \times N \times F] \times D$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = actual normality of the *Titrant* (mEq/mL)

$F$  = equivalency factor, 18.23 mg/mEq

$D$  = dilution factor, 4

**Acceptance criteria:** 328–401 mg in 100 mL

**SPECIFIC TESTS**

**• pH <791>:** 1.0–1.2

**• STERILITY TESTS <71>:** It meets the requirements when tested as directed under *Test for Sterility of the Product to be Examined*, *Membrane Filtration*.

**• BACTERIAL ENDOTOXINS TEST <85>:** NMT 1.5 USP Endotoxin/mL

**ADDITIONAL REQUIREMENTS**

**• PACKAGING AND STORAGE:** Package in polypropylene container or equivalent. Store at controlled room temperature or at controlled cold temperature.

**• LABELING:** Label it Hydrochloric Acid Injection, 0.1 N. Label it to state that this is a single-dose intravenous injection and that it contains no antimicrobial preservatives. Label it to state the *Beyond-Use Date*.

**• BEYOND-USE DATE:** If a sterility test and bacterial endotoxin test is passed, NMT 120 days when stored at controlled room temperature or controlled cold temperature. In the absence of passing a sterility test and endotoxin test, the storage periods at controlled room temperature or cold temperature for *High-Risk Level CSPs* applies. (See *CSP Microbial Contamination Risk Levels in Pharmaceutical Compounding—Sterile Preparations* <797>.)

**• USP REFERENCE STANDARDS <11>**

USP Endotoxin RS $\blacktriangle$ USP36

**Hydrochlorothiazide**

$C_7H_8ClN_3O_4S_2$  297.74

2*H*-1,2,4-Benzothiadiazine-7-sulfonamide, 6-chloro-3,4-dihydro-, 1,1-dioxide;

6-Chloro-3,4-dihydro-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide [58-93-5].

**DEFINITION**

Hydrochlorothiazide contains NLT 98.0% and NMT 102.0% of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ), calculated on the dried basis.

**IDENTIFICATION****• A. INFRARED ABSORPTION <197K>**

**Sample:** Potassium bromide–hydrochlorothiazide mixture, previously heated at 105° for 2 h

**Acceptance criteria:** Meets the requirements

**• B. ULTRAVIOLET ABSORPTION <197U>**

**Sample solution:** 10  $\mu$ g/mL in methanol

**Acceptance criteria:** Meets the requirements

**ASSAY****• PROCEDURE**

**Buffer:** 2.76 g of monobasic sodium phosphate in a 1000-mL volumetric flask. Add 990 mL of water. Adjust with phosphoric acid to a pH of  $2.7 \pm 0.1$ , and dilute with water to volume.

**Diluent:** Acetonitrile and *Buffer* (3:7)

**Solution A:** Acetonitrile and methanol (3:1)

**Solution B:** Anhydrous formic acid in water (5 in 1000)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	3	97
5	3	97
14	36	64
18	3	97
20	3	97

**System suitability solution:** 0.32 mg/mL of USP Hydrochlorothiazide RS, 0.0032 mg/mL of USP Chlorothiazide RS, and 0.0032 mg/mL of USP Benzothiadiazine Related Compound A RS in *Diluent*; sonicate if necessary to dissolve. Pass a portion through a filter of 0.45- $\mu$ m or finer pore size.

**Standard solution:** 0.32 mg/mL of USP Hydrochlorothiazide RS in *Diluent*. Sonicate if necessary to dissolve. Pass a portion through a filter of 0.45- $\mu$ m or finer pore size.

**Sample solution:** 0.32 mg/mL of Hydrochlorothiazide in *Diluent*, prepared as follows. Transfer 32 mg of Hydrochlorothiazide into a 100-mL volumetric flask. Add 70 mL of *Diluent*, sonicate for 10 min if necessary to dissolve, and allow to cool to ambient temperature. Dilute with *Diluent* to volume. Pass a portion through a filter of 0.45- $\mu$ m or finer pore size.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 275 nm

**Column:** 4.6-mm  $\times$  5-cm; 3.5- $\mu$ m packing L1

**Column temperature:** 35°

**Flow rate:** 1 mL/min

**Injection volume:** 10  $\mu$ L

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—See *Table 2* for the relative retention times.]

Chromatograph the *Diluent* to check for interference by system-related peaks.

**Suitability requirements**

**Resolution:** NLT 2.0 between benzothiadiazine related compound A and chlorothiazide and NLT 1.5 between chlorothiazide and hydrochlorothiazide, *System suitability solution*

**Tailing factor:** NMT 1.5 for the peaks for benzothiadiazine related compound A, chlorothiazide, and hydrochlorothiazide, *System suitability solution*

**Relative standard deviation:** NMT 1.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) in the portion of Hydrochlorothiazide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of hydrochlorothiazide from the *Sample solution*

$r_S$  = peak response of hydrochlorothiazide from the *Standard solution*

$C_S$  = concentration of USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Hydrochlorothiazide in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

#### IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **CHLORIDE AND SULFATE**, *Chloride* (221)

**Sample solution:** Shake 0.50 g with 40 mL of water for 5 min, and filter.

**Acceptance criteria:** 0.035%; the filtrate shows no more chloride than corresponds to 0.25 mL of 0.020 N hydrochloric acid.

• **SELENIUM** (291)

**Sample:** 200 mg

**Acceptance criteria:** NMT 30 ppm

• **HEAVY METALS**, *Method II* (231): NMT 10 ppm

• **ORGANIC IMPURITIES**

**Diluent, Solution A, Solution B, Mobile phase, System suitability solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Quantitative limit solution:** 0.16 µg/mL of USP Hydrochlorothiazide RS in *Diluent*. Sonicate if necessary to dissolve.

**Sample solution:** 0.32 mg/mL of Hydrochlorothiazide in *Diluent*, prepared as follows. Transfer 32 mg of Hydrochlorothiazide into a 100-mL volumetric flask. Add 70 mL of *Diluent*, sonicate for 10 min if necessary to dissolve, and allow to cool to ambient temperature. Dilute with *Diluent* to volume, mix, and pass a portion through a filter of 0.45-µm or finer pore size.

#### System suitability

**Samples:** *System suitability solution* and *Quantitative limit solution*

[NOTE—See Table 2 for the relative retention times.]

#### Suitability requirements

**Resolution:** NLT 2.0 between benzothiadiazine related compound A and chlorothiazide and NLT 1.5 between chlorothiazide and hydrochlorothiazide, *System suitability solution*

**Tailing factor:** NMT 1.5 for the peaks for benzothiadiazine related compound A, chlorothiazide, and hydrochlorothiazide, *System suitability solution*

**Relative standard deviation:** NMT 5.0% for benzothiadiazine related compound A and chlorothiazide, *System suitability solution*; NMT 25% for hydrochlorothiazide, based on 3 replicate injections, *Quantitative limit solution*

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Hydrochlorothiazide taken:

$$\text{Result} = (R_U/R_T) \times 100$$

$R_U$  = ratio of the peak area for each impurity to its response factor

$R_T$  = sum of the ratios of all the peak areas to their respective response factors

**Acceptance criteria:** See Table 2.

**Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Benzothiadiazine related compound A	0.5	0.54	1.0
Chlorothiazide	0.8	0.63	0.5
Hydrochlorothiazide	1.0	—	—
5-Chlorohydrochlorothiazide	2.1	—	0.5
Hydrochlorothiazide dimer <sup>a</sup>	2.6	—	0.5
Any other individual impurity	—	1.0	0.5
Total impurities	—	—	0.9 <sup>b</sup>

<sup>a</sup> 6-Chloro-N-[(6-chloro-7-sulfamoyl-2,3-dihydro-4H-1,2,4-benzothiadiazine-4-yl 1,1-dioxide)methyl]3,4-dihydro-2H-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide.

<sup>b</sup> Excluding benzothiadiazine related compound A.

#### SPECIFIC TESTS

• **LOSS ON DRYING** (731)

**Analysis:** Dry a sample at 105° for 1 h.

**Acceptance criteria:** NMT 0.5%

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** (11)

USP Benzothiadiazine Related Compound A RS  
4-Amino-6-chloro-1,3-benzenedisulfonamide.

USP Chlorothiazide RS

USP Hydrochlorothiazide RS

## Hydrochlorothiazide Capsules

#### DEFINITION

Hydrochlorothiazide Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ).

#### IDENTIFICATION

• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### PROCEDURE

**Buffer:** 13.8 g/L of monobasic sodium phosphate

**Mobile phase:** Acetonitrile and *Buffer* (10:90). Adjust with 10% (v/v) phosphoric acid to a pH of  $3.0 \pm 0.1$ . Pass through a filter of 0.45-µm pore size.

**System suitability solution:** 0.15 mg/mL each of USP Hydrochlorothiazide RS and USP Chlorothiazide RS in *Mobile phase*. Sonicate to completely dissolve.

**Standard stock solution:** 0.50-mg/mL solution prepared as follows: Dissolve a quantity of USP Hydrochlorothiazide RS in acetonitrile (10% of the volume of the flask), and dilute with *Mobile phase*. Sonicate to completely dissolve.

**Standard solution:** 50-µg/mL solution in *Mobile phase* from the *Standard stock solution*. Sonicate to completely dissolve.

**Sample stock solution:** 0.25 mg/mL of hydrochlorothiazide solution prepared as follows: Transfer a number of

Capsules into a suitable volumetric flask. Add water, 10% of the volume of the flask, and sonicate for 10 min with vigorous shaking. Add *Buffer*, 20% of the volume of the flask, and again sonicate for 10 min. Add acetonitrile up to 40% of the volume of the flask, and sonicate for 30 min. Dilute with *Buffer* to volume, and pass through a suitable filter of 0.45- $\mu$ m pore size.

**Sample solution:** 50  $\mu$ g/mL of hydrochlorothiazide in *Mobile phase* from the *Sample stock solution*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 272 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Flow rate:** 2.0 mL/min

**Injection volume:** 20  $\mu$ L

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between chlorothiazide and hydrochlorothiazide, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Column efficiency:** NLT 4000 theoretical plates, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of hydrochlorothiazide from the *Sample solution*

$r_S$  = peak response of hydrochlorothiazide from the *Standard solution*

$C_S$  = concentration of hydrochlorothiazide in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of hydrochlorothiazide in the *Sample solution* ( $\mu$ g/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### • DISSOLUTION <711>

##### Test 1

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 30 min

**Standard solution:** 6.75- $\mu$ g/mL solution prepared as follows: Dissolve a quantity of USP Hydrochlorothiazide RS in acetonitrile (10% of the volume of the flask), and dilute with *Medium*. Sonicate to completely dissolve.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size. Dilute with *Medium* to a concentration similar to the *Standard solution*.

**Analytical wavelength:** UV 272 nm

**Pathlength:** 1 cm

**Blank:** *Medium*

Calculate the percentage of the labeled amount of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times D \times V \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of hydrochlorothiazide in the *Standard solution* (mg/mL)

$L$  = label claim (mg/Capsule)

$D$  = dilution for the *Sample solution*

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** 0.01 N hydrochloric acid; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 30 min

**Standard stock solution:** 0.35 mg/mL of USP Hydrochlorothiazide RS in *Medium*. An amount of acetonitrile, not exceeding 25% of the final volume, may be used to help solubilize hydrochlorothiazide.

**Standard solution:** ( $L/900$ ) mg/mL of hydrochlorothiazide in *Medium*, from the *Standard stock solution*, where  $L$  is the Capsule label claim in mg

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size.

**Empty capsules solution:** Place 10 Capsules into a 900-mL volumetric flask. Slowly add 800 mL of *Medium* pre-heated to 37°, and stir until dissolved. Cool to room temperature, and dilute with *Medium* to volume.

**Analytical wavelength:** UV 272 nm

**Pathlength:** 1 cm

**Blank:** *Medium*

Calculate the percentage of the labeled amount of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) dissolved:

$$\text{Result} = [(A_U - A_{EC})/A_S] \times (C_S/L) \times V \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_{EC}$  = absorbance of the *Empty capsules solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of hydrochlorothiazide in the *Standard solution* (mg/mL)

$L$  = label claim (mg/Capsule)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

### IMPURITIES

#### • ORGANIC IMPURITIES

**Buffer, Mobile phase, System suitability solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard stock solution:** 0.25-mg/mL solution prepared as follows: Dissolve a quantity of USP Hydrochlorothiazide RS in acetonitrile (10% of the volume of the flask), and dilute with *Mobile phase*.

**Standard solution:** 0.25  $\mu$ g/mL of USP Hydrochlorothiazide RS in *Mobile phase* from the *Standard stock solution*

**Sample solution:** Use the *Sample stock solution* as prepared in the *Assay*.

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between chlorothiazide and hydrochlorothiazide, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Column efficiency:** NLT 4000 theoretical plates, *Standard solution*

**Relative standard deviation:** NMT 5.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each individual impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

- $r_s$  = peak response of hydrochlorothiazide from the *Standard solution*  
 $C_s$  = concentration of hydrochlorothiazide in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_u$  = nominal concentration of hydrochlorothiazide in the *Sample solution* ( $\mu\text{g/mL}$ )  
 $F$  = relative response factor (see *Table 1*)

**Acceptance criteria**

**Individual impurities:** See *Table 1*.

**Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Benzothiadiazine related compound A	0.65	0.61	1.0
Chlorothiazide	0.80	—	— <sup>a</sup>
Hydrochlorothiazide	1.0	1.0	—
5-Chlorohydrochlorothiazide	2.88	—	— <sup>a</sup>
Any other individual unspecified degradant	—	1.0	0.2
Total impurities <sup>b</sup>	—	—	1.5

<sup>a</sup> Process related impurity. The relative retention time is given for identification.

<sup>b</sup> Total impurities include benzothiadiazine related compound A and all unknown degradation impurities. Disregard any peak less than 0.05%.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** (11)
  - USP Chlorothiazide RS
  - 2*H*-1,2,4-Benzothiadiazine-7-sulfonamide, 6-chloro-, 1,1-dioxide.
  - $\text{C}_7\text{H}_8\text{ClN}_3\text{O}_4\text{S}_2$  295.72
  - USP Hydrochlorothiazide RS

**Hydrochlorothiazide Tablets**

» Hydrochlorothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrochlorothiazide ( $\text{C}_7\text{H}_8\text{ClN}_3\text{O}_4\text{S}_2$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Hydrochlorothiazide RS  
 USP Benzothiadiazine Related Compound A RS  
 4-Amino-6-chloro-1,3-benzenedisulfonamide.  
 $\text{C}_6\text{H}_8\text{ClN}_3\text{O}_4\text{S}_2$  285.73

**Identification**—

**A:** Transfer a portion of finely powdered Tablets, equivalent to about 50 mg of hydrochlorothiazide, to a 50-mL volumetric flask. Add about 20 mL of sodium hydroxide solution (1 in 125), and shake vigorously for 15 minutes. Dilute with the same solvent to volume, mix, and filter, discarding the first few mL of the filtrate. Transfer 5 mL of the filtrate to a 125-mL separator, and add 5 mL of dilute hydrochloric acid (1 in 10). Extract with 50 mL of ether, filter the ether extract through a small, dry, folded filter paper, and evaporate to dryness. Add 5 mL of alcohol, and again evaporate

to dryness: the IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Hydrochlorothiazide RS previously dissolved in alcohol and recovered by evaporating the solution to dryness.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

*Medium:* 0.1 N hydrochloric acid; 900 mL.

*Apparatus 1:* 100 rpm.

*Time:* 60 minutes.

*Procedure*—Determine the amount of  $\text{C}_7\text{H}_8\text{ClN}_3\text{O}_4\text{S}_2$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 272 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Hydrochlorothiazide RS in the same *Medium*.

*Tolerances*—Not less than 60% (Q) of the labeled amount of  $\text{C}_7\text{H}_8\text{ClN}_3\text{O}_4\text{S}_2$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Related compounds**—

*Mobile phase*, *System suitability solution*, and *Chromatographic system*—Proceed as directed in the *Assay*.

*Test solution*—Proceed as directed for *Assay preparation* in the *Assay*.

*Standard solution*—[NOTE—A volume of acetonitrile not exceeding 10% of the total volume of the solution may be used to dissolve the USP Reference Standard.] Dissolve an accurately weighed quantity of USP Benzothiadiazine Related Compound A RS in *Mobile phase* to obtain a solution having a known concentration of about 1.5  $\mu\text{g}$  per mL.

*Procedure*—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of benzothiadiazine related compound A in the portion of tablets taken by the formula:

$$0.2C(r_u / r_s)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Benzothiadiazine Related Compound A RS in the *Standard solution*; and  $r_u$  and  $r_s$  are the peak responses for benzothiadiazine related compound A obtained from the *Test solution* and the *Standard solution*, respectively: not more than 1.0% is present.

**Assay**—

*Mobile phase*—Prepare a degassed mixture of 0.1 M monobasic sodium phosphate and acetonitrile (9:1), adjust with phosphoric acid to a pH of  $3.0 \pm 0.1$ , and filter. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability solution*—[NOTE—A volume of acetonitrile not exceeding 10% of the total volume of solution may be used to dissolve the USP Reference Standards.] Dissolve accurately weighed quantities of chlorothiazide and USP Hydrochlorothiazide RS in *Mobile phase* to obtain a solution containing about 0.15 mg of each per mL.

*Standard preparation*—[NOTE—A volume of acetonitrile not exceeding 10% of the total volume of the solution may be used to dissolve the USP Reference Standard.] Dissolve an accurately weighed quantity of USP Hydrochlorothiazide RS in *Mobile phase* to obtain a solution having a known concentration of about 0.15 mg per mL.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of

the powder, equivalent to about 30 mg of hydrochlorothiazide, to a 200-mL volumetric flask. Add about 20 mL of *Mobile phase*, sonicate for 5 minutes, and add about 20 mL of acetonitrile. Sonicate for 5 minutes, add about 50 mL of *Mobile phase*, and shake by mechanical means for 10 minutes. Dilute with *Mobile phase* to volume, mix, and filter, discarding the first 10 mL of the filtrate.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 for chlorothiazide and 1.0 for hydrochlorothiazide; and the resolution, *R*, between chlorothiazide and hydrochlorothiazide is not less than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of hydrochlorothiazide (C<sub>7</sub>H<sub>8</sub>ClN<sub>3</sub>O<sub>4</sub>S<sub>2</sub>) in the portion of Tablets taken by the formula:

$$200C(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Hydrochlorothiazide RS in the *Standard preparation*; and *r<sub>u</sub>* and *r<sub>s</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydrocodone Bitartrate

C<sub>18</sub>H<sub>21</sub>NO<sub>3</sub> · C<sub>4</sub>H<sub>6</sub>O<sub>6</sub> · 2½H<sub>2</sub>O 494.49  
Morphinan-6-one, 4,5-epoxy-3-methoxy-17-methyl-, (5α)-, [R-(R\*,R\*)]-2,3-dihydroxybutanedioate (1:1), hydrate (2:5).  
4,5α-Epoxy-3-methoxy-17-methylmorphinan-6-one tartrate (1:1) hydrate (2:5) [34195-34-1; 6190-38-1].  
Anhydrous 449.46 [143-71-5].

» Hydrocodone Bitartrate, dried in vacuum at 105° for 2 hours, contains not less than 98.0 percent and not more than 102.0 percent of C<sub>18</sub>H<sub>21</sub>NO<sub>3</sub> · C<sub>4</sub>H<sub>6</sub>O<sub>6</sub>.

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards <11>—

USP Dihydrocodeine Bitartrate RS

USP Hydrocodone Bitartrate RS

USP Hydrocodone Bitartrate Related Compound A RS

### Identification—

**A:** *Infrared Absorption* <197M>.

**B:** *Ultraviolet Absorption* <197U>—

*Solution:* 100 µg per mL.

*Medium:* 0.1 N sulfuric acid.

**Specific rotation** <781S>: between −79° and −84°.

*Test solution:* 20 mg, undried, per mL, in water. Calculate the result on the basis of the undried aliquot.

**pH** <791>: between 3.2 and 3.8, in a solution (1 in 50).

**Loss on drying**—Dry it in vacuum at 105° for 2 hours [NOTE—See the *Note* in the *Assay* for precautions regarding handling of the dried material.]: it loses not less than 7.5% and not more than 12.0% of its weight.

**Residue on ignition** <281>: not more than 0.1%.

**Chloride**—To 10 mL of a solution (1 in 100), acidified with nitric acid, add a few drops of silver nitrate TS: no opalescence is produced immediately.

**Assay**—[NOTE—Dry both the USP Hydrocodone Bitartrate RS and the Hydrocodone Bitartrate materials in vacuum at 105° for 2 hours. Immediately transfer the dried materials to a desiccator containing phosphorus pentoxide. Weigh each dried material individually within 1 minute, and proceed with the *Assay*.]

**Mobile phase**—Prepare a mixture of acetonitrile, water, and diethylamine (800:4:1). Prepare a filtered and degassed mixture of this solution and methanol (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Transfer about 10 mg of previously dried USP Hydrocodone Bitartrate RS, accurately weighed, to a 10-mL volumetric flask, add 5 mL of water, and mix to dissolve. Dilute with methanol to volume, and mix to obtain a solution having a known concentration of about 1 mg per mL.

**Assay preparation**—Transfer an accurately weighed quantity of previously dried Hydrocodone Bitartrate, equivalent to about 100 mg of hydrocodone bitartrate, C<sub>18</sub>H<sub>21</sub>NO<sub>3</sub> · C<sub>4</sub>H<sub>6</sub>O<sub>6</sub>, to a 100-mL volumetric flask, add 50 mL of water, and mix to dissolve. Dilute with methanol to volume, and mix.

**Resolution solution**—Prepare a solution in methanol containing about 0.4 mg of USP Dihydrocodeine Bitartrate RS and 0.6 mg of USP Hydrocodone Bitartrate RS per mL. Prepare a mixture of this solution and water (1:1).

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 25-cm column that contains packing L3. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the responses as directed for *Procedure*: the relative retention times are about 0.7 for hydrocodone and 1.0 for dihydrocodeine; and the resolution, *R*, between hydrocodone and dihydrocodeine is not less than 3.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>18</sub>H<sub>21</sub>NO<sub>3</sub> · C<sub>4</sub>H<sub>6</sub>O<sub>6</sub> in the portion of Hydrocodone Bitartrate taken by the formula:

$$(100C)(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Hydrocodone Bitartrate RS in the *Standard preparation*; and *r<sub>u</sub>* and *r<sub>s</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydrocodone Bitartrate Tablets

» Hydrocodone Bitartrate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocodone bi-

tartrate disesquihydrate ( $C_{18}H_{21}NO_3 \cdot C_4H_6O_6 \cdot 2\frac{1}{2}H_2O$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Hydrocodone Bitartrate RS

**Identification**—Tablets meet the requirements under *Identification—Organic Nitrogenous Bases* (181).

**Dissolution** (711)—

Medium: water; 500 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

**Phosphate buffer–bromothymol blue solution**—Dissolve 3.40 g of monobasic sodium phosphate in about 50 mL of water, add 18 mL of 0.1 N sodium hydroxide, dilute with water to 500 mL, and mix. Adjust the solution, if necessary, with 1 N sodium hydroxide or 1 N phosphoric acid (*Buffer solution*) to a pH of  $5.8 \pm 0.1$ . Mix 31.2 mg of bromothymol blue with 1.0 mL of 0.1 N sodium hydroxide, add *Buffer solution* to obtain 500 mL of solution, and mix.

**Standard solution**—Dissolve an accurately weighed quantity of USP Hydrocodone Bitartrate RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 10  $\mu$ g per mL.

**Test solution**—Pipet into a 125-mL separator a volume of a filtered portion of the solution under test that is estimated to contain about 0.4 mg of hydrocodone bitartrate. Add 2 drops of 6 N ammonium hydroxide, and extract with three 25-mL portions of chloroform. Filter the extracts through about 3 g of anhydrous sodium sulfate supported on filter paper, and combine the filtered extracts in a 100-mL volumetric flask. Add chloroform through the filter to volume, and mix.

**Procedure**—Pipet 10 mL of the *Standard solution* into a 125-mL separator, and add 25.0 mL of chloroform. Pipet 25 mL of the *Test solution* into a second 125-mL separator, and add 10.0 mL of water. Pipet 25 mL of chloroform and 10 mL of water into a third 125-mL separator to provide a blank. Treat each mixture as follows. Add 30 mL of *Phosphate buffer–bromothymol blue solution*, and shake vigorously for not less than 15 minutes. Allow the layers to separate, and pass the chloroform layer through filter paper, discarding the first 10 mL of the filtrate. Determine the absorbances of the clear filtrates in 3-cm cells at the wavelength of maximum absorbance at about 415 nm, using the solution from the blank to set the spectrometer. Calculate the amount of  $C_{18}H_{21}NO_3 \cdot C_4H_6O_6 \cdot 2\frac{1}{2}H_2O$  dissolved by the formula:

$$(494.49 / 449.46)100(C_S / V_U)(A_U / A_S)$$

in which 494.49 and 449.46 are the molecular weights of the hydrated and anhydrous forms of hydrocodone bitartrate, respectively;  $C_S$  is the concentration, in  $\mu$ g per mL, of USP Hydrocodone Bitartrate RS in the *Standard solution*;  $V_U$  is the volume of the filtered solution under test that is estimated to contain 0.4 mg of hydrocodone bitartrate; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Test solution* and the *Standard solution*, respectively.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{18}H_{21}NO_3 \cdot C_4H_6O_6 \cdot 2\frac{1}{2}H_2O$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Procedure for content uniformity**—Transfer 1 finely powdered Tablet to a 50-mL volumetric flask, add 0.1 N sulfuric acid to volume, and mix. Filter if necessary, discarding the first 20 mL of the filtrate. Concomitantly determine the absorbances of this solution and a solution of USP Hydrocodone Bitartrate RS in the same medium, having a known concentration of about 100  $\mu$ g per mL, in 1-cm cells at the

wavelength of maximum absorbance at about 280 nm, with a suitable spectrophotometer, using 0.1 N sulfuric acid as the blank. Calculate the quantity, in mg, of  $C_{18}H_{21}NO_3 \cdot C_4H_6O_6 \cdot 2\frac{1}{2}H_2O$  in the Tablet taken by the formula:

$$(494.49 / 449.46)(TC / D)(A_U / A_S)$$

in which 494.49 and 449.46 are the molecular weights of the hydrated and anhydrous forms of hydrocodone bitartrate, respectively;  $T$  is the labeled quantity, in mg, of hydrocodone bitartrate in the Tablet;  $C$  is the concentration, in  $\mu$ g per mL, of USP Hydrocodone Bitartrate RS in the *Standard solution*;  $D$  is the concentration, in  $\mu$ g per mL, of the solution from the Tablet, based upon the labeled quantity per Tablet and the extent of dilution; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Tablet and the *Standard solution*, respectively.

**Assay**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of hydrocodone bitartrate, to a 250-mL separator with the aid of 10 mL of water. Add a small piece of red litmus paper, then add, dropwise, 6 N ammonium hydroxide until the litmus paper turns blue (about 3 drops). Extract with 25-, 25-, 20-, 20-, 15-, and 15-mL portions of chloroform, and filter the chloroform extracts through a small pledget of cotton into a 250-mL conical flask. Evaporate the combined chloroform extracts almost to dryness, remove the flask from the steam bath, and evaporate the remainder of the chloroform with the aid of a current of air. Dissolve the residue in 80 mL of glacial acetic acid, warming, if necessary. Cool, and titrate with 0.02 N perchloric acid VS, determining the endpoint potentiometrically (see *Titrimetry* (541)). Perform a blank determination, and make any necessary correction. Each mL of 0.02 N perchloric acid is equivalent to 9.890 mg of  $C_{18}H_{21}NO_3 \cdot C_4H_6O_6 \cdot 2\frac{1}{2}H_2O$ .

## Hydrocodone Bitartrate and Acetaminophen Tablets

» Hydrocodone Bitartrate and Acetaminophen Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of hydrocodone bitartrate disesquihydrate ( $C_{18}H_{21}NO_3 \cdot C_4H_6O_6 \cdot 2\frac{1}{2}H_2O$ ) and acetaminophen ( $C_8H_9NO_2$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—The labeling indicates the *Dissolution* test with which the product complies.

**USP Reference standards** (11)—

USP Acetaminophen RS

USP Hydrocodone Bitartrate RS

**Identification**—

**A:** Finely powder 1 Tablet, and transfer about half of the powder to a test tube. Add 1 mL of 1 N sodium hydroxide and 10 mL of water, and centrifuge. Add 5 or 6 drops of ferric chloride TS: a deep blue color develops, and almost immediately a gray-black precipitate forms (*presence of acetaminophen*).

**B:** The retention times of the hydrocodone bitartrate peak and the acetaminophen peak in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution**, *Procedure for a Pooled Sample* (711)—

TEST 1: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

**Medium:** pH 5.8 ± 0.05 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes.

**Procedure**—Proceed as directed in the *Assay*, making any necessary modifications.

**Tolerances**—Not less than 80% (Q) each of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ) and hydrocodone bitartrate ( $C_{18}H_{21}NO_3 \cdot C_4H_6O_6 \cdot 2\frac{1}{2}H_2O$ ) are dissolved in 30 minutes.

**TEST 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** 0.1 N hydrochloric acid; 900 mL.

**Apparatus, Time, and Procedure**—Proceed as directed under *Test 1*.

**Tolerances**—Not less than 80% (Q) each of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ) and hydrocodone bitartrate ( $C_{18}H_{21}NO_3 \cdot C_4H_6O_6 \cdot 2\frac{1}{2}H_2O$ ) is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

**Buffer solution**—Dissolve 6.8 g of monobasic potassium phosphate in 1000 mL of water.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (85:15), and add 0.2 mL of triethylamine per L of *Mobile phase*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Hydrocodone bitartrate standard stock preparation**—Dissolve an accurately weighed quantity of USP Hydrocodone Bitartrate RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 35 µg per mL.

**Standard preparation**—Transfer about 38 mg of USP Acetaminophen RS, accurately weighed, to a 50-mL volumetric flask. Add an accurately measured volume of *Hydrocodone bitartrate standard stock preparation* containing about 38000 µg of USP Hydrocodone Bitartrate RS, *J* being the ratio of the labeled amount, in mg, of hydrocodone bitartrate to that of acetaminophen per Tablet, dilute with *Mobile phase* to volume, and mix. This solution contains about 0.76 mg of USP Acetaminophen RS per mL and about 760 µg of USP Hydrocodone Bitartrate RS per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 76 mg of acetaminophen, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Pass a portion of this mixture through a membrane having a 0.45-µm or finer porosity, discarding the first 5 mL of the filtrate.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a detector set at 210 nm for hydrocodone bitartrate and 295 nm for acetaminophen and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for acetaminophen and 2.0 for hydrocodone; the resolution, *R*, between hydrocodone and acetaminophen is not less than 5.0; the tailing factor for the hydrocodone peak is not more than 1.6; and the relative standard deviation for replicate injections determined from both acetaminophen and hydrocodone is not more than 2.0% each.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. From the responses obtained at 210 nm, calculate the quantity, in mg, of hy-

drocodone bitartrate ( $C_{18}H_{21}NO_3 \cdot C_4H_6O_6 \cdot 2\frac{1}{2}H_2O$ ) in the portion of Tablets taken by the formula:

$$(494.49/449.46)(0.1C)(r_U / r_S)$$

in which 494.49 is the molecular weight of hydrocodone bitartrate disesquihydrate; 449.46 is the molecular weight of anhydrous hydrocodone bitartrate; *C* is the concentration, in µg per mL, of USP Hydrocodone Bitartrate RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. From the responses obtained at 295 nm, calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydrocodone Bitartrate and Homatropine Methylbromide Tablets

» Hydrocodone Bitartrate and Homatropine Methylbromide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of hydrocodone bitartrate disesquihydrate ( $C_{18}H_{21}NO_3 \cdot C_4H_6O_6 \cdot 2\frac{1}{2}H_2O$ ) and homatropine methylbromide ( $C_{17}H_{24}BrNO_3$ ). NOTE—Use of silanized autosampler vials such as dimethyldichlorosilane vials\* is required for the *Dissolution* test, the *Limit* tests, and the *Assay* to prevent drug degradation.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

#### USP Reference standards (11)—

USP Dihydrocodeine Bitartrate RS  
USP Homatropine Methylbromide RS  
USP Hydrocodone Bitartrate RS

#### Identification—

**A:** *Thin-Layer Chromatographic Identification Test* (201)—

**Solution A**—Dissolve 850 mg of bismuth subnitrate in a mixture of 10 mL of glacial acetic acid and 40 mL of water.

**Solution B**—Dissolve 8 g of potassium iodide in 20 mL of water.

**Stock solution:** a mixture of *Solution A* and *Solution B* (1:1).

**Solvent:** a mixture of methanol and water (9:1).

**Spray reagent 1**—[NOTE—Prepare immediately before use.] Prepare a mixture of water, glacial acetic acid, and *Stock solution* (50:10:5).

**Spray reagent 2:** hydrogen peroxide TS.

**Standard solution 1**—Transfer an accurately weighed quantity of about 30 mg of USP Homatropine Methylbromide RS to a 100-mL volumetric flask, dissolve in and dilute with *Solvent* to volume, and mix.

**Standard solution 2**—Transfer an accurately weighed quantity of about 25 mg of USP Hydrocodone Bitartrate RS

\*A suitable grade is available from Analytical Research and Testing, Somerville, NJ; Fax: 908-725-8848.

to a 25-mL volumetric flask, dissolve in and dilute with *Solvent* to volume, and mix.

**Test solution**—Transfer a portion of 20 finely powdered Tablets, equivalent to the average Tablet weight, to a centrifuge tube, add 5.0 mL of *Solvent*, centrifuge, and use the supernatant.

**Developing solvent system**: a mixture of ethyl acetate, water, and formic acid (134:33:33).

**Procedure**—Apply 50  $\mu$ L of *Standard solution 1*, *Standard solution 2*, and the *Test solution*, and proceed as directed in the chapter. Remove the plate, and dry at 105°. Spray the plate with *Spray reagent 1* and then with *Spray reagent 2*: the  $R_f$  values for the principal spots in the chromatogram of the *Test solution* correspond to those of the *Standard solutions*.

**B**: The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Dissolution <711>—

TEST 1—

**Medium**: water; 900 mL, deaerated.

**Apparatus 2**: 50 rpm.

**Time**: 30 minutes.

Determine the amounts of hydrocodone bitartrate and homatropine bromide dissolved employing the following method.

**Buffer solution and Mobile phase**—Proceed as directed in the *Assay*.

**Standard solution**—Dissolve an accurately weighed quantity of USP Hydrocodone Bitartrate RS and USP Homatropine Methylbromide RS in *Medium*, and dilute quantitatively with *Medium* to obtain a solution having known concentrations of about 0.0055 mg per mL and 0.00165 mg per mL, respectively.

**Test solution**—Use the solution under test passed through a suitable 0.45- $\mu$ m filter.

**Chromatographic system**—Proceed as directed in the *Assay*, using the *Standard solution*: the resolution,  $R$ , between homatropine methylbromide and hydrocodone bitartrate is not less than 13; and the relative standard deviation for replicate injections is not more than 3.0% for each analyte.

**Procedure**—Separately inject equal volumes (about 250  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of hydrocodone bitartrate and homatropine methylbromide dissolved by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times LC}$$

in which  $r_U$  and  $r_S$  are the peak areas of each drug substance in the *Test solution* and in the *Standard solution*, respectively;  $C_S$  is the concentration of each drug substance, in mg per mL, in the *Standard solution*; 900 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; and  $LC$  is the tablet label claim for each drug substance, in mg.

**Tolerances**—Not less than 80% (Q) of hydrocodone bitartrate and homatropine methylbromide is dissolved in 30 minutes.

TEST 2—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

**Medium**: water, 500 mL.

**Apparatus 2**: 50 rpm.

**Time**: 45 minutes.

Determine the amounts of hydrocodone bitartrate and homatropine bromide dissolved employing the following method.

**Mobile phase**—Prepare a filtered and degassed mixture of water and acetonitrile (3:1) that contains 1.4 g of octanesulfonic acid sodium salt and 1.0 mL of phosphoric acid per 1000 mL. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Hydrocodone bitartrate standard solution**—Transfer about 50 mg, accurately weighed, of USP Hydrocodone Bitartrate RS to a 100-mL volumetric flask, and dissolve in and dilute with *Mobile phase* to volume.

**Homatropine methylbromide standard solution**—Transfer about 37.5 mg, accurately weighed, of USP Homatropine Methylbromide RS to a 250-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume.

**System suitability solution**—Transfer 10.0 mL of *Hydrocodone bitartrate standard solution* and *Homatropine methylbromide standard solution* to a 500-mL volumetric flask, add 105 mL of *Mobile phase*. Dilute with *Medium* to volume.

**Test solution**—Pass a portion of 20 mL of the solution under test through a suitable 0.45- $\mu$ m filter, discarding the first 2 to 3 mL. Mix thoroughly 15.0 mL of the filtrate with 5.0 mL of *Mobile phase*.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 212-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *System suitability solution*, and record the chromatogram as directed for *Procedure*: the tailing factor for each drug substance is not more than 1.5; the resolution,  $R$ , between homatropine methylbromide and hydrocodone bitartrate is not less than 2.2; and the relative standard deviation for replicate injections is not more than 3.0% for homatropine methylbromide and not more than 2.0% for hydrocodone bitartrate.

**Procedure**—Separately inject equal volumes (about 200  $\mu$ L) of the appropriate *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each drug substance dissolved by the formula:

$$\frac{r_U \times C_S \times D_U \times 500 \times 100}{r_S \times LC}$$

in which  $r_U$  and  $r_S$  are the peak responses of each drug substance in the *Test solution* and in the correspondent *Standard solution*, respectively;  $C_S$  is the concentration of each drug substance, in mg per mL, in the correspondent *Standard solution*;  $D_U$  is the dilution factor of the *Test solution*; 500 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; and  $LC$  is the tablet label claim for each drug substance, in mg.

**Tolerances**—Not less than 75% (Q) of hydrocodone bitartrate and homatropine methylbromide is dissolved in 45 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

#### Limit of dihydrocodeine bitartrate, hydrocodone diol, and related substances—

**Ion-pair solution**—Prepare 0.005 M sodium 1-octanesulfonate, and adjust with glacial acetic acid to a pH of  $2.5 \pm 0.1$ .

**Mobile phase**—Prepare a filtered and degassed mixture of *Ion-pair solution* and methanol (6:4). Add 0.5 mL of triethylamine per L. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability solution**—Dissolve about 2 mg each of hydrocodone diol and USP Dihydrocodeine Bitartrate RS in 35 mL of *Mobile phase* in a 100-mL volumetric flask, and dilute with *Mobile phase* to volume. Dilute this solution quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of each of about 0.1  $\mu$ g per mL.

**Standard solution**—Use the *Standard preparation*, prepared as directed in the *Assay*.

**Test solution**—Use the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.67 for hydrocodone diol, 0.75 for dihydrocodeine bitartrate, and 1.0 for hydrocodone bitartrate; the resolution, *R*, between hydrocodone diol and dihydrocodeine bitartrate is not less than 2.0; and the relative standard deviation for replicate injections of each of these compounds is not more than 5.0%.

**Procedure**—Separately inject equal volumes (about 200 μL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentages of hydrocodone diol and dihydrocodeine bitartrate in the portion of Tablets taken by the formula:

$$100(r_D / r_S)$$

in which  $r_D$  is the individual peak response of either hydrocodone diol or dihydrocodeine in the chromatogram obtained from the *Test solution*; and  $r_S$  is the peak response of hydrocodone bitartrate in the chromatogram obtained from the *Standard solution*: not more than 0.5% of hydrocodone diol is found, and not more than 1.0% of dihydrocodeine bitartrate is found. Calculate the percentage of each other related substance in the portion of Tablets taken by the formula:

$$100(r_i / r_S)$$

in which  $r_i$  is the peak response for any individual related substance with a retention time greater than 5 minutes; and  $r_S$  is the sum of the responses of all the peaks: not more than 0.5% of any individual related substance is found. The sum of all impurities is not more than 1.5%.

#### Limit of homatropine hydrobromide and related substances—

**Buffer solution**—Prepare a solution of 0.005 M dibasic potassium phosphate, and adjust with phosphoric acid to a pH of  $6.4 \pm 0.1$ .

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (17:3). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Dissolve an accurately weighed quantity of homatropine hydrobromide in *Mobile phase*, and dilute quantitatively with *Mobile phase* to obtain a solution having a known concentration of about 0.6 μg per mL.

**Test solution**—Use the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 5.0%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of homatropine hydrobromide in the portion of Tablets taken by the formula:

$$100(r_H / r_S)$$

in which  $r_H$  is the individual peak response of homatropine hydrobromide in the chromatogram obtained from the *Test*

*solution*; and  $r_S$  is the peak response for homatropine methylbromide in the chromatogram obtained from the *Standard solution*: not more than 0.5% of homatropine hydrobromide is found. Calculate the percentage of each other related substance in the portion of Tablets taken by the formula:

$$100(r_i / r_S)$$

in which  $r_i$  is the peak response for any individual related substance with a relative retention time less than 0.44 in relation to the retention time of hydrocodone bitartrate; and  $r_S$  is the sum of the responses of all the peaks: not more than 0.5% of any individual related substance is found. The sum of all impurities is not more than 1.5%.

#### Limit of tropine—

**Adsorbent**: 0.25-mm layer of chromatographic silica gel.

**Diluent**: diethyl ether.

**Test solution**—Finely powder 25 Tablets, and add to a centrifuge tube. Pipet 5.0 mL of diethyl ether into the centrifuge tube, mix on a vortex mixer for 5 minutes, centrifuge, and use the supernatant.

**Standard stock solution**—Dissolve an accurately weighed quantity of tropine in *Diluent*, and dilute quantitatively with *Diluent* to obtain a solution having a known concentration of about 150 μg per mL.

**Stock solutions**—Transfer 5.0 mL of the *Standard stock solution* to a 10-mL volumetric flask, and dilute with *Diluent* to volume quantitatively, and stepwise if necessary, to obtain *Standard solutions A, B, C, and D* having known concentrations of about 75 μg per mL, 37.5 μg per mL, 18.75 μg per mL, and 9.38 μg per mL, respectively.

**Spray reagent**—Dissolve 300 mg of platinic acid in 3 mL of diluted hydrochloric acid, add 97 mL of water and 100 mL of 6% potassium iodide in water, and mix.

**Developing solvent system**: a mixture of alcohol and ammonium hydroxide (400:100).

**Procedure**—Apply equal volumes (about 500 μL) of the *Standard stock solution*, *Standard solutions A, B, C, and D*, and the *Test solution* to a thin-layer chromatographic plate (see *Chromatography* (621)), and proceed as directed in the chapter. After the plate has dried, position it in a chamber saturated with iodine vapor for about 30 minutes, then place it in a hood to allow the iodine to sublime from the plate, and spray the plate with *Spray reagent* until spots appear. Any spot from the *Test solution* occurring at an  $R_f$  value corresponding to tropine is not greater in size or intensity than the corresponding spot obtained from *Standard solution B* (0.5%): not more than 0.5% of tropine is found.

#### Assay—

**Buffer solution**—Prepare a solution of 0.005 M dibasic potassium phosphate, and adjust with phosphoric acid to a pH of  $6.4 \pm 0.01$ .

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (17:3).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Hydrocodone Bitartrate RS and USP Homatropine Methylbromide RS in *Mobile phase*, and dilute quantitatively with *Mobile phase* to obtain a solution having known concentrations of about 0.2 mg per mL and 0.06 mg per mL, respectively.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg of hydrocodone bitartrate and about 1.5 mg of homatropine methylbromide, to a 25-mL volumetric flask. Pipet 15 mL of the *Mobile phase* into the volumetric flask, sonicate for 15 minutes, and then shake with a wrist-action shaker for 15 additional minutes. Pipet an additional 10 mL of *Mobile phase* into the volumetric flask, and mix. Pass the solution through a filter having a 0.45-μm porosity prior to injection into the chromatograph.

**Chromatographic system**—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.44 for homatropine methylbromide and 1.0 for hydrocodone bitartrate; the resolution, *R*, between hydrocodone bitartrate and homatropine methylbromide is not less than 2.5; and the relative standard deviation for replicate injections is not more than 3.0% for each analyte.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the amount, in mg, of homatropine methylbromide (C<sub>17</sub>H<sub>24</sub>BrNO<sub>3</sub>) in the portion of Tablets taken by the formula:

$$(LC_S / C_U)(r_U / r_S)$$

in which *L* is the labeled quantity, in mg, of homatropine methylbromide in each Tablet; *C<sub>S</sub>* is the concentration, in mg per mL, of USP Homatropine Methylbromide RS in the *Standard preparation*; *C<sub>U</sub>* is the concentration, in mg per mL, of homatropine methylbromide in the *Assay preparation*, based on the labeled amount per Tablet and the extent of dilution; and *r<sub>U</sub>* and *r<sub>S</sub>* are the homatropine methylbromide peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the amount, in mg, of hydrocodone bitartrate disesquihydrate (C<sub>18</sub>H<sub>21</sub>NO<sub>3</sub> · C<sub>4</sub>H<sub>6</sub>O<sub>6</sub> · 2½ H<sub>2</sub>O) in the portion of Tablets taken by the formula:

$$(494.50/449.46)(LC_S / C_U)(r_U / r_S)$$

in which 494.50 and 449.46 are the molecular weights of hydrocodone bitartrate disesquihydrate and anhydrous hydrocodone bitartrate, respectively; *L* is the labeled amount, in mg, of hydrocodone bitartrate disesquihydrate in each Tablet; *C<sub>S</sub>* is the concentration, in mg per mL, of USP Hydrocodone Bitartrate RS in the *Standard preparation*; *C<sub>U</sub>* is the concentration, in mg per mL, of hydrocodone bitartrate disesquihydrate in the *Assay preparation*, based on the labeled amount per Tablet and the extent of dilution; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydrocortisone

C<sub>21</sub>H<sub>30</sub>O<sub>5</sub> 362.46  
Pregn-4-ene-3,20-dione, 11,17,21-trihydroxy-, (11β)-;  
Cortisol [50-23-7].

### DEFINITION

Hydrocortisone contains NLT 97.0% and NMT 102.0% of C<sub>21</sub>H<sub>30</sub>O<sub>5</sub>, calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197M>
- **B. ULTRAVIOLET ABSORPTION** <197U>  
Analytical wavelength: 242 nm  
Sample solution: 10 μg/mL in methanol  
Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 2.5%.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Acetonitrile, methanol, and water (25:25:50)

**Diluent:** Methanol and water (1:1)

**Internal standard solution:** 1 mg/mL of propylparaben in methanol

**Standard stock solution:** 1 mg/mL of USP Hydrocortisone RS in methanol

**Standard solution:** 2.0 mL of *Standard stock solution* and 2.0 mL of *Internal standard solution*. Dilute with *Diluent* to 50 mL.

**Sample stock solution:** 1 mg/mL of Hydrocortisone in methanol

**Sample solution:** 2.0 mL of *Sample stock solution* and 2.0 mL of *Internal standard solution*. Dilute with *Diluent* to 50 mL.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10 μL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for hydrocortisone and propylparaben are about 1.0 and 1.8, respectively.]

#### Suitability requirements

**Resolution:** NLT 9.0 between the hydrocortisone and propylparaben peaks

**Column efficiency:** NLT 3000 theoretical plates for hydrocortisone

**Tailing factor:** NMT 1.2

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of hydrocortisone (C<sub>21</sub>H<sub>30</sub>O<sub>5</sub>) in the portion of Hydrocortisone taken:

$$\text{Result} = (R_U / R_S) \times (C_S / C_U) \times 100$$

*R<sub>U</sub>* = peak response ratio of hydrocortisone to the internal standard from the *Sample solution*

*R<sub>S</sub>* = peak response ratio of hydrocortisone to the internal standard from the *Standard solution*

*C<sub>S</sub>* = concentration of USP Hydrocortisone RS in the *Standard solution* (mg/mL)

*C<sub>U</sub>* = concentration of Hydrocortisone in the *Sample solution* (mg/mL)

**Acceptance criteria:** 97.0%–102.0% on the dried basis

### IMPURITIES

#### • RESIDUE ON IGNITION <281>

**Sample:** 100 mg

**Acceptance criteria:** NMT 0.5%

#### • ORGANIC IMPURITIES

**Mobile phase:** Butyl chloride, tetrahydrofuran, methanol, glacial acetic acid, and water (890: 56: 28: 24: 0.4)

**Diluent:** Butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (81.5: 10: 8: 0.5)

**Standard solution:** 40 μg/mL of USP Hydrocortisone RS in *Diluent*. [NOTE—Sonicate for 5 min.]

**Sample solution:** 2 mg/mL of Hydrocortisone in *Diluent*. [NOTE—Sonicate for 5 min.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 3-μm packing L3

**Flow rate:** 1.5 mL/min

**Injection size:** 5 μL

**System suitability****Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 2.0**Relative standard deviation:** NMT 5%**Analysis****Samples:** *Standard solution*, *Sample solution*, and *Diluent*. [NOTE—Ignores artifact peaks.]

Calculate the percentage of impurities in the portion of Hydrocortisone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = individual impurity peak area from the *Sample solution* $r_S$  = peak area from the *Standard solution* $C_S$  = concentration of USP Hydrocortisone RS in the *Standard solution* (mg/mL) $C_U$  = concentration of Hydrocortisone in the *Sample solution* (mg/mL)**Acceptance criteria****Individual impurities:** NMT 0.5%**Total impurities:** NMT 2.0%**SPECIFIC TESTS**

- **OPTICAL ROTATION**, *Specific Rotation* (781S)  
**Sample solution:** 10 mg/mL, in dioxane  
**Acceptance criteria:** +150° to +156°
- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 1.0% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)  
USP Hydrocortisone RS

---

**Hydrocortisone Cream**

---

**DEFINITION**Hydrocortisone Cream is Hydrocortisone in a suitable cream base. It contains NLT 90.0% and NMT 110.0% of the labeled amount of hydrocortisone (C<sub>21</sub>H<sub>30</sub>O<sub>5</sub>).**IDENTIFICATION**

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)

**Sample solution:** Transfer a portion of Cream, equivalent to 5 mg of hydrocortisone, to a flask. Add 5 mL of alcohol, and heat on a steam bath for 5 min, with frequent shaking. Cool, and filter. Use the filtrate.**Analysis:** Proceed as directed in the chapter.**Acceptance criteria:** Meets the requirements**ASSAY**

- **PROCEDURE**

**Diluent:** Dilute methanol (1 in 2)**Mobile phase:** Acetonitrile and water (25:75)**Standard stock solution:** 500 µg/mL of USP Hydrocortisone RS in methanol**Standard solution:** 50 µg/mL of USP Hydrocortisone RS prepared by mixing *Standard stock solution* and *Diluent* (1:9). [NOTE—If methanol is used in the final dilution of the *Sample solution*, similarly use methanol instead of aqueous methanol in the final dilution of the *Standard solution*.]**Sample solution:** Transfer a quantity of Cream, nominally equivalent to 10 mg of hydrocortisone, to a 150-mL beaker. Add 40 mL of methanol, and heat on a steam bath while stirring to melt and disperse the Cream. Cool to room temperature, and filter through glass wool into a 100-mL volumetric flask. Repeat the extraction with two 20-mL portions of methanol, com-bining the filtrates in the 100-mL volumetric flask. Add methanol to volume, and mix. Quantitatively dilute one volume of this solution with an equal volume of water, and pass through a membrane filter of 5-µm pore size. If precipitation occurs on dilution with water and the solution is still cloudy after filtration, dilute the initial *Sample solution* with methanol instead of water. Pass this solution through a membrane filter of 5-µm pore size.**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 254 nm**Column:** 3.9-mm × 30-cm; packing L1**Injection volume:** 10–25 µL**System suitability**[NOTE—Adjust the composition of the *Mobile phase* so that the retention time of hydrocortisone is about 10 min.]**Sample:** *Standard solution***Suitability requirements****Relative standard deviation:** NMT 3.0% for five replicate injections**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of hydrocortisone (C<sub>21</sub>H<sub>30</sub>O<sub>5</sub>) in the portion of Cream taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response from the *Sample solution* $r_S$  = peak response from the *Standard solution* $C_S$  = concentration of USP Hydrocortisone RS in the *Standard solution* (µg/mL) $C_U$  = nominal concentration of hydrocortisone in the *Sample solution* (µg/mL)**Acceptance criteria:** 90.0%–110.0%**PERFORMANCE TESTS**

- **MINIMUM FILL** (755): Meets the requirements

**SPECIFIC TESTS**

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements of the tests for the absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)  
USP Hydrocortisone RS

---

**Hydrocortisone Gel**

---

» Hydrocortisone Gel is Hydrocortisone in a suitable hydroalcoholic gel base. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone (C<sub>21</sub>H<sub>30</sub>O<sub>5</sub>).**Packaging and storage**—Preserve in tight containers.**USP Reference standards** (11)—

USP Hydrocortisone RS

**Identification**—Proceed with Gel as directed under *Hydrocortisone Cream*. The specified result is obtained.**Minimum fill** (755): meets the requirements.**Assay**—**Mobile solvent**—Prepare a mixture of 2 volumes of methanol, 2 volumes of acetonitrile, and 6 volumes of water.

**Standard preparation**—Dissolve a suitable quantity of USP Hydrocortisone RS, accurately weighed, in alcohol and dichloromethane (75:25) to obtain a solution having a known concentration of about 0.1 mg per mL. Dilute this solution with alcohol to a concentration of 10 µg per mL.

**Assay preparation**—Weigh accurately an aliquot of Gel, equivalent to about 10 mg of hydrocortisone, and dilute with alcohol and dichloromethane (75:25) to obtain a solution having a concentration of about 0.1 mg per mL. Dilute this solution with alcohol to a concentration of 10 µg per mL.

**Procedure**—Introduce equal volumes (between 5 µL and 15 µL) of the *Assay preparation* and the *Standard preparation* into a high-pressure liquid chromatograph (see *Chromatography* <621>) operated at room temperature, by means of a suitable microsyringe or sampling valve, adjusting the specimen size and other operating parameters such that the peak obtained from the *Standard preparation* is about 0.6 full-scale. Typically, the apparatus is fitted with a 4-mm × 30-cm column that contains packing L1 and is equipped with an UV detector capable of monitoring absorption at 254 nm, and a suitable recorder, and is capable of operating at a column pressure of up to 6000 psi. In a suitable chromatogram, the coefficient of variation for five replicate injections of the *Standard preparation* is not more than 3.0%. Determine the ratios of the peak heights, at equivalent retention times, obtained from the *Assay preparation* and the *Standard preparation*, and calculate the quantity, in mg, of hydrocortisone (C<sub>21</sub>H<sub>30</sub>O<sub>5</sub>) in the portion of Gel taken by the formula:

$$C(H_U / H_S)$$

in which C is the concentration, in µg per mL, of USP Hydrocortisone RS in the *Standard preparation*; and  $H_U$  and  $H_S$  are the peak heights of the *Assay preparation* and the *Standard preparation*, respectively.

## Hydrocortisone Lotion

### DEFINITION

Hydrocortisone Lotion is Hydrocortisone in a suitable aqueous vehicle. It contains NLT 90.0% and NMT 110.0% of the labeled amount of hydrocortisone (C<sub>21</sub>H<sub>30</sub>O<sub>5</sub>).

### IDENTIFICATION

#### • A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST <201>

**Standard solution:** 500 µg/mL of USP Hydrocortisone RS in methanol

**Sample solution:** Transfer a quantity of Lotion, nominally equivalent to 5 mg of hydrocortisone, to a separator containing 10 mL of methylene chloride. Shake for 1 min, and allow the layers to separate. Filter the methylene chloride extract onto a suitable chromatographic column that has been packed with 2 g of activated magnesium silicate. Wash the column with 25 mL of methylene chloride with the aid of slight air pressure, discarding the washings, and elute the hydrocortisone with 10 mL of methanol.

#### Chromatographic system

**Developing solvent system:** Chloroform, methanol, and water (180:15:1)

**Analysis:** Proceed as directed in the chapter.

**Acceptance criteria:** Meets the requirements

### ASSAY

#### • PROCEDURE

**Mobile phase:** Acetonitrile, methanol, and water (21:21:58)

**Standard stock solution:** 0.1 mg/mL of USP Hydrocortisone RS in alcohol

**Standard solution:** 0.05 mg/mL of USP Hydrocortisone RS from *Standard stock solution* in water

**System suitability stock solution:** 0.05 mg/mL of propylparaben in alcohol

**System suitability solution:** 5 µg/mL of propylparaben and 45 µg/mL of USP Hydrocortisone RS, prepared by diluting 1 mL of the *System suitability stock solution* with *Standard solution* to 10 mL

**Sample stock solution:** Nominally 0.1 mg/mL of hydrocortisone, prepared as follows. Shake a 100-mL portion of Lotion to ensure homogeneity, and allow to stand until the entrapped air rises. Invert carefully, and transfer a quantity of this Lotion, freshly mixed but free from air bubbles, nominally equivalent to 10 mg of hydrocortisone, to a 40-mL beaker, and add 30 mL of alcohol. Warm gently until the Lotion is dispersed, and cool to room temperature. Filter the mixture into a 100-mL volumetric flask through a pledget of cotton previously moistened with alcohol. Rinse the beaker with two 20-mL portions of alcohol, and collect the washings in the same volumetric flask. Dilute with alcohol to volume.

**Sample solution:** Nominally 0.05 mg/mL of hydrocortisone from *Sample stock solution* in water

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between propylparaben and hydrocortisone, *System suitability solution*

**Column efficiency:** NLT 1000 theoretical plates for hydrocortisone, *System suitability solution*

**Tailing factor:** NMT 1.2 for hydrocortisone, *System suitability solution*

**Relative standard deviation:** NMT 3.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of hydrocortisone (C<sub>21</sub>H<sub>30</sub>O<sub>5</sub>) in the portion of Lotion taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Hydrocortisone RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of hydrocortisone in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

- **MINIMUM FILL <755>:** Meets the requirements

### SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS <61> and TESTS FOR SPECIFIED MICROORGANISMS <62>:** It meets the requirements for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS <11>**  
USP Hydrocortisone RS

## Hydrocortisone Ointment

### DEFINITION

Hydrocortisone Ointment is Hydrocortisone in a suitable ointment base. It contains NLT 90.0% and NMT 110.0% of the labeled amount of hydrocortisone ( $C_{21}H_{30}O_5$ ).

### IDENTIFICATION

#### • A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

**Sample solution:** Transfer a portion of Ointment, equivalent to 5 mg of hydrocortisone, to a flask. Add 10 mL of methanol, and heat on a steam bath for 5 min with frequent shaking. Cool to solidify the ointment base, and filter. Use the filtrate.

**Acceptance criteria:** Meets the requirements

### ASSAY

#### • PROCEDURE

**Diluent:** Dilute alcohol (1 in 2)

**Mobile phase:** Acetonitrile and water (25:75)

**Standard stock solution:** 500  $\mu\text{g/mL}$  of USP Hydrocortisone RS in alcohol

**Standard solution:** 50  $\mu\text{g/mL}$  of USP Hydrocortisone RS prepared by mixing *Standard stock solution* and *Diluent* (1:9). [NOTE—If alcohol is used in the final dilution of the *Sample solution*, similarly use alcohol instead of aqueous alcohol in the final dilution of the *Standard solution*.]

**Sample solution:** Transfer a quantity of Ointment, nominally equivalent to 10 mg of hydrocortisone, to a 150-mL beaker. Add 40 mL of alcohol, and heat on a steam bath while stirring to melt and disperse the Ointment. Cool to room temperature, and filter through glass wool into a 100-mL volumetric flask. Repeat the extraction with two 20-mL portions of alcohol, combining the filtrates in the 100-mL volumetric flask. Add alcohol to volume, and mix. Quantitatively dilute one volume of this solution with an equal volume of water, and pass through a membrane filter of 5- $\mu\text{m}$  pore size. If precipitation occurs on dilution with water, and the solution is still cloudy after filtration, dilute the initial *Sample solution* with alcohol instead of water. Pass this solution through a membrane filter of 5- $\mu\text{m}$  pore size.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Injection volume:** 10–25  $\mu\text{L}$

#### System suitability

[NOTE—Adjust the composition of the *Mobile phase* so that the retention time of hydrocortisone is about 10 min.]

**Sample:** *Standard solution*

#### Suitability requirements

**Relative standard deviation:** NMT 3.0% for 5 replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of hydrocortisone ( $C_{21}H_{30}O_5$ ) in the portion of Ointment taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Hydrocortisone RS in the *Standard solution* ( $\mu\text{g/mL}$ )

$C_U$  = nominal concentration of hydrocortisone in the *Sample solution* ( $\mu\text{g/mL}$ )

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

- **MINIMUM FILL (755):** Meets the requirements

### SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED ORGANISMS (62):** It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS (11)**  
USP Hydrocortisone RS

## Hydrocortisone Injectable Suspension

» Hydrocortisone Injectable Suspension is a sterile suspension of Hydrocortisone in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone ( $C_{21}H_{30}O_5$ ).

**Packaging and storage—**Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

#### USP Reference standards (11)—

USP Hydrocortisone RS

USP Endotoxin RS

**Identification—**It responds to the *Identification* test under *Hydrocortisone Lotion*.

**Bacterial endotoxins (85)—**It contains not more than 1.25 USP Endotoxin Units per mg of hydrocortisone.

**pH (791):** between 5.0 and 7.0.

**Other requirements—**It meets the requirements under *Injections* (1).

#### Assay—

**Standard preparation—**Prepare as directed for *Standard Preparation* under *Assay for Steroids* (351), using USP Hydrocortisone RS.

**Assay preparation—**Transfer to a separator an accurately weighed quantity of Injectable Suspension, equivalent to about 50 mg of hydrocortisone, using a total of 25 mL of water to effect the transfer. Extract with four 40-mL portions of chloroform, filtering each portion through chloroform-washed cotton into a 200-mL volumetric flask. Add chloroform to volume, and mix. Pipet 20 mL of this solution into a 100-mL volumetric flask, add chloroform to volume, and mix. Pipet 10 mL of the resulting solution into a glass-stoppered, 100-mL conical flask, evaporate on a steam bath just to dryness, cool, and dissolve the residue in 50.0 mL of alcohol.

**Procedure—**Proceed as directed for *Procedure* under *Assay for Steroids* (351). Calculate the quantity, in mg, of  $C_{21}H_{30}O_5$  in the portion of Injectable Suspension taken by the formula:

$$5C(A_U / A_S).$$

## Hydrocortisone Rectal Suspension

» Hydrocortisone Rectal Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone ( $C_{21}H_{30}O_5$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Hydrocortisone RS

**Identification**, *Thin-Layer Chromatographic Identification Test* (201)—

*Test solution*—Use the *Assay preparation*, except to omit addition of the *Internal standard solution*.

**pH** (791): between 5.5 and 7.0.

**Assay**—

*Mobile phase*—Mix 55 mL of a solution of water in methanol (5 in 100) with 1.0 mL of glacial acetic acid, dilute with water-washed 1,2-dichloroethane to 1000 mL, and mix. Degass before using. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Internal standard solution*—Dissolve 200 mg of acetaminophen in 4 mL of methanol, dilute with water-washed 1,2-dichloroethane to 200 mL, and mix. Keep the solution tightly stoppered and protected from light.

*Standard preparation*—Accurately weigh about 8 mg of USP Hydrocortisone RS, add 4 mL of methanol and 4.0 mL of *Internal standard solution*, dilute with chloroform to 100.0 mL, and mix to obtain a solution having a known concentration of about 0.08 mg of USP Hydrocortisone RS per mL.

*Assay preparation*—Transfer an accurately weighed quantity of Rectal Suspension, equivalent to about 8 mg of hydrocortisone, to a separator. Extract with four 20-mL portions of chloroform, filtering each portion through chloroform-washed cotton into a 100-mL volumetric flask. Add 4 mL of methanol and 4.0 mL of *Internal standard solution*, dilute with chloroform to volume, and mix. Pass the extract through a 0.5- $\mu$ m porosity polytetrafluoroethylene filter, discarding the first 20 mL of the filtrate.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L3. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.3 for acetaminophen and 1.0 for hydrocortisone; the resolution,  $R$ , between the analyte and internal standard is not less than 2.5; the column efficiency determined from the analyte peak is not less than 5000 theoretical plates; and the relative standard deviation for replicate injections is not more than 1.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of hydrocortisone ( $C_{21}H_{30}O_5$ ) in the portion of Rectal Suspension taken by the formula:

$$100C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Hydrocortisone RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydrocortisone Tablets

### DEFINITION

Hydrocortisone Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of hydrocortisone ( $C_{21}H_{30}O_5$ ).

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197M)

**Sample:** Powder a number of Tablets, equivalent to 50 mg of hydrocortisone, and digest with 15 mL of solvent hexane for 15 min. Decant the solvent hexane as completely as possible, and extract the residue first with 10 mL of solvent hexane, then with 10 mL of peroxide-free ether in the same manner as before, and discard the extracts. Digest the final residue with 25 mL of dehydrated alcohol for 15 min with frequent agitation. Filter, and evaporate the alcohol extract on a steam bath to dryness. Use the residue.

**Acceptance criteria:** Meet the requirements

### ASSAY

#### • PROCEDURE

**Mobile phase:** Butyl chloride, water-saturated butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (95:95:14:7:6)

**Internal standard solution:** 0.06 mg/mL of USP Prednisone RS in water-saturated chloroform

**Standard solution:** 0.1 mg/mL of USP Hydrocortisone RS in *Internal standard solution*

**Sample solution:** Nominally 0.1 mg/mL of hydrocortisone from NLT 10 finely powdered Tablets, prepared as follows. Transfer a portion of the powder, equivalent to 5 mg of hydrocortisone, to a suitable container, and add 50.0 mL of the *Internal standard solution*. Shake vigorously for 30 min, and centrifuge a portion. Use the clear supernatant.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm  $\times$  30-cm; packing L3

**Flow rate:** 0.9 mL/min

**Injection volume:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 3.0 between hydrocortisone and prednisone

**Relative standard deviation:** NMT 2.0% for four replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of hydrocortisone ( $C_{21}H_{30}O_5$ ) in the portion of Tablets taken:

$$\text{Result} = (R_U / R_S) \times (C_S / C_U) \times 100$$

$R_U$  = peak response ratio of hydrocortisone to the internal standard from the *Sample solution*

$R_S$  = peak response ratio of hydrocortisone to the internal standard from the *Standard solution*

$C_S$  = concentration of USP Hydrocortisone RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of hydrocortisone in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

## PERFORMANCE TESTS

### • DISSOLUTION 〈711〉

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard solution: USP Hydrocortisone RS at a known concentration in Medium

Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute with Medium if necessary.

### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* 〈851〉.)

Mode: UV

Analytical wavelength: Maximum absorbance at about 248 nm

### Analysis

Samples: Standard solution and Sample solution  
Determine the amount of hydrocortisone ( $C_{21}H_{30}O_5$ ) dissolved.

Tolerances: NLT 70% (Q) of the labeled amount of hydrocortisone ( $C_{21}H_{30}O_5$ ) is dissolved.

### • UNIFORMITY OF DOSAGE UNITS (905)

#### Procedure for content uniformity

Mobile phase, Internal standard solution, Standard solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Sample solution: Nominally 0.1 mg/mL of hydrocortisone, prepared as follows. Transfer 1 Tablet to a suitable container, and add 0.3 mL of water directly onto the Tablet. Allow the Tablet to stand for about 5 min. Shake the container to break up the Tablet, and sonicate briefly to ensure complete disintegration. Add a few small glass beads and 50.0 mL of the Internal standard solution to the container. Shake the container for about 30 min. Dilute an accurately measured volume of the clear supernatant with a known, accurately measured volume of the Internal standard solution to obtain the desired concentration. Shake the contents of the container to mix.

### Analysis

Samples: Standard solution and Sample solution  
Calculate the percentage of the labeled amount of hydrocortisone ( $C_{21}H_{30}O_5$ ) in the Tablet taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of hydrocortisone to the internal standard from the Sample solution

$R_S$  = peak response ratio of hydrocortisone to the internal standard from the Standard solution

$C_S$  = concentration of USP Hydrocortisone RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of hydrocortisone in the Sample solution (mg/mL)

Acceptance criteria: Meet the requirements

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** 〈11〉

USP Hydrocortisone RS

USP Prednisone RS

## Hydrocortisone and Acetic Acid Otic Solution

### DEFINITION

Hydrocortisone and Acetic Acid Otic Solution is a solution of Hydrocortisone and Glacial Acetic Acid in a suitable non-aqueous solvent. It contains NLT 90.0% and NMT

120.0% of the labeled amount of hydrocortisone ( $C_{21}H_{30}O_5$ ), and NLT 85.0% and NMT 130.0% of the labeled amount of acetic acid ( $C_2H_4O_2$ ).

## IDENTIFICATION

### • A.

Analysis: Dilute 5 mL of Otic Solution with 10 mL of water, and adjust with 1 N sodium hydroxide to a pH of about 7. Add ferric chloride TS.

Acceptance criteria: A deep red color is produced, and it is destroyed by the addition of hydrochloric acid.

• **B.** The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, both relative to the internal standard, as obtained in the Assay for Acetic Acid.

• **C.** The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay for Hydrocortisone.

## ASSAY

### • ACETIC ACID

Internal standard solution: Dilute 2.0 mL of anisole with methanol to 100 mL.

Standard stock solution: 20 mg/mL of glacial acetic acid in methanol

Standard solution: 10 mg/mL of glacial acetic acid in methanol, prepared as follows. Transfer a sufficient volume of the Standard stock solution to a volumetric flask of suitable size, add 20% of the flask volume of the Internal standard solution, and dilute with methanol to volume.

Sample solution: Nominally 10 mg/mL of glacial acetic acid, prepared as follows. Transfer a sufficient volume of Otic Solution to a volumetric flask of suitable size, add 20% of the flask volume of the Internal standard solution, and dilute with methanol to volume.

### Chromatographic system

(See *Chromatography* 〈621〉, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 2-mm × 1.8-m glass; packed with 20% liquid phase G35 on support STA

Carrier gas: Nitrogen

Flow rate: 25 mL/min

Temperatures

Injection port: 180°

Detector: 220°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
115	0	115	12
115	35	190	3

Injection volume: 4 µL

### System suitability

Sample: Standard solution

[NOTE—The relative retention times for anisole and acetic acid are 1.0 and 1.5, respectively.]

### Suitability requirements

Resolution: NLT 1.5 between anisole and acetic acid

Relative standard deviation: NMT 2.0%

### Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of acetic acid ( $C_2H_4O_2$ ) in the portion of Otic Solution taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of acetic acid to the internal standard from the Sample solution

- $R_S$  = peak response ratio of acetic acid to the internal standard from the *Standard solution*  
 $C_S$  = concentration of glacial acetic acid in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of acetic acid in the *Sample solution* (mg/mL)

**Acceptance criteria:** 85.0%–130.0%

#### • HYDROCORTISONE

**Diluent:** Dilute alcohol (1 in 2)  
**Mobile phase:** Acetonitrile and water (30:70)  
**Standard solution:** 0.5 mg/mL of USP Hydrocortisone RS in *Diluent*  
**Sample solution:** Nominally equivalent to 0.5 mg/mL of hydrocortisone from Otic Solution in *Diluent*  
**Chromatographic system**  
 (See *Chromatography* <621>, *System Suitability*).  
**Mode:** LC  
**Detector:** UV 254 nm  
**Column:** 4-mm × 30-cm; packing L1  
**Flow rate:** 2 mL/min  
**Injection volume:** 20 µL  
**System suitability**  
**Sample:** *Standard solution*  
**Suitability requirements**  
**Relative standard deviation:** NMT 2.0% for four replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of the labeled amount of hydrocortisone ( $C_{21}H_{30}O_5$ ) in the portion of Otic Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Hydrocortisone RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of hydrocortisone in the *Sample solution* (mg/mL)  
**Acceptance criteria:** 90.0%–120.0%

#### SPECIFIC TESTS

##### • pH <791>

**Sample solution:** Otic Solution and water (1:1)  
**Acceptance criteria:** 2.0–4.0

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** <11>  
 USP Hydrocortisone RS

## Hydrocortisone Acetate

$C_{23}H_{32}O_6$  404.50  
 Pregn-4-ene-3,20-dione, 21-(acetyloxy)-11,17-dihydroxy-, (11 $\beta$ )-;  
 Cortisol 21-acetate [50-03-3].

#### DEFINITION

Hydrocortisone Acetate contains NLT 97.0% and NMT 102.0% of  $C_{23}H_{32}O_6$ , calculated on the dried basis.

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197M>
- **B. ULTRAVIOLET ABSORPTION** <197U>  
**Analytical wavelength:** 242 nm  
**Sample solution:** 10 µg/mL in methanol  
**Acceptance criteria:** Absorptivities, calculated on the dried basis, do not differ by more than 2.5%.

#### ASSAY

##### • PROCEDURE

**Mobile phase:** Butyl chloride, water-saturated butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (475:475:70:35:30)  
**Standard solution:** 0.10 mg/mL of USP Hydrocortisone Acetate RS in *Mobile phase*  
**Sample solution:** 0.10 mg/mL of Hydrocortisone Acetate in *Mobile phase*  
**Chromatographic system**  
 (See *Chromatography* <621>, *System Suitability*).  
**Mode:** LC  
**Detector:** UV 254 nm  
**Column:** 3.9-mm × 30-cm; 10-µm packing L3  
**Flow rate:** 1 mL/min  
**Injection size:** 10 µL  
**System suitability**  
**Sample:** *Standard solution*  
**Suitability requirements**  
**Tailing factor:** NMT 2.0  
**Relative standard deviation:** NMT 2.0%  
**Analysis**  
**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of hydrocortisone acetate ( $C_{23}H_{32}O_6$ ) in the portion of Hydrocortisone Acetate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of hydrocortisone acetate from the *Sample solution*  
 $r_S$  = peak response of hydrocortisone acetate from the *Standard solution*  
 $C_S$  = concentration of USP Hydrocortisone Acetate RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Hydrocortisone Acetate in the *Sample solution* (mg/mL)  
**Acceptance criteria:** 97.0%–102.0% on the dried basis

#### IMPURITIES

- **RESIDUE ON IGNITION** <281>  
**Sample:** 100 mg  
**Acceptance criteria:** NMT 0.5%
- **ORGANIC IMPURITIES**  
**Solution A:** Acetonitrile and water (20:80)  
**Solution B:** Acetonitrile and water (70:30)  
**Mobile phase:** See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
5	90	10
25	10	90
30	10	90
35	90	10
40	90	10

**Diluent:** Acetonitrile, glacial acetic acid, and water (700:1:300)  
**Standard solution:** 5 µg/mL of USP Hydrocortisone Acetate RS in *Diluent*  
**Sample solution:** 1 mg/mL of Hydrocortisone Acetate in *Diluent*

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 254 nm**Column:** 4.6-mm × 15-cm; 3-μm packing L1**Flow rate:** 1 mL/min**Injection size:** 10 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Relative standard deviation:** NMT 5.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Hydrocortisone Acetate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response of each impurity from the *Sample solution* $r_S$  = peak response from the *Standard solution* $C_S$  = concentration of USP Hydrocortisone Acetate RS in the *Standard solution* (mg/mL) $C_U$  = concentration of Hydrocortisone Acetate in the *Sample solution* (mg/mL)**Acceptance criteria****Individual impurities:** NMT 1.0%**Total impurities:** NMT 2.0%**SPECIFIC TESTS**• **OPTICAL ROTATION**, *Specific Rotation* <781S>**Sample solution:** 10 mg/mL in dioxane**Acceptance criteria:** Between +158° and +167° at 20°• **LOSS ON DRYING** <731>: Dry a sample in vacuum at 60° for 3 h: it loses NMT 1.0% of its weight.**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in well-closed containers.• **USP REFERENCE STANDARDS** <11>

 $r_U$  = peak response from the *Sample solution* $r_S$  = peak response from the *Standard solution* $C_S$  = concentration of USP Hydrocortisone Acetate RS in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of hydrocortisone acetate in the *Sample solution* (mg/mL)**Acceptance criteria:** 90.0%–110.0%**PERFORMANCE TESTS**• **MINIMUM FILL** <755>: Meets the requirements**SPECIFIC TESTS**• **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: It meets the requirements of the tests for the absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in well-closed containers.• **USP REFERENCE STANDARDS** <11>

USP Hydrocortisone Acetate RS

---

**Hydrocortisone Acetate Lotion**

---

» Hydrocortisone Acetate Lotion is Hydrocortisone Acetate in a suitable aqueous vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone acetate (C<sub>23</sub>H<sub>32</sub>O<sub>6</sub>).**Packaging and storage**—Preserve in tight containers.**USP Reference standards** <11>—

USP Hydrocortisone Acetate RS

**Identification**—It responds to the *Identification* test under *Hydrocortisone Acetate Ointment*.

**Minimum fill** (755): meets the requirements.

**Assay—**

*Mobile phase*—Prepare a filtered and degassed solution containing butyl chloride, water-saturated butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (475:475:70:35:30). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Hydrocortisone Acetate RS in water-saturated chloroform to obtain a solution having a known concentration of about 0.10 mg per mL.

*Assay preparation*—Transfer an accurately weighed quantity of Lotion, equivalent to about 2.5 mg of hydrocortisone acetate, to a closable container. Add 25.0 mL of water-saturated chloroform and about 10 glass beads. Securely close the container, and shake vigorously for approximately 15 minutes. Centrifuge, and use the clear, lower chloroform layer.

*Procedure*—Introduce equal volumes of the *Assay preparation* and the *Standard preparation* into a high-pressure liquid chromatograph fitted with a 254-nm detector. Typically the apparatus is fitted with a 4-mm × 30-cm column containing packing L3 and operated at room temperature. Six replicate injections of the *Standard preparation* show a relative standard deviation of not more than 2.0%. Calculate the quantity, in mg, of hydrocortisone acetate ( $C_{23}H_{32}O_6$ ) in the portion of Lotion taken by the formula:

$$25C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Hydrocortisone Acetate RS in the *Standard preparation*; and  $r_u$  and  $r_s$  are the hydrocortisone acetate peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydrocortisone Acetate Ointment

» Hydrocortisone Acetate Ointment is Hydrocortisone Acetate in a suitable ointment base. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{23}H_{32}O_6$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Hydrocortisone Acetate RS

**Identification**—Transfer a quantity of Ointment, equivalent to about 5 mg of hydrocortisone acetate, to a flask, add 5 mL of methanol, and heat on a steam bath for 5 minutes with frequent mixing. Cool to solidify the ointment base, and filter. Using the filtrate as the test solution, proceed as directed under *Thin-layer Chromatographic Identification Test* (201). Locate the spots by spraying the dried plate with a 70% methanolic sulfuric acid solution. Heat the plate for 20 to 30 minutes at 90°, allow to cool, and view under long-wavelength UV light: the  $R_f$  value and fluorescence of the principal spot obtained from the test solution correspond to those obtained from the Standard solution.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** (755): meets the requirements.

**Assay**—Proceed with Ointment as directed in the *Assay* under *Hydrocortisone Acetate Lotion*.

## Hydrocortisone Acetate Ophthalmic Ointment

» Hydrocortisone Acetate Ophthalmic Ointment is Hydrocortisone Acetate in a suitable ophthalmic ointment base. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of total steroids, calculated as  $C_{23}H_{32}O_6$ . It is sterile.

**Packaging and storage**—Preserve in collapsible ophthalmic ointment tubes.

**USP Reference standards** (11)—

USP Hydrocortisone Acetate RS

**Identification**—It responds to the *Identification* test under *Hydrocortisone Acetate Ointment*.

**Sterility** (71): meets the requirements.

**Minimum fill** (755): meets the requirements.

**Particulate matter**—It meets the requirements of the test for *Metal Particles in Ophthalmic Ointments* (751).

**Assay—**

*Standard preparation*—Prepare as directed for *Standard Preparation* under *Assay for Steroids* (351), using USP Hydrocortisone Acetate RS.

*Assay preparation*—Transfer to a suitable flask an accurately weighed quantity of Ophthalmic Ointment, equivalent to about 10 mg of hydrocortisone acetate, and add 30 mL of alcohol. Heat on a steam bath to melt the ointment base, and mix. Cool to solidify the ointment base, and filter the alcohol solution into a 100-mL volumetric flask. Repeat the extraction with three 20-mL portions of alcohol, add alcohol to volume, and mix. Pipet 10 mL of this solution into a 100-mL volumetric flask, add alcohol to volume, and mix. Pipet 20 mL of the resulting solution into a glass-stoppered, 50-mL conical flask.

*Procedure*—Proceed as directed for *Procedure* under *Assay for Steroids* (351). Calculate the quantity, in mg, of  $C_{23}H_{32}O_6$  in the portion of Ophthalmic Ointment taken by the formula:

$$C(A_u / A_s)$$

in which the terms are as defined therein.

## Hydrocortisone Acetate Injectable Suspension

» Hydrocortisone Acetate Injectable Suspension is a sterile suspension of Hydrocortisone Acetate in a suitable aqueous medium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of total steroids, calculated as hydrocortisone acetate ( $C_{23}H_{32}O_6$ ). It may contain suitable buffers and suspending agents.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP Hydrocortisone Acetate RS

**Identification**—Extract a volume of Injectable Suspension, equivalent to about 50 mg of hydrocortisone acetate, with two 10-mL portions of peroxide-free ether, and discard the ether extracts. Filter with suction, wash with small portions

of water, and dry at 105° for 1 hour: the hydrocortisone acetate so obtained responds to *Identification test A* under *Hydrocortisone Acetate*.

**pH** (791): between 5.0 and 7.0.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Standard preparation*—Prepare as directed for *Standard Preparation* under *Assay for Steroids* (351), using USP Hydrocortisone Acetate RS.

*Assay preparation*—Transfer to a separator an accurately measured volume of Injectable Suspension, equivalent to about 50 mg of hydrocortisone acetate, and dilute with water to about 15 mL. Extract with four 25-mL portions of chloroform, filtering each portion through chloroform-washed cotton into a 250-mL volumetric flask. Add chloroform to volume, and mix. Pipet 10 mL of this solution into a 100-mL volumetric flask, add chloroform to volume, and mix. Pipet 10 mL of the resulting solution into a glass-stoppered, 50-mL conical flask, evaporate the chloroform on a steam bath just to dryness, cool, and dissolve the residue in 20.0 mL of alcohol.

*Procedure*—Proceed as directed for *Procedure* under *Assay for Steroids* (351). Calculate the quantity, in mg, of hydrocortisone acetate ( $C_{23}H_{32}O_6$ ) in each mL of the Injectable Suspension taken by the formula:

$$5(C/V)(A_U/A_S)$$

in which *V* is the volume, in mL, of Injectable Suspension taken; and the other terms are as defined therein.

## Hydrocortisone Acetate Ophthalmic Suspension

» Hydrocortisone Acetate Ophthalmic Suspension is a sterile suspension of Hydrocortisone Acetate in an aqueous medium containing a suitable antimicrobial agent. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of total steroids, calculated as hydrocortisone acetate ( $C_{23}H_{32}O_6$ ). It may contain suitable buffers and suspending agents.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Hydrocortisone Acetate RS

**Identification**—Evaporate 50 mL of the *Assay preparation* prepared as directed in the *Assay* on a steam bath just to dryness, dissolve the residue in 1 mL of chloroform, and proceed as directed under *Thin-layer Chromatographic Identification Test* (201).

**Sterility** (71): meets the requirements.

**pH** (791): between 6.0 and 8.0.

**Assay**—Proceed as directed in the *Assay* under *Hydrocortisone Acetate Injectable Suspension*, except to read Ophthalmic Suspension in place of Injectable Suspension.

## Hydrocortisone Butyrate

$C_{25}H_{36}O_6$  432.55  
Pregn-4-ene-3,20-dione, 11,21-dihydroxy-17-  
(1-oxobutoxy)-, (11 $\beta$ )-;  
Cortisol 17-butyrate;

11 $\beta$ ,17,21-Trihydroxypregn-4-ene-3,20-dione 17-butyrate  
[13609-67-1].

### DEFINITION

Hydrocortisone Butyrate contains NLT 97.0% and NMT 102.0% of hydrocortisone butyrate ( $C_{25}H_{36}O_6$ ), calculated on the dried basis.

### IDENTIFICATION

• **A. INFRARED ABSORPTION** (197K)

• **B. ULTRAVIOLET ABSORPTION** (197U)

Sample solution: 10  $\mu$ g/mL in methanol

Analytical wavelength: 242 nm

Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

### ASSAY

#### PROCEDURE

**Mobile phase:** Acetonitrile, glacial acetic acid, and water (76:1:124)

**Diluent A:** Tetrahydrofuran and glacial acetic acid (1000:1)

**Diluent B:** Methanol, water, and glacial acetic acid (500:500:1)

**System suitability stock solution:** 0.1 mg/mL each of USP Hydrocortisone Butyrate RS and propyl 4-hydroxybenzoate in *Diluent A*

**System suitability solution:** 0.02 mg/mL each of USP Hydrocortisone Butyrate RS and propyl 4-hydroxybenzoate in *Diluent B*, from *System suitability stock solution*

**Standard stock solution:** 0.1 mg/mL of USP Hydrocortisone Butyrate RS in *Diluent A*

**Standard solution:** 0.02 mg/mL of USP Hydrocortisone Butyrate RS in *Diluent B*, from *Standard stock solution*

**Sample stock solution:** 0.1 mg/mL of Hydrocortisone Butyrate in *Diluent A*

**Sample solution:** 0.02 mg/mL of Hydrocortisone Butyrate in *Diluent B*, from *Sample stock solution*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.0-mm  $\times$  10-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 5  $\mu$ L

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for propyl 4-hydroxybenzoate and hydrocortisone butyrate are 0.7 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 4.0 between propyl 4-hydroxybenzoate and hydrocortisone butyrate, *System suitability solution*

**Column efficiency:** NLT 4000 theoretical plates, *Standard solution*

**Tailing factor:** NMT 1.6, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of hydrocortisone butyrate ( $C_{25}H_{36}O_6$ ) in the portion of Hydrocortisone Butyrate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Hydrocortisone Butyrate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Hydrocortisone Butyrate in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–102.0% on the dried basis

## IMPURITIES

### • ORGANIC IMPURITIES

**Solution A:** 1 g of monobasic potassium phosphate in 1000 mL of water, adjusted with 45% potassium hydroxide to a pH of 5.5

**Solution B:** Acetonitrile

**Mobile phase:** See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	80	20
12.5	35	65
15.5	35	65
20.5	80	20
22.5	80	20

**Diluent:** Acetonitrile and Solution A (80:20)

**Standard solution:** 0.5 mg/mL of USP Hydrocortisone Butyrate RS in Diluent

**Sample solution:** 1 mg/mL of Hydrocortisone Butyrate in Diluent

### Chromatographic system

(See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 10-cm; 3-μm packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 5 μL

### System suitability

**Samples:** Standard solution and Sample solution

### Suitability requirements

**Resolution:** NLT 1.0 between hydrocortisone butyrate and any impurity

**Column efficiency:** NLT 10,000 theoretical plates

### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of each impurity in the portion of Hydrocortisone Butyrate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity from the Sample solution

$r_S$  = peak response of hydrocortisone butyrate from the Standard solution

$C_S$  = concentration of USP Hydrocortisone Butyrate RS in the Standard solution (mg/mL)

$C_U$  = concentration of Hydrocortisone Butyrate in the Sample solution (mg/mL)

### Acceptance criteria

Disregard any peak having a percentage of 0.05% or less.

**Any individual impurity:** NMT 1.0%

**Total impurities:** NMT 2.0%

## SPECIFIC TESTS

### • OPTICAL ROTATION, Specific Rotation <781S>

**Sample solution:** 10 mg/mL, in chloroform

**Acceptance criteria:** +47° to +54° at 20°

### • LOSS ON DRYING <731>

**Sample:** Dry Hydrocortisone Butyrate under vacuum at 78° for 3 h.

**Acceptance criteria:** NMT 1.0%

### • COMPLETENESS OF SOLUTION <641>

**Sample solution:** 1 g in 10 mL of dichloromethane

**Acceptance criteria:** The Sample solution is clear.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

## • USP REFERENCE STANDARDS <11>

USP Hydrocortisone Butyrate RS

## Hydrocortisone Butyrate Cream

### DEFINITION

Hydrocortisone Butyrate Cream is Hydrocortisone Butyrate in a suitable cream base. It contains NLT 90.0% and NMT 110.0% of the labeled amount of hydrocortisone butyrate ( $C_{25}H_{36}O_6$ ).

### IDENTIFICATION

- **A.** The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Acetonitrile, glacial acetic acid, and water (76:1:124)

**Diluent A:** Tetrahydrofuran and glacial acetic acid (1000:1)

**Diluent B:** Methanol, water, and glacial acetic acid (500:500:1)

**System suitability stock solution:** 0.1 mg/mL each of USP Hydrocortisone Butyrate RS and propyl 4-hydroxybenzoate in Diluent A

**System suitability solution:** 0.02 mg/mL each of USP Hydrocortisone Butyrate RS and propyl 4-hydroxybenzoate in Diluent B, from System suitability stock solution

**Standard stock solution:** 0.1 mg/mL of USP Hydrocortisone Butyrate RS in Diluent A

**Standard solution:** 0.02 mg/mL of USP Hydrocortisone Butyrate RS in Diluent B, from Standard stock solution

**Sample solution:** Nominally 0.02 mg/mL of hydrocortisone butyrate, prepared as follows. Transfer a sufficient quantity of Cream to a volumetric flask of suitable size, add 20% of the flask volume of Diluent A, shake by mechanical means for 30 min, and dilute with Diluent B to volume.

### Chromatographic system

(See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.0-mm × 10-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 5 μL

### System suitability

**Samples:** System suitability solution and Standard solution

[NOTE—The relative retention times for propyl 4-hydroxybenzoate and hydrocortisone butyrate are 0.7 and 1.0, respectively.]

### Suitability requirements

**Resolution:** NLT 4.0 between propyl 4-hydroxybenzoate and hydrocortisone butyrate, System suitability solution

**Column efficiency:** NLT 4000 theoretical plates, Standard solution

**Tailing factor:** NMT 1.6, Standard solution

**Relative standard deviation:** NMT 2.0%, Standard solution

### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of the labeled amount of hydrocortisone butyrate ( $C_{25}H_{36}O_6$ ) in the portion of Cream taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

- $C_s$  = concentration of USP Hydrocortisone Butyrate RS in the *Standard solution* (mg/mL)  
 $C_u$  = nominal concentration of hydrocortisone butyrate in the *Sample solution* (mg/mL)  
**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

- **MINIMUM FILL** (755): Meets the requirements

**SPECIFIC TESTS**

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements of the tests for the absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.
- **PH** (791): 3.5–4.5

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)  
USP Hydrocortisone Butyrate RS

**Hydrocortisone Hemisuccinate**

$C_{25}H_{34}O_8 \cdot H_2O$  480.55  
 Pregn-4-ene-3,20-dione, 21-(3-carboxy-1-oxopropoxy)-11,17-dihydroxy-, (11 $\beta$ )-, monohydrate.  
 Cortisol 21-(hydrogen succinate) monohydrate  
 [83784-20-7].  
 Anhydrous 462.54 [2203-97-6].

» Hydrocortisone Hemisuccinate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{25}H_{34}O_8$ , calculated on the dried basis. It contains one molecule of water of hydration or is anhydrous.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label it to indicate whether it is hydrous or anhydrous.

**USP Reference standards** (11)—  
 USP Hydrocortisone Hemisuccinate RS  
 USP Fluorometholone RS

**Identification**—

- A:** *Infrared Absorption* (197M).  
**B:** *Ultraviolet Absorption* (197U)—  
*Solution:* 20  $\mu$ g per mL.  
*Medium:* alcohol.

Absorptivities at 242 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Specific rotation** (781S): between +124° and +134°.

*Test solution:* 10 mg per mL, in acetone.

**Loss on drying** (731)—Dry it at 105° for 3 hours: the anhydrous form loses not more than 1.0% of its weight, and the hydrous form loses not more than 4.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Chromatographic purity**—

*Mobile phase*—Prepare a filtered and degassed mixture of water, acetonitrile, and methanol (700:285:15). Add 3.0 mL of glacial acetic acid per Liter of this solution. Mix thoroughly. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Diluting solution*—Prepare a mixture of water, acetonitrile, tetrahydrofuran, and glacial acetic acid (500:250:250:1). Mix thoroughly.

*Standard solution*—Dissolve an accurately weighed quantity of USP Hydrocortisone Hemisuccinate RS in *Diluting solution*, and dilute quantitatively, and stepwise if necessary,

with *Diluting solution* to obtain a solution having a known concentration of about 6.6  $\mu$ g per mL.

*Test solution*—Transfer about 6.6 mg of Hydrocortisone Hemisuccinate, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Diluting solution* to volume, and mix. [NOTE—Samples should be maintained at 5° or colder during analysis.]

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L1. The flow rate is about 0.8 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 5000 theoretical plates; and the relative standard deviation for replicate injections is not more than 5.0%.

*Procedure*—Inject a volume (about 15  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Hydrocortisone Hemisuccinate taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses of all the peaks: not more than 1.0% of any individual impurity is found; and not more than 2.0% of total impurities is found. Disregard any peak representing less than 0.05%.

**Assay**—

*Internal standard solution*—Prepare a solution of USP Fluorometholone RS in tetrahydrofuran containing about 3 mg per mL.

*Mobile phase*—Prepare a filtered mixture of butyl chloride, water-saturated butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (95:95:14:7:6). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Transfer an accurately weighed amount of USP Hydrocortisone Hemisuccinate RS to a suitable container to obtain a solution containing 0.6 mg per mL. Add an accurately measured volume of *Internal standard solution* so that the *Standard preparation* contains 10% *Internal standard solution*. Dilute with chloroform containing 3% glacial acetic acid to volume.

*Assay preparation*—Transfer about 30 mg of Hydrocortisone Hemisuccinate, accurately weighed, to a 50-mL volumetric flask, add 5.0 mL of *Internal standard solution*, and dilute with chloroform containing 3% glacial acetic acid to volume.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L3. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between hydrocortisone hemisuccinate and the internal standard is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 6  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{25}H_{34}O_8$  in the portion of Hydrocortisone Hemisuccinate taken by the formula:

$$50C(R_u / R_s)$$

in which  $C$  is the concentration, in mg per mL, of USP Hydrocortisone Hemisuccinate RS in the *Standard preparation*; and  $R_u$  and  $R_s$  are the peak area ratios of hydrocortisone hemisuccinate to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydrocortisone Sodium Phosphate

$C_{21}H_{29}Na_2O_8P$  486.40

Pregn-4-ene-3,20-dione, 11,17-dihydroxy-21-(phosphonoxy)-, disodium salt, (11 $\beta$ )-.

Cortisol 21-(disodium phosphate) [6000-74-4].

» Hydrocortisone Sodium Phosphate contains not less than 96.0 percent and not more than 102.0 percent of  $C_{21}H_{29}Na_2O_8P$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Hydrocortisone RS

USP Hydrocortisone Phosphate Triethylamine RS

$C_{21}H_{31}O_8P \cdot C_6H_{15}N$  543.64

**Identification**—

**A:** Evaporate 15 mL of a methylene chloride solution of it, prepared as directed under *Procedure* in the *Assay*, on a steam bath to dryness, and dissolve the residue in 1 mL of methylene chloride. Proceed as directed in *Identification* test B under *Hydrocortisone Sodium Phosphate Injection*, beginning with "Apply 5  $\mu$ L of this solution."

**B:** The residue from the ignition of about 20 mg of it responds to the tests for *Phosphate* (191) and for *Sodium* (191).

**Phosphate ions**—

*Standard phosphate solution*—Dissolve 143.3 mg of dried monobasic potassium phosphate,  $KH_2PO_4$ , in water to make 1000.0 mL. This solution contains the equivalent of 0.10 mg of phosphate ( $PO_4$ ) in each mL.

*Phosphate reagent A*—Dissolve 5 g of ammonium molybdate in 1 N sulfuric acid to make 100 mL.

*Phosphate reagent B*—Dissolve 350 mg of *p*-methylaminophenol sulfate in 50 mL of water, add 20 g of sodium bisulfite, mix to dissolve, and dilute with water to 100 mL.

*Procedure*—Dissolve about 50 mg of Hydrocortisone Sodium Phosphate, accurately weighed, in a mixture of 10 mL of water and 5 mL of 2 N sulfuric acid contained in a 25-mL volumetric flask, by warming if necessary. Add 1 mL each of *Phosphate reagent A* and *Phosphate reagent B*, dilute with water to 25 mL, mix, and allow to stand at room temperature for 30 minutes. Similarly and concomitantly, prepare a standard solution, using 5.0 mL of *Standard phosphate solution* instead of the 50 mg of the substance under test. Concomitantly determine the absorbances of both solutions in 1-cm cells at 730 nm, with a suitable spectrophotometer, using water as the blank. The absorbance of the test solution is not more than that of the standard solution. The limit is 1.0% of phosphate ( $PO_4$ ).

**Chloride (as NaCl)**—Dissolve about 3 g, accurately weighed, in 75 mL of water, add 1 mL of nitric acid, and titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically, using a glass silver-silver chloride electrode system. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of NaCl. Not more than 1.00% of NaCl is found.

**Specific rotation, pH, and free hydrocortisone**—Place about 2.5 g in a tared 50-mL flask, and weigh accurately ( $W_U$ ). Add 25 mL of carbon dioxide-free water, and again weigh ( $W_S$ ). Calculate the quantity, in mg, of anhydrous hydrocortisone sodium phosphate in each g of solution taken by the formula:

$$1000W_U(1 - L/100) / W_S$$

in which  $W_U$  is the weight of Hydrocortisone Sodium Phosphate taken,  $L$  is the average percentage of *Loss on drying*, and  $W_S$  is the weight of the solution in carbon dioxide-free water. Use this as the *Test preparation* for the following tests.

*Specific rotation* (781S): between +121° and +129°, determined in a solution prepared by weighing accurately 5.0 mL of *Test preparation* and diluting with pH 7.0 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*) to 50.0 mL.

*pH* (791): between 7.5 and 10.5, in a solution prepared by diluting a portion of *Test preparation* with 9 volumes of carbon dioxide-free water.

*Free hydrocortisone*—Dilute 1 mL of *Test preparation* with carbon dioxide-free water to 100 mL. Pipet 5 mL of this solution into a glass-stoppered, 50-mL tube, add 25.0 mL of methylene chloride, insert the stopper, and mix by gentle shaking. Prepare a 1 in 500,000 solution of USP Hydrocortisone RS in methylene chloride. Similarly, shake 25 mL of this solution with 5 mL of water. Allow to stand until the methylene chloride layers are clear (about 5 minutes). Determine the absorbances of the methylene chloride solutions in 1-cm cells at 239 nm, with a suitable spectrophotometer, using methylene chloride as the blank. The absorbance of the *Test preparation* does not exceed that of the Standard solution (1.0%).

**Loss on drying** (731)—Dry it in vacuum at 80° for 5 hours: the average percentage weight loss for two determinations ( $L$ ) does not exceed 5.0%.

**Heavy metals, Method II** (231): 0.004%.

**Assay**—

*pH 9 buffer with magnesium*—Mix 3.1 g of boric acid and 500 mL of water in a 1-liter volumetric flask, add 21 mL of 1 N sodium hydroxide and 10 mL of 0.1 M magnesium chloride, dilute with water to volume, and mix.

*Alkaline phosphatase solution*—Transfer 250 mg of alkaline phosphatase enzyme to a 25-mL volumetric flask, and dissolve by diluting with *pH 9 buffer with magnesium* to volume. Prepare this solution fresh daily.

*Standard preparation*—Dissolve about 50 mg of USP Hydrocortisone Phosphate Triethylamine RS, accurately weighed, in carbon dioxide-free water to make 25.0 mL.

*Assay preparation*—Weigh accurately, in g, 2.0 mL of the *Test preparation*, prepared as directed under *Specific rotation*, *pH*, and *Free hydrocortisone*, into a tared 100-mL volumetric flask, and dilute with carbon dioxide-free water that has been saturated with methylene chloride to volume. Pipet 10 mL of this solution into a 125-mL separator, and extract with two 25-mL portions of water-washed methylene chloride, discarding the washings.

*Procedure*—Weigh accurately 1.0 mL each of the *Standard preparation* ( $W_S$ ) and the *Assay preparation* ( $W_A$ ) into separate tared 100-mL volumetric flasks. To each flask, and to a similar flask containing 1.0 mL of water to provide a blank, add 1.0 mL of *Alkaline phosphatase solution* and then 50 mL of methylene chloride, and insert the stopper. Allow the flasks to stand at room temperature (not below 25°) for 2 hours with gentle mixing about every 15 minutes. Add 1 mL of dilute hydrochloric acid (1 in 10) to each flask, and mix gently. Add methylene chloride to each flask until the interfaces are at the 100-mL marks, and mix gently. Remove the aqueous layers by aspiration. Determine the absorbances of the methylene chloride solutions obtained from the *Standard preparation* and the *Assay preparation* at 239 nm, with a suitable spectrophotometer, using the methylene chloride solution blank to set the instrument. Calculate the percentage of  $C_{21}H_{29}Na_2O_8P$ , on the dried basis, taken by the formula:

$$100(A_U / A_S)(C_S / C_A)0.895(W_S / W_A)$$

in which  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively;  $C_A$  and  $C_S$  are the corresponding concentrations, in mg per mL, of those preparations; and 0.895 is the ratio of the molecular weight of hydrocortisone sodium phosphate to that of hydrocortisone phosphate triethylamine.

## Hydrocortisone Sodium Phosphate Injection

» Hydrocortisone Sodium Phosphate Injection is a sterile, buffered solution of Hydrocortisone Sodium Phosphate in Water for Injection. It contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of hydrocortisone ( $C_{21}H_{30}O_5$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

### USP Reference standards (11)—

USP Endotoxin RS

USP Hydrocortisone RS

USP Hydrocortisone Phosphate Triethylamine RS

$C_{21}H_{31}O_8P \cdot C_6H_{15}N$  543.64

### Identification—

**A:** *Ultraviolet Absorption* (197U)—

**Solution:** 20 µg per mL, USP Hydrocortisone Phosphate Triethylamine RS being used to prepare the Standard solution.

**Medium:** water.

**B:** Place 5 mL of the *Assay preparation*, obtained as directed in the *Assay*, in a glass-stoppered, 50-mL tube, and add 5 mL of a solution prepared by dissolving 50 mg of alkaline phosphatase enzyme in 50 mL of pH 9 buffer with magnesium prepared as directed in the *Assay* under *Hydrocortisone Sodium Phosphate*. Allow to stand at room temperature for 2 hours, with occasional mixing, and extract with 25 mL of methylene chloride. Evaporate 15 mL of the methylene chloride extract on a steam bath to dryness, and dissolve the residue in 0.5 mL of methylene chloride. Apply 5 µL of this solution and 5 µL of a solution of USP Hydrocortisone RS in methylene chloride containing 300 µg per mL to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a tank completely lined with filter paper, using a solvent system consisting of a mixture of 50 parts of chloroform, 50 parts of acetone, and 1 part of water, until the solvent front has moved about three-fourths of the length of the plate. Remove the plate, mark the solvent front, and dry. Spray the plate with dilute sulfuric acid (1 in 2), and heat at 105° until brown or black spots appear: the  $R_f$  value of the principal spot obtained from the solution under test corresponds to that obtained from the Standard solution.

**Bacterial endotoxins** (85)—It contains not more than 1.25 USP Endotoxin Units per mg of hydrocortisone.

**pH** (791): between 7.5 and 8.5.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* (1).

### Assay—

**Phenylhydrazine hydrochloride solution**—Dissolve 65 mg of phenylhydrazine hydrochloride in 100 mL of dilute sulfuric acid (3 in 5), add 50 mL of isopropyl alcohol, and mix. Prepare this solution fresh daily.

**Standard preparation**—Dissolve a suitable quantity of USP Hydrocortisone Phosphate Triethylamine RS, accurately weighed, in water, and dilute quantitatively and stepwise with water to obtain a solution having a known concentration of about 110 µg per mL.

**Assay preparation**—Pipet a volume of Injection, equivalent to about 100 mg of hydrocortisone sodium phosphate, into a 100-mL volumetric flask, and dilute with water to volume.

Pipet 10 mL of this solution into a separator, wash the solution with two 25-mL portions of methylene chloride, and discard the washings. Transfer the aqueous layer to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Pipet 2 mL each of the *Standard preparation* and the *Assay preparation* into separate glass-stoppered, 50-mL conical flasks. To each flask, and to a similar flask containing 2.0 mL of water to provide a blank, add 10.0 mL of *Phenylhydrazine hydrochloride solution*, and mix. Place the flasks in a water bath maintained at a temperature of 60° for 2 hours, then cool the solutions to room temperature. Concomitantly determine the absorbances of the solutions from the *Assay preparation* and the *Standard preparation* at the wavelength of maximum absorbance at about 410 nm, with a suitable spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mg, of  $C_{21}H_{30}O_5$  in each mL of the Injection taken by the formula:

$$0.667(C/V)(A_U/A_S)$$

in which 0.667 is the ratio of the molecular weight of hydrocortisone to that of hydrocortisone phosphate triethylamine; C is the concentration, in µg per mL, of USP Hydrocortisone Phosphate Triethylamine RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydrocortisone Sodium Succinate

$C_{25}H_{33}NaO_8$  484.51  
Pregn-4-ene-3,20-dione, 21-(3-carboxy-1-oxopropoxy)-  
11,17-dihydroxy-, monosodium salt, (11β)-;  
Cortisol 21-(sodium succinate) [125-04-2].

### DEFINITION

Hydrocortisone Sodium Succinate contains NLT 97.0% and NMT 102.0% of total steroids, calculated as  $C_{25}H_{33}NaO_8$ , on the dried basis.

### IDENTIFICATION

#### • A. INFRARED ABSORPTION

**Sample:** Transfer 100 mg of Hydrocortisone Sodium Succinate to a suitable container, and dissolve in 10 mL of water. In rapid succession, add 1 mL of 3 N hydrochloric acid, shake briefly, immediately decant the aqueous layer, and wash the precipitate with two additional 10-mL portions of water, each time removing the water by decanting. Remove as much of the water as possible, spread the precipitate in a suitable container, and dry under vacuum at 60° for 3 h.

**Acceptance criteria:** The IR spectrum of a mineral oil dispersion of the precipitate so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Hydrocortisone Hemisuccinate RS.

#### • B. ULTRAVIOLET ABSORPTION (197U)

**Sample solution:** 20 µg/mL in methanol

**Analytical wavelength:** 242 nm

**Acceptance criteria:** Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

#### • C. IDENTIFICATION TESTS—GENERAL, Sodium (191):

It meets the requirements of the flame test.

### ASSAY

#### • ASSAY FOR STEROIDS (351)

**Blue tetrazolium solution:** 5 mg/mL of blue tetrazolium in alcohol

**Tetramethylammonium hydroxide solution:** Tetramethylammonium hydroxide TS in alcohol (1 in 10)

**Standard preparation:** Prepare as directed in the chapter for the *Standard Preparation*, using USP Hydrocortisone Hemisuccinate RS, but dilute the solution with alcohol to a concentration of 12.5 µg/mL.

**Assay preparation:** 12.5 µg/mL of Hydrocortisone Sodium Succinate in alcohol

**Blank solution:** Alcohol

#### Analysis

**Samples:** *Standard preparation*, *Assay preparation*, and *Blank solution*

Transfer 20.0-mL aliquots of the *Samples* to separate glass-stoppered, 50-mL conical flasks. To each flask add 2.0 mL of *Blue tetrazolium solution*, mix, and add 4.0 mL of *Tetramethylammonium hydroxide solution*. Allow to stand in the dark for 90 min, add 1.0 mL of glacial acetic acid, and proceed as directed in the *Procedure*, beginning with "Concomitantly determine the absorbances..."

Calculate the percentage of total steroids, as  $C_{25}H_{33}NaO_8$ , in the portion of Hydrocortisone Sodium Succinate taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$A_U$  = absorbance of the *Assay preparation*

$A_S$  = absorbance of the *Standard preparation*

$C_S$  = concentration of USP Hydrocortisone Hemisuccinate RS in the *Standard preparation* (µg/mL)

$C_U$  = concentration of hydrocortisone sodium succinate in the *Assay preparation* (µg/mL)

$M_{r1}$  = molecular weight of hydrocortisone sodium succinate, 484.51

$M_{r2}$  = molecular weight of hydrocortisone hemisuccinate, 462.53

**Acceptance criteria:** 97.0%–102.0% on the dried basis

#### SPECIFIC TESTS

##### • SODIUM CONTENT

**Sample:** 1 g

**Analysis:** Dissolve the *Sample*, with gentle heating, in 75 mL of glacial acetic acid. Add 20 mL of dioxane, then add crystal violet TS, and titrate with 0.1 N perchloric acid VS. Each mL of 0.1 N perchloric acid is equivalent to 2.299 mg of sodium (Na).

**Acceptance criteria:** 4.60%–4.84% on the dried basis

##### • OPTICAL ROTATION, Specific Rotation (7815)

**Sample solution:** 10 mg/mL in alcohol

**Acceptance criteria:** +140° to +150°

##### • LOSS ON DRYING (731)

**Sample:** Dry at 105° for 3 h.

**Acceptance criteria:** NMT 2.0%

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS (11)**

USP Hydrocortisone Hemisuccinate RS

## Hydrocortisone Sodium Succinate for Injection

#### DEFINITION

Hydrocortisone Sodium Succinate for Injection is a sterile mixture of Hydrocortisone Sodium Succinate and suitable buffers. It may be prepared from Hydrocortisone Sodium Succinate, or from Hydrocortisone Hemisuccinate with the aid of Sodium Hydroxide or Sodium Carbonate. It contains the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of hydrocortisone ( $C_{21}H_{30}O_5$ ) in sin-

gle-compartment containers, or in the volume of solution designated on the label of containers that are constructed to hold, in separate compartments, the Hydrocortisone Sodium Succinate for Injection and a solvent.

#### IDENTIFICATION

##### • A. INFRARED ABSORPTION

**Sample:** Transfer a quantity of Hydrocortisone Sodium Succinate for Injection, equivalent to 100 mg of hydrocortisone sodium succinate, to a suitable container, and dissolve in 10 mL of water. In rapid succession, add 1 mL of 3 N hydrochloric acid, shake briefly, immediately decant the aqueous layer, and wash the precipitate with two additional 10-mL portions of water, each time removing the water by decanting. Remove as much of the water as possible, spread the precipitate in a suitable container, and dry under vacuum at 60° for 3 h.

**Acceptance criteria:** The IR spectrum of a mineral oil dispersion of the precipitate so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Hydrocortisone Hemisuccinate RS.

#### ASSAY

##### • PROCEDURE

**Mobile phase:** Butyl chloride, water-saturated butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (95:95:14:7:6)

**Internal standard solution:** 3 mg/mL of USP Fluorometholone RS in tetrahydrofuran

**Diluent:** Glacial acetic acid in chloroform (3 in 100)

**Solution A:** 0.30 mg/mL of USP Hydrocortisone RS in *Diluent*

**Standard solution:** 0.65 mg/mL of USP Hydrocortisone Hemisuccinate RS, prepared as follows. Transfer 32.5 mg of USP Hydrocortisone Hemisuccinate RS to a 50-mL volumetric flask. Add by pipet 5.0 mL of *Internal standard solution* and 5.0 mL of *Solution A*. Dilute with *Diluent* to volume.

**Sample solution:** Mix the constituted solutions prepared from the contents of 10 vials of Hydrocortisone Sodium Succinate for Injection. Transfer a volume, equivalent to 50 mg of hydrocortisone from the resulting constituted solution, to a suitable flask containing 10.0 mL of *Internal standard solution*, and dilute with *Diluent* to 100.0 mL. Shake thoroughly for 5 min, then allow the phases to separate, discarding the upper phase.

##### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm × 30-cm; packing L3

**Flow rate:** 1.0 mL/min

**Injection volume:** 6 µL

##### System suitability

**Sample:** *Standard solution*

##### Suitability requirements

**Resolution:** NLT 2.0 between hydrocortisone hemisuccinate and the internal standard

**Relative standard deviation:** NMT 2.0%

##### Analysis

**Samples:** *Standard solution* and *Sample solution*

[NOTE—The order of elution of peaks is that from the internal standard, hydrocortisone hemisuccinate, and successive smaller peaks representing free hydrocortisone and hydrocortisone 17-hemisuccinate, the relative retention times of which are about 1.0, 1.5, 2.0, and 2.5, respectively.]

Calculate the percentage of the labeled amount of hydrocortisone ( $C_{21}H_{30}O_5$ ) in the portion of Hydrocortisone Sodium Succinate for Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- $R_U$  = ratio of the summation of the peak areas of hydrocortisone hemisuccinate and hydrocortisone 17-hemisuccinate to the peak area of the internal standard from the *Sample solution*
- $R_S$  = ratio of the summation of the peak areas of hydrocortisone hemisuccinate and hydrocortisone 17-hemisuccinate to the peak area of the internal standard from the *Standard solution*
- $C_S$  = concentration of USP Hydrocortisone Hemisuccinate RS in the *Standard solution* (mg/mL)
- $C_U$  = nominal concentration of the *Sample solution* (mg/mL)
- $M_{r1}$  = molecular weight of hydrocortisone, 362.46
- $M_{r2}$  = molecular weight of hydrocortisone hemisuccinate, 462.53
- To this percentage add the percentage of free hydrocortisone found in the test for *Free Hydrocortisone*.
- Acceptance criteria:** 90.0%–110.0%

**OTHER COMPONENTS****• FREE HYDROCORTISONE**

**Analysis:** Using the chromatograms obtained in the *Assay*, measure the areas of the peaks from the internal standard and free hydrocortisone. Calculate the percentage of free hydrocortisone ( $C_{21}H_{30}O_5$ ) in the portion of Hydrocortisone Sodium Succinate for Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

- $R_U$  = peak area ratio of the free hydrocortisone to the internal standard from the *Sample solution*
- $R_S$  = peak area ratio of the free hydrocortisone to the internal standard from the *Standard solution*
- $C_S$  = concentration of USP Hydrocortisone RS in the *Standard solution* (mg/mL)
- $C_U$  = nominal concentration of the *Sample solution* (mg/mL)
- Acceptance criteria:** NMT 6.7% of the labeled amount of hydrocortisone

**PERFORMANCE TESTS**

- UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements

**SPECIFIC TESTS**

- pH (791)**  
**Sample solution:** A solution containing the equivalent of 50 mg/mL of hydrocortisone  
**Acceptance criteria:** 7.0–8.0
- LOSS ON DRYING (731)**  
**Sample:** Dry at 105° for 3 h.  
**Acceptance criteria:** NMT 2.0%
- BACTERIAL ENDOTOXINS TEST (85):** Contains NMT 1.25 USP Endotoxin Units/mg of hydrocortisone
- PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements for small-volume injections
- CONSTITUTED SOLUTION:** At the time of use, it meets the requirements in *Injections (1)*, *Constituted Solutions*.
- STERILITY TESTS (71):** Meets the requirements
- OTHER REQUIREMENTS:** It meets the requirements in *Injections (1)*, *Labeling*.

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve as described in *Injections (1)*, *Containers for Sterile Solids*.
- LABELING:** Label it to indicate that the constituted solution prepared from Hydrocortisone Sodium Succinate for Injection is suitable for use only if it is clear, and that the

solution is to be discarded after 3 days. Label it to indicate that it was prepared by freeze-drying, having been filled into its container in the form of a true solution.

## Hydroflumethiazide

C<sub>8</sub>H<sub>8</sub>F<sub>3</sub>N<sub>3</sub>O<sub>4</sub>S<sub>2</sub> 331.29

2H-1,2,4-Benzothiadiazine-7-sulfonamide, 3,4-dihydro-6-(trifluoromethyl)-, 1,1-dioxide.

3,4-Dihydro-6-(trifluoromethyl)-2H-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide [135-09-1].

» Hydroflumethiazide contains not less than 98.0 percent and not more than 102.0 percent of C<sub>8</sub>H<sub>8</sub>F<sub>3</sub>N<sub>3</sub>O<sub>4</sub>S<sub>2</sub>, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards <11>—

USP 2,4-Disulfamyl-5-trifluoromethylaniline RS

C<sub>7</sub>H<sub>8</sub>F<sub>3</sub>N<sub>3</sub>O<sub>4</sub>S<sub>2</sub> 319.29

USP Hydroflumethiazide RS

#### Identification—

**A:** *Infrared Absorption* <197K>, previously dried over silica gel for 4 hours.

**B:** *Ultraviolet Absorption* <197U>—

*Solution:* 10 µg per mL.

*Medium:* methanol.

**Melting range, Class I** <741>: between 270° and 275°.

**pH** <791>: between 4.5 and 7.5, in a 1-in-100 dispersion in water.

**Water, Method I** <921>: not more than 1.0%.

**Residue on ignition** <281>: not more than 1.0%.

**Heavy metals, Method II** <31>: 0.002%.

**Selenium** <291>: 0.003%.

#### Diazotizable substances—

**Standard preparation**—Transfer 10.0 mg of USP 2,4-Disulfamyl-5-trifluoromethylaniline RS to a 50-mL volumetric flask, dissolve in and dilute with acetone to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Test preparation**—Transfer 100 mg to a 50-mL volumetric flask, dissolve in 5 mL of acetone, dilute with water to volume, and mix.

**Procedure**—Transfer 5.0 mL each of the *Standard preparation*, the *Test preparation*, and a solution of acetone in water (1 in 10) to provide the blank, to separate 25-mL volumetric flasks. To each flask add 2.0 mL of dilute hydrochloric acid (1 in 5), and immediately add 1 mL of freshly prepared sodium nitrite solution (1 in 100). Mix, and allow to stand for 5 minutes. Add 1 mL of freshly prepared ammonium sulfamate solution (1 in 10) to each flask, mix, and allow to stand for 1 minute, with frequent swirling. Add 1 mL of a freshly prepared solution of N-(1-naphthyl)ethylenediamine dihydrochloride (1 in 1000), and mix. After 1 minute, dilute with water to volume, and mix. Concomitantly, and within 5 minutes after mixing, taking care to establish the same elapsed time for each solution, determine the absorbances of the solutions in 1-cm cells at 518 nm, with a suitable spectrophotometer, using the blank to set the instrument: the absorbance of the solution from the *Test preparation* does not exceed that of the solution from the *Standard preparation*, corresponding to not more than 1.0% of diazotizable substances.

**Assay**—Transfer about 50 mg of Hydroflumethiazide, accurately weighed, to a 100-mL volumetric flask, add methanol to volume, and mix. Transfer 2.0 mL of this solution to a second 100-mL volumetric flask, dilute with methanol to volume, and mix. Concomitantly determine the absorbances of this solution and a Standard solution of USP Hydroflumethiazide RS in the same medium having a known concentration of about 10 µg per mL, in 1-cm cells at the wavelength of maximum absorbance at about 273 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg, of C<sub>8</sub>H<sub>8</sub>F<sub>3</sub>N<sub>3</sub>O<sub>4</sub>S<sub>2</sub> in the Hydroflumethiazide taken by the formula:

$$5C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Hydroflumethiazide RS in the Standard solution; and  $A_U$  and

$A_S$  are the absorbances of the solution of Hydroflumethiazide and the Standard solution, respectively.

## Hydroflumethiazide Tablets

» Hydroflumethiazide Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of hydroflumethiazide ( $C_8H_8F_3N_3O_4S_2$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Hydroflumethiazide RS

**Identification**—Finely powder a number of Tablets, equivalent to about 100 mg of hydroflumethiazide, and place the powder in a 35-mL, screw-capped centrifuge tube. Add 30 mL of acetone, cap the tube, and allow it to stand for 30 minutes, with occasional shaking. Centrifuge, and decant the supernatant into a 100-mL beaker. Evaporate on a steam bath to dryness, add 10 mL of sodium hydroxide solution (1 in 250) to the residue, and mix. Transfer the liquid to a 125-mL separator. Rinse the beaker with 5 mL of water, and add the rinsing to the main portion. Add 50 mL of anhydrous ethyl ether to the separator, insert the stopper, shake vigorously for 2 minutes, releasing pressure as necessary, and allow the phases to separate. Draw off the lower phase, retaining any emulsion in the separator, and pass it through a membrane filter having a 0.2- to 2- $\mu$ m porosity. Add dilute hydrochloric acid (1 in 10) dropwise to the filtrate in a 50-mL beaker, stirring well and checking the pH with wide-range test paper after each drop. [NOTE—Crystallization begins at about pH 5. Rubbing the bottom of the beaker with a glass stirring rod helps to initiate crystallization.] When precipitation is complete, decant and discard the supernatant, and wash the precipitate with 5 mL of water. Decant and discard the wash water, and dry the precipitate at 105° for 30 minutes: the IR spectrum of a potassium bromide dispersion of the dried material exhibits maxima only at the same wavelengths as that of a similar preparation of USP Hydroflumethiazide RS.

**Dissolution** (711)—

*Medium:* dilute hydrochloric acid (1 in 100); 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 60 minutes.

**Procedure**—Determine the amount of  $C_8H_8F_3N_3O_4S_2$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 273 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Hydroflumethiazide RS in the same medium.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_8H_8F_3N_3O_4S_2$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Procedure for content uniformity**—Crush 1 Tablet and quantitatively transfer to a 100-mL volumetric flask, add about 50-mL of methanol, and shake until disintegration is complete. Dilute with methanol to volume, mix, and filter, discarding the first 20 mL of the filtrate. Dilute a portion of the subsequent filtrate with methanol to obtain a solution containing approximately 10  $\mu$ g of hydroflumethiazide per mL. Concomitantly determine the absorbances of this solution and of a Standard solution of USP Hydroflumethiazide RS, in the same medium having a known concentration of about 10  $\mu$ g per mL in 1-cm cells at the wavelength of maximum absorbance at about 273 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate the

quantity, in mg, of  $C_8H_8F_3N_3O_4S_2$  in the Tablet taken by the formula:

$$(TC / D)(A_U / A_S)$$

in which  $T$  is the labeled quantity, in mg, of hydroflumethiazide in the Tablet;  $C$  is the concentration, in  $\mu$ g per mL, of USP Hydroflumethiazide RS in the Standard solution;  $D$  is the concentration, in  $\mu$ g per mL, of hydroflumethiazide in the test solution, based upon the labeled quantity per Tablet and the extent of dilution; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Tablet and the Standard solution, respectively.

**Assay**—

**Standard preparation**—Transfer about 30 mg of USP Hydroflumethiazide RS, accurately weighed, to a 100-mL volumetric flask, add sodium hydroxide solution (1 in 100) to volume, and mix. Transfer 5.0 mL of this solution to a second 100-mL volumetric flask, dilute with sodium hydroxide solution (1 in 100) to volume, and mix. The concentration of USP Hydroflumethiazide RS in the *Standard preparation* is about 15  $\mu$ g per mL.

**Chromatographic column**—Proceed as directed for *Column Partition Chromatography* under *Chromatography* (621), packing a chromatographic tube with two segments of packing material. The lower segment is a mixture of 1 g of *Solid Support* and 1 mL of sodium hydroxide solution (1 in 100), and the upper segment is a mixture prepared as directed under *Assay preparation*.

**Assay preparation**—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 75 mg of hydroflumethiazide, to a 50-mL volumetric flask, add about 35 mL of sodium hydroxide solution (1 in 100), shake vigorously, dilute with sodium hydroxide solution (1 in 100) to volume, and mix. Mix 2.0 mL of this solution with 3 g of *Solid Support* as directed under *Chromatographic column*, and transfer to the column. Wash the column with 50 mL of water-saturated chloroform, then with 50 mL of water-saturated ether, and discard the eluates. Elute the hydroflumethiazide from the column with 100 mL of glacial acetic acid in ether (1 in 1000), collecting the eluate in a 250-mL separator. Add 100 mL of a 1 in 1000 solution of glacial acetic acid in ether to a second 250-mL separator to provide a blank, and treat each as follows: Add 60 mL of isooctane to each separator, mix, and extract the resulting solution with three 50-mL portions of sodium hydroxide solution (1 in 100), collecting the extracts in a 200-mL volumetric flask. Dilute with sodium hydroxide solution (1 in 100) to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 273 nm, with a suitable spectrophotometer, using the blank. Calculate the quantity, in mg, of hydroflumethiazide ( $C_8H_8F_3N_3O_4S_2$ ) in the portion of Tablets taken by the formula:

$$5C(A_U / A_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP Hydroflumethiazide RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Hydrogen Peroxide Concentrate

$H_2O_2$  34.01

Hydrogen peroxide.

Hydrogen peroxide [7722-84-1].

» Hydrogen Peroxide Concentrate contains not less than 29.0 percent and not more than

32.0 percent, by weight, of  $\text{H}_2\text{O}_2$ . It contains not more than 0.05 percent of a suitable preservative or preservatives.

**Caution**—Hydrogen Peroxide Concentrate is a strong oxidant.

**Packaging and storage**—Preserve in partially-filled containers having a small vent in the closure, and store in a cool place.

**Labeling**—Label it to indicate the name and amount of any added preservative. The label states that this article is not intended for direct administration to humans or animals.

**Acidity**—Dilute 25 g with water to 250 mL, and mix thoroughly. Take 25 mL of the solution, add phenolphthalein TS, and titrate with 0.10 N sodium hydroxide: not more than 2.5 mL is required for neutralization.

**Chloride** (221): 1.5 g diluted with water to 25 mL shows no more chloride than 0.10 mL of 0.020 N hydrochloric acid (0.005%).

**Other requirements**—It responds to the *Identification* test and meets the requirements of the tests for *Nonvolatile residue*, *Heavy metals*, and *Limit of preservative* (90 mL of it being used) under *Hydrogen Peroxide Topical Solution*.

**Assay**—Accurately weigh about 1 mL of Concentrate in a tared 100-mL volumetric flask, dilute with water to volume, and mix. To 20.0 mL of this solution add 20 mL of 2 N sulfuric acid, and titrate with 0.1 N potassium permanganate VS. Each mL of 0.1 N potassium permanganate is equivalent to 1.701 mg of  $\text{H}_2\text{O}_2$ .

## Hydrogen Peroxide Topical Solution

$\text{H}_2\text{O}_2$  34.01

Hydrogen peroxide.

Hydrogen peroxide [7722-84-1].

» Hydrogen Peroxide Topical Solution contains, in each 100 mL, not less than 2.5 g and not more than 3.5 g of  $\text{H}_2\text{O}_2$ . It contains not more than 0.05 percent of a suitable preservative or preservatives.

**Packaging and storage**—Preserve in tight, light-resistant containers, at controlled room temperature.

**Identification**—Shake 1 mL with 10 mL of water containing 1 drop of 2 N sulfuric acid, and add 2 mL of ether: the subsequent addition of a drop of potassium dichromate TS produces an evanescent blue color in the water layer which upon agitation and standing passes into the ether layer.

**Acidity**—To 25 mL add phenolphthalein TS, and titrate with 0.10 N sodium hydroxide: not more than 2.5 mL is required for neutralization.

**Barium**—To 10 mL add two drops of 2 N sulfuric acid: no turbidity or precipitate is produced within 10 minutes.

**Heavy metals** (231)—Dilute 4 mL, previously shaken, with 20 mL of water, add 2 mL of 6 N ammonium hydroxide, and gently boil the solution until the volume is reduced to about 5 mL. Dilute with water to 25 mL: the limit is 5 ppm.

**Limit of nonvolatile residue**—Evaporate 20 mL, previously shaken, on a steam bath to dryness, and dry the residue at 105° for 1 hour: the weight of the residue does not exceed 30 mg.

**Limit of preservative**—Extract 100 mL of well-mixed Topical Solution in a separator with a mixture of 3 volumes of chloroform and 2 volumes of ether, using 50 mL, 25 mL, and 25 mL, respectively. Evaporate the combined extracts at room temperature in a tared glass dish to dryness, and dry

over silica gel for 2 hours: the residue, if any, weighs not more than 50 mg (0.05%).

**Assay**—Pipet 2 mL of Topical Solution into a suitable flask containing 20 mL of water. Add 20 mL of 2 N sulfuric acid, and titrate with 0.1 N potassium permanganate VS. Each mL of 0.1 N potassium permanganate is equivalent to 1.701 mg of  $\text{H}_2\text{O}_2$ .

## Hydromorphone Hydrochloride

$\text{C}_{17}\text{H}_{19}\text{NO}_3 \cdot \text{HCl}$  321.80  
Morphinan-6-one, 4,5-epoxy-3-hydroxy-17-methyl-, hydrochloride, (5 $\alpha$ )-;  
4,5 $\alpha$ -Epoxy-3-hydroxy-17-methylmorphinan-6-one hydrochloride [71-68-1].

### DEFINITION

Hydromorphone Hydrochloride, dried at 105° for 2 h, contains NLT 98.0% and NMT 101.0% of  $\text{C}_{17}\text{H}_{19}\text{NO}_3 \cdot \text{HCl}$ .

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. ULTRAVIOLET ABSORPTION** (197U)  
Sample solution: 100  $\mu\text{g}/\text{mL}$   
Analytical wavelength: 280 nm  
Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.
- **C. IDENTIFICATION TESTS—GENERAL**, Chloride (191)  
Sample solution: 1 in 20  
Acceptance criteria: Meets the requirements

### ASSAY

- **PROCEDURE**  
Sample: 225 mg, previously dried  
Analysis: Transfer the Sample to a 250-mL conical flask. Dissolve in 80 mL of glacial acetic acid, warming, if necessary. Cool, and add 5 mL of acetic anhydride and 10 mL of mercuric acetate TS. Add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue endpoint. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.1 N perchloric acid is equivalent to 32.18 mg of  $\text{C}_{17}\text{H}_{19}\text{NO}_3 \cdot \text{HCl}$ .  
Acceptance criteria: 98.0%–101.0%, dried at 105° for 2 h

### IMPURITIES

#### Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.3%
- **SULFATE**

Sample solution: 100 mg in 5 mL of water

Analysis: To the Sample solution add 0.5 mL of 3 N hydrochloric acid and 1 mL of barium chloride TS.

Acceptance criteria: No turbidity is produced.

**Organic Impurities** [NOTE—If (5 $\alpha$ )-7-[(5 $\alpha$ )-3,6-dihydroxy-17-methyl-4,5-epoxymorphinan-6-yl]-3-hydroxy-17-methyl-4,5-epoxymorphinan-6-one (hydromorphone aldol dimer) or (5 $\alpha$ )-3-hydroxy-8-[(5 $\alpha$ )-3-hydroxy-17-methyl-6-oxo-4,5-epoxymorphinan-7-yl]-17-methyl-4,5-epoxymorphinan-6-one (7,8'-bishydromorphone) are potential impurities, Procedure 2 is recommended.]

#### PROCEDURE 1

Diluent: Phosphoric acid and water (1:1000)

Solution A: 1.0 mg/mL of sodium 1-heptanesulfonate monohydrate in 1000 mL of methanol and water (1:9).

Add 1.0 mL of triethylamine, and adjust with phosphoric acid to a pH of  $2.5 \pm 0.1$ .

**Solution B:** 1.0 mg/mL of sodium 1-heptanesulfonate monohydrate in 1000 mL of methanol and water (1:1). Add 1.0 mL of triethylamine, and adjust with phosphoric acid to a pH of  $2.5 \pm 0.1$ .

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	94	6
25	94	6
40	20	80
70	20	80
75	94	6
90	94	6

**System suitability solution:** 0.8 mg/mL each of USP Hydromorphone Hydrochloride RS and USP Hydromorphone Related Compound A RS in *Diluent*. [NOTE—The solution should be kept in a cool place protected from light.]

**Standard solution:** 4 µg/mL of USP Hydromorphone Hydrochloride RS in *Diluent*

**Sample solution:** 0.8 mg/mL of Hydromorphone Hydrochloride in *Diluent*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 3.9-mm × 15-cm; 5-µm packing L1

**Column temperature:** 45°

**Flow rate:** 1.0 mL/min

**Injection size:** 20 µL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.0 between the hydromorphone related compound A and hydromorphone peaks, *System suitability solution*

**Tailing factor:** NMT 1.5 for the hydromorphone peak, *Standard solution*

**Relative standard deviation:** NMT 5.0%, *Standard solution*

#### Analysis

**Samples:** *Diluent*, *Standard solution*, and *Sample solution*

Calculate the percentage of any specified or unspecified impurity in the portion of Hydromorphone Hydrochloride taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 1/F \times 100$$

$r_u$  = peak response for each degradation found, including those in *Impurity Table 1*, from the *Sample solution*

$r_s$  = peak response of hydromorphone from the *Standard solution*

$C_s$  = concentration of USP Hydromorphone Hydrochloride RS in the *Standard solution* (mg/mL)

$C_u$  = concentration of Hydromorphone Hydrochloride in the *Sample solution* (mg/mL)

$F$  = relative response factor for the corresponding individual specified or unspecified impurity from *Impurity Table 1*

**Acceptance criteria:** See *Impurity Table 1*. [NOTE—Disregard peaks corresponding to those obtained from the *Diluent*.]

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
8-Hydroxyhydromorphone <sup>a</sup>	0.50	1.0	0.15
Dihydromorphone (DHM) <sup>b</sup>	0.61	1.0	0.5
Morphine <sup>c</sup>	0.65	1.8	0.15
Hydromorphone N-oxide <sup>d</sup>	0.79	1.0	0.15
Hydromorphone related compound A <sup>e</sup>	0.93	1.4	0.1
Hydromorphone	1.0	—	—
8,14-Dihydrooripavine*	1.66	1.0	0.15
6β-Te-tetrahydrooripavine*	1.71	1.0	0.15
2,2'-Bis hydromorphone <sup>f</sup>	2.02	1.7	0.15
Individual unspecified impurities	—	1.0	0.1
Total impurities	—	—	1.0

<sup>a</sup> 4,5α-Epoxy-17-methylmorphinan-3,8-diol-6-one.

<sup>b</sup> 4,5α-Epoxy-17-methylmorphinan-3,6α-diol.

<sup>c</sup> 7,8-Didehydro-4,5α-epoxy-17-methylmorphinan-3,6α-diol.

<sup>d</sup> 4,5α-Epoxy-3-hydroxy-17-methylmorphinan-6-one N-oxide.

<sup>e</sup> 7,8-Didehydro-4,5α-epoxy-3-hydroxy-17-methylmorphinan-6-one.

<sup>f</sup> (5β)-3-Hydroxy-2-[(5α)-3-hydroxy-17-methyl-6-oxo-4,5-epoxymorphinan-2-yl]-17-methyl-4,5-epoxymorphinan-6-one.

\* 8,14-Dihydrooripavine and 6β-tetrahydrooripavine are process impurities from another process and are controlled only if present.

#### • PROCEDURE 2

**Diluent:** Phosphoric acid and water (1:100)

**Solution A:** Mix 3520 mL of water, 18.40 g of monobasic ammonium phosphate, and 4.32 g of sodium 1-octanesulfonate. Add 4.0 mL of triethylamine, adjust with phosphoric acid to a pH of 2.90, and add 480 mL of acetonitrile.

**Solution B:** Acetonitrile and water (1600:400)

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
20	80	20
21	100	0
30	100	0

**System suitability solution:** 0.15 mg/mL of USP Hydromorphone Hydrochloride RS and 0.1 mg/mL of USP Morphine RS in *Diluent*. [NOTE—The solution should be kept in a cool place protected from light.]

**Standard solution:** 15 µg/mL of USP Hydromorphone Hydrochloride RS in *Diluent*

**Sample solution:** 3 mg/mL of Hydromorphone Hydrochloride in *Diluent*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 3.9-mm × 15-cm; 5-µm packing L7

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 10 µL

**Run time:** 30 min

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

**Resolution:** NLT 4.0 between the morphine and hydromorphone peaks, *System suitability solution*

**Tailing factor:** NMT 1.5 for the hydromorphone peak, *System suitability solution*

**Relative standard deviation:** NMT 5.0%, *Standard solution*

**Analysis**

**Samples:** *Diluent*, *Standard solution*, and *Sample solution*

Calculate the percentage of any specified or unspecified impurity in the portion of Hydromorphone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 1/F \times 100$$

$r_U$  = peak response for each peak found, including those in *Impurity Table 2*, from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Hydromorphone Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Hydromorphone Hydrochloride in the *Sample solution* (mg/mL)

$F$  = relative response factor for the corresponding individual specified or unspecified impurity from *Impurity Table 2*

**Acceptance criteria:** See *Impurity Table 2*. [NOTE—Disregard peaks corresponding to those obtained from the *Diluent*.]

**Impurity Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Dihydromorphone (DHM) <sup>a</sup>	0.63	1.0	0.5

Hydromorphone Hydrochloride Aldol Dimer <sup>d</sup>	2.12	1.0	0.5
7,8-Bishydromorphone <sup>e</sup>	2.32	1.0	0.5
Individual unspecified impurities	—	1.0	0.10
Total impurities	—	—	2.0

<sup>a</sup> 4,5 $\alpha$ -Epoxy-17-methylmorphinan-3,6 $\alpha$ -diol.

<sup>b</sup> 7,8-Didehydro-4,5 $\alpha$ -epoxy-17-methylmorphinan-3,6 $\alpha$ -diol.

<sup>c</sup> (5 $\beta$ )-3-Hydroxy-2-[(5 $\alpha$ )-3-hydroxy-17-methyl-6-oxo-4,5-epoxymorphinan-2-yl]-17-methyl-4,5-epoxymorphinan-6-one.

<sup>d</sup> (5 $\alpha$ )-7-[(5 $\alpha$ )-3,6-Dihydroxy-17-methyl-4,5-epoxymorphinan-6-yl]-3-hydroxy-17-methyl-4,5-epoxymorphinan-6-one.

<sup>e</sup> (5 $\alpha$ )-3-Hydroxy-8-[(5 $\alpha$ )-3-hydroxy-17-methyl-6-oxo-4,5-epoxymorphinan-7-yl]-17-methyl-4,5-epoxymorphinan-6-one.

**SPECIFIC TESTS**

- OPTICAL ROTATION** (781S)

**Sample solution:** 50 mg/mL

**Acceptance criteria:** Between  $-136^\circ$  and  $-139^\circ$

- ACIDITY**

**Sample:** 300 mg

**Analysis:** Dissolve the *Sample* in 10 mL of water, add 1 drop of methyl red TS, and titrate with 0.020 N sodium hydroxide VS.

**Acceptance criteria:** NMT 0.30 mL is required to produce a yellow color.

- LOSS ON DRYING** (731): Dry a sample at  $105^\circ$  for 2 h: it loses NMT 1.5% of its weight.

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at  $25^\circ$ , excursions permitted between  $15^\circ$  and  $30^\circ$ .

- USP REFERENCE STANDARDS** (11)

USP Hydromorphone Hydrochloride RS

USP Hydromorphone Related Compound A RS

## Hydromorphone Hydrochloride Injection

» Hydromorphone Hydrochloride Injection is a sterile solution of Hydromorphone Hydrochloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of hydromorphone hydrochloride ( $C_{17}H_{19}NO_3 \cdot HCl$ ).

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Hydromorphone Hydrochloride RS

**Identification**—Place a volume of Injection, equivalent to about 10 mg of hydromorphone hydrochloride, in a separator. Extract with four 10-mL portions of chloroform, and discard the extracts. Add 1 mL of sodium carbonate TS, and extract with three 10-mL portions of chloroform. Filter the chloroform extracts into a glass-stoppered, 50-mL flask, and evaporate on a steam bath with the aid of a current of air to dryness. Dissolve the residue in 1 mL of chloroform: the IR absorption spectrum of the solution so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Hydromorphone Hydrochloride RS.

**Bacterial endotoxins** (85)—It contains not more than 88.0 USP Endotoxin Units per mg of hydromorphone hydrochloride.

**pH** (791): between 3.5 and 5.5.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

**Standard preparation**—Using an accurately weighed quantity of USP Hydromorphone Hydrochloride RS, prepare a solution in water having a known concentration of about 0.2 mg per mL.

**Assay preparation**—Quantitatively dilute an accurately measured volume of Injection, if necessary, with water to obtain a solution containing about 0.2 mg per mL.

**Procedure**—Transfer 20.0 mL each of the *Standard preparation* and the *Assay preparation* to separate 50-mL volumetric flasks. To each flask add, with mixing, 1.0 mL of hydrochloric acid and 1.0 mL of sodium nitrite solution (1 in 20). Insert the stoppers, allow to stand for 40 to 45 minutes, with occasional swirling, then add 2 mL of ammonium hydroxide, and mix. Allow to stand for 2 minutes, then dilute with water to volume, and mix. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 440 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of hydromorphone hydrochloride ( $C_{17}H_{19}NO_3 \cdot HCl$ ) in each mL of the Injection taken by the formula:

$$(V_A / V_i)(C)(A_U / A_S)$$

in which  $V_A$  is the volume, in mL, of the *Assay preparation*;  $V_i$  is the volume, in mL, of Injection taken to prepare the *Assay preparation*;  $C$  is the concentration, in mg per mL, of USP Hydromorphone Hydrochloride RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydromorphone Hydrochloride Oral Solution

### DEFINITION

Hydromorphone Hydrochloride Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of hydromorphone hydrochloride ( $C_{17}H_{19}NO_3 \cdot HCl$ ). It may contain suitable preservatives.

### IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### PROCEDURE

**Diluent:** Phosphoric acid and water (1:1000)

**Solution A:** 1.0 mg/mL of sodium 1-heptanesulfonate monohydrate in methanol and water (1:9). To each liter of this solution add 1.0 mL of triethylamine, and adjust with phosphoric acid to a pH of  $2.5 \pm 0.1$ .

**Solution B:** 1.0 mg/mL of sodium 1-heptanesulfonate monohydrate in methanol and water (1:1). To each liter of this solution add 1.0 mL of triethylamine, and adjust with phosphoric acid to a pH of  $2.5 \pm 0.1$ .

**Mobile phase:** See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	85	15
24	5	95
25	85	15
30	85	15

[NOTE—The *Standard solution* and *Sample solution* should be kept in a cool place, protected from light.]

**Standard solution:** 0.08 mg/mL of USP Hydromorphone Hydrochloride RS in *Diluent*

**Sample solution:** Equivalent to 0.08 mg/mL of hydromorphone hydrochloride by diluting a suitable volume of Oral Solution in *Diluent*

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm  $\times$  5-cm; 3.5- $\mu$ m packing L1

**Column temperature:** 45°

**Flow rate:** 1 mL/min

**Injection size:** 20  $\mu$ L

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Tailing factor:** NMT 1.5 for the hydromorphone peak

**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of hydromorphone hydrochloride ( $C_{17}H_{19}NO_3 \cdot HCl$ ) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Hydromorphone Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of hydromorphone hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### IMPURITIES

#### ORGANIC IMPURITIES

**Diluent, Solution A, and Solution B:** Prepare as directed in the Assay.

**Mobile phase:** See Table 2.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	94	6
25	94	6
40	20	80
70	20	80
75	94	6
90	94	6

[NOTE—The *System suitability solution*, *Quantitation limit solution*, *Standard solution*, and *Sample solution* should be kept in a cool place, protected from light.]

**System suitability solution:** 0.8 mg/mL of USP Hydromorphone Hydrochloride RS and 0.8  $\mu$ g/mL of USP Hydromorphone Related Compound A RS in *Diluent*

**Quantitation limit solution:** 0.4  $\mu$ g/mL of USP Hydromorphone Hydrochloride RS in *Diluent*

**Standard solution:** 4  $\mu$ g/mL of USP Hydromorphone Hydrochloride RS in *Diluent*

**Sample solution:** Equivalent to 0.4 mg/mL of hydromorphone hydrochloride in *Diluent*

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 3.9-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Column temperature:** 45°

**Flow rate:** 1 mL/min

**Injection size:** 20  $\mu$ L

### System suitability

**Samples:** *System suitability solution*, *Quantitation limit solution*, and *Standard solution*

**Suitability requirements**

**Resolution:** NLT 1.0 between the hydromorphone related compound A and hydromorphone peaks, *System suitability solution*

**Signal-to-noise ratio:** 10:1, *Quantitation limit solution*

**Tailing factor:** NMT 1.5 for the hydromorphone peak, *Standard solution*

**Relative standard deviation:** NMT 5.0%, *Standard solution*

**Analysis**

**Samples:** *Diluent, Standard solution, and Sample solution*  
Calculate the percentage of any specified or unspecified impurity in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response for each degradation product found, including those in *Table 3*, from the *Sample solution*

$r_S$  = peak response of hydromorphone from the *Standard solution*

$C_S$  = concentration of USP Hydromorphone Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of hydromorphone hydrochloride in the *Sample solution* (mg/mL)

$F$  = relative response factor for the corresponding individual specified or unspecified impurity (see *Table 3*)

Calculate the total degradation products by summing the percentage of all individual specified and unspecified degradation products determined to be at a level of 0.1% or greater, excluding the known process impurities, as indicated in *Table 3*.

**Acceptance criteria:** See *Table 3*.

[NOTE—Disregard peaks corresponding to those from the *Diluent*, peaks that elute before a relative retention time of about 0.50, except for any peak with a relative retention time of about 0.34, and peaks that elute at the relative retention times of the process-related substances designated in *Table 3*.]

**Table 3**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

<sup>e</sup> 2,2'-Bihydromorphone.

**Table 3 (Continued)**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Individual unspecified degradation products	—	1.0	0.2
Total degradation products	—	—	1.0

\* Degradation product.

\*\* Process impurity.

<sup>a</sup> 4,5 $\alpha$ -Epoxy-17-methylmorphinan-3,8-diol-6-one.

<sup>b</sup> 4,5 $\alpha$ -Epoxy-17-methylmorphinan-3,6 $\alpha$ -diol.

<sup>c</sup> 7,8-Didehydro-4,5 $\alpha$ -epoxy-17-methylmorphinan-3,6 $\alpha$ -diol.

<sup>d</sup> 4,5 $\alpha$ -Epoxy-3-hydroxy-17-methylmorphinan-6-one *N*-oxide.

<sup>e</sup> 2,2'-Bihydromorphone.

**SPECIFIC TESTS**

• **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: The total aerobic microbial count does not exceed 10<sup>2</sup> cfu/mL, and the total yeasts and molds count does not exceed 10 cfu/mL. It meets the requirements of the test for the absence of *Escherichia coli*.

• **PH** <791>: 4.5–6.5

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light. Store at 25°, excursions permitted between 15° and 30°.

• **LABELING:** Identify in the product labeling any preservative used in the Oral Solution.

• **USP REFERENCE STANDARDS** <11>  
USP Hydromorphone Hydrochloride RS  
USP Hydromorphone Related Compound A RS

**Hydromorphone Hydrochloride Tablets**

» Hydromorphone Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydromorphone hydrochloride (C<sub>17</sub>H<sub>19</sub>NO<sub>3</sub> · HCl).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** <11>—

USP Hydromorphone Hydrochloride RS

USP Morphine Sulfate RS

**Identification**—Place a quantity of finely powdered Tablets, equivalent to about 10 mg of hydromorphone hydrochloride, in a separator, and proceed as directed in the *Identification* test under *Hydromorphone Hydrochloride Injection*, beginning with "Extract with four 10-mL portions of chloroform".

**Dissolution** <711>—

*Medium:* water; 500 mL.

*Apparatus 2:* 50 rpm.

*Time:* 45 minutes.

Determine the amount of C<sub>17</sub>H<sub>19</sub>NO<sub>3</sub> · HCl dissolved by employing the following method.

*Buffer solution, Mobile phase, and System suitability solution*—Proceed as directed in the *Assay*.

*Test solution*—Withdraw a 15-mL portion of the solution under test, filter, and discard the first few mL of the filtrate.

**Standard solution**—Dissolve an accurately weighed quantity of USP Hydromorphone Hydrochloride RS in water at a concentration similar to that of the *Test solution*.

**Chromatographic system**—Proceed as directed in the *Assay*, except to inject the *Standard solution* instead of the *Standard preparation* to obtain the relative standard deviation for replicate injections of not more than 5.0%.

**Procedure**—Proceed as directed in the *Assay*, except to use an injection volume of about 200  $\mu$ L.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{17}H_{19}NO_3 \cdot HCl$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

**Buffer solution**—Dissolve 10 g of sodium dodecyl sulfate and 20 mL of glacial acetic acid in 1.2 liters of water, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (33:17). Make adjustments if necessary.

**System suitability solution**—Dissolve suitable quantities of USP Morphine Sulfate RS and USP Hydromorphone Hydrochloride RS in water to obtain a solution containing about 30 and 40  $\mu$ g of each per mL, respectively.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Hydromorphone Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 40  $\mu$ g per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer a portion of the powder, equivalent to about 4 mg of hydromorphone hydrochloride, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, sonicate if necessary, and mix. Filter a portion of the solution using a glass fiber filter, and discard the first 5 mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between morphine and hydromorphone is not less than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the hydromorphone hydrochloride peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 100  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of hydromorphone hydrochloride ( $C_{17}H_{19}NO_3 \cdot HCl$ ) in the portion of Tablets taken by the formula:

$$0.1 C(r_U / r_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Hydromorphone Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydroquinone

$C_6H_6O_2$  110.11  
1,4-Benzenediol.  
Hydroquinone [123-31-9].

» Hydroquinone contains not less than 99.0 percent and not more than 100.5 percent of  $C_6H_6O_2$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Hydroquinone RS

#### Identification—

**A: Infrared Absorption** (197K).

**B:** Prepare a solution of it in methanol containing approximately 1 mg per mL, and prepare a similar solution of USP Hydroquinone RS. Apply 5  $\mu$ L of each solution to a suitable thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of equal volumes of methanol and chloroform until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Heat on a hot plate or under a lamp until spots appear: the  $R_f$  value of the principal spot obtained from the solution under test corresponds to that obtained from the *Standard solution*.

**C:** A 1 in 40,000 solution in methanol exhibits an absorbance maximum at  $293 \pm 2$  nm.

**Melting range** (741): between  $172^\circ$  and  $174^\circ$ .

**Water, Method I** (921): not more than 0.5%.

**Residue on ignition** (281): not more than 0.5%.

**Assay**—Dissolve about 250 mg of Hydroquinone, accurately weighed, in a mixture of 100 mL of water and 10 mL of 0.1 N sulfuric acid, add 3 drops of diphenylamine TS, and titrate with 0.1 N ceric sulfate VS until a red-violet endpoint is reached. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N ceric sulfate is equivalent to 5.506 mg of  $C_6H_6O_2$ .

## Hydroquinone Cream

» Hydroquinone Cream contains not less than 94.0 percent and not more than 106.0 percent of the labeled amount of hydroquinone ( $C_6H_6O_2$ ).

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Hydroquinone RS

**Identification**—Dissolve a portion of Cream equivalent to about 50 mg of hydroquinone, in a mixture of equal volumes of methanol and chloroform to make 50 mL: a 5- $\mu$ L portion of this solution responds to *Identification test B* under *Hydroquinone*.

**Minimum fill** (755): meets the requirements.

#### Assay—

**Standard preparation**—Dissolve a suitable quantity of USP Hydroquinone RS in methanol, and dilute quantitatively and

stepwise with methanol to obtain a solution having a known concentration of about 10 µg per mL.

**Assay preparation**—Transfer an accurately weighed portion of Cream, equivalent to about 20 mg of hydroquinone, to a 100-mL beaker. Triturate the Cream with 50 mL of methanol, and pass the liquid through folded filter paper, previously washed with methanol, into a 500-mL volumetric flask. Repeat the trituration and filtration. Dilute, by washing the contents of the filter paper with methanol through the paper into the volumetric flask, to volume, and mix. Pipet 25 mL of this solution into a 100-mL volumetric flask, add methanol to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* in 1-cm cells at the wavelength of maximum absorbance at about 293 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg, of hydroquinone (C<sub>6</sub>H<sub>6</sub>O<sub>2</sub>) in each g of the Cream taken by the formula:

$$2000(C / W)(A_U / A_S)$$

in which C is the concentration, in mg per mL, of USP Hydroquinone RS in the *Standard preparation*; W is the weight, in g, of Cream taken; and A<sub>U</sub> and A<sub>S</sub> are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Hydroquinone Topical Solution

» Hydroquinone Topical Solution contains not less than 95.0 percent and not more than 110.0 percent of the labeled amount of hydroquinone (C<sub>6</sub>H<sub>6</sub>O<sub>2</sub>).

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Hydroquinone RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**pH** (791): between 3.0 and 4.2.

### Assay—

**Mobile phase**—Mix 55 volumes of methanol and 45 volumes of water.

**Standard preparation**—Transfer about 250 mg of USP Hydroquinone RS, accurately weighed, to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 3.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Topical Solution, equivalent to about 30 mg of hydroquinone, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 0.8 mL per minute. Chromatograph three replicate injections of the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph by means of a suitable microsyringe or sampling valve, record the chromatograms, and measure the responses for the major peaks. The retention time is

about 4 minutes for hydroquinone. Calculate the quantity, in mg, of hydroquinone (C<sub>6</sub>H<sub>6</sub>O<sub>2</sub>) in each mL of the Topical Solution taken by the formula:

$$100(C / V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Hydroquinone RS in the *Standard preparation*; V is the volume, in mL, of Topical Solution taken; and r<sub>U</sub> and r<sub>S</sub> are the peak responses of hydroquinone obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydroxocobalamin

C<sub>62</sub>H<sub>89</sub>CoN<sub>13</sub>O<sub>15</sub>P

1346.36

Cobinamide, dihydroxide, dihydrogen phosphate (ester), mono(inner salt), 3'-ester with 5,6-dimethyl-1-α-D-ribofuranosyl-1H-benzimidazole;

Cobinamide dihydroxide dihydrogen phosphate (ester), mono(inner salt), 3'-ester with 5,6-dimethyl-1-α-D-ribofuranosylbenzimidazole [13422-51-0].

### DEFINITION

Hydroxocobalamin contains NLT 95.0% and NMT 102.0% of hydroxocobalamin (C<sub>62</sub>H<sub>89</sub>CoN<sub>13</sub>O<sub>15</sub>P), calculated on the dried basis.

### IDENTIFICATION

#### • A. ULTRAVIOLET ABSORPTION (197U)

**Wavelength range:** 400–700 nm

**Sample solution:** Use the *Sample solution* as directed in *pH-dependent Cobalamins*.

**Acceptance criteria:** Meets the requirements in the chapter. The visible absorption spectrum of the *Sample solution* exhibits maxima at 426 ± 2, 516 ± 2, and 550 ± 2 nm.

#### • B. COBALT

**Sample:** 1 mg of Hydroxocobalamin

**Analysis:** Fuse the *Sample* with 50 mg of potassium pyrosulfate in a porcelain crucible. Cool, break up the mass with a glass rod, add 3 mL of water, and boil until dissolved. Add 1 drop of phenolphthalein TS, and add 2 N sodium hydroxide dropwise until a pink color appears. Add 0.5 g of sodium acetate, 0.5 mL of 1 N acetic acid, and 0.5 mL of a 10-mg/mL solution of nitroso R salt. Add 0.5 mL of hydrochloric acid, and boil for 1 min.

**Acceptance criteria:** A red or orange-red color appears immediately after the addition of nitroso R salt. The red or orange-red color persists after boiling with the addition of hydrochloric acid.

### ASSAY

#### • PROCEDURE

Cyanocobalamin tracer reagent, Cresol-carbon tetrachloride solution, Phosphate-cyanide solution, Butanol-benzalkonium chloride solution, and Alumina-resin column: Prepare as directed in *Cobalamin Radiotracer Assay* (371).

**Standard solution:** Use *Standardization* as directed in *Cobalamin Radiotracer Assay* (371).

**Sample solution:** Transfer 40 mg of Hydroxocobalamin to a 2000-mL volumetric flask. Dissolve in and dilute with water to volume. Transfer 25.0 mL of this solution to a beaker. Add 5.0 mL of *Cyanocobalamin tracer reagent*, and proceed as directed for *Assay preparation* in *Cobalamin Radiotracer Assay* (371), beginning with "Add, while working under a hood, 5 mg of sodium nitrite..."

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Proceed as directed for *Procedure* in *Cobalamin Radiotracer Assay* (371).

Calculate the percentage of hydroxocobalamin ( $C_{62}H_{89}Co-N_{13}O_{15}P$ ) in the portion of Hydroxocobalamin taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (R_S/R_U) \times (M_{r1}/M_{r2}) \times 100$$

$A_U$  = absorbance of the *Sample solution* at 361 nm  
 $A_S$  = absorbance of the *Standard solution* at 361 nm  
 $C_S$  = concentration of USP Cyanocobalamin RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = concentration of Hydroxocobalamin in the *Sample solution* ( $\mu\text{g/mL}$ )  
 $R_S$  = corrected average radioactivity values of the *Standard solution* (counts/min/mL)  
 $R_U$  = corrected average radioactivity values of the *Sample solution* (counts/min/mL)  
 $M_{r1}$  = molecular weight of hydroxocobalamin, 1346.36  
 $M_{r2}$  = molecular weight of cyanocobalamin, 1355.37  
**Acceptance criteria:** 95.0%–102.0% on the dried basis

#### IMPURITIES

##### • LIMIT OF CYANOCOBALAMIN

**Cyanocobalamin tracer reagent, Cresol-carbon tetrachloride solution, Butanol-benzalkonium chloride solution, and Alumina-resin column:** Prepare as directed in *Cobalamin Radiotracer Assay* (371).

**Standard solution:** Use *Standardization* as directed in *Cobalamin Radiotracer Assay* (371).

**Sample solution:** 50 mg of Hydroxocobalamin in 25 mL of water

**Analysis:** Transfer 5.0 mL of the *Sample solution* to a glass-stoppered, 50-mL centrifuge tube, and add 5.0 mL of *Cyanocobalamin tracer reagent* and 15 mL of *Cresol-carbon tetrachloride solution*. Insert the stopper, shake gently, centrifuge, carefully remove the upper, aqueous layer by aspiration, and discard the aspirated liquid. Add 25 mL of 5 N sulfuric acid, insert the stopper, shake gently, centrifuge, and remove and discard the upper, aqueous layer. Repeat the washing with additional 25-mL portions of the 5 N sulfuric acid until the acid wash is colorless (6–8 washings), and discard the acid washings. Add *Cresol-carbon tetrachloride solution* as necessary during the acid washings to maintain the volume of this phase at NLT 10 mL. Wash this solution successively with two 10-mL portions of saturated dibasic sodium phosphate solution and one 10-mL portion of water, and discard all of the aqueous washings. Proceed as directed for *Procedure* in *Cobalamin Radiotracer Assay* (371), beginning with "To the washed extract add 30 mL of a mixture of 2 volumes of *Butanol-benzalkonium chloride solution* and 1 volume of *carbon tetrachloride*".

Repeat the same procedure for the *Standard solution*. Calculate the percentage of cyanocobalamin in the portion of Hydroxocobalamin taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (R_S/R_U) \times 100$$

$A_U$  = absorbance of the *Sample solution* at 361 nm  
 $A_S$  = absorbance of the *Standard solution* at 361 nm

$C_S$  = concentration of USP Cyanocobalamin RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = concentration of Hydroxocobalamin in the *Sample solution* ( $\mu\text{g/mL}$ )  
 $R_S$  = corrected average radioactivity values of the *Standard solution* (counts/min/mL)  
 $R_U$  = corrected average radioactivity values of the *Sample solution* (counts/min/mL)

**Acceptance criteria:** NMT 5.0% on the dried basis

#### SPECIFIC TESTS

##### • pH (791)

**Sample solution:** 20 mg/mL of solution

**Acceptance criteria:** 8.0–10.0

##### • LOSS ON DRYING (731):

Dry a sample at a pressure below 5 mm of mercury at 100° for 2 h: it loses 14.0%–18.0% of its weight.

##### • PH-DEPENDENT COBALAMINS

[NOTE—Perform the test in subdued light.]

**Buffer A:** Dissolve 23.8 g of sodium borate and 402 mg of boric acid in 1500 mL of water. The pH is 9.3.

**Buffer B:** Dissolve 2.61 g of sodium acetate and 20.5 g of sodium chloride in 5.25 mL of glacial acetic acid, and dilute with water to 1500 mL. The pH is 4.0.

**Sample stock solution:** Transfer 40 mg of Hydroxocobalamin into a 25-mL volumetric flask. Dissolve and dilute with carbon dioxide-free water to volume.

**Sample solution A:** Transfer 1.0-mL aliquot of the *Sample stock solution* to a glass-stoppered test tube. Add 3.0 mL of *Buffer A* and mix.

**Sample solution B:** Transfer 1.0-mL aliquot of the *Sample stock solution* to a glass-stoppered test tube. Add 3.0 mL of *Buffer B* and mix.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Visible

**Analytical wavelength:** 550 nm

**Cell:** 1 cm

#### Analysis

**Samples:** *Sample solution A* and *Sample solution B*  
Determine the absorbance of *Sample solution A* against that of *Sample solution B*. Calculate the percentage of pH-dependent cobalamins, as hydroxocobalamin, in the portion of Hydroxocobalamin taken:

$$\text{Result} = A/(F \times C)$$

$A$  = pH corrected absorbance of *Sample solution A*  
 $F$  = coefficient of extinction ( $E_{1\%}^{1\text{cm}}$ ) of pure hydroxocobalamin in pH 9.3 buffer ( $100 \text{ mL} \cdot \text{g}^{-1} \cdot \text{cm}^{-1}$ ), 19.66  
 $C$  = concentration of Hydroxocobalamin in *Sample solution A* (g/mL)

**Acceptance criteria:** 95.0%–102.0% on the dried basis

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store in a cool place.

• **USP REFERENCE STANDARDS (11)**  
USP Cyanocobalamin RS

## Hydroxocobalamin Injection

» Hydroxocobalamin Injection is a sterile solution of Hydroxocobalamin in Water for Injection. It contains not less than 95.0 percent and not more than 115.0 percent of the labeled amount of hydroxocobalamin ( $C_{62}H_{89}CoN_{13}O_{15}P$ ).

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

**USP Reference standards** <11>—

USP Cyanocobalamin RS  
USP Endotoxin RS

**Identification**—Dilute 3.0 mL of Injection with pH 4.0 buffer (prepared by dissolving 2.61 g of sodium acetate and 20.5 g of sodium chloride in 5.25 mL of glacial acetic acid and sufficient water to make 1500 mL of solution) to 100 mL: the UV-visible absorption spectrum of this solution exhibits maxima at  $352 \pm 2$  nm and  $525 \pm 2$  nm. The ratio  $A_{352}/A_{525}$  is between 2.7 and 3.3.

**Bacterial endotoxins** <85>—It contains not more than 0.4 USP Endotoxin Unit per  $\mu$ g of hydroxocobalamin.

**pH** <791>: between 3.5 and 5.0.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay**—

**pH 9.3 Buffer**—Dissolve 23.8 g of sodium borate and 402 mg of boric acid in sufficient water to make 1500 mL of solution, and mix.

**Standard preparation**—Dissolve a suitable quantity of USP Cyanocobalamin RS, accurately weighed, in pH 9.3 Buffer and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 30  $\mu$ g per mL.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 5 mg of hydroxocobalamin, to a 50-mL volumetric flask containing about 25 mL of pH 9.3 Buffer. Add 5.0 mL of potassium cyanide solution (1 in 10,000), allow to stand at room temperature for 30 minutes, dilute with pH 9.3 Buffer to volume, and mix. Transfer 15.0 mL of this solution to a second 50-mL volumetric flask, dilute with pH 9.3 Buffer to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 361 nm, with a suitable spectrophotometer, using pH 9.3 Buffer as the blank. Calculate the quantity, in mg, of hydroxocobalamin ( $C_{62}H_{89}CoN_{13}O_{15}P$ ) in each mL of the Injection taken by the formula:

$$(1346.36 / 1355.37)(0.1667C / V)(A_U / A_S)$$

in which 1346.36 and 1355.37 are the molecular weights of hydroxocobalamin and cyanocobalamin, respectively; C is the concentration, in  $\mu$ g per mL, of USP Cyanocobalamin RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Hydroxyamphetamine Hydrobromide

$C_9H_{13}NO \cdot HBr$  232.12

Phenol, 4-(2-aminopropyl)-, hydrobromide.  
( $\pm$ )-p-(2-Aminopropyl)phenol hydrobromide [306-21-8].

» Hydroxyamphetamine Hydrobromide contains not less than 98.0 percent and not more than 101.5 percent of  $C_9H_{13}NO \cdot HBr$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** <11>—

USP Hydroxyamphetamine Hydrobromide RS

**Identification**—

**A: Infrared Absorption** <197K>.

**B:** Dissolve about 500 mg of ammonium molybdate in 10 mL of sulfuric acid, and add to this solution about 2 mg of Hydroxyamphetamine Hydrobromide: an intense blue color is produced (*distinction from similar amino compounds such as amphetamine and methamphetamine, which, lacking a phenolic hydroxyl, do not undergo this reaction*).

**C:** Dissolve about 200 mg in 2 mL of water, and add a solution of 500 mg of potassium carbonate in 2 mL of water. Extract with two 10-mL portions of ether, allow the clear ether solution to evaporate to dryness, and dry at about 80°: the hydroxyamphetamine so obtained melts between 124° and 127° (see *Class I* under *Melting Range or Temperature* <741>).

**D:** To a solution of about 10 mg of it in 10 mL of water add 1 mL of 2 N nitric acid, then add silver nitrate TS: a pale yellow precipitate is formed, and it is slightly soluble in 6 N ammonium hydroxide.

**Melting range** <741>: between 189° and 192°.

**Loss on drying** <731>—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** <281>: not more than 0.1%.

**Bromide content**—Accurately weigh about 400 mg, and dissolve in 50 mL of water. Add 50 mL of methanol and 10 mL of glacial acetic acid, then add eosin Y TS, and titrate with 0.1 N silver nitrate VS. Each mL of 0.1 N silver nitrate is equivalent to 7.990 mg of Br: the content of Br, calculated on the dried basis, is between 33.6% and 35.2%.

**Ordinary impurities** <466>—

**Test solution:** methanol.

**Standard solution:** methanol.

**Eluant:** a mixture of toluene, methanol, and ammonium hydroxide (10:4:0.25).

**Visualization:** 1.

**Assay**—Dissolve about 400 mg of Hydroxyamphetamine Hydrobromide, accurately weighed, in a mixture of 10 mL of glacial acetic acid and 10 mL of mercuric acetate TS, warming slightly, if necessary, to effect solution. Add crystal violet TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 23.21 mg of  $C_9H_{13}NO \cdot HBr$ .

## Hydroxyamphetamine Hydrobromide Ophthalmic Solution

» Hydroxyamphetamine Hydrobromide Ophthalmic Solution is a sterile, buffered, aqueous solution of Hydroxyamphetamine Hydrobromide. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_9H_{13}NO \cdot HBr$ . It contains a suitable antimicrobial agent.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** <11>—

USP Hydroxyamphetamine Hydrobromide RS

**Identification—**

**A:** Dissolve about 500 mg of ammonium molybdate in 10 mL of sulfuric acid, and add 0.2 mL of Ophthalmic Solution: an intense blue color is produced (*distinction from similar amino compounds such as amphetamine and methamphetamine, which, lacking a phenolic hydroxyl, do not undergo this reaction*).

**B:** The dried diacetylhydroxyamphetamine obtained in the Assay melts between 96° and 100° (see *Class I* under *Melting Range or Temperature* <741>), but the range between beginning and end of melting does not exceed 2.0°.

**C:** It responds to *Identification test D* under *Hydroxyamphetamine Hydrobromide*.

**D:** Dilute a volume of Ophthalmic Solution, equivalent to about 50 mg of hydroxyamphetamine hydrobromide, with 0.01 N hydrochloric acid to 25 mL, and proceed as directed under *Identification—Organic Nitrogenous Bases* <181>, using sodium carbonate TS in place of 1 N sodium hydroxide, beginning with "Transfer the liquid to a separator": the Ophthalmic Solution meets the requirements of the test.

**Sterility** <71>: meets the requirements.

**pH** <791>: between 4.2 and 6.0.

**Assay—**Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 100 mg of hydroxyamphetamine hydrobromide, to a 125-mL separator. Wash the solution with 15 mL of chloroform, and discard the washing. Rinse the stopper and the mouth of the separator with a few drops of water. Add 1.05 g of sodium bicarbonate, preventing it from coming in contact with the mouth of the separator, and swirl until most of the bicarbonate has dissolved. By means of a 1-mL syringe, rapidly inject 0.5 mL of acetic anhydride directly into the contents of the separator. Immediately insert the stopper in the separator, and shake vigorously until the evolution of carbon dioxide has ceased (7 to 10 minutes), releasing the pressure as necessary through the stopcock. Allow to stand for 5 minutes, and extract the solution with five 10-mL portions of chloroform, filtering each extract through a pledget of cotton, previously washed with chloroform, into a tared 100-mL beaker. Evaporate the combined chloroform extracts on a steam bath in a current of air or stream of nitrogen to dryness. Dry the residue at 80° for 90 minutes, cool in a desiccator, and weigh. The weight of the diacetylhydroxyamphetamine so obtained, multiplied by 0.9866, represents the weight of  $C_9H_{13}NO \cdot HBr$  in the volume of Ophthalmic Solution taken.

## Hydroxychloroquine Sulfate

$C_{18}H_{26}ClN_3O \cdot H_2SO_4$  433.95

Ethanol, 2-[[4-[(7-chloro-4-quinolyl)amino]pentyl]ethylamino]-, (±)-, sulfate (1:1) (salt).

(±)-2-[[4-[(7-chloro-4-quinolyl)amino]pentyl]ethylamino]ethanol sulfate (1:1) (salt) [747-36-4].

» Hydroxychloroquine Sulfate contains not less than 98.0 percent and not more than 102.0 percent of  $C_{18}H_{26}ClN_3O \cdot H_2SO_4$ , calculated on the dried basis.

**Packaging and storage—**Preserve in well-closed, light-resistant containers.

**USP Reference standards** <11>—  
USP Hydroxychloroquine Sulfate RS

**Identification—**

**A:** *Ultraviolet Absorption* <197U>—

*Solution:* 10 µg per mL.

*Medium:* dilute hydrochloric acid (1 in 100).

**B:** *Infrared Absorption* <197K>.

**C:** A solution (1 in 100) responds to the tests for *Sulfate* <191>.

**Loss on drying** <731>—Dry it at 105° for 2 hours: it loses not more than 2.0% of its weight.

**Ordinary impurities** <466>—

*Test solution:* 10% water in methanol.

*Standard solution:* 10% water in methanol.

*Eluant:* a mixture of alcohol, water, and ammonium hydroxide (80:16:4).

*Visualization:* 1.

**Assay—**Dissolve about 100 mg of Hydroxychloroquine Sulfate, accurately weighed, in about 5 mL of water, and dilute quantitatively and stepwise with dilute hydrochloric acid (1 in 100) to obtain a solution containing about 10 µg per mL. Similarly prepare a Standard solution of USP Hydroxychloroquine Sulfate RS. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 343 nm, with a suitable spectrophotometer, using dilute hydrochloric acid (1 in 100) as the blank. Calculate the quantity, in mg, of  $C_{18}H_{26}ClN_3O \cdot H_2SO_4$  in the portion of Hydroxychloroquine Sulfate taken by the formula:

$$10C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Hydroxychloroquine Sulfate RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the solution of Hydroxychloroquine Sulfate and the Standard solution, respectively.

## Hydroxychloroquine Sulfate Tablets

» Hydroxychloroquine Sulfate Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of hydroxychloroquine sulfate ( $C_{18}H_{26}ClN_3O \cdot H_2SO_4$ ).

**Packaging and storage—**Preserve in tight, light-resistant containers.

**USP Reference standards** <11>—  
USP Hydroxychloroquine Sulfate RS

**Identification—**

**A:** Triturate a quantity of finely powdered Tablets, equivalent to about 1 g of hydroxychloroquine sulfate, with 50 mL of water, and filter (retain the remainder of the filtrate for *Identification test B*): the clear filtrate so obtained meets the requirements under —*Identification—Organic Nitrogenous Bases* <181>.

**B:** The clear filtrate obtained from *Identification test A* meets the requirements of the tests for *Sulfate* <191>.

**C:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the Assay.

**Dissolution** <711>—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 60 minutes.

**Procedure**—Determine the amount of  $C_{18}H_{26}ClN_3O \cdot H_2SO_4$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 343 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Hydroxychloroquine Sulfate RS in the same medium.

**Tolerances**—Not less than 70% (Q) of the labeled amount of  $C_{18}H_{26}ClN_3O \cdot H_2SO_4$  is dissolved in 60 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Assay**—

**Mobile phase**—To 800 mL of water, add 100 mL of methanol, 100 mL of acetonitrile, 2.0 mL of phosphoric acid, and 96 mg of sodium 1-pentanesulfonate, mix, and filter. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Solvent mixture**—Prepare a mixture of methanol and water (1:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Hydroxychloroquine Sulfate RS in *Solvent mixture*, dilute quantitatively with *Solvent mixture*, and mix to obtain *Solution A* having a known concentration of about 1 mg per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain the *Standard preparation* having a known concentration of about 0.05 mg per mL.

**Resolution solution**—Prepare a solution of chloroquine phosphate in methanol having a concentration of 1 mg per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 5.0 mL of *Solution A*, dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 200 mg of hydroxychloroquine sulfate to a 200-mL volumetric flask, add about 150 mL of *Solvent mixture*, and mix. Sonicate, with intermittent shaking, for about 15 minutes, and cool to room temperature. Dilute with *Solvent mixture* to volume, mix, and filter. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- to 10- $\mu$ m packing L1. The flow rate is about 1.0 mL per minute. Chromatograph about 20  $\mu$ L of the *Resolution solution*, and record the peak responses as directed under *Procedure*: the resolution,  $R$ , between chloroquine and hydroxychloroquine is not less than 1.8. Chromatograph replicate injections of the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of hydroxychloroquine sulfate ( $C_{18}H_{26}ClN_3O \cdot H_2SO_4$ ) in the portion of Tablets taken by the formula:

$$4000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Hydroxychloroquine Sulfate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Hydroxyprogesterone Caproate**

$C_{27}H_{40}O_4$  428.60

Pregn-4-ene-3,20-dione, 17-[(1-oxohexyl)oxy]-.

17-Hydroxypregn-4-ene-3,20-dione hexanoate [630-56-8].

» Hydroxyprogesterone Caproate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{27}H_{40}O_4$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** <11>—

USP Hydroxyprogesterone Caproate RS

**Identification, Infrared Absorption** <197K>.

**Melting range** <741>: between 120° and 124°.

**Specific rotation** <781S>: between +58° and +64°.

*Test solution*: 10 mg per mL, in chloroform.

**Water, Method I** <921>: not more than 0.1%.

**Free n-caproic acid**—Dissolve 0.20 g in 25 mL of alcohol that previously has been neutralized to a faint pink color following the addition of 2 or 3 drops of phenolphthalein TS. Promptly titrate with 0.020 N sodium hydroxide: not more than 0.50 mL of 0.020 N sodium hydroxide is required (0.58%).

**Ordinary impurities** <466>—

*Test solution*: chloroform.

*Standard solution*: chloroform.

*Eluant*: a mixture of chloroform and ethyl acetate (3:1).

*Visualization*: 5; then view under long-wavelength UV light.

**Assay**—Transfer about 50 mg of Hydroxyprogesterone Caproate, accurately weighed, to a 100-mL volumetric flask, add alcohol to volume, and mix. Dilute 2.0 mL of this solution with alcohol to volume in a second 100-mL volumetric flask, and mix. Dissolve in alcohol a suitable quantity of USP Hydroxyprogesterone Caproate RS, and dilute quantitatively and stepwise with alcohol to obtain a Standard solution having a known concentration of about 10  $\mu$ g per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 240 nm, using alcohol as the blank. Calculate the quantity, in mg, of  $C_{27}H_{40}O_4$  in the Hydroxyprogesterone Caproate taken by the formula:

$$5C(A_U / A_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Hydroxyprogesterone Caproate RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the solution of Hydroxyprogesterone Caproate and the Standard solution, respectively.

## Hydroxyprogesterone Caproate Injection

» Hydroxyprogesterone Caproate Injection is a sterile solution of Hydroxyprogesterone Caproate in a suitable vegetable oil. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydroxyprogesterone caproate ( $C_{27}H_{40}O_4$ ).

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I or Type III glass.

**USP Reference standards** (11)—  
USP Hydroxyprogesterone Caproate RS

### Identification—

**A:** Transfer a volume of Injection, equivalent to 125 mg of hydroxyprogesterone caproate, to a 60-mL separator containing 10 mL of solvent hexane, 8 mL of methanol, and 2 mL of water. Insert the stopper, shake for 2 minutes, and allow the phases to separate. To 3 mL of the lower layer add sulfuric acid dropwise until a color develops, then add 3 mL of methanol: a purple color develops, and the solution, when viewed under long-wavelength UV light, exhibits a pale yellow fluorescence.

**B:** Evaporate 4 mL of the *Assay preparation*, obtained as directed in the *Assay*, on a water bath to dryness, and dissolve the residue in 0.5 mL of chloroform. Apply 10  $\mu$ L of this solution and 10  $\mu$ L of a solution of USP Hydroxyprogesterone Caproate RS in chloroform, containing 400  $\mu$ g per mL, to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture, on a line about 2.5 cm from the bottom edge and about 2 cm apart. Place the plate in a developing chamber that contains and that has been equilibrated with a mixture of 3 volumes of chloroform and 1 volume of ethyl acetate. Develop the plate until the solvent front has moved to about 10 cm above the points of application. Remove the plate, mark the solvent front, and dry. Spray the plate with a mixture of 1 volume of sulfuric acid and 3 volumes of alcohol, and heat in an oven at 105° for 5 minutes: the  $R_f$  value of the principal yellowish green spot obtained from the solution under test corresponds to that obtained from the Standard solution.

**Water, Method I** (921): not more than 0.2%.

**Other requirements**—It meets the requirements under *Injections* (1).

### Assay—

**Isoniazid reagent**—Dissolve 375 mg of isoniazid and 0.47 mL of hydrochloric acid in 500 mL of methanol.

**Standard preparation**—Dissolve a suitable quantity of USP Hydroxyprogesterone Caproate RS, accurately weighed, in methanol, and dilute quantitatively and stepwise with methanol to obtain a solution having a known concentration of about 50  $\mu$ g per mL.

**Assay preparation**—Transfer to a 250-mL volumetric flask an accurately measured volume of Injection, equivalent to about 250 mg of hydroxyprogesterone caproate, add methanol to volume, and mix. Pipet 5 mL of this solution into a 100-mL volumetric flask, add methanol to volume, and mix.

**Procedure**—Pipet 5 mL of *Assay preparation* into a glass-stoppered, 50-mL conical flask. Pipet 5 mL of *Standard preparation* into a similar flask. To each flask, add 10.0 mL of *Isoniazid reagent*, mix, and allow to stand in a water bath at 30° for about 45 minutes. Concomitantly determine the absorbances of both solutions at the wavelength of maximum absorbance at about 380 nm, with a suitable spectrophotometer, using as a blank a mixture of 5 mL of methanol and 10 mL of *Isoniazid reagent*. Calculate the quantity, in

mg, of hydroxyprogesterone caproate ( $C_{27}H_{40}O_4$ ) in each mL of the Injection taken by the formula:

$$5(C/V)(A_U/A_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Hydroxyprogesterone Caproate RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydroxypropyl Cellulose Ocular System

### DEFINITION

Hydroxypropyl Cellulose Ocular System contains NLT 85.0% and NMT 115.0% of the labeled amount of Hydroxypropyl Cellulose. It contains no other substance. It is sterile.

### IDENTIFICATION

#### • INFRARED ABSORPTION

**Sample solution:** A 10-mg/mL solution in methanol, based on the labeled amount of Hydroxypropyl Cellulose. Evaporate 2 drops of the solution on a silver chloride plate so that it forms a thin film.

**Acceptance criteria:** The infrared absorption spectrum of the film exhibits maxima only at the same wavelengths as that of a similar preparation of USP Hydroxypropyl Cellulose RS.

### ASSAY

#### • PROCEDURE

**Standard stock solution:** 0.25 mg/mL of USP Hydroxypropyl Cellulose RS prepared as follows: Weigh 25 mg of USP Hydroxypropyl Cellulose RS into a 100-mL volumetric flask. Dissolve in 80 mL of water. Mix well by agitating on a mechanical shaker until completely dissolved. Add one drop of methanol to dispel the foam and dilute with water to volume. [NOTE—Stirring overnight before diluting to volume is recommended.]

**Standard solution:** 0.05 mg/mL of hydroxypropyl cellulose in water, from *Standard stock solution*

**Sample stock solution:** 0.25 mg/mL of hydroxypropyl cellulose prepared using the same procedure as the *Standard stock solution*

**Sample solution:** 0.05 mg/mL of hydroxypropyl cellulose in water, from *Sample stock solution*

#### Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** UV-Vis

**Analytical wavelength:** 620 nm

**Cell length:** 1.0 cm, quartz

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Separately pipet 2 mL of the *Standard solution*, the *Sample solution*, and water, to provide a blank, into individual 50-mL centrifuge tubes. Add to each tube, 6.0 mL of a 0.5 mg/mL solution of anthrone in sulfuric acid, and mix on a vortex mixer. Let the centrifuge tubes cool for approximately 40 min and remix. Concomitantly determine the absorbances of the *Standard solution* and the *Sample solution*. [NOTE—Prepare anthrone in sulfuric acid solution just before use in low-actinic glassware, and mix well before adding to the tube. Use it within 12 h of preparation. Avoid contact between the glassware and the paper products during analysis; the cellulose in the paper will react with the sulfuric acid and alter the results.]

Calculate the percentage of hydroxypropyl cellulose in the Ocular System:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

- $A_U$  = absorbance of the *Sample solution*  
 $A_S$  = absorbance of the *Standard solution*  
 $C_S$  = concentration of the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of hydroxypropyl cellulose in the *Sample solution* (mg/mL)

**Acceptance criteria:** 85.0%–115.0%

## PERFORMANCE TESTS

### • WEIGHT VARIATION

**Analysis:** Determine the weight of each of a sufficient number of Systems.

**Acceptance criteria:** NMT 1 out of 20 Systems varies more than 25% from the average or, failing that, NMT 6 out of 60 (including the original 20) vary more than 25% (but none more than 35%) from the average weight.

## SPECIFIC TESTS

- **STERILITY TESTS** <71>: Meets the requirements

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose containers, at a temperature not exceeding 30°.  
 • **USP REFERENCE STANDARDS** <11>  
 USP Hydroxypropyl Cellulose RS

# Hydroxyurea

CH<sub>4</sub>N<sub>2</sub>O<sub>2</sub> 76.05

Urea, hydroxy-

Hydroxyurea [127-07-1].

» Hydroxyurea contains not less than 97.0 percent and not more than 103.0 percent of CH<sub>4</sub>N<sub>2</sub>O<sub>2</sub>, calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers, in a dry atmosphere.

**USP Reference standards** <11>—

USP Hydroxyurea RS

**Identification, Infrared Absorption** <197K>.

**Loss on drying** <731>—Dry it in vacuum at 60° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** <281>: not more than 0.50%.

**Heavy metals** <231>: not more than 0.003%.

**Urea and related compounds**—

**Developing solvent**—Shake equal volumes of isobutyl alcohol and water in a separator, and allow the layers to separate. Use the upper layer as the *Mobile phase* and the lower layer as the *Stationary phase*.

**p-Dimethylaminobenzaldehyde solution, 1%**—Dissolve 1.0 g of p-dimethylaminobenzaldehyde in 50 mL of alcohol, add 2 mL of hydrochloric acid, and dilute with alcohol to 100.0 mL.

**pH 6.5 Buffer solution**—Mix 700 mL of 0.2 M dibasic sodium phosphate and 300 mL of 0.1 M citric acid.

**Standard preparation**—Prepare a solution of urea in water, containing 0.1 mg per mL.

**Test preparation**—Dissolve 10.0 mg of Hydroxyurea in 1.0 mL of water.

**Procedure**—Treat a suitable chromatographic paper strip (Whatman No. 1 or equivalent) by dipping it in pH 6.5 Buffer solution. Dry the paper strip, and apply 100 µL of the Test preparation and 50 µL of the Standard preparation. Place

the strip in a chromatographic chamber for descending chromatography containing the *Stationary phase* in the bottom of the chamber and the *Mobile phase* in the trough. Develop for 24 hours, remove the strip from the chamber, air-dry, and develop again for 24 hours. Remove the strip, air-dry, spray with p-Dimethylaminobenzaldehyde solution, 1%, and heat at 90° for 1 to 2 minutes. Not more than two spots, other than the major component, are present in the Test preparation, and their intensities are not greater than the intensity of the spot from the Standard preparation (0.5% of each impurity). The R<sub>f</sub> values relative to hydroxyurea, the principal spot, are 0.65 and 1.26 (urea).

### Assay—

**Solution A**—Dissolve 1.7 g of tetrabutylammonium hydrogensulfate and 1.74 g of dibasic potassium phosphate, anhydrous, in 1000 mL of water, and adjust with 1 N sodium hydroxide or 85% phosphoric acid to a pH of 5.0.

**Solution B:** methanol.

**Mobile phase**—Prepare a solution of filtered, degassed Solution A and Solution B (8.5:1.5). Make adjustments if necessary (see System Suitability under Chromatography <621>).

**Resolution solution**—Dissolve accurately weighed quantities of USP Hydroxyurea RS and hydroxylamine hydrochloride in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.4 mg per mL of each.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Hydroxyurea RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.4 mg per mL.

**Assay preparation**—Transfer about 200 mg of Hydroxyurea, accurately weighed, to a 500-mL volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

**Chromatographic system** (see Chromatography <621>)—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 0.5 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, R<sub>s</sub>, between the hydroxylamine and hydroxyurea peaks is not less than 1.5; for the hydroxyurea peak, the column efficiency is not less than 5000; and the tailing factor is not more than 1.5. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of CH<sub>4</sub>N<sub>2</sub>O<sub>2</sub> in the portion of Hydroxyurea taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Hydroxyurea RS in the Standard preparation; and r<sub>U</sub> and r<sub>S</sub> are the peak responses of the hydroxyurea peaks obtained from the Assay preparation and the Standard preparation, respectively.

## Hydroxyurea Capsules

» Hydroxyurea Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydroxyurea (CH<sub>4</sub>N<sub>2</sub>O<sub>2</sub>).

**Packaging and storage**—Preserve in tight containers, in a dry atmosphere.

**USP Reference standards** (11)—

USP Hydroxyurea RS

**Identification**—Transfer a portion of the Capsule contents, equivalent to about 30 mg of hydroxyurea, to a suitable centrifuge tube, and add 10 mL of anhydrous methanol. Mix, and centrifuge for 3 minutes. Transfer 1.0 mL of the clear supernatant to a mortar containing 500 mg of potassium bromide, triturate to a homogeneous blend, dry in a vacuum desiccator at 60° for 3 hours, and prepare a suitable disk: the IR absorption spectrum exhibits maxima only at the same wavelengths as that of a similar preparation of USP Hydroxyurea RS.

**Dissolution** (711)—

Medium: water; 500 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

**Procedure**—Determine the amount of  $\text{CH}_4\text{N}_2\text{O}_2$  dissolved, employing the procedure set forth in the Assay, making any necessary modifications.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $\text{CH}_4\text{N}_2\text{O}_2$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

*Solution A, Solution B, Mobile phase, Resolution solution, Standard preparation, and Chromatographic system*—Prepare as directed in the Assay under Hydroxyurea.

**Assay preparation**—Remove, as completely as possible, the contents of not fewer than 20 Capsules. Grind to a fine powder, and transfer an accurately weighed portion of the powder, equivalent to about 200 mg of hydroxyurea, to a 500-mL volumetric flask. Add about 300 mL of *Mobile phase*, sonicate for 10 minutes, stir with the aid of a magnetic stirrer for 30 minutes, sonicate for an additional 10 minutes, and dilute as necessary with *Mobile phase* to volume. Filter a portion of the resulting solution, discarding the first 2 mL of the filtrate.

**Procedure**—Proceed as directed for *Procedure* in the Assay under Hydroxyurea. Calculate the quantity, in mg, of hydroxyurea ( $\text{CH}_4\text{N}_2\text{O}_2$ ) in the portion of Capsules taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Hydroxyurea RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses for the *Assay preparation* and the *Standard preparation*, respectively.

## Hydroxyzine Hydrochloride

 $\text{C}_{21}\text{H}_{27}\text{ClN}_2\text{O}_2 \cdot 2\text{HCl}$  447.83

Ethanol, 2-[2-[4-[(4-chlorophenyl)phenylmethyl]-1-piperazinyl]ethoxy]-, dihydrochloride, (±)-  
(±)-2-[2-[4-(p-Chloro-α-phenylbenzyl)-1-piperazinyl]ethoxy]ethanol dihydrochloride  
[2192-20-3].

» Hydroxyzine Hydrochloride, contains not less than 98.0 percent and not more than 102.0 per-

cent of  $\text{C}_{21}\text{H}_{27}\text{ClN}_2\text{O}_2 \cdot 2\text{HCl}$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Hydroxyzine Hydrochloride RS

USP Hydroxyzine Related Compound A RS

p-Chlorobenzhydrylpiperazine.

**Identification**—

A: Infrared Absorption (197K).

B: Ultraviolet Absorption (197U)—

Solution: 10 µg per mL.

Medium: alcohol.

Absorptivities at 230 nm, calculated on the dried basis, do not differ by more than 3.0%.

C: To 10 mL of a solution (1 in 400) add 2 drops of nitric acid and 1 mL of silver nitrate TS: a curdy, white precipitate, insoluble in 2 N nitric acid, but soluble in 6 N ammonium hydroxide, separates (*presence of chloride*).

**Loss on drying** (731)—Dry it in vacuum at 75° for 3 hours: it loses not more than 5.0% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Heavy metals, Method II** (231): 0.002%.

**Chromatographic purity**—

*Mobile phase, Resolution solution, and Chromatographic system*—Proceed as directed in the Assay.

**Standard solution**—Quantitatively dilute the *Standard preparation* with *Mobile phase* to obtain a solution having a known concentration of about 1.8 µg per mL of Hydroxyzine Hydrochloride.

**Test solution**—Use the Assay stock preparation.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for a total time of not less than 1.8 times the retention time of the hydroxyzine peak, and measure the response for each peak, except for the main hydroxyzine peak in the chromatogram obtained from the *Test solution*. Calculate the percentage of each impurity in the specimen taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Hydroxyzine Hydrochloride RS in the *Standard solution*;  $C_U$  is the concentration, in mg per mL, of specimen in the *Test solution*;  $r_U$  is the peak response of a given impurity in the chromatogram obtained from the *Test solution*; and  $r_S$  is the peak response of hydroxyzine in the chromatogram obtained from the *Standard solution*: not more than 0.3% of any impurity is found, and the sum of all impurities found is not greater than 1.5%.

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile and 0.12 N sulfuric acid (90:10). Make adjustments if necessary (see *System Suitability* under Chromatography (621)).

**Standard preparation**—Quantitatively dissolve an accurately weighed quantity of USP Hydroxyzine Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.3 mg per mL.

**Resolution solution**—Dissolve suitable quantities of USP Hydroxyzine Hydrochloride RS and USP Hydroxyzine Related Compound A RS in *Mobile phase* to obtain a solution containing 3.6 µg of each per mL.

**Assay stock preparation**—Transfer an accurately weighed quantity of Hydroxyzine Hydrochloride to a suitable volumetric flask, dissolve in and dilute with *Mobile phase* to volume to obtain a solution containing a known concentration of about 0.6 mg of Hydroxyzine Hydrochloride per mL, and mix.

**Assay preparation**—Quantitatively dilute the *Assay stock preparation* with *Mobile phase* to obtain a final known concentration of about 0.3 mg per mL of Hydroxyzine Hydrochloride.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains packing L3. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution* and the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between hydroxyzine related compound A and hydroxyzine is not less than 1.5; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%. [NOTE—For identification purposes, the relative retention times are about 0.9 for hydroxyzine related compound A and 1.0 for hydroxyzine.]

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms for a total time of not less than 1.8 times the retention time of the hydroxyzine peak, and measure the response for the main hydroxyzine peak in the chromatograms. Calculate the percentage of  $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ , in the portion of Hydroxyzine Hydrochloride taken by the formula:

$$100(C_s / C_u)(r_u / r_s)$$

in which  $C_s$  is the concentration, in mg per mL, of USP Hydroxyzine Hydrochloride RS in the *Standard preparation*;  $C_u$  is the concentration, in mg per mL, of Hydroxyzine Hydrochloride in the *Assay preparation*; and  $r_u$  and  $r_s$  are the peak responses of hydroxyzine in the chromatograms obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydroxyzine Hydrochloride Injection

» Hydroxyzine Hydrochloride Injection is a sterile solution of Hydroxyzine Hydrochloride in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydroxyzine hydrochloride ( $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, protected from light.

### USP Reference standards <11>—

USP Endotoxin RS

USP Hydroxyzine Hydrochloride RS

**Identification**—Dilute a volume of Injection with 0.1 N hydrochloric acid to obtain a solution having a concentration of about 20  $\mu$ g of hydroxyzine hydrochloride per mL: the UV absorption spectrum of this solution exhibits maxima and minima at the same wavelengths as that of a 1 in 50,000 solution of USP Hydroxyzine Hydrochloride RS in 0.1 N hydrochloric acid, concomitantly measured.

**Bacterial endotoxins** <85>—It contains not more than 3.6 USP Endotoxin Units per mg of hydroxyzine hydrochloride.

**pH** <791>: between 3.5 and 6.0.

**Other requirements**—It meets the requirements under *Injections* <1>.

### Assay and limit of 4-chlorobenzophenone—

**Mobile phase**—Adjust about 1000 mL of *Buffer No. 1* (see *Phosphate Buffers and Other Solutions* in the section *Media and Diluents*, under *Antibiotics—Microbial Assays* <81>) with 10 N potassium hydroxide to a pH of 6.6. To about 35 volumes of this solution add about 65 volumes of methanol,

mix, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve accurately weighed quantities of USP Hydroxyzine Hydrochloride RS and 4-chlorobenzophenone in *Mobile phase*, and dilute quantitatively with *Mobile phase* to obtain a solution having known concentrations of about 250  $\mu$ g of USP Hydroxyzine Hydrochloride RS and 0.5  $\mu$ g of 4-chlorobenzophenone per mL. Protect this solution from light.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 125 mg of hydroxyzine hydrochloride, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pipet 10 mL of this solution into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Protect this solution from light.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the tailing factors for the 4-chlorobenzophenone and hydroxyzine peaks are not more than 2.5, the resolution,  $R$ , between the 4-chlorobenzophenone and hydroxyzine peaks is not less than 2.0, and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%. The relative retention times are about 0.75 for 4-chlorobenzophenone and 1.0 for hydroxyzine.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of hydroxyzine hydrochloride ( $C_{21}H_{27}ClN_2O_2 \cdot HCl$ ) in each mL of the Injection taken by the formula:

$$0.5(C / V)(r_u / r_s)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP Hydroxyzine Hydrochloride RS in the *Standard preparation*;  $V$  is the volume, in mL, of Injection taken; and  $r_u$  and  $r_s$  are the hydroxyzine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. The ratio of the response of the 4-chlorobenzophenone peak to that of the hydroxyzine peak obtained from the *Assay preparation* does not exceed the corresponding ratio of peak responses obtained from the *Standard preparation* (0.2%).

## Hydroxyzine Hydrochloride Oral Solution

» Hydroxyzine Hydrochloride Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydroxyzine hydrochloride ( $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards <11>—

USP Hydroxyzine Hydrochloride RS

**Identification**—Dilute a volume of Oral Solution, equivalent to about 20 mg of hydroxyzine hydrochloride, with 50 mL of methanol, and mix. Apply 100  $\mu$ L of this solution and 100  $\mu$ L of a solution in the same medium containing about 350  $\mu$ g of USP Hydroxyzine Hydrochloride RS per mL to a suitable thin-layer chromatographic plate (see *Chromatography* <621>), coated with a 0.25-mm layer of chromatographic silica gel and dried in air for 30 minutes followed by drying in vacuum at 140° for 30 minutes. Allow the spots to dry, and develop the chromatogram in a solvent system

consisting of a mixture of toluene, alcohol, and ammonium hydroxide (150:95:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots by lightly spraying with potassium iodoplatinate TS: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**Uniformity of dosage units** (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**Assay—**

*Mobile phase and Chromatographic system*—Proceed as directed in the Assay under *Hydroxyzine Hydrochloride Tablets*.

*Standard preparation*—Dissolve a suitable quantity of USP Hydroxyzine Hydrochloride RS, accurately weighed, in water to obtain a solution having a known concentration of about 100 µg per mL.

*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 20 mg of hydroxyzine hydrochloride, to a 200-mL volumetric flask, dilute with water to volume, mix, and pass a portion through a polytetrafluoroethylene membrane filter having a 5-µm or finer porosity.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Hydroxyzine Hydrochloride Tablets*. Calculate the quantity, in mg, of hydroxyzine hydrochloride ( $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ ) in each mL of the Oral Solution taken by the formula:

$$0.2(C/V)(r_U / r_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Hydroxyzine Hydrochloride RS in the *Standard preparation*;  $V$  is the volume, in mL, of Oral Solution taken; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydroxyzine Hydrochloride Tablets

» Hydroxyzine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydroxyzine hydrochloride ( $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

**USP Reference standards** (11)—

USP Hydroxyzine Hydrochloride RS

**Identification**—Triturate a quantity of finely powdered Tablets, equivalent to about 100 mg of hydroxyzine hydrochloride, with 50 mL of methanol, and filter. Apply 100 µL of this solution and 100 µL of a solution in the same medium containing 2 mg of USP Hydroxyzine Hydrochloride RS per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel and dried in air for 30 minutes followed by drying in vacuum at 140° for 30 minutes. Proceed as directed in the *Identification* test under *Hydroxyzine Hydrochloride Oral Solution*, beginning with "Allow the spots to dry."

**Dissolution** (711)—

TEST 1—

*Medium*: water, 900 mL.

*Apparatus 2*: 50 rpm.

*Time*: 45 minutes.

*Procedure*—Determine the amount of  $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 230 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Hydroxyzine Hydrochloride RS in the same *Medium*. Calculate the amount of  $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$  dissolved per Tablet.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$  is dissolved in 45 minutes.

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

*Medium*: water, 250 mL.

*Apparatus 3*: 30 dips per minute.

*Time*: 45 minutes.

*Procedure*—Determine the amount of  $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 230 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Hydroxyzine Hydrochloride RS in the same *Medium*. Calculate the amount of  $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$  dissolved per Tablet.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay—**

*Mobile phase*—Dissolve 6.8 g of monobasic potassium phosphate in 1000 mL of water, add 1000 mL of methanol, and mix. Pass the solution through a polytetrafluoroethylene membrane filter having a 5-µm or finer porosity, and degas.

*Standard preparation*—Dissolve a suitable quantity of USP Hydroxyzine Hydrochloride RS, accurately weighed, in methanol to obtain a solution having a known concentration of about 100 µg per mL.

*Assay preparation*—Place 20 Tablets in a high-speed blender jar containing 400.0 mL of methanol, and blend for 5 minutes. The Tablets are completely disintegrated. Allow to settle, and filter a portion of the supernatant through a polytetrafluoroethylene membrane filter having a 1-µm or finer porosity. Dilute an accurately measured volume of the filtrate so obtained quantitatively with methanol to obtain an *Assay preparation* having a concentration of about 100 µg of hydroxyzine hydrochloride per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 232-nm detector and a 4.6-mm × 25-cm column that contains packing L9. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.5%.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of hydroxyzine hydrochloride ( $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ ) in each Tablet taken by the formula:

$$(L/D)(C)(r_U / r_S)$$

in which  $L$  is the labeled quantity, in mg, of hydroxyzine hydrochloride in each Tablet;  $D$  is the concentration, in µg per mL, of hydroxyzine hydrochloride in the *Assay preparation* on the basis of the labeled quantity in each Tablet and the extent of dilution;  $C$  is the concentration, in µg per mL,

of USP Hydroxyzine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydroxyzine Pamoate

$C_{21}H_{27}ClN_2O_2 \cdot C_{23}H_{16}O_6$  763.27

Ethanol, 2-[2-[4-[(4-chlorophenyl)phenylmethyl]-1-piperazinyl]ethoxy]-, ( $\pm$ )-, compd. with 4,4'-methylenedibis[3-hydroxy-2-naphthalenecarboxylic acid] (1:1).

( $\pm$ )-2-[2-[4-(*p*-Chloro- $\alpha$ -phenylbenzyl)-1-piperazinyl]ethoxy]ethanol 4,4'-methylenedibis[3-hydroxy-2-naphthoate] (1:1) [10246-75-0].

» Hydroxyzine Pamoate contains not less than 97.0 percent and not more than 102.0 percent of  $C_{21}H_{27}ClN_2O_2 \cdot C_{23}H_{16}O_6$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Hydroxyzine Pamoate RS

USP Hydroxyzine Hydrochloride RS

USP Pamoic Acid RS

$C_{23}H_{16}O_6$  388.38

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Water**, *Method I* (921): not more than 5.0%.

**Residue on ignition** (281): not more than 0.2%.

**Heavy metals**, *Method II* (231): 20 ppm.

**Assay**—

**Mobile phase**—Dissolve 8.65 g of sodium 1-octanesulfonate in about 1000 mL of water in a 2000-mL volumetric flask, add 4.0 mL of phosphoric acid, dilute with water to volume, mix, and pass through a 0.5- $\mu$ m or finer porosity membrane filter. Prepare a suitable mixture of this solution and acetonitrile (45:55), making any adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Hydroxyzine Hydrochloride RS in dimethylformamide to obtain a solution having a known concentration of about 1 mg per mL. Transfer 2.0 mL of the resulting solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, mix, and pass through a 0.5- $\mu$ m or finer porosity membrane filter.

**Assay preparation**—Transfer about 90 mg of Hydroxyzine Pamoate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with dimethylformamide to volume, and mix. Transfer 2.0 mL of the resulting solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, mix, and pass through a 0.5- $\mu$ m or finer porosity membrane filter, discarding the first 5 mL of the filtrate.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 230-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1.

The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency, calculated from the analyte peak, is not less than 2000 theoretical plates, and the relative standard deviation for replicate injections is not more than 2%. Chromatograph the *Assay preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between hydroxyzine and pamoic acid is not less than 1.5.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.5 for hydroxyzine and 1.0 for pamoic acid. Calculate the percentage of  $C_{21}H_{27}ClN_2O_2 \cdot C_{23}H_{16}O_6$  in the portion of Hydroxyzine Pamoate taken by the formula:

$$100(763.27 / 447.83)(C_S / C_U)(r_U / r_S)$$

in which 763.27 and 447.83 are the molecular weights of hydroxyzine pamoate and hydroxyzine hydrochloride, respectively;  $C_S$  is the concentration, in mg per mL, of USP Hydroxyzine Hydrochloride RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of Hydroxyzine Pamoate in the *Assay preparation*; and  $r_U$  and  $r_S$  are the hydroxyzine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydroxyzine Pamoate Capsules

» Hydroxyzine Pamoate Capsules contain hydroxyzine pamoate ( $C_{21}H_{27}ClN_2O_2 \cdot C_{23}H_{16}O_6$ ) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydroxyzine hydrochloride ( $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Hydroxyzine Pamoate RS

USP Hydroxyzine Hydrochloride RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

**Medium:** 0.1 N hydrochloric acid; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 60 minutes.

**Mobile phase**—Prepare a suitable degassed solution of methanol and 0.05 M monobasic sodium phosphate (6:4).

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 232-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L9. The flow rate is about 1.9 mL per minute. Chromatograph replicate injections of a Standard solution, and record the peak responses as directed under *Procedure*: the relative standard deviation is not more than 2.0%.

**Procedure**—Inject alternately 50  $\mu$ L of a filtered portion of the solution under test and a Standard solution, having a known concentration of USP Hydroxyzine Hydrochloride RS in the same medium, into the chromatograph, record the chromatogram, and measure the response for the major peak. Determine the amount of  $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$  dissolved from the peak response obtained in comparison with the peak response obtained from the Standard solution.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**Mobile phase**—Dissolve 7.0 g of monobasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 4.4. Pass the solution through a 5- $\mu$ m porosity polytetrafluoroethylene membrane filter. Mix 900 mL of the filtrate with 900 mL of methanol, and degas by stirring under vacuum prior to use.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Hydroxyzine Pamoate RS in methanol to obtain a solution having a known concentration of about 0.18 mg per mL (equivalent to about 0.1 mg of hydroxyzine hydrochloride per mL).

**Assay preparation**—Transfer, as completely as possible, the contents of not less than 20 Capsules to a tared beaker, and determine the average weight per capsule. Mix the combined contents, and transfer an accurately weighed portion, equivalent to about 25 mg of hydroxyzine hydrochloride, to a 250-mL volumetric flask. Add 200 mL of methanol to the flask, sonicate for 5 minutes, shake by mechanical means for 30 minutes, and sonicate for 2 minutes. Dilute with methanol to volume, and mix. Filter the solution through a 5- $\mu$ m porosity polytetrafluoroethylene membrane filter equipped with a glass fiber prefilter.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 232-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L9. The flow rate is about 2.5 mL per minute. Chromatograph four replicate injections of the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The retention time is about 6 minutes for hydroxyzine. Calculate the equivalent quantity, in percentage, of hydroxyzine hydrochloride ( $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ ) in the portion of Capsules taken by the formula:

$$100(447.83 / 763.27)(C_S / C_U)(r_U / r_S)$$

in which 447.83 and 763.27 are the molecular weights of hydroxyzine hydrochloride and hydroxyzine pamoate, respectively;  $C_S$  is the concentration, in mg per mL, of USP Hydroxyzine Pamoate RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of hydroxyzine pamoate in the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak responses of hydroxyzine pamoate obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydroxyzine Pamoate Oral Suspension

» Hydroxyzine Pamoate Oral Suspension contains hydroxyzine pamoate ( $C_{21}H_{27}ClN_2O_2 \cdot C_{23}H_{16}O_6$ ) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydroxyzine hydrochloride ( $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Hydroxyzine Hydrochloride RS  
USP Hydroxyzine Pamoate RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Uniformity of dosage units** (905)—

FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 4.5 and 7.0.

**Assay**—

**Mobile phase**—Dissolve 7.0 g of monobasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 4.4. Pass the solution through a 5- $\mu$ m porosity polytetrafluoroethylene membrane filter. Mix 900 mL of the filtrate with 900 mL of methanol, and degas by stirring under vacuum prior to use.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Hydroxyzine Pamoate RS in methanol to obtain a solution having a known concentration of about 0.18 mg per mL (equivalent to about 0.1 mg of hydroxyzine hydrochloride per mL).

**Assay preparation**—Transfer an accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, equivalent to about 25 mg of hydroxyzine hydrochloride, to a 250-mL volumetric flask. Dissolve in and dilute with methanol to volume, and mix. Pass this solution through a polytetrafluoroethylene membrane filter having a 1- $\mu$ m or finer porosity.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 232-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L9. The flow rate is about 2.5 mL per minute. Chromatograph four replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the equivalent quantity, in percentage, of hydroxyzine hydrochloride ( $C_{21}H_{27}ClN_2O_2 \cdot 2HCl$ ) in the portion of the Oral Suspension taken by the formula:

$$100(447.83 / 763.27)(C_S / C_U)(r_U / r_S)$$

in which 447.83 and 763.27 are the molecular weights of hydroxyzine hydrochloride and hydroxyzine pamoate, respectively;  $C_S$  is the concentration, in mg per mL, of USP Hydroxyzine Pamoate RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of hydroxyzine pamoate in the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak responses of the hydroxyzine peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hyoscyamine

$C_{17}H_{23}NO_3$  289.37

Benzeneacetic acid,  $\alpha$ -(hydroxymethyl)-, 8-methyl-8-azabicyclo[3.2.1]oct-3-yl ester, [3(*S*)-endo-].

1 $\alpha$ H,5 $\alpha$ H-Tropan-3 $\alpha$ -ol (-)-tropate (ester). [101-31-5].

» Hyoscyamine contains not less than 98.0 percent and not more than 101.0 percent of  $C_{17}H_{23}NO_3$ , calculated on the dried basis.

[Caution—Handle Hyoscyamine with exceptional care, since it is highly potent.]

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Hyoscyamine Sulfate RS

**Identification**—

**A:** Transfer 30 mg of Hyoscyamine and 36 mg of USP Hyoscyamine Sulfate RS to individual 60-mL separators with the aid of 5-mL portions of water. To each separator add 1.5 mL of 1 N sodium hydroxide and 10 mL of chloroform. Shake for 1 minute, allow the layers to separate, and filter the chloroform extracts through separate filters of about 2 g of anhydrous granular sodium sulfate supported on pledgets of glass wool. Extract each aqueous layer with two additional 10-mL portions of chloroform, filtering and combining with the respective main extracts. Evaporate the chloroform solutions under reduced pressure to dryness, and dissolve each residue in 10 mL of carbon disulfide: the IR absorption spectrum, determined in a 1-mm cell, of the solution obtained from the test specimen exhibits maxima only at the same wavelengths as that of the solution obtained from the Reference Standard.

**B:** Dissolve 60 mg in 1 mL of 0.2 N hydrochloric acid, and add gold chloride TS, dropwise with shaking, until a definite precipitate separates. Add a small amount of 3 N hydrochloric acid, dissolve the precipitate with the aid of heat, and then allow to cool: lustrous golden yellow scales are formed (*distinction from atropine and scopolamine*).

**Melting range** (741): between 106° and 109°.

**Specific rotation** (781S): between −20° and −23°.

*Test solution:* 10 mg per mL, in dilute alcohol (1 in 2).

**Loss on drying** (731)—Dry it in vacuum over silica gel to constant weight: it loses not more than 0.2% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Limit of foreign alkaloids and other impurities**—Prepare a solution of it in methanol containing 20 mg per mL, and by quantitative dilution of a portion of this solution with methanol, prepare a second solution of Hyoscyamine containing 1 mg per mL. Apply 25  $\mu$ L of the first (20 mg per mL) Hyoscyamine solution, 1  $\mu$ L of the second (1 mg per mL) Hyoscyamine solution, and 5  $\mu$ L of a methanol solution of USP Hyoscyamine Sulfate RS containing 24 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.5-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform, acetone, and diethylamine (5:4:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by spraying with potassium iodoplatinate TS. The  $R_f$  value of the principal spot obtained from each test solution corresponds to that obtained from the Standard solution, and no secondary spot obtained from the first Hyoscyamine solution exhibits intensity equal to or greater than the principal spot obtained from the second Hyoscyamine solution (0.2%).

**Assay**—Dissolve about 500 mg of Hyoscyamine, accurately weighed, in 50 mL of glacial acetic acid, add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 28.94 mg of  $C_{17}H_{23}NO_3$ .

## Hyoscyamine Tablets

» Hyoscyamine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hyoscyamine ( $C_{17}H_{23}NO_3$ ).

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Hyoscyamine Sulfate RS

**Identification**—Macerate a quantity of powdered Tablets, equivalent to about 5 mg of hyoscyamine, with 20 mL of water, filter, and transfer the filtrate to a separator. Render the solution alkaline with 6 N ammonium hydroxide, and extract the alkaloid with 50 mL of methylene chloride. Divide the methylene chloride layer into two equal portions, and evaporate each to dryness. Perform tests A and B on the residues.

**A:** To one portion of the dry residue add 2 drops of nitric acid, and evaporate on a steam bath to dryness. Cool and add 10 mL of acetone to dissolve the residue. Add a few drops of alcoholic potassium hydroxide TS: a violet color is produced.

**B:** Dissolve the other portion of the residue in 1 mL of 0.1 N hydrochloric acid, and add gold chloride TS, dropwise with shaking, until a definite precipitate separates. Slowly heat until the precipitate dissolves, and allow the solution to cool: lustrous golden yellow scales are formed.

**Disintegration** (701): 30 minutes, the use of disks being omitted.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

*pH 9.0 Buffer*—Dissolve 34.8 g of dibasic potassium phosphate in 900 mL of water, and adjust to a pH of 9.0, determined electrometrically, by the addition of 3 N hydrochloric acid or 1 N sodium hydroxide, as necessary, with mixing.

*Internal standard solution*—Dissolve about 25 mg of homatropine hydrobromide, accurately weighed, in water contained in a 50-mL volumetric flask, add water to volume, and mix. Prepare fresh daily.

*Standard preparation*—Dissolve about 10 mg of USP Hyoscyamine Sulfate RS, accurately weighed, in water contained in a 100-mL volumetric flask, add water to volume, and mix. Prepare fresh daily. Pipet 10.0 mL of this solution into a separator, add 2.0 mL of *Internal standard solution* and 5.0 mL of *pH 9.0 Buffer*, and adjust with 1 N sodium hydroxide to a pH of 9.0. Extract with two 10-mL portions of methylene chloride, filter the methylene chloride extracts through 1 g of anhydrous sodium sulfate supported by a small cotton plug in a funnel into a 50-mL beaker, and evaporate under nitrogen to dryness. Dissolve the residue in 2.0 mL of methylene chloride.

*Assay preparation*—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 0.86 mg of hyoscyamine, to a separator containing 5 mL of *pH 9.0 Buffer*, and add, by pipet, 2.0 mL of *Internal standard solution*. Proceed as directed under *Standard preparation*, beginning with “adjust with 1 N sodium hydroxide to a pH of 9.0.”

*Chromatographic system*—Under typical conditions, the instrument contains a 1.8-m  $\times$  2-mm glass column packed with 3% liquid phase G3 on support S1AB, cured as directed (see *Gas Chromatography* (621)). Maintain the column at 225°, and use nitrogen as the carrier gas at a flow rate of 25 mL per minute.

*System suitability*—Chromatograph six to ten injections of the *Standard preparation*, and record peak areas as directed for *Procedure*. The analytical system is suitable for con-

ducting this assay if the relative standard deviation for the ratio of the peak areas does not exceed 2.0%, the resolution factor is not less than 5, and the tailing factor does not exceed 2.0.

**Procedure**—Inject 1- $\mu$ L portions of the *Assay preparation* and the *Standard preparation* successively into the gas chromatograph. Measure the areas under the peaks for hyoscyamine and homatropine in each chromatogram. Calculate the ratio,  $A_U$ , of the area of the hyoscyamine peak to the area of the internal standard peak in the chromatogram from the *Assay preparation*, and similarly calculate the ratio,  $A_S$ , in the chromatogram from the *Standard preparation*. Calculate the quantity, in mg, of hyoscyamine ( $C_{17}H_{23}NO_3$ ) in the portion of Tablets taken by the formula:

$$(289.37 / 676.83)(W / 10)(A_U / A_S)$$

in which 289.37 and 676.83 are the molecular weights of hyoscyamine and anhydrous hyoscyamine sulfate, respectively, and  $W$  is the weight, in mg, of USP Hyoscyamine Sulfate RS taken for the *Standard preparation*.

## Hyoscyamine Hydrobromide

$C_{17}H_{23}NO_3 \cdot HBr$  370.28

Benzeneacetic acid,  $\alpha$ -(hydroxymethyl)-, 8-methyl-8-azabicyclo[3.2.1]oct-3-yl ester, hydrobromide [3(S)-endo]-.

1 $\alpha$ H,5 $\alpha$ H-Tropan-3 $\alpha$ -ol (-)-tropate (ester) hydrobromide [306-03-6].

» Hyoscyamine Hydrobromide contains not less than 98.5 percent and not more than 100.5 percent of  $C_{17}H_{23}NO_3 \cdot HBr$ , calculated on the dried basis. [*Caution*—Handle Hyoscyamine Hydrobromide with exceptional care, since it is highly potent.]

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Hyoscyamine Sulfate RS

**Identification**—

**A:** Transfer 30 mg of Hyoscyamine Hydrobromide and 36 mg of USP Hyoscyamine Sulfate RS to individual 60-mL separators with the aid of 5-mL portions of water. To each separator add 1.5 mL of 1 N sodium hydroxide and 10 mL of chloroform. Shake for 1 minute, allow the layers to separate, and filter the chloroform extracts through separate filters of about 2 g of anhydrous granular sodium sulfate supported on pledgets of glass wool. Extract each aqueous layer with two additional 10-mL portions of chloroform, filtering and combining with the respective main extracts. Evaporate the chloroform solutions under reduced pressure to dryness, and dissolve each residue in 10 mL of carbon disulfide: the IR absorption spectrum, determined in a 1-mm cell, of the solution obtained from the test specimen exhibits maxima only at the same wavelengths as that of the solution obtained from the Reference Standard.

**B:** To about 1 mL of a solution (1 in 20) add gold chloride TS, dropwise with shaking, until a definite precipitate separates. Add a small amount of 3 N hydrochloric acid, dissolve the precipitate with the aid of heat, and allow the solution to cool: lustrous reddish brown scales that may be accompanied by reddish brown needles are formed (*distinction from atropine and scopolamine*).

**C:** To an aqueous solution (1 in 20) add silver nitrate TS: a yellowish-white precipitate is formed, and it is insoluble in nitric acid.

**Melting temperature** (741): not less than 149°.

**Specific rotation** (781S): not less than  $-24^\circ$ .

*Test solution:* 50 mg per mL, in water.

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Other alkaloids**—Dissolve 250 mg in 1 mL of 0.1 N hydrochloric acid, and dilute with water to 15 mL. To 5 mL of the solution add a few drops of platinic chloride TS: no precipitate is formed immediately. To another 5-mL portion add 2 mL of 6 N ammonium hydroxide: the mixture may develop a slight opalescence, but no turbidity or precipitate is formed immediately.

**Assay**—Dissolve about 700 mg of Hyoscyamine Hydrobromide, accurately weighed, in a mixture of 50 mL of glacial acetic acid and 10 mL of mercuric acetate TS. Add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 37.03 mg of  $C_{17}H_{23}NO_3 \cdot HBr$ .

## Hyoscyamine Sulfate

$(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot 2H_2O$  712.85

Benzeneacetic acid,  $\alpha$ -(hydroxymethyl)-, 8-methyl-8-azabicyclo-

[3.2.1]oct-3-yl ester, [3(S)-endo]-, sulfate (2:1), dihydrate. 1 $\alpha$ H,5 $\alpha$ H-Tropan-3 $\alpha$ -ol (-)-tropate (ester) sulfate (2:1) (salt) dihydrate [6835-16-1].

Anhydrous 676.83 [620-61-1].

» Hyoscyamine Sulfate contains not less than 98.5 percent and not more than 100.5 percent of  $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4$ , calculated on the anhydrous basis. [*Caution*—Handle Hyoscyamine Sulfate with exceptional care, since it is highly potent.]

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Hyoscyamine Sulfate RS

USP Hyoscyamine Related Compound A RS

Norhyoscyamine sulfate or (1R,3R,5S)-8-azabicyclo[3.2.1]oct-3-yl(2S)-3-hydroxy-2-phenylpropanoate.

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution*, as obtained in the test for *Chromatographic purity*.

**C:** A solution (1 in 20) responds to the tests for *Sulfate* (191).

**Specific rotation** (781S): between  $-24^\circ$  and  $-29^\circ$ , measured at 20°.

*Test solution:* 50 mg per mL, in water.

**Water, Method Ia** (921): between 2.0% and 5.5%.

**Residue on ignition** (281): not more than 0.1%.

**Chromatographic purity**—

*Buffer solution*—Dissolve 7.0 g of monobasic potassium phosphate in 1000 mL of water, adjust with 0.05 M phosphoric acid to a pH of 3.3, and mix.

*Solution A*—Dissolve 3.5 g of sodium dodecyl sulfate in 606 mL of *Buffer solution*, add 320 mL of acetonitrile, and mix.

*Solution B*—Use acetonitrile.

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Standard stock solution*—Dissolve an accurately weighed quantity of USP Hyoscyamine Sulfate RS in *Solution A* to obtain a solution having a known concentration of about 1.2 mg of hyoscyamine sulfate per mL.

*Standard solution*—Dilute a portion of the *Standard stock solution* with *Solution A* to obtain a solution having a known concentration of about 0.24 mg of hyoscyamine sulfate per mL.

*Diluted standard solution*—Dilute the *Standard solution* with *Solution A* to obtain a solution having a known concentration of about 0.24 µg of hyoscyamine sulfate per mL.

*System suitability solution*—Prepare a solution of USP Hyoscyamine Related Compound A RS in *Solution A* having a concentration of about 2.4 µg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, add 10 mL of the *Standard stock solution*, dilute with *Solution A* to volume and mix.

*Test solution*—Transfer about 60 mg of Hyoscyamine Sulfate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Solution A* to volume, and mix. Transfer 10 mL of this solution to a 50-mL volumetric flask, and dilute with *Solution A* to volume. This solution contains about 0.24 mg of hyoscyamine sulfate per mL.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 10-cm column that contains 3-µm packing L1. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–2	95	5	isocratic
2–20	95→70	5→30	linear gradient
20–20.1	70→95	30→5	linear gradient
20.1–25	95	5	re-equilibration

Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 1.0%. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between hyoscyamine related compound A and hyoscyamine is greater than 2.0.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Diluted standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses of the major peaks. Calculate the percentage of each impurity in the portion of Hyoscyamine Sulfate taken by the formula:

$$0.1(C_S / C_T) (r_i / r_S)$$

in which  $C_S$  is the concentration, in µg per mL, of hyoscyamine sulfate in the *Diluted standard solution*;  $C_T$  is the concentration, in mg per mL, of hyoscyamine sulfate in the *Test solution*;  $r_i$  is the peak response for each impurity obtained from the *Test solution*; and  $r_S$  is the hyoscyamine peak response obtained from the *Diluted standard solution*. In addition to not exceeding the limits for each impurity in *Table 1*, not more than 0.1% of any other individual impurity is found; and not more than 0.5% of total impurities is found.

Table 1

Name	Relative Retention Time	Limit (%)
DL-Tropic acid	0.2	0.2
7-Hydroxyhyoscyamine	0.67	0.2
6-Hydroxyhyoscyamine	0.72	0.2
Scopolamine	0.8	0.2
Norhyoscyamine (Hyoscyamine related compound A)	0.9	0.3
Apoatropine	1.8	0.2
Littorine	1.1	0.2

**Assay**—Dissolve about 0.5 g of Hyoscyamine Sulfate, accurately weighed, in 50 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 67.68 mg of  $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4$ .

## Hyoscyamine Sulfate Elixir

» Hyoscyamine Sulfate Elixir contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hyoscyamine sulfate  $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot 2H_2O]$ .

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

**USP Reference standards** <11>—

USP Hyoscyamine Sulfate RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**pH** <791>: between 3.0 and 6.5.

**Alcohol content** <611>: between 90.0% and 110.0% of the labeled amount of  $C_2H_5OH$ .

**Assay**—

*Diluent*—Use 0.01 N hydrochloric acid.

*Buffer solution*—Transfer 13.6 g of monobasic potassium phosphate to a 2000-mL volumetric flask, dissolve in about 1800 mL of water, adjust with phosphoric acid to a pH of  $3.0 \pm 0.1$ , dilute with water to volume, mix, and filter.

*Mobile phase*—Prepare a degassed mixture containing *Buffer solution* and methanol (75:25).

*Standard stock preparation*—Dissolve an accurately weighed quantity of USP Hyoscyamine Sulfate RS in *Diluent* to obtain a solution having a concentration of about 0.16 mg of anhydrous hyoscyamine sulfate per mL. [NOTE—This solution may be stored in a refrigerator for 30 days.]

*Standard preparation*—Transfer 3.0 mL of the *Standard stock preparation* into a 100-mL volumetric flask, dilute with *Diluent*, to volume and mix. Calculate the concentration,  $C$ , in mg per mL, of anhydrous hyoscyamine sulfate in this solution.

*Tropic acid solution*—Dissolve an accurately weighed quantity of tropic acid in *Diluent* to obtain a solution having a concentration of about 4 µg of tropic acid per mL.

*System suitability preparation*—Transfer 3.0 mL of the *Standard stock preparation* into a 100-mL volumetric flask, add 4.0 mL of the *Tropic acid solution*, dilute with *Diluent*, to volume and mix.

*Assay preparation*—Transfer an accurately measured volume of Elixir, equivalent to about 0.25 mg of hyoscyamine

sulfate, to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix. Pass an aliquot through a 0.45- $\mu$ m filter, discarding the first 5 mL of the filtrate.

**Chromatographic system**—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm  $\times$  15-cm column that contains 4- $\mu$ m packing L11 and a 3-mm  $\times$  4-mm guard column that contains packing L11. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 30°. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the elution order is tropic acid peak, followed by hyoscyamine peak; the resolution,  $R$ , between tropic acid and hyoscyamine is not less than 1.5; the tailing factor for the hyoscyamine peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of hyoscyamine sulfate  $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot 2H_2O]$  in each mL of the Elixir taken by the formula:

$$50 \times 1.053 \times (C/V)(r_U / r_S)$$

in which 1.053 is the ratio of the molecular weight of hydrated hyoscyamine sulfate to that of anhydrous hyoscyamine sulfate;  $C$  is as defined in the *Standard preparation*;  $V$  is the volume, in mL, of the Elixir taken; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hyoscyamine Sulfate Injection

» Hyoscyamine Sulfate Injection is a sterile solution of Hyoscyamine Sulfate in Water for Injection. It contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of hyoscyamine sulfate  $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot 2H_2O]$ .

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, and store at controlled room temperature.

### USP Reference standards (11)—

USP Hyoscyamine Sulfate RS  
USP Endotoxin RS

### Identification—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** After evaporation to dryness, or appropriate adjustment of concentration, it meets the requirements of the tests for *Sulfate* (191).

**C:** The angular rotation of the Injection is levorotatory.

**Bacterial endotoxins** (85)—It contains not more than 714.3 USP Endotoxin Units per mg of hyoscyamine sulfate.

**pH** (791): between 3.0 and 6.5.

**Other requirements**—It meets the requirements under *Injections* (1).

### Assay—

**Diluent**—Use 0.01 N hydrochloric acid.

**Buffer solution**—Transfer 13.6 g of monobasic potassium phosphate to a 2000-mL volumetric flask, dissolve in about 1800 mL of water, adjust with phosphoric acid to a pH of  $3.0 \pm 0.1$ , dilute with water to volume, mix, and filter.

**Mobile phase**—With continuous stirring, add 0.3 mL of triethylamine to 1800 mL of the *Buffer solution*. Add 200 mL of acetonitrile, mix well, and degas.

**Standard stock preparation**—Dissolve an accurately weighed quantity of USP Hyoscyamine Sulfate RS in *Diluent* to obtain a solution having a concentration of about 0.16 mg of anhydrous hyoscyamine sulfate per mL. [NOTE—This solution may be stored in a refrigerator for 30 days.]

**Standard preparation**—Transfer 3.0 mL of the *Standard stock preparation* into a 100-mL volumetric flask, dilute with *Diluent*, to volume and mix. Calculate the concentration,  $C$ , in mg per mL, of anhydrous hyoscyamine sulfate in this solution.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 1.0 mg of hyoscyamine sulfate, to a 200-mL volumetric flask, dilute with *Diluent* to volume, and mix. Pass an aliquot through a 0.45- $\mu$ m filter, discarding the first 5 mL of the filtrate.

**Chromatographic system**—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm  $\times$  15-cm column that contains 4- $\mu$ m packing L11 and a 3-mm  $\times$  4-mm guard column that contains packing L11. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 30°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.8, and the relative standard deviation for six replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of hyoscyamine sulfate  $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot 2H_2O]$  in each mL of the Injection taken by the formula:

$$100 \times 1.053 \times (C/V)(r_U / r_S)$$

in which 1.053 is the ratio of the molecular weight of hydrated hyoscyamine sulfate to that of anhydrous hyoscyamine sulfate;  $C$  is as defined under *Standard preparation*;  $V$  is the volume, in mL, of Injection taken; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hyoscyamine Sulfate Oral Solution

» Hyoscyamine Sulfate Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hyoscyamine sulfate  $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot 2H_2O]$ .

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

### USP Reference standards (11)—

USP Hyoscyamine Sulfate RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Uniformity of dosage units (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

### Deliverable volume (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 3.0 and 6.5.

#### Assay—

*Diluent, Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under *Hyoscyamine Sulfate Injection*.

*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 0.5 mg of hyoscyamine sulfate, to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Pass an aliquot through a 0.45- $\mu$ m filter, discarding the first 5 mL of the filtrate.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of hyoscyamine sulfate  $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot 2H_2O]$  in each mL of the Oral Solution taken by the formula:

$$100 \times 1.053 \times (C/V)(r_U / r_S)$$

in which 1.053 is the ratio of the molecular weight of hydrated hyoscyamine sulfate to that of anhydrous hyoscyamine sulfate; C is defined under *Standard preparation*; V is the volume, in mL, of Oral Solution taken; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Hyoscyamine Sulfate Tablets

» Hyoscyamine Sulfate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hyoscyamine sulfate  $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot 2H_2O]$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards (11)—

USP Hyoscyamine Sulfate RS

#### Identification—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the Assay.

**B:** A filtered solution of Tablets meets the requirements of the tests for *Sulfate* (191).

**Disintegration** (701): 15 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

*Diluent, Buffer solution, Mobile phase, Standard stock preparation, and Standard preparation*—Proceed as directed in the Assay under *Hyoscyamine Sulfate Injection*.

*Tropic acid solution*—Dissolve an accurately weighed quantity of tropic acid in *Diluent* to obtain a solution having a concentration of about 3  $\mu$ g of tropic acid per mL.

*System suitability preparation*—Transfer 3.0 mL of the *Standard stock preparation* into a 100-mL volumetric flask, add 4.0 mL of the *Tropic acid solution*, dilute with *Diluent*, to volume and mix.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 0.125 mg of hyoscyamine sulfate, to a 25-mL volumetric flask. Add about 20 mL of the *Diluent*, and sonicate for 15 minutes with occasional swirling. Allow to cool to room temperature, dilute with *Diluent* to volume, and mix. Pass an aliquot through a 0.45- $\mu$ m filter, discarding the first 5 mL of the filtrate.

*Chromatographic system*—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm  $\times$  15-cm column that contains 4- $\mu$ m packing L11 and a 3-mm  $\times$  4-mm guard column that contains packing L11. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 30°. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the elution order is the tropic acid peak, followed by the hyoscyamine peak; the resolution,  $R_s$ , between tropic acid and hyoscyamine is not less than 1.5; the tailing factor for the hyoscyamine peak is not more than 1.8; and the relative standard deviation for six replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of hyoscyamine sulfate  $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot 2H_2O]$  in the portion of Tablets taken by the formula:

$$25 \times 1.053 \times C(r_U / r_S)$$

in which 1.053 is the ratio of the molecular weight of hydrated hyoscyamine sulfate to that of anhydrous hyoscyamine sulfate; C is as defined under *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Cellulose, 2-hydroxypropyl methyl ether;  
 Cellulose hydroxypropyl methyl ether [9004-65-3].

#### DEFINITION

Hypromellose is a methyl and hydroxypropyl mixed ether of cellulose. It contains, calculated on the dried basis, methoxy ( $-OCH_3$ : 31.03) and hydroxypropoxy ( $-OC_3H_6OH$ : 75.09) groups conforming to the limits for the types of Hypromellose (hydroxypropyl methylcellulose) set forth in the table below.

Substitution Type	Methoxy (%)		Hydroxypropoxy (%)	
	Min.	Max.	Min.	Max.
1828	16.5	20.0	23.0	32.0
2208	19.0	24.0	4.0	12.0

Substitution Type	Methoxy (%)		Hydroxypropoxy (%)	
	Min.	Max.	Min.	Max.
2906	27.0	30.0	4.0	7.5
2910	28.0	30.0	7.0	12.0

**IDENTIFICATION****A. PROCEDURE****Sample:** 1 g**Analysis:** Gently add the *Sample* to the top of 100 mL of water in a beaker, and allow to disperse over the surface, tapping the top of the container to ensure an even dispersion of the substance. Allow the beaker to stand for 1–2 min.**Acceptance criteria:** The powdered material aggregates on the surface.**B. PROCEDURE****Sample:** 1 g**Analysis:** Add the *Sample* to 100 mL of boiling water, and stir the mixture using a magnetic stirrer with a bar 25 mm long.**Acceptance criteria:** A slurry is formed, but the powdered material does not dissolve. Cool the slurry to 10°, and stir using a magnetic stirrer: the resulting liquid is a clear or slightly turbid solution with thickness dependent on the viscosity grade.**C. PROCEDURE****Solution A:** Sulfuric acid and water (9:1). [NOTE—Carefully add sulfuric acid to water.]**Sample solution:** 0.1 mL of the solution prepared for Identification test B**Analysis:** To the *Sample solution*, add 9 mL of *Solution A*, and shake. Heat in a water bath for exactly 3 min, immediately cool in an ice bath, and add carefully 0.6 mL of ninhydrin TS. Shake, and allow to stand at 25°.**Acceptance criteria:** A red color develops at first that changes to purple within 100 min.**D. PROCEDURE****Sample solution:** 2–3 mL of the solution prepared for Identification test B**Analysis:** Pour the *Sample solution* onto a glass slide as a thin film, and allow the water to evaporate.**Acceptance criteria:** A coherent, clear film forms on the glass slide.**E. PROCEDURE****Sample solution:** 50 mL of the solution prepared in Identification test B**Analysis:** Add the *Sample solution* to exactly 50 mL of water in a beaker. Insert a thermometer into the solution. Stir the solution on a magnetic stirrer/hot plate, and begin heating at a rate of 2° to 5°/min. Determine the temperature at which a turbidity increase begins to occur, and designate this temperature as the flocculation temperature.**Acceptance criteria:** The flocculation temperature is higher than 50°.**ASSAY****PROCEDURE****[CAUTION—** Hydriodic acid and its reaction byproducts are highly toxic. Perform all steps in the preparation of the *Standard solution* and the *Sample solution* in a properly functioning hood. Specific safety practices to be followed are to be identified to the analyst performing this test.]**Apparatus:** For the reaction vial, use a 5-mL pressure-tight serum vial, 50 mm in height, 20 mm in outside diameter, and 13 mm in inside diameter at the mouth. The vial is equipped with a pressure-tight septum having a polytetrafluoroethylene-faced butyl rubber and an airtight seal using an aluminum crimp or any sealing system that provides sufficient airtightness. Use a heater having a heating module that has a square-shape alu-

minum block with holes 20 mm in diameter and 32 mm in depth, into which the reaction vial fits. The heating module is also equipped with a magnetic stirrer capable of mixing the contents of the vial, or use a reciprocal shaker that performs a reciprocating motion of about 100 times/min.

**Hydriodic acid:** Use a reagent having a typical concentration of HI of about 57%.**Internal standard solution:** 30 mg/mL of *n*-octane in *o*-xylene**Standard solution:** Into a suitable serum vial, weigh between 60 and 100 mg of adipic acid, and add 2.0 mL of *Hydriodic acid* and 2.0 mL of *Internal standard solution*. Close the vial securely with a suitable septum stopper. Weigh the vial and contents, add between 15 µL and 22 µL of isopropyl iodide through the septum with a syringe, weigh again, and calculate the weight of isopropyl iodide added, by difference. Add 45 µL of methyl iodide similarly, weigh again, and calculate the weight of methyl iodide added, by difference. Shake the reaction vial well, and allow the layers to separate. Use the upper layer as the *Standard solution*.**Sample solution:** Transfer 0.065 g of dried Hypromellose to a 5-mL thick-walled reaction vial equipped with a pressure-tight septum-type closure, add between 60 and 100 mg of adipic acid, and pipet 2.0 mL of *Internal standard solution* into the vial. Cautiously pipet 2.0 mL of *Hydriodic acid* into the mixture, immediately cap the vial tightly, and weigh. Using the magnetic stirrer equipped in the heating module, or using a reciprocal shaker, mix the contents of the vial continuously, heating and maintaining the temperature of the contents at 130 ± 2° for 60 min. If a reciprocal shaker or magnetic stirrer cannot be used, shake the vial well by hand at 5-min intervals during the initial 30 min of the heating time. Allow the vial to cool, and weigh. If the weight loss is ≥ 0.50% of the contents or there is evidence of a leak, discard the mixture, and prepare another *Sample solution*.**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)**Mode:** GC**Detector:** Thermal conductivity or hydrogen flame-ionization**Column:** 3- to 4-mm × 1.8- to 3-m glass column packed with 20% liquid phase G28 on 100- to 120-mesh support S1C that is not silanized

[NOTE—Use a column giving well-resolved peaks of methyl iodide, isopropyl iodide, and the internal standard, in that order.]

**Column temperature:** 100°**Carrier gas:** Use helium with the thermal conductivity detector; helium or nitrogen can be used for the hydrogen flame-ionization detector.**Flow rate:** With the *Standard solution*, adjust the flow rate so that the retention time of the internal standard is about 10 min.**Injection size:** 1–2 µL**Analysis****Samples:** Upper layer of the *Standard solution* and the *Sample solution*Calculate the percentage of –OCH<sub>3</sub> in the portion of Hypromellose taken:

$$\text{Result} = 21.864 \times (R_{\text{Ua}}/R_{\text{Sa}}) \times (W_{\text{Sa}}/W_{\text{U}})$$

 $R_{\text{Ua}}$  = peak area ratio of methyl iodide to *n*-octane from the *Sample solution* $R_{\text{Sa}}$  = peak area ratio of methyl iodide to *n*-octane from the *Standard solution* $W_{\text{Sa}}$  = weight of methyl iodide in the *Standard solution* (mg) $W_{\text{U}}$  = weight of Hypromellose, calculated on the dried basis, taken for the *Sample solution* (mg)

Calculate the percentage of  $-\text{OC}_3\text{H}_6\text{OH}$  in the portion of Hypromellose taken:

$$\text{Result} = 44.17 \times (R_{\text{Ub}}/R_{\text{Sb}}) \times (W_{\text{Sb}}/W_{\text{U}})$$

- $R_{\text{Ub}}$  = peak area ratio of isopropyl iodide to *n*-octane from the *Sample solution*  
 $R_{\text{Sb}}$  = peak area ratio of isopropyl iodide to *n*-octane from the *Standard solution*  
 $W_{\text{Sb}}$  = weight of isopropyl iodide in the *Standard solution* (mg)  
 $W_{\text{U}}$  = weight of Hypromellose, calculated on the dried basis, taken for the *Sample solution* (mg)

**Acceptance criteria:** See the limits, calculated on the dried basis, in the table in the *Definition*.

## IMPURITIES

### Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 1.5% on a 1.0-g sample
- **HEAVY METALS**, *Method III* (231): NMT 20 ppm

### SPECIFIC TESTS

- **pH** (791): 5.0–8.0, measured on the solution prepared in the tests for Viscosity at a temperature of  $20 \pm 2^\circ$ . Read the indicated pH value after the probe has been immersed for  $5 \pm 0.5$  min.
- **LOSS ON DRYING** (731): Dry 1.0 g at  $105^\circ$  for 1 h: it loses NMT 5.0% of its weight.
- **VISCOSITY—CAPILLARY VISCOMETER METHODS** (911) and **ROTATIONAL RHEOMETER METHODS** (912)

For hypromellose samples having a viscosity type of less than 600 mPa · s

**Sample solution:** Transfer a quantity of Hypromellose equivalent to 4 g of solids, calculated on the dried basis, to a tared, wide-mouth centrifuge bottle. Add hot water to obtain a total weight of the sample and water of 200.0 g. Capping the bottle, stir by mechanical means at  $400 \pm 50$  rpm for 10–20 min until the particles are thoroughly dispersed and wetted out. Scrape down the walls of the bottle with a spatula, if necessary, to ensure that there is no undissolved material on the sides of the bottle, and continue the stirring in a cooling water bath equilibrated at a temperature below  $10^\circ$  for another 20–40 min. Adjust the solution weight, if necessary, to 200.0 g, using cold water. Centrifuge the solution, if necessary, to expel any entrapped air. If any foam is present, remove with a spatula.

**Analysis:** Determine the viscosity in a suitable viscometer of the Ubbelohde type as directed under *Viscosity—Capillary Viscometer Methods* (911).

**Acceptance criteria:** 80%–120% of the viscosity stated on the label

For hypromellose samples having a viscosity type of 600 mPa · s or higher

**Sample solution:** Transfer a quantity of Hypromellose equivalent to 10 g of solids, calculated on the dried basis, to a tared, wide-mouth centrifuge bottle, and add hot water to obtain a total weight of the sample and water of 500.0 g. Capping the bottle, stir by mechanical means at  $400 \pm 50$  rpm for 10–20 min until the particles are thoroughly dispersed and wetted out. Scrape down the walls of the bottle with a spatula, if necessary, to ensure that there is no undissolved material on the sides of the bottle, and continue the stirring in a cooling water bath equilibrated at a temperature below  $10^\circ$  for another 20–40 min. Adjust the solution weight if necessary to 500.0 g, using cold water. Centrifuge the solution, if necessary, to expel any entrapped air. If any foam is present, remove with a spatula.

**Analysis:** Equip a suitable single-cylinder type rotational viscometer (Brookfield type LV Model, or equivalent), and determine the viscosity of this solution at  $20 \pm$

$0.1^\circ$  under the operating conditions specified in the table below.

Labeled Viscosity <sup>a</sup> (mPa · s)	Rotor No.	Revolution (rpm)	Calculation Multiplier
600 or more and less than 1400	3	60	20
1400 or more and less than 3500	3	12	100
3500 or more and less than 9500	4	60	100
9500 or more and less than 99,500	4	6	1000
99,500 or more	4	3	2000

<sup>a</sup> The Labeled Viscosity is based on the manufacturer's specifications.

Allow the spindle to rotate for 2 min before taking the measurement. Allow a rest period of 2 min between subsequent measurements. Repeat the operation twice to rotate the spindle as specified above, and average the three readings.

**Acceptance criteria:** 75%–140% of the viscosity stated on the label

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements are specified.
- **LABELING:** Label it to indicate its substitution type and its nominal viscosity value in millipascals per second (mPa · s).

## Hypromellose Ophthalmic Solution

» Hypromellose Ophthalmic Solution is a sterile solution of Hypromellose. It contains not less than 85.0 percent and not more than 115.0 percent of the labeled amount of Hypromellose (hydroxypropyl methylcellulose). It may contain suitable antimicrobial, buffering, and stabilizing agents.

**Packaging and storage—**Preserve in tight containers.

**USP Reference standards** (11)—

USP Hypromellose RS

**Identification—**

**A:** Pour a few mL of Ophthalmic Solution onto a glass plate, and allow the water to evaporate: a thin, self-sustaining film results.

**B:** Heat 5 mL of Ophthalmic Solution in a test tube over a low flame: the warm solution turns cloudy but clears upon chilling.

**Sterility** (71): meets the requirements.

**pH** (791): between 6.0 and 7.8.

**Assay—**

**Standard preparation—**Dissolve a suitable quantity of USP Hypromellose RS, accurately weighed, in water, and dilute quantitatively with water to obtain a solution having a known concentration of about 100 µg per mL.

**Assay preparation—**Dilute an accurately measured volume of Ophthalmic Solution quantitatively with water to obtain a solution having an equivalent concentration of about 100 µg of hypromellose per mL.

**Procedure—**Pipet 2 mL each of the *Standard preparation*, the *Assay preparation*, and water to provide a blank, into separate, glass-stoppered test tubes. To each tube add 5.0 mL of diphenylamine solution (prepared by dissolving

3.75 g of colorless diphenylamine crystals in 150 mL of glacial acetic acid and diluting the solution with 90 mL of hydrochloric acid), mix, and immediately insert the tubes into an oil bath at 105° to 110° for 30 minutes, the temperature being kept uniform within 0.1° during heating. Remove the tubes, and place them in an ice-water bath for 10 minutes or until thoroughly cool. At room temperature and using a suitable spectrophotometer, concomitantly determine the absorbances of the solutions from the *Standard preparation* and the *Assay preparation* at 635 nm, using the water solution as the blank. Calculate the quantity, in mg, of hypromellose in each mL of the Ophthalmic Solution taken by the formula:

$$0.001Cd(A_U / A_S)$$

in which *C* is the concentration, in µg per mL, of USP Hypromellose RS in the *Standard preparation*; *d* is the dilution factor used to obtain the *Assay preparation*; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Ibuprofen

$C_{13}H_{18}O_2$  206.28

Benzeneacetic acid,  $\alpha$ -methyl-4-(2-methylpropyl), ( $\pm$ )-.

( $\pm$ )-*p*-Isobutylhydratropic acid.

( $\pm$ )-2-(*p*-Isobutylphenyl)propionic acid [15687-27-1].

( $\pm$ ) Mixture [58560-75-1].

» Ibuprofen contains not less than 97.0 percent and not more than 103.0 percent of  $C_{13}H_{18}O_2$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Ibuprofen RS

USP Ibuprofen Related Compound C RS

**Identification**—

**A:** *Infrared Absorption* (197M)—Do not dry specimens.

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 250  $\mu$ g per mL.

*Medium:* 0.1 N sodium hydroxide.

Respective absorptivities at 264 nm and 273 nm, calculated on the anhydrous basis, do not differ by more than 3.0%.

**C:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for ibuprofen, the retention time of which, relative to that of the internal standard, corresponds to that exhibited in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay*.

**Water**, *Method I* (921): not more than 1.0%.

**Residue on ignition** (281): not more than 0.5%.

**Heavy metals**, *Method II* (231): 0.002%.

**Chromatographic purity**—

*Mobile phase*—Prepare a suitable filtered mixture of water, previously adjusted with phosphoric acid to a pH of 2.5 and acetonitrile (1340:680). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Test preparation*—Prepare a solution of Ibuprofen in acetonitrile containing about 5 mg per mL.

*Resolution solution*—Prepare a solution in acetonitrile containing in each mL about 5 mg of Ibuprofen and 5 mg of valerophenone.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4-mm  $\times$  15-cm column that contains 5- $\mu$ m packing L1 and is maintained at 30  $\pm$  0.5°. The flow rate is about 2 mL per minute. Chromatograph a series of 5- $\mu$ L injections of the *Test preparation* to condition the column. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 for valerophenone and 1.0 for ibuprofen, and the resolution, *R*, between the valerophenone peak and the ibuprofen peak is not less than 2.0.

*Procedure*—[NOTE—Use peak areas where peak responses are indicated.] Inject about 5  $\mu$ L of the *Test preparation* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity taken by the formula:

$$100r_i / r_t$$

in which  $r_i$  is the response of an individual peak, other than the solvent peak and the main ibuprofen peak, and  $r_t$  is the

sum of the responses of all the peaks, excluding that of the solvent peak: not more than 0.3% of any individual impurity is found, and the sum of all the individual impurities found does not exceed 1.0%.

**Limit of ibuprofen related compound C**—Using the chromatograms of the *Assay preparation* and the *Ibuprofen related compound C standard solution*, obtained as directed in the *Assay*, calculate the percentage of ibuprofen related compound C ( $C_{12}H_{16}O$ ) in the portion of Ibuprofen taken by the formula:

$$10,000(C / W)(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Ibuprofen Related Compound C RS in the *Ibuprofen related compound C standard solution*; *W* is the weight, in mg, of Ibuprofen taken to prepare the *Assay preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of ibuprofen related compound C to valerophenone obtained from the *Assay preparation* and the *Ibuprofen related compound C standard solution*, respectively: not more than 0.1% is found.

**Assay**—

*Mobile phase*—Dissolve 4.0 g of chloroacetic acid in 400 mL of water, and adjust with ammonium hydroxide to a pH of 3.0. Add 600 mL of acetonitrile, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Internal standard solution*—Prepare a solution of valerophenone in *Mobile phase* having a concentration of about 0.35 mg per mL.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Ibuprofen RS in *Internal standard solution* to obtain a solution having a known concentration of about 12 mg per mL.

*Ibuprofen related compound C standard solution*—Quantitatively dissolve an accurately weighed quantity of USP Ibuprofen Related Compound C RS in acetonitrile to obtain a solution having a known concentration of about 0.6 mg per mL. Add 2.0 mL of this stock solution to 100.0 mL of *Internal standard solution*, and mix to obtain a solution having a known concentration of about 0.012 mg of ibuprofen related compound C per mL.

*Assay preparation*—Transfer about 1200 mg of Ibuprofen, accurately weighed, to a 100-mL volumetric flask, dilute with *Internal standard solution* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.4 for the internal standard and 1.0 for ibuprofen; the resolution, *R*, between ibuprofen and the internal standard is not less than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph the *Ibuprofen related compound C standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for valerophenone and 1.2 for ibuprofen related compound C; the resolution, *R*, between valerophenone and ibuprofen related compound C is not less than 2.5; the tailing factors for the individual peaks are not more than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 5  $\mu$ L) of the *Standard preparation*, the *Assay preparation*, and the *Ibuprofen related compound C standard solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in

mg, of  $C_{13}H_{18}O_2$  in the portion of Ibuprofen taken by the formula:

$$100C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Ibuprofen RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ibuprofen Oral Suspension

» Ibuprofen Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{13}H_{18}O_2$ .

**Packaging and storage**—Preserve in well-closed containers, and store at controlled room temperature.

### USP Reference standards (11)—

USP Ibuprofen RS

USP Ibuprofen Related Compound C RS

### Identification—

**A:** Transfer a volume of Oral Suspension, equivalent to about 200 mg of ibuprofen, to a separator containing about 10 mL of chloroform, and shake for about 1 minute. Allow the layers to separate, and pass the lower chloroform layer through a filter containing about 2 g of anhydrous sodium sulfate. Use the filtrate as the test solution. [NOTE—Retain a portion of this test solution for use in *Identification* test B.] Separately apply 10- $\mu$ L portions of the test solution and of a Standard solution containing 20 mg per mL of USP Ibuprofen RS in chloroform to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel and previously activated by heating at 105° for 30 minutes. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of *n*-hexane, butyl acetate, and glacial acetic acid (17:3:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and dry in a current of cool air. Examine the chromatograms under short-wave-length UV light: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**B: Infrared Absorption** (197K)—Prepare the test specimen and the standard as follows. Evaporate about 20 drops of the test solution and the Standard solution retained from *Identification* test A to dryness in a current of air without heating.

### Dissolution (711)—

**Medium:** pH 7.2 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 60 minutes.

Determine the percentage of the labeled amount of  $C_{13}H_{18}O_2$  dissolved by the following procedure:

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay*.

**Internal standard solution**—Prepare a solution of benzophenone in acetonitrile containing about 0.3 mg per mL.

**Standard solution**—Dissolve an accurately weighed quantity of USP Ibuprofen RS in *Dissolution Medium* to obtain a solution having a known concentration of about 0.011/ mg per mL,  $J$  being the labeled quantity, in mg, of ibuprofen in each mL of the Oral Suspension. Mix 10.0 mL of this solution and 10.0 mL of the *Internal standard solution*, pass the mixture through a filter having a 0.5- $\mu$ m or finer porosity, and use the filtrate as the *Standard solution*.

**Test solution**—Filter a portion of the solution under test. Mix 10.0 mL of the filtrate and 10.0 mL of the *Internal standard solution*, pass the mixture through a filter having a 0.5- $\mu$ m or finer porosity, and use the filtrate as the *Test solution*.

**Procedure**—Using an accurately tared syringe, draw about 10 mL of well-mixed Oral Suspension into the syringe, which is connected to tubing, and accurately weigh. [NOTE—The tubing of the syringe is placed into a zone that is between the surface of the *Dissolution Medium* and the top of the rotating blade.] Express the Oral Suspension into the *Dissolution Medium*. Promptly reweigh the syringe, and determine the weight,  $W_U$ , in g, of the Oral Suspension added to the *Dissolution Medium*. Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of the labeled amount of  $C_{13}H_{18}O_2$  dissolved by the formula:

$$90,000(C/L)(D/W_U)(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Ibuprofen RS in the *Standard solution*;  $L$  is the labeled quantity, in mg per mL, of ibuprofen in the Oral Suspension;  $D$  is the density, in g per mL, of the Oral Suspension, determined as directed for *Density* in the *Assay*;  $W_U$  is the weight, in g, of the Oral Suspension added to the *Dissolution Medium*; and  $R_U$  and  $R_S$  are the ratios of the ibuprofen peak areas to the benzophenone peak areas obtained from the *Test solution* and the *Standard solution*, respectively.

**Tolerances**—Not less than 80% ( $Q$ ) of the labeled amount of  $C_{13}H_{18}O_2$  is dissolved in 60 minutes.

### Uniformity of dosage units (905)—

FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

### Deliverable volume (698)—

FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 3.6 and 4.6.

**Deliverable volume** (698): meets the requirements.

### Limit of ibuprofen related compound C—

**Mobile phase and Diluent**—Proceed as directed in the *Assay*.

**Standard solution**—Quantitatively dissolve an accurately weighed quantity of USP Ibuprofen Related Compound C RS in acetonitrile to obtain a stock solution having a known concentration of about 0.5 mg per mL. Transfer 3.0 mL of this stock solution to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix. Transfer 2.0 mL of this solution to a second 50-mL volumetric flask, add 18 mL of *Diluent*, dilute with acetonitrile to volume, mix, and pass through a filter having a porosity of 0.22- $\mu$ m. This *Standard solution* contains about 0.0012 mg of ibuprofen related compound C per mL.

**Test solution**—Transfer 20.0 mL of the portion of the stock solution retained from the *Assay preparation* in the *Assay* into a 50-mL volumetric flask, dilute with acetonitrile to volume, mix, and pass through a filter having a porosity of 0.22- $\mu$ m.

**System suitability solution**—Transfer 1.5 mL of the stock solution of USP Ibuprofen Related Compound C RS prepared as directed for *Standard solution* and 9 mL of the stock solution of USP Ibuprofen RS prepared as directed for *Standard preparation* in the *Assay* to a 25-mL volumetric flask, dilute with acetonitrile to volume, mix, and pass through a filter having a porosity of 0.22- $\mu$ m. This solution contains about 0.03 mg of ibuprofen related compound C and about 0.4 mg of ibuprofen per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  15-cm column that contains 5- $\mu$ m packing L7. The flow rate is about 2 mL per minute. Chromatograph

the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.3 for ibuprofen related compound C and 1.0 for ibuprofen; the resolution,  $R$ , between ibuprofen and ibuprofen related compound C is not less than 1.5; and the tailing factor is not more than 2.0. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 35  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of ibuprofen related compound C in the Oral Suspension, based on the labeled content of ibuprofen, taken by the formula:

$$(12,500C/DL)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Ibuprofen Related Compound C RS in the *Standard solution*;  $D$  is the quantity, in mL, of Oral Suspension taken to prepare the stock solution for the *Assay preparation*;  $L$  is the labeled quantity, in mg, of ibuprofen in each mL of Oral Suspension; and  $r_U$  and  $r_S$  are the ibuprofen related compound C peak areas obtained from the *Test solution* and the *Standard solution*, respectively. Not more than 0.25% is found.

#### Assay—

**Mobile phase**—Dilute 0.7 mL of phosphoric acid with water to obtain 1000 mL of 0.01 M phosphoric acid. Prepare a mixture of this solution and acetonitrile (63:37). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Prepare a mixture of acetonitrile and water (1:1).

**Internal standard solution**—Prepare a solution of benzophenone in acetonitrile containing about 3.2 mg per mL.

**Standard preparation**—Quantitatively dissolve an accurately weighed quantity of USP Ibuprofen RS in *Diluent* to obtain a stock solution having a known concentration of about 1.2 mg per mL. Transfer 20.0 mL of this stock solution and 5.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with acetonitrile to volume, mix, and filter. This solution contains about 0.48 mg of ibuprofen per mL.

**Density**—Using a tared 50-mL volumetric flask, weigh 50 mL of Oral Suspension that has been previously well shaken to ensure homogeneity, allow to stand until the entrapped air has risen, and finally invert carefully just prior to transferring it to the volumetric flask. From the observed weight of 50 mL of the Oral Suspension, calculate the density, in g per mL, of the Oral Suspension.

**Assay preparation**—Transfer an accurately weighed portion of Oral Suspension, equivalent to about 60 mg of ibuprofen, to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix (stock solution). Transfer 20.0 mL of this stock solution and 5.0 mL of *Internal standard solution* to a second 50-mL volumetric flask, dilute with acetonitrile to volume, mix, and filter. [NOTE—Retain a portion of the stock solution for use in the test for *Limit of ibuprofen related compound C*.]

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm  $\times$  15-cm column that contains 5- $\mu$ m packing L7. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.9 for benzophenone and 1.0 for ibuprofen; the resolution,  $R$ , between benzophenone and ibuprofen is not less than 1.5; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 5  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into

the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of  $C_{13}H_{18}O_2$  in each mL of the Oral Suspension taken by the formula:

$$125C(D/W_U)(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Ibuprofen RS in the *Standard preparation*;  $D$  is the density, in g per mL, of Oral Suspension;  $W_U$  is the weight, in g, of the portion of Oral Suspension taken to prepare the *Assay preparation*; and  $R_U$  and  $R_S$  are the ratios of the ibuprofen peak areas to the benzophenone peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ibuprofen Tablets

» Ibuprofen Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{13}H_{18}O_2$ .

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Where the Tablets are gelatin-coated, the label so states.

#### USP Reference standards (11)—

USP Ibuprofen RS

USP Ibuprofen Related Compound C RS

#### Identification—

**A:** Grind 1 Tablet to a fine powder in a mortar, add about 5 mL of chloroform, and swirl. Filter the mixture, and evaporate the filtrate with the aid of a stream of nitrogen to dryness: the IR absorption spectrum of a mineral oil dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Ibuprofen RS.

**B:** Its retention time, relative to that of the internal standard, determined as directed in the *Assay*, corresponds to that of USP Ibuprofen RS.

#### Dissolution (711)—

**Medium:** pH 7.2 phosphate buffer (see under *Buffers* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 60 minutes.

**Procedure**—Determine the amount of  $C_{13}H_{18}O_2$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 221 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Ibuprofen RS in the same medium. [NOTE—Where the Tablets are labeled as gelatin-coated, determine the amount of  $C_{13}H_{18}O_2$  dissolved from the UV absorbance at the wavelength of maximum absorbance at about 266 nm from which is subtracted the absorbance at 280 nm, in comparison with the Standard solution similarly measured.]

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{13}H_{18}O_2$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 5.0%, except that Tablets labeled as gelatin-coated are exempt from this requirement.

**Limit of ibuprofen related compound C**—Using the chromatograms of the *Assay preparation* and the *Ibuprofen related compound C standard solution* obtained as directed in

the Assay, calculate the percentage of ibuprofen related compound C ( $C_{12}H_{16}O$ ) in the Tablets taken by the formula:

$$10,000C(A/W)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Ibuprofen Related Compound C RS in the *Ibuprofen related compound C standard solution*; A is the average weight, in mg, of a Tablet; W is the weight of Tablet powder taken to prepare the *Assay preparation*; I is the quantity, in mg, of ibuprofen per Tablet as obtained in the *Assay*; and  $R_U$  and  $R_S$  are the ratios of the ibuprofen related compound C peak response to the valerophenone peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively: not more than 0.25% per Tablet is found.

#### Assay—

*Mobile phase, Internal standard solution, and Standard preparation*—Prepare as directed in the *Assay under Ibuprofen*.

*Ibuprofen related compound C standard solution*—Quantitatively dissolve an accurately weighed quantity of USP Ibuprofen Related Compound C RS in acetonitrile to obtain a stock solution having a known concentration of about 0.6 mg per mL. Add 2.0 mL of this stock solution to 100 mL of *Internal standard solution*, and mix.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1200 mg of ibuprofen, to a suitable container, add 100.0 mL of *Internal standard solution*, and shake for 10 minutes. [NOTE—Where the Tablets are coated, place an accurately counted number of Tablets, equivalent to not less than 1200 mg of ibuprofen, in a container, add an accurately measured volume of *Internal standard solution*, sufficient to obtain an *Assay preparation* containing about 12 mg of ibuprofen per mL, and about 15 glass beads, and shake until the Tablets are completely disintegrated.] Centrifuge a portion of the suspension so obtained and use the clear supernatant as the *Assay preparation*.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.75 for ibuprofen and 1.0 for valerophenone; the resolution,  $R$ , between ibuprofen and valerophenone is not less than 2.5; the tailing factors for the individual peaks are not more than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph the *Ibuprofen related compound C standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for valerophenone and 1.2 for ibuprofen related compound C; the resolution,  $R$ , between valerophenone and ibuprofen related compound C is not less than 2.5; the tailing factors for the individual peaks are not more than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 5  $\mu$ L) of the *Standard preparation*, the *Assay preparation*, and the *Ibuprofen related compound C standard solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ibuprofen ( $C_{13}H_{18}O_2$ ) in each Tablet taken by the formula:

$$100C(A/W)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Ibuprofen RS in the *Standard preparation*; A is the average weight, in mg, of a Tablet; W is the weight, in mg, of Tablet powder taken to prepare the *Assay preparation*; and  $R_U$  and  $R_S$  are the ratios of the ibuprofen peak response to the valerophenone peak response obtained from the *Assay prepara-*

*tion* and the *Standard preparation*, respectively; or where intact Tablets were taken, calculate the quantity, in mg, of  $C_{13}H_{18}O_2$  in each Tablet taken by the formula:

$$(CV/N)(R_U/R_S)$$

in which V is the volume, in mL, of *Internal standard solution* used to prepare the *Assay preparation*; N is the number of Tablets taken; and the other terms are as defined above.

## Ibuprofen and Pseudoephedrine Hydrochloride Tablets

» Ibuprofen and Pseudoephedrine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of Ibuprofen ( $C_{13}H_{18}O_2$ ) and Pseudoephedrine Hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ).

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards <11>—

USP Ibuprofen RS

USP Pseudoephedrine Hydrochloride RS

#### Identification—

**A:** Place a Tablet in a small beaker, crack the Tablet coating, add 10 mL of methanol, and stir by mechanical means for about 10 minutes. Allow to settle, and use the clear supernatant as the *Test solution*. Prepare a Standard solution in methanol containing about 20 mg of USP Ibuprofen RS and 20J mg of USP Pseudoephedrine Hydrochloride RS per mL, J being the ratio of the labeled amount, in mg, of pseudoephedrine hydrochloride to the labeled amount, in mg, of ibuprofen per Tablet. Separately apply 10  $\mu$ L each of the *Test solution* and the *Standard solution* to a thin-layer chromatographic plate (see *Chromatography* <621>) covered with a 0.25-mm layer of chromatographic silica gel mixture and activated by heating the plate at 105° for about 30 minutes. Place the plate in a chromatographic chamber equilibrated with a solvent system consisting of a mixture of chloroform, methanol, and glacial acetic acid (80:15:5). Develop the chromatograms until the solvent has moved about 10 cm from the origin. Remove the plate from the chromatographic chamber, place it in a chamber containing iodine vapors for about 10 minutes, and examine the chromatograms: the principal spots obtained from the *Test solution* correspond in  $R_f$  value and appearance to those obtained from the *Standard solution*.

**B:** The retention times of the pseudoephedrine and ibuprofen peaks, relative to that of the butylparaben internal standard peak in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Dissolution <711>—

*Medium:* pH 7.2 phosphate buffer (see under *Buffers* in the section *Reagents, Indicators, and Solutions*); 900 mL.

*Apparatus 2:* 50 rpm.

*Times:* 30 minutes (ibuprofen); 45 minutes (pseudoephedrine hydrochloride).

*Procedure for ibuprofen*—Determine the amount of ibuprofen ( $C_{13}H_{18}O_2$ ) dissolved from UV absorbances at the wavelength of maximum absorbance at about 224 nm of filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Ibuprofen RS in the same medium.

*Procedure for pseudoephedrine hydrochloride*—

**MOBILE PHASE**—Prepare a solution of monobasic potassium phosphate in water containing 500 mg per 1000 mL. Filter

through a filter having a porosity of 0.5  $\mu\text{m}$  or finer. Prepare a mixture of this solution and acetonitrile (500:500), and adjust with phosphoric acid to a pH of  $3.3 \pm 0.1$ . Make any necessary adjustments (see *System Suitability* under *Chromatography* (621)). Increasing the concentration of monobasic potassium phosphate or increasing the pH increases the retention time of pseudoephedrine.

**STANDARD PREPARATION**—Prepare a solution of USP Pseudoephedrine Hydrochloride RS in *Dissolution Medium* having a known concentration of about  $P/900$  mg per mL,  $P$  being the labeled quantity, in mg, of pseudoephedrine hydrochloride per Tablet.

**CHROMATOGRAPHIC SYSTEM** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector, a guard column containing packing L10, and a 4.6-mm  $\times$  25-cm column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the pseudoephedrine peak is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**PROCEDURE**—Pass a portion of the solution under test through a filter having a porosity of 0.5  $\mu\text{m}$  or finer. Separately inject equal volumes (about 10  $\mu\text{L}$ ) of the filtrate and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the areas for the pseudoephedrine peaks. Calculate the quantity, in mg, of pseudoephedrine hydrochloride ( $\text{C}_{10}\text{H}_{15}\text{NO} \cdot \text{HCl}$ ) dissolved by the formula:

$$900C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are pseudoephedrine peak responses obtained from the solution under test and the *Standard preparation*, respectively.

**Tolerances**—Not less than 75% ( $Q$ ) of the labeled amounts of ibuprofen ( $\text{C}_{13}\text{H}_{18}\text{O}_2$ ) and pseudoephedrine hydrochloride ( $\text{C}_{10}\text{H}_{15}\text{NO} \cdot \text{HCl}$ ) are dissolved in 30 minutes and in 45 minutes, respectively.

#### Uniformity of dosage units (905)—

**Procedure for content uniformity**—Proceed as directed in the *Assay*, preparing the *Assay preparation* as follows. Transfer 1 Tablet to a glass-stoppered conical flask, add 10.0 mL of *Internal standard solution*, and stir with a magnetic stirrer until the Tablet disintegrates. Add 10.0 mL of acetonitrile, stir for about 15 minutes, and filter.

#### Assay—

**Mobile phase**—Dissolve 2.5 g of docusate sodium in a mixture of water and acetonitrile (590:410). Add 1.0 mL of phosphoric acid, and adjust with ammonium hydroxide to a pH of  $3.2 \pm 0.05$ . Make any necessary adjustments (see *System Suitability* under *Chromatography* (621)). Decreasing the proportion of docusate sodium increases the resolution between pseudoephedrine and ibuprofen.

**Internal standard solution**—Prepare a solution of butylparaben in *Mobile phase* containing about 0.15 mg per mL.

**Standard preparation**—Prepare a solution in *Internal standard solution* having known concentrations of about 20 mg of USP Ibuprofen RS and 20/ mg of USP Pseudoephedrine Hydrochloride RS per mL,  $J$  being the ratio of the labeled amount, in mg, of pseudoephedrine hydrochloride to the labeled amount, in mg, of ibuprofen per Tablet. To the resulting solution add an equal volume of acetonitrile, accurately measured, and mix. Pass through a filter having 0.5  $\mu\text{m}$  porosity or finer, and use the filtrate as the *Standard preparation*. This solution contains about 10 mg of USP Ibuprofen RS and 10/ mg of USP Pseudoephedrine Hydrochloride RS per mL.

**Assay preparation**—Transfer an accurately counted number of Tablets, equivalent to about 2000 mg of ibuprofen, to a glass-stoppered conical flask, add 100 mL of *Internal standard solution*, and stir with a magnetic stirrer until the Tablets disintegrate. Add 100 mL of acetonitrile, and mix. Filter through a filter of 0.5  $\mu\text{m}$  porosity or finer, and use the filtrate as the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector, a guard column that contains packing L1, and a 4.6-mm  $\times$  10-cm column that contains 5- $\mu\text{m}$  packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.55 for butylparaben, 0.7 for pseudoephedrine, and 1.0 for ibuprofen; the resolution,  $R$ , between the butylparaben peak and the pseudoephedrine peak and between the pseudoephedrine peak and the ibuprofen peak is not less than 2.0; the tailing factors for the butylparaben peak, the pseudoephedrine peak, and the ibuprofen peak are not more than 3.0; and the relative standard deviation for replicate injections determined from the peak response ratios is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 5  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantities, in mg, of ibuprofen ( $\text{C}_{13}\text{H}_{18}\text{O}_2$ ) and of pseudoephedrine hydrochloride ( $\text{C}_{10}\text{H}_{15}\text{NO} \cdot \text{HCl}$ ) in each Tablet taken by the formula:

$$200(C / N)(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Ibuprofen RS or USP Pseudoephedrine Hydrochloride RS, as appropriate, in the *Standard preparation*;  $N$  is the number of Tablets taken; and  $R_U$  and  $R_S$  are the ratios of the relevant analyte peak response to the butylparaben peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ichthammol

Ichthammol.

Ichthammol [8029-68-3].

» Ichthammol is obtained by the destructive distillation of certain bituminous schists, sulfonation of the distillate, and neutralization of the product with ammonia. Ichthammol yields not less than 2.5 percent of ammonia ( $\text{NH}_3$ ) and not less than 10.0 percent of total sulfur ( $S$ ).

**Packaging and storage**—Preserve in well-closed containers.

#### Identification—

**A:** Dilute 10 mL with 90 mL of water, and stir for 5 minutes with a magnetic stirrer. Add 25 mL of hydrochloric acid, and mix: a heavy, resinous precipitate is formed. Remove the liquid by decantation, and wash the precipitate with 2 N hydrochloric acid until the last washing is nearly colorless. Transfer the precipitate to absorbent paper, allow it to stand for 10 minutes, and then transfer 10 mg of the precipitate to a 250-mL conical flask. To the flask add 100 mL of ether, attach an air condenser to the flask, and stir for 30 minutes with a magnetic stirrer: the precipitate does not dissolve completely.

**B:** To a solution (1 in 10) add 1 N sodium hydroxide, and heat to the boiling point: ammonia is evolved.

**Loss on drying** (731)—Dry it at 80° for 8 hours, and continue the drying at 100° for constant weight: it loses not more than 50.0% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Limit for ammonium sulfate**—Accurately weigh about 1 g, transfer to a 100-mL beaker, and add 25 mL of alcohol. Stir, filter, and wash the filter with a mixture of equal volumes of ether and alcohol until the last washing is clear and colorless. Air-dry the filter and residue, and pass 200 mL of warm water, slightly acidified with hydrochloric acid, through the residue on the filter. Heat the filtrate to boiling, add barium chloride TS in excess, and heat for 1 hour on a steam bath. Collect the precipitate of barium sulfate on a filter, wash it well, dry, and ignite to constant weight. Each g of barium sulfate is equivalent to 566.1 mg of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>. Ichthammol contains not more than 8.0% of ammonium sulfate.

**Assay for ammonia**—Dissolve about 5 g of Ichthammol, accurately weighed, in 100 mL of water, transfer the solution to a distillation flask, add 3 g of paraffin, and add 20 mL of sodium hydroxide solution (4 in 10). Connect the flask to a condenser by means of a spray trap, and immerse the lower outlet tube of the condenser in 30.0 mL of 0.5 N sulfuric acid VS. Distill slowly, collect about 50 mL of distillate, and then titrate the excess acid with 0.5 N sodium hydroxide VS, using methyl red TS as the indicator. Perform a blank determination, and make any necessary correction. Each mL of 0.5 N sulfuric acid is equivalent to 8.515 mg of NH<sub>3</sub>.

**Assay for total sulfur**—Transfer from 500 mg to 800 mg of Ichthammol, accurately weighed, to a Kjeldahl flask with the aid of 20 mL of water. Add 3 g of potassium chlorate, then add slowly 30 mL of nitric acid, and evaporate the mixture on a hot plate to about 5 mL. Cool, repeat the oxidation with 3 g of potassium chlorate and 30 mL of nitric acid, and evaporate to about 5 mL. Add 25 mL of hydrochloric acid, and again evaporate to about 5 mL. Add 100 mL of water, heat to boiling, filter, and wash well. To the hot filtrate add 25 mL of barium chloride TS, and heat on a steam bath for 1 hour. Collect the barium sulfate on a previously ignited and tared filtering crucible, wash, dry, and ignite, then cool, and weigh. Each g of barium sulfate is equivalent to 137.4 mg of S.

## Ichthammol Ointment

» Ichthammol Ointment contains an amount of Ichthammol equivalent to not less than 0.25 percent of ammonia (NH<sub>3</sub>).

Ichthammol . . . . .	100 g
Lanolin . . . . .	100 g
Petrolatum . . . . .	800 g
to make . . . . .	1000 g

Thoroughly incorporate the Ichthammol with the Lanolin, and combine this mixture with the Petrolatum.

**Packaging and storage**—Preserve in collapsible tubes or in tight containers, and avoid prolonged exposure to temperatures exceeding 30°.

### Assay—

**Assay preparation**—Transfer an accurately weighed portion of Ointment, equivalent to about 2 g of ichthammol, to a 250-mL beaker, and add about 70 mL of boiling water.

Mix with a glass rod, heat on a steam bath, with frequent agitation, for 10 minutes, cover with a watch glass without removing the stirring rod, and allow to stand at room temperature for 15 to 20 minutes. Place in a refrigerator to cause the upper layer to congeal, form a second opening through the congealed layer with the glass rod, and transfer the dark-colored aqueous extract to a funnel containing a pledget of cotton, collecting the filtrate in a 500-mL volumetric flask. Repeat the extraction of the portion of the Ointment several times in the same manner until the aqueous extract is practically colorless, passing each extract through the same cotton filter into the flask containing the main extract. Dilute with water to volume, and mix.

**Procedure for ammonia**—Transfer 100.0 mL of the *Assay preparation* to a suitable distillation flask, add 3 g of paraffin, and add 20 mL of sodium hydroxide solution (4 in 10). Connect the flask to a condenser by means of a spray trap, and immerse the lower outlet tube of the condenser in 30.0 mL of 0.05 N sulfuric acid VS. Distill slowly, collect about 50 mL of distillate, and then titrate the excess acid with 0.05 N sodium hydroxide VS, using methyl red TS as the indicator. Perform a blank determination, and make any necessary correction. Each mL of 0.05 N sulfuric acid is equivalent to 0.8515 mg of NH<sub>3</sub>.

## Idarubicin Hydrochloride

C<sub>26</sub>H<sub>27</sub>NO<sub>9</sub> · HCl 533.95

5,12-Naphthacenedione, 9-acetyl-7-[(3-amino-2,3,6-trideoxy-α-L-lyxo-hexopyranosyl)oxy]-7,8,9,10-tetrahydro-6,9,11-trihydroxyhydrochloride, (7*S*-*cis*)-(1*S*,3*S*)-3-Acetyl-1,2,3,4,6,11-hexahydro-3,5,12-trihydroxy-6,11-dioxo-1-naphthacenyl 3-amino-2,3,6-trideoxy-α-L-lyxo-hexopyranoside, hydrochloride [57852-57-0].

» Idarubicin Hydrochloride contains not less than 960 μg and not more than 1030 μg of C<sub>26</sub>H<sub>27</sub>NO<sub>9</sub> · HCl per mg, calculated on the anhydrous basis.

**Caution**—Great care should be taken to prevent inhaling particles of Idarubicin Hydrochloride and exposing the skin to it.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—The amorphous form is so labeled.

**USP Reference standards** (11)—

USP Idarubicin Hydrochloride RS

### Identification—

**A: Infrared Absorption** (197K).

**B:** The chromatogram of the *Assay preparation* obtained in the *Assay* exhibits a major peak for idarubicin, the retention time of which corresponds to that in the chromatogram of the *Standard preparation* obtained in the *Assay*.

**Crystallinity** (695): meets the requirements, except where it is labeled as amorphous, most of the particles do not exhibit birefringence and extinction positions.

**pH** (791): between 5.0 and 6.5, in a solution containing 5 mg per mL.

**Water, Method I** (921): not more than 5.0%.

**Chromatographic purity**—Using the chromatogram of the *Assay preparation* obtained in the *Assay*, and disregarding the solvent peak, calculate the percentage of each impurity taken by the formula:

$$100r_i / r_s$$

in which  $r_i$  is the response of each impurity peak; and  $r_s$  is the sum of the responses of all the peaks: not more than 1.0% of any individual impurity is found; and the sum of all impurities is not more than 3.0%.

**Assay**—

**Mobile phase**—Prepare a mixture of water, acetonitrile, methanol, and phosphoric acid (540:290:170:2). Dissolve 1 g of sodium lauryl sulfate in 1000 mL of this solution, adjust with 2 N sodium hydroxide to a pH of  $3.6 \pm 0.1$ , pass through a filter having a porosity of 0.5  $\mu\text{m}$  or finer, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Prepare as directed for *Mobile phase*, except to omit the sodium lauryl sulfate.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Idarubicin Hydrochloride RS in *Diluent* to obtain a solution having a known concentration of about 500  $\mu\text{g}$  of idarubicin hydrochloride per mL.

**Assay preparation**—Transfer about 50 mg of Idarubicin Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in *Diluent*, dilute with *Diluent* to volume, and mix.

**Resolution solution**—Prepare an aqueous solution containing 1 mg of Idarubicin Hydrochloride per mL. To 2 mL of this solution in a test tube, add 20  $\mu\text{L}$  of hydrochloric acid, and heat in an oil bath at  $95^\circ$  for about 8 minutes. Mix 1 mL of this solution and 9 mL of *Diluent*. This *Resolution solution* contains a mixture of 4-demethoxydaunorubicinone and idarubicin.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L13. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for 4-demethoxydaunorubicinone and 1.0 for idarubicin; and the resolution,  $R$ , between the 4-demethoxydaunorubicinone peak and the idarubicin peak is not less than 9.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , for the idarubicin peak is not less than 10 and not more than 20; the tailing factor for the idarubicin peak is not less than 0.85 and not more than 1.2; the column efficiency calculated from the idarubicin peak is not less than 3000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in  $\mu\text{g}$ , of  $\text{C}_{26}\text{H}_{27}\text{NO}_9 \cdot \text{HCl}$  in each mg of the Idarubicin Hydrochloride taken by the formula:

$$100(C/M)(r_u / r_s)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of idarubicin hydrochloride ( $\text{C}_{26}\text{H}_{27}\text{NO}_9 \cdot \text{HCl}$ ) in the *Standard preparation*;  $M$  is the quantity, in mg, of Idarubicin Hydrochloride taken to prepare the *Assay preparation*; and  $r_u$  and  $r_s$  are the responses of the idarubicin peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Idarubicin Hydrochloride for Injection

» Idarubicin Hydrochloride for Injection is a sterile mixture of Idarubicin Hydrochloride and Lactose. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $\text{C}_{26}\text{H}_{27}\text{NO}_9 \cdot \text{HCl}$ .

**Caution**—Great care should be taken to prevent inhaling particles of Idarubicin Hydrochloride and exposing the skin to it.

**Packaging and storage**—Preserve in Containers for Sterile Solids as described under *Injections* (1).

**USP Reference standards** (11)—

USP Endotoxin RS

USP Idarubicin Hydrochloride RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

**Identification**—The chromatogram of the *Assay preparation* obtained in the *Assay* exhibits a major peak for idarubicin, the retention time of which corresponds to that in the chromatogram of the *Standard preparation* obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 8.9 USP Endotoxin Units per mg of idarubicin hydrochloride, a solution of Idarubicin Hydrochloride for Injection containing 0.07 mg of idarubicin hydrochloride per mL being used in the *Test Procedure*.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 5.0 and 7.0, in a solution constituted as directed in the labeling, water being used as the diluent.

**Water, Method I** (921): not more than 4.0%, the *Test Preparation* being prepared as directed for a hygroscopic specimen.

**Other requirements**—It meets the requirements for *Uniformity of Dosage Units* (905) and for *Labeling* under *Injections* (1).

**Assay**—

**Mobile phase, Diluent, Standard preparation, Resolution solution, and Chromatographic system**—Proceed as directed in the *Assay* under *Idarubicin Hydrochloride*.

**Assay preparation**—Dilute the contents of 1 container of Idarubicin Hydrochloride for Injection quantitatively with *Diluent* to obtain a solution containing about 0.5 mg of idarubicin hydrochloride per mL.

**Procedure**—Proceed as directed for *Procedure* under *Idarubicin Hydrochloride*. Calculate the quantity, in mg, of  $\text{C}_{26}\text{H}_{27}\text{NO}_9 \cdot \text{HCl}$  in the container of Idarubicin Hydrochloride for Injection taken by the formula:

$$(C / 1000)(L / D)(r_u / r_s)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of idarubicin hydrochloride ( $\text{C}_{26}\text{H}_{27}\text{NO}_9 \cdot \text{HCl}$ ) in the *Standard preparation*;  $L$  is the labeled quantity, in mg, of idarubicin hydrochloride in the container;  $D$  is the concentration, in mg per mL, of idarubicin hydrochloride in the *Assay preparation* on the basis of the labeled quantity in the container and the extent of dilution; and  $r_u$  and  $r_s$  are the responses of the idarubicin peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Idoxuridine

$C_9H_{11}IN_2O_5$  354.10  
Uridine, 2'-deoxy-5-iodo-  
2'-Deoxy-5-iodouridine [54-42-2].

» Idoxuridine contains not less than 98.0 percent and not more than 101.0 percent of  $C_9H_{11}IN_2O_5$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Idoxuridine RS

### Identification—

**A:** Infrared Absorption (197M).

**B:** Ultraviolet Absorption (197U)—

Solution: 35  $\mu$ g per mL.

**Medium:** pH 12.0 buffer (prepared from 7.46 g of potassium chloride and 24 mL of 1 N sodium hydroxide dissolved in 2000 mL of water).

Absorptivities at 279 nm, calculated on the dried basis for the test sample only, do not differ by more than 2.0%.

**Loss on drying** (731)—Dry about 500 mg, accurately weighed, in vacuum at 60° for 2 hours: it loses not more than 1.0% of its weight.

**Assay**—Dissolve about 250 mg of Idoxuridine, accurately weighed, in 20 mL of dimethylformamide that previously has been neutralized with 0.1 N sodium methoxide in toluene VS, a solution of 300 mg of thymol blue in 100 mL of methanol being used as the indicator. Titrate with 0.1 N sodium methoxide in toluene VS to a blue endpoint, taking precautions against absorption of atmospheric carbon dioxide. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium methoxide is equivalent to 35.41 mg of  $C_9H_{11}IN_2O_5$ .

## Idoxuridine Ophthalmic Ointment

» Idoxuridine Ophthalmic Ointment is Idoxuridine in a Petrolatum base. It contains not less than 0.45 percent and not more than 0.55 percent of  $C_9H_{11}IN_2O_5$ . It is sterile.

**Packaging and storage**—Preserve in collapsible ophthalmic ointment tubes in a cool place.

**USP Reference standards** (11)—  
USP Idoxuridine RS

**Identification**—The UV absorption spectrum of the solution from the Ophthalmic Ointment employed for measurement of absorbance in the Assay exhibits maxima and minima at the same wavelengths as that of the *Standard preparation* prepared for the Assay.

**Sterility** (71): meets the requirements.

**Metal particles**—It meets the requirements of the test for *Metal Particles in Ophthalmic Ointments* (751).

### Assay—

**Chromatographic column**—Mix 4 g of chromatographic siliceous earth with 4 mL of 0.1 N hydrochloric acid in a glass mortar until the mixture is fluffy. Transfer to a 19- × 250-mm chromatographic tube (see *Chromatography* (621)) that contains a pledget of glass wool and is fitted with a stopcock at the bottom. Tamp gently to compress to a uniform mass.

**Standard preparation**—Transfer about 25 mg of USP Idoxuridine RS, accurately weighed, to a 50-mL volumetric flask, add methanol to volume, and mix. Dilute 5.0 mL of this solution with a mixture of 1 volume of butyl alcohol and 5 volumes of chloroform to 100.0 mL, and mix.

**Assay preparation**—Mix 4 g of chromatographic siliceous earth with 2 mL of 0.1 N hydrochloric acid in a glass mortar until the mixture is fluffy. Add a quantity of Ophthalmic Ointment, equivalent to about 5 mg of idoxuridine and accurately weighed, to the mixture, and mix.

**Procedure**—Transfer the Assay preparation to the prepared *Chromatographic column*. Transfer 2 g of chromatographic siliceous earth and 2 mL of 0.1 N hydrochloric acid to the glass mortar, and mix until fluffy, using this material to rinse the mortar and pick up any remaining Ophthalmic Ointment. Transfer about half of this mixture to the tube, and tamp gently until the column appears uniform. Transfer the remaining portion to the *Chromatographic column*, and tamp as before. Wipe the walls of the mortar with a small pledget of glass wool, and insert the pledget in the top of the column. Pass 50 mL of chloroform through the column at a flow rate of approximately 1 mL per minute, and discard the chloroform. Elute with about 200 mL of a mixture of 1 volume of butyl alcohol and 5 volumes of chloroform at the same flow rate, discarding the first 20 mL of the eluate. Collect the remainder of the eluate in a 200-mL volumetric flask, dilute with the eluting solvent to volume, and mix. Concomitantly determine the absorbances of this solution and the *Standard preparation* in 1-cm cells at 320 nm and at the wavelength of maximum absorbance at about 283 nm, with a suitable spectrophotometer, using a mixture of butyl alcohol and chloroform as the blank. Calculate the quantity, in mg, of  $C_9H_{11}IN_2O_5$  in the Ophthalmic Ointment taken by the formula:

$$0.2C(A_{283} - A_{320})_U / (A_{283} - A_{320})_S$$

in which C is the concentration, in  $\mu$ g per mL, of USP Idoxuridine RS in the *Standard preparation*; and the parenthetic expressions are the differences in the absorbances of the two solutions at the wavelengths indicated by the subscripts, for the solution from the Ophthalmic Ointment (U) and the *Standard preparation* (S), respectively.

## Idoxuridine Ophthalmic Solution

» Idoxuridine Ophthalmic Solution is a sterile, aqueous solution of Idoxuridine. It contains not less than 0.09 percent and not more than 0.11 percent of  $C_9H_{11}IN_2O_5$ . It may contain suitable buffers, stabilizers, and antimicrobial agents.

**Packaging and storage**—Preserve in tight, light-resistant containers in a cold place.

**USP Reference standards** (11)—  
USP Idoxuridine RS

**Identification**—The UV absorption spectrum of the solution employed for measurement of absorbance in the Assay exhibits maxima and minima at the same wavelengths as that of the *Standard preparation* prepared for the Assay.

**Sterility** (71): meets the requirements.

**pH** (791): between 4.5 and 7.0.

**Assay—**

**Chromatographic column and Standard preparation—**Prepare as directed in the Assay under *Idoxuridine Ophthalmic Ointment*.

**Assay preparation—**Mix an accurately measured volume of Ophthalmic Solution, equivalent to about 5 mg of idoxuridine, with 3 g of chromatographic siliceous earth in a glass mortar until the mixture is fluffy.

**Procedure—**Proceed as directed for *Procedure* in the Assay under *Idoxuridine Ophthalmic Ointment*, omitting the treatment of the column with 50 mL of chloroform. Calculate the quantity, in mg, of  $C_7H_{15}Cl_2N_2O_2P$  in each mL of the Ophthalmic Solution taken by the formula:

$$0.2C(A_{283} - A_{320})_U / V(A_{283} - A_{320})_S$$

in which *C* is the concentration, in  $\mu\text{g}$  per mL, of USP Idoxuridine RS in the *Standard preparation*; *V* is the volume, in mL, of Ophthalmic Solution taken; and the parenthetical expressions are the differences in the absorbances of the two solutions at the wavelengths indicated by the subscripts, for the Solution (*U*) and the *Standard preparation* (*S*), respectively.

## Ifosfamide

$C_7H_{15}Cl_2N_2O_2P$  261.09

2*H*-1,3,2-Oxazaphosphorin-2-amine, *N*,  
3-bis(2-chloroethyl)tetrahydro-, 2-oxide.

3-(2-Chloroethyl)-[(2-chloroethyl)amino]tetrahydro-2*H*-1,3,  
2-oxazaphosphorine 2-oxide [3778-73-2].

» Ifosfamide contains not less than 98.0 percent and not more than 102.0 percent of  $C_7H_{15}Cl_2N_2O_2P$ .

**Caution—***Great care should be taken in handling Ifosfamide, as it is a potent cytotoxic agent and suspected carcinogen.*

**Packaging and storage—**Preserve in tight containers at a temperature not exceeding 25°.

**Labeling—**Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Ifosfamide RS

**Identification—**

**A: Infrared Absorption** (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the Assay.

**pH** (791): between 4.0 and 7.0 in a solution (1 in 10).

**Water, Method I** (921): not more than 0.3%.

**Heavy metals, Method I** (231): not more than 0.002%.

**Ionic chloride—**

**Standard sodium chloride solution—**Transfer about 118.7 mg of sodium chloride, accurately weighed, to a 200-mL volumetric flask, dissolve in and dilute with water to

volume, and mix. This solution contains 360 ppm of ionic chloride.

**Procedure—**Pipet 10 mL of *Standard sodium chloride solution* into a beaker, and add 90 mL of water and 10 mL of acetic acid. Titrate with 0.01 N silver nitrate VS (prepared fresh daily), determining the endpoint potentiometrically using silver and silver-silver chloride electrodes. Record the volume,  $V_1$ , of 0.01 N silver nitrate VS consumed. Transfer about 2.0 g of Ifosfamide, accurately weighed, into a beaker, and add 90 mL of water and 10 mL of acetic acid. Pipet 10 mL of *Standard sodium chloride solution* into the beaker, and stir, if necessary, until solution is complete. Titrate with 0.01 N silver nitrate VS as directed above, and record the volume,  $V_2$ , of 0.01 N silver nitrate VS consumed. Calculate the difference in volume, *V*, of 0.01 N silver nitrate VS consumed between the two determinations by subtracting  $V_1$  from  $V_2$ : a difference of not more than 1.0 mL corresponding to not more than 0.018% of ionic chloride is found.

**Chloroform-insoluble phosphorus—**

**Ammonium molybdate solution—**[NOTE—Prepare fresh on the day of use.] Dissolve 25 g of ammonium molybdate in 300 mL of water (*Solution A*). Cautiously add 75 mL of sulfuric acid to 100 mL of water, cool to room temperature, and dilute with water to 200.0 mL (*Solution B*). Mix *Solution A* and *Solution B* to obtain *Ammonium molybdate solution*.

**Hydroquinone solution—**Dissolve 0.5 g of hydroquinone in 100 mL of water, and add one drop of concentrated sulfuric acid. [NOTE—When this solution darkens, discard it and prepare fresh.]

**Sodium sulfite solution—**Prepare a solution of sodium sulfite in water having a concentration of 200 mg per mL. [NOTE—Prepare fresh at the time of use.]

**Phosphorus stock solution—**Transfer 0.1824 g of monobasic potassium phosphate, accurately weighed, to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

**Phosphorus intermediate solution—**Transfer 10.0 mL of *Phosphorus stock solution* to a 100-mL volumetric flask, dilute with water to volume, and mix. Prepare this solution fresh on the day of use.

**Phosphorus standard solution—**Transfer 10.0 mL of *Phosphorus intermediate solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Test preparation—**Transfer 1 g of Ifosfamide, accurately weighed, to a 100-mL volumetric flask, dissolve in 50 mL of water, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a separatory funnel, and add 5 mL of water. Add 15 mL of chloroform, shake vigorously for 30 seconds, allow the layers to separate and drain, and discard the lower chloroform layer. Repeat this extraction four times, each time with 15 mL of chloroform, discarding the chloroform layer after each extraction. Transfer the aqueous portion to a conical flask, wash the separatory funnel with two 5-mL portions of water, and collect all the aqueous washings in the same flask. Add 3 mL of sulfuric acid, and heat under a hood until white fumes appear. Remove the flask from the heat, and with swirling, add 0.6 mL of hydrogen peroxide. Heat until white fumes reappear. If the solution is not colorless, repeat additions of hydrogen peroxide followed by heating until all color is gone. Cool to room temperature, add 25 mL of water, and cautiously add 10 mL of ammonium hydroxide solution. Cool to room temperature, add 2 drops of phenolphthalein TS, and then add hydrochloric acid dropwise until all pink color has disappeared. Transfer the contents of the flask to a 100-mL flask, dilute with water to volume, and mix.

**Blank solution—**To 3 mL of sulfuric acid in a second conical flask, adding 0.6 mL of hydrogen peroxide, proceed as directed for the *Test preparation*, beginning with "Heat until white fumes reappear."

**Procedure**—Transfer 15.0 mL each of the *Test preparation*, the *Blank solution*, and the *Phosphorus standard solution* to three separate 25-mL volumetric flasks. Add 2.5 mL of *Ammonium molybdate solution* to each of the flasks, swirl, and allow to stand for about 30 seconds. To each of the three flasks in order, rapidly add 2.5 mL each of *Hydroquinone solution* and *Sodium sulfite solution*. Dilute the contents of each flask with water to volume, mix, and allow the flasks to stand for 30 minutes. Concomitantly determine the absorbances of the solutions obtained from the *Test preparation* and the *Phosphorus standard solution* in 1-cm cells at the wavelength of maximum absorbance at about 730 nm, with a suitable spectrophotometer, using the solution obtained from the *Blank solution* as the blank. Calculate the percentage of chloroform-insoluble phosphorus in the portion of Ifosfamide taken by the formula:

$$100(C / W)(A_U / A_S)$$

in which *C* is the concentration, in µg per mL, of phosphorus in the *Phosphorus standard solution*; *W* is the weight, in mg, of Ifosfamide taken; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances from the solutions obtained from the *Test preparation* and the *Phosphorus standard solution*, respectively: not more than 0.0415% is found.

#### Limit of 2-chloroethylamine hydrochloride—

**Standard solution**—Dissolve an accurately weighed quantity of 2-chloroethylamine hydrochloride in *N,N*-dimethylacetamide, and dilute quantitatively, and stepwise if necessary, with the same solvent to obtain a solution having a known concentration of about 0.025 mg per mL.

**Test solution**—Transfer about 100 mg of Ifosfamide, accurately weighed, to a flask, add 10.0 mL of *N,N*-dimethylacetamide, and shake until dissolved.

**Chromatographic system**—The gas chromatograph is equipped with a flame-ionization detector and contains a 2-mm × 1.8-m column packed with 10% liquid phase G16 containing 2% potassium hydroxide on 80- to 100-mesh support S1A. The injection port is maintained at a temperature of about 200°, the detector is maintained at a temperature of about 300°, the oven is maintained at a temperature of about 140°, and nitrogen is used as the carrier gas at a flow rate of about 25 mL per minute.

**Procedure**—Separately inject equal volumes (about 1.0 µL) of the *Test solution* and the *Standard solution* into the gas chromatograph, record the chromatograms, and measure the areas of the peaks due to 2-chloroethylamine hydrochloride. Calculate the percentage of 2-chloroethylamine hydrochloride in the portion of Ifosfamide taken by the formula:

$$1000(C / W)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of 2-chloroethylamine hydrochloride in the *Standard solution*; *W* is the weight, in mg, of Ifosfamide taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the areas of the 2-chloroethylamine peaks obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.25% of 2-chloroethylamine hydrochloride is found.

**Other requirements**—Where the label states that Ifosfamide is sterile, it meets the requirements for *Sterility Tests* (71) and for *Bacterial endotoxins* under *Ifosfamide for Injection*. Where the label states that Ifosfamide must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Ifosfamide for Injection*.

**Assay**—[NOTE—Ifosfamide degrades in solution. Prepare solutions of Ifosfamide fresh daily and do not store for more than 24 hours. Prepare the *Standard preparation* and the *Assay preparation* simultaneously.]

**Mobile phase**—Prepare a filtered and degassed mixture of water and acetonitrile (70:30). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Transfer about 50 mg of ethylparaben, accurately weighed, to a 100-mL volumetric flask, and add 25 mL of alcohol to dissolve. Dilute with water to volume, and mix.

**Standard preparation**—Transfer about 15 mg of USP Ifosfamide RS, accurately weighed, to a 25-mL volumetric flask, add 1.0 mL of *Internal standard solution*, dilute with water to volume, and mix.

**Assay preparation**—Transfer about 150 mg of Ifosfamide, accurately weighed, to a 250-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 195-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between ifosfamide and ethylparaben is not less than 6.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of C<sub>7</sub>H<sub>15</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>2</sub>P in the portion of Ifosfamide taken by the formula:

$$250C(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Ifosfamide RS in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the ratios of the responses of the ifosfamide peak to the ethylparaben peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ifosfamide for Injection

» Ifosfamide for Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>7</sub>H<sub>15</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>2</sub>P.

**Caution**—Great care should be taken in handling Ifosfamide, as it is a potent cytotoxic agent and suspected carcinogen.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1), at controlled room temperature.

#### USP Reference standards (11)—

USP Endotoxin RS  
USP Ifosfamide RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

#### Identification—

**A:** (See *Thin-layer Chromatographic Identification Tests* (201).)

**Developing solvent**—Prepare a mixture of isopropyl alcohol and toluene (1:1).

**Standard solution**—Dissolve 20.0 mg of USP Ifosfamide RS in 1.0 mL of alcohol.

**Test solution**—Dissolve 20 mg of Ifosfamide for Injection in 1.0 mL of alcohol.

**Procedure**—Apply separately 10 µL each of the *Standard solution* and the *Test solution* to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture, allow the spots to dry, and develop the plate in a paper-lined

chromatographic chamber equilibrated with *Developing solvent* for about 15 minutes prior to use. Allow the chromatogram to develop until the solvent front has moved about 15 cm. Remove the plate, mark the solvent front, and air-dry for 5 minutes. Place the plates into a chromatographic chamber containing iodine crystals, and view the spots that develop. [NOTE—For better detection, overspray the iodine stain with a mixture of alcohol and water (1:1).] The  $R_f$  value of the principal spot obtained from the *Test solution* corresponds to that obtained from the *Standard solution*.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.125 USP Endotoxin Unit per mg.

**pH** (791): between 4.0 and 7.0 in a solution prepared as directed for *Constituted Solutions* under *Injections* (1), determined 30 minutes after its preparation.

**Water, Method I** (921): not more than 0.3%.

**Other requirements**—It meets the requirements for *Sterility Tests* (71), *Uniformity of Dosage Units* (905), and *Labeling* under *Injections* (1).

#### Assay—

*Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Ifosfamide*.

*Assay preparation*—Select an accurately counted number of containers of Ifosfamide for Injection, the combined contents of which are equivalent to about 6 g of Ifosfamide. Dissolve the contents of each container in water and combine all of the solutions in a 1000-mL volumetric flask. Rinse each container with water, and add the rinsings to the volumetric flask. Dilute with water to volume, and mix. Transfer 10.0 mL of the resulting solution to a 100-mL volumetric flask, add 4.0 mL of *Internal standard solution*, dilute with water to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Ifosfamide*. Calculate the quantity, in g, of  $C_7H_{15}Cl_2N_2O_2P$  in each container of Ifosfamide for Injection taken by the formula:

$$10(C / N)(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Ifosfamide RS in the *Standard preparation*; N is the number of containers selected for the *Assay preparation*, and  $R_U$  and  $R_S$  are the ratios of the responses of the ifosfamide peak to the ethylparaben peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Imipenem

$C_{12}H_{17}N_3O_4S \cdot H_2O$  317.36

1-Azabicyclo[3.2.0]hept-2-ene-2-carboxylic acid, 6-(1-hydroxyethyl)-3-[[2-(iminomethyl)amino]ethyl]thio]-7-oxo-, monohydrate, [5*R*]-[5 $\alpha$ ,6 $\alpha$ ( $R^*$ )]-.

(5*R*,6*S*)-3-[[2-(Formimidoylamino)ethyl]thio]-6-[(*R*)-1-hydroxyethyl]-7-oxo-1-azabicyclo[3.2.0]hept-2-ene-2-carboxylic acid monohydrate [74431-23-5].

Anhydrous 299.35 [64221-86-9].

» Imipenem contains the equivalent of not less than 98.0 percent and not more than 101.0 per-

cent of imipenem monohydrate ( $C_{12}H_{17}N_3O_4S \cdot H_2O$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1), and store in a cold place.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile.

#### USP Reference standards (11)—

USP Endotoxin RS

USP Imipenem Monohydrate RS

**Identification, Infrared Absorption** (197M).

**Specific rotation** (781S): between +84° and +89°.

*Test solution:* 5 mg per mL, in a pH 7 buffer. Prepare the pH 7 buffer solution as follows. Dissolve 5 g of monobasic potassium phosphate and 11 g of dibasic potassium phosphate in 900 mL of water, adjust with phosphoric acid or 5 N sodium hydroxide to a pH of 7, dilute with water to 1000 mL, and mix.

**Crystallinity** (695): meets the requirements.

**Bacterial endotoxins** (85) (where the label states that Imipenem is sterile)—It contains not more than 0.17 USP Endotoxin Unit per mg.

**Sterility** (71) (where the label states that Imipenem is sterile)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, 6 g of specimen dissolved in 200 mL of *Fluid A* being used.

**Loss on drying** (see *Thermal Analysis* (891))—[NOTE—The quantity taken for the determination may be adjusted, if necessary, for instrument sensitivity. Weight loss occurring at temperatures above about 160°, indicative of decomposition, is not to be interpreted as *Loss on drying*.] Determine the percentage of volatile substances by thermogravimetric analysis on an appropriately calibrated instrument, using 5 to 10 mg of Imipenem, accurately weighed. Heat the specimen under test at a rate of 20° per minute under vacuum. Record the thermogram to 200°, and calculate the weight loss at the plateau or inflection point at about 150°: it loses not less than 5.0% and not more than 8.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Heavy metals, Method II** (231): not more than 0.002%.

#### Solvents—

*Internal standard solution*—Add 1 mL of *n*-propyl alcohol to 2000 mL of water, and mix.

*Standard preparation*—Transfer 1.0 mL of acetone and 2.0 mL of isopropyl alcohol to a 1000-mL volumetric flask, dilute with water to volume, and mix. Transfer 1.0 mL of this solution and 5.0 mL of *Internal standard solution* to a 25-mL volumetric flask, dilute with water to volume, and mix. Each mL of this *Standard preparation* contains 31.6 µg of acetone and 63.2 µg of isopropyl alcohol.

*Test preparation*—Transfer about 250 mg of Imipenem, accurately weighed, to a 10-mL volumetric flask, add 4.0 mL of 1 N ammonium hydroxide, and dissolve by swirling. Add 2.0 mL of *Internal standard solution*, dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 3-mm × 1.8-m column containing 10% phase G16 on support S5. The column temperature is programmed to operate at 70° for 8 minutes, then to increase at a rate of 32° per minute to 170°, and to maintain the temperature at 170° for 8 minutes. The injection port is maintained at 200°, the detector is maintained at 250°, and helium is used as the carrier gas at a flow rate of about 19 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.3 for acetone, 0.5 for isopropyl alcohol, and 1.0 for *n*-propyl alcohol, and the relative standard deviation of each of the ratios of the

response of the respective analyte peak to the response of the *n*-propyl alcohol peak for replicate injections is not more than 5%.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 2  $\mu$ L) of the *Standard preparation* and the *Test preparation* into the chromatograph, using the solvent (water) flush technique, record the chromatograms, and measure the responses for the acetone, isopropyl alcohol, and *n*-propyl alcohol peaks. Calculate the percentages of acetone and isopropyl alcohol in the portion of Imipenem taken by the same formula:

$$(C/W)(R_U/R_S)$$

in which *C* is the concentration, in  $\mu$ g per mL, of the appropriate analyte in the *Standard preparation*; *W* is the quantity, in mg, of Imipenem taken to prepare the *Test preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the ratios of the peak response of each of the corresponding analytes to the peak responses of *n*-propyl alcohol obtained from the *Test preparation* and the *Standard preparation*, respectively. Add the percentages of acetone and isopropyl alcohol found: the total is not more than 0.25%.

#### Assay—

**Mobile phase**—Dissolve 0.54 g of monobasic potassium phosphate in 3600 mL of water, adjust with 0.5 N sodium hydroxide or 0.5 M phosphoric acid to a pH of  $6.8 \pm 0.1$ , dilute with water to make 4000 mL of solution, and mix. Filter this solution through a filter of 0.5- $\mu$ m or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Imipenem Monohydrate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.4 mg per mL. Store this solution in an ice bath, and discard after 8 hours.

**Assay preparation**—Transfer about 100 mg of Imipenem, accurately weighed, to a 250-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Store this solution in an ice bath, and discard the unused portion after 8 hours.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 300-nm detector and a 4.6-mm  $\times$  30-cm column that contains packing L1, and is maintained at a temperature of  $30 \pm 1.0^\circ$ . The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 600 theoretical plates, and the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of imipenem monohydrate ( $C_{12}H_{17}N_3O_4S \cdot H_2O$ ) in the portion of Imipenem taken by the formula:

$$(317.36/299.35)(0.25CP)(r_U/r_S)$$

in which 317.36 and 299.35 are the molecular weights of imipenem monohydrate and anhydrous imipenem, respectively; *C* is the concentration, in mg per mL, of USP Imipenem Monohydrate RS in the *Standard preparation*; *P* is the content, in  $\mu$ g per mg, of anhydrous imipenem ( $C_{12}H_{17}N_3O_4S$ ) in USP Imipenem Monohydrate RS; and *r<sub>U</sub>* and *r<sub>S</sub>* are the imipenem peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Imipenem and Cilastatin for Injection

» Imipenem and Cilastatin for Injection is a sterile mixture of Imipenem, Cilastatin Sodium, and Sodium Bicarbonate. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amounts of imipenem ( $C_{12}H_{17}N_3O_4S$ ) and cilastatin ( $C_{16}H_{26}N_2O_5S$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1), and store at controlled room temperature.

**Labeling**—Label it to indicate that after constitution it is to be solubilized in a suitable parenteral fluid prior to intravenous infusion.

#### USP Reference standards (11)—

USP Cilastatin Ammonium Salt RS

USP Endotoxin RS

USP Imipenem Monohydrate RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

**Identification**—The retention times of the peaks for imipenem and cilastatin in the chromatogram of the *Assay preparation* correspond to those in the chromatograms of the *Imipenem standard preparation* and the *Cilastatin standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.17 USP Endotoxin Unit per mg of imipenem and not more than 0.17 USP Endotoxin Unit per mg of cilastatin.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, the specimen being dissolved in *Fluid A*.

**pH** (791): between 6.5 and 8.5, when constituted as directed in the labeling.

**Uniformity of dosage units** (905): meets the requirements.

**Loss on drying** (731)—Dry about 100 mg in vacuum at a pressure not exceeding 5 mm of mercury at  $60^\circ$  for 3 hours: it loses not more than 3.5% of its weight.

**Particulate matter** (788): meets the requirements for small-volume injections.

#### Assay—

**pH 6.8 Buffer**—Dissolve 0.54 g of monobasic potassium phosphate in 3600 mL of water, adjust with 0.5 N sodium hydroxide or 0.5 M phosphoric acid to a pH of  $6.8 \pm 0.1$ , dilute with water to make 4000 mL of solution, and mix. Pass this solution through a filter of 0.5- $\mu$ m or finer porosity.

**Mobile phase**—Dissolve 2.0 g of sodium 1-hexanesulfonate in 800 mL of *pH 6.8 Buffer*, adjust with 0.5 N sodium hydroxide or 0.5 M phosphoric acid to a pH of  $6.8 \pm 0.1$ , and dilute with *pH 6.8 Buffer* to make 1000 mL of solution. Pass this solution through a filter of 0.5- $\mu$ m or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Imipenem standard preparation**—Transfer about 13 mg of USP Imipenem Monohydrate RS, accurately weighed, to a 25-mL volumetric flask. Add 5 mL of saline TS, 0.5 mL of a 0.1% solution of sodium bicarbonate, and about 15 mL of *pH 6.8 Buffer*, and dissolve by shaking and sonicating.

[NOTE—The duration of sonication should not exceed 1 minute.] Dilute with *pH 6.8 Buffer* to volume, and mix. This solution contains the equivalent of about 500  $\mu$ g of anhydrous imipenem per mL. Use this solution immediately.

**Cilastatin standard preparation**—Transfer about 12.5 mg of USP Cilastatin Ammonium Salt RS, accurately weighed, to a 25-mL volumetric flask. Add 5 mL of saline TS, 0.5 mL of a 0.1% solution of sodium bicarbonate, and about 15 mL of

*pH 6.8 Buffer*, and dissolve by shaking and sonicating. [NOTE—The duration of sonication should not exceed 1 minute.] Dilute with *pH 6.8 Buffer* to volume, and mix. This solution contains the equivalent of about 500 µg of cilastatin per mL. Use this solution immediately.

**Assay preparation**—Constitute Imipenem and Cilastatin for Injection in a volume of saline TS, accurately measured, corresponding to the volume of solvent specified in the labeling. Quantitatively transfer this suspension to a 100-mL volumetric flask with the aid of *pH 6.8 Buffer*, dilute with *pH 6.8 Buffer* to volume, and mix. Dilute an accurately measured volume of this solution quantitatively with *pH 6.8 Buffer* to obtain an *Assay preparation* having a concentration of about 500 µg of imipenem per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 30-cm column that contains packing L1, and is maintained at a temperature of 50 ± 1.0°. The flow rate is about 2 mL per minute. Chromatograph the *Imipenem standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the imipenem peak is not less than 600 theoretical plates when calculated by the formula:

$$5.545(t / W_{h/2})^2$$

the tailing factor for the imipenem peak is not more than 1.5 when calculated by the formula:

$$W_{0.1} / 2f$$

where  $W_{0.1}$  is the width of the peak at 10% height, and the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph the *Cilastatin standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the cilastatin peak is not less than 600 theoretical plates when calculated by the formula:

$$5.545(t / W_{h/2})^2$$

the tailing factor for the cilastatin peak is not more than 1.5 when calculated by the formula:

$$W_{0.1} / 2f$$

and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Imipenem standard preparation*, the *Cilastatin standard preparation*, and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantities, in mg, of anhydrous imipenem ( $C_{12}H_{17}N_3O_4S$ ) and cilastatin ( $C_{16}H_{26}N_2O_5S$ ) in the container, taken by the same formula:

$$(CPL / D)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Imipenem Monohydrate RS or USP Cilastatin Ammonium Salt RS in the appropriate *Standard preparation*;  $P$  is the content, in µg per mg, of anhydrous imipenem ( $C_{12}H_{17}N_3O_4S$ ) or cilastatin ( $C_{16}H_{26}N_2O_5S$ ) in the relevant Reference Standard;  $L$  is the labeled quantity, in mg, of imipenem or cilastatin in the container;  $D$  is the concentration, in µg per mL, of imipenem or cilastatin in the *Assay preparation* based on the labeled quantity in the container and the extent of dilution; and  $r_U$  and  $r_S$  are the peak responses of the corresponding analyte obtained from the *Assay preparation* and the appropriate *Standard preparation*, respectively.

## Imipenem and Cilastatin for Injectable Suspension

» Imipenem and Cilastatin for Injectable Suspension is a sterile mixture of Imipenem and Cilastatin Sodium. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amounts of imipenem ( $C_{12}H_{17}N_3O_4S$ ) and cilastatin ( $C_{16}H_{26}N_2O_5S$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* <1>, and store at controlled room temperature.

**Labeling**—Label it to indicate that the suspension obtained when constituted as directed in the labeling is for intramuscular injection only.

**USP Reference standards** <11>—

USP Cilastatin Ammonium Salt RS

USP Endotoxin RS

USP Imipenem Monohydrate RS

**Identification**—The retention times of the peaks for imipenem and cilastatin in the chromatogram of *Assay preparation 1* correspond to those of the *Imipenem standard preparation* and the *Cilastatin standard preparation* as obtained in the *Assay*.

**Bacterial endotoxins** <85>—It contains not more than 0.23 USP Endotoxin Unit per mg of imipenem and not more than 0.23 USP Endotoxin Unit per mg of cilastatin.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, the specimen being dissolved in *Fluid A*.

**pH** <791>: between 6.0 and 7.5, when constituted as directed in the labeling.

**Uniformity of dosage units** <905>: meets the requirements.

**Loss on drying** <731>—Dry about 100 mg in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 3.5% of its weight.

**Assay**—

*pH 6.8 Buffer*, *Mobile phase*, *Imipenem standard preparation*, *Cilastatin standard preparation*, and *Chromatographic system*—Prepare as directed in the *Assay* under *Imipenem and Cilastatin for Injection*.

**Assay preparation**—Constitute Imipenem and Cilastatin for Injectable Suspension in a volume of saline TS, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with saline TS to obtain a stock solution containing about 2500 µg of imipenem per mL. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with *pH 6.8 Buffer* to volume, and mix.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Imipenem standard preparation*, the *Cilastatin standard preparation*, and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantities, in mg, of anhydrous imipenem ( $C_{12}H_{17}N_3O_4S$ ) and cilastatin ( $C_{16}H_{26}N_2O_5S$ ) withdrawn from the container taken by the formula:

$$(CPL / D)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Imipenem Monohydrate RS or USP Cilastatin Ammonium Salt RS in the appropriate *Standard preparation*;  $P$  is the content, in µg per mg, of anhydrous imipenem ( $C_{12}H_{17}N_3O_4S$ ) or cilastatin ( $C_{16}H_{26}N_2O_5S$ ) in the relevant Reference Stan-

dard;  $L$  is the labeled quantity, in mg, of imipenem or cilastatin in the container;  $D$  is the concentration, in  $\mu\text{g}$  per mL, of imipenem or cilastatin in the *Assay preparation* based on the labeled quantity in the container and the extent of dilution; and  $r_U$  and  $r_S$  are the peak responses of the corresponding analyte obtained from the *Assay preparation* and the appropriate *Standard preparation*, respectively.

## Imipramine Hydrochloride

$\text{C}_{19}\text{H}_{24}\text{N}_2 \cdot \text{HCl}$  316.87

5*H*-Dibenz[*b,f*]azepine-5-propanamine, 10,11-dihydro-*N,N*-dimethyl-, monohydrochloride.

5-3-(Dimethylamino)propyl-10,11-dihydro-5*H*-dibenz[*b,f*]azepine monohydrochloride [113-52-0].

» Imipramine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $\text{C}_{19}\text{H}_{24}\text{N}_2 \cdot \text{HCl}$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Desipramine Hydrochloride RS

USP Imipramine Hydrochloride RS

USP Iminodibenzyl RS

$\text{C}_{14}\text{H}_{13}\text{N}$  195.28

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**C:** Dissolve 0.10 g in 2 mL of alcohol, and add 1 mL of 2 N nitric acid and 3 drops of silver nitrate TS: a white precipitate is formed, and it dissolves on the dropwise addition of ammonium hydroxide.

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals**, *Method II* (231): 0.001%.

**Related compounds**—[NOTE—Use low-actinic glassware throughout the following procedure.]

*Mobile phase*, *System suitability solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay*.

*Standard solution*—Dissolve accurately weighed quantities of USP Imipramine Hydrochloride RS and USP Iminodibenzyl RS in acetonitrile, and dilute with a mixture of water and acetonitrile (5:3) to obtain a solution having known concentrations of about 2.5  $\mu\text{g}$  of each component per mL.

*Test solution*—Transfer about 63 mg of Imipramine Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with a mixture of water and acetonitrile (5:3), and mix.

*Procedure*—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. The relative retention times are about 0.8 for *N*-(dimethylaminopropyl) iminostilbene and 1.0 for

imipramine. Calculate the percentage of iminodibenzyl in the portion of Imipramine Hydrochloride taken by the formula:

$$5(C / W)(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Iminodibenzyl RS in the *Standard solution*;  $W$  is the weight, in mg, of Imipramine Hydrochloride taken to prepare the *Test solution*; and  $r_U$  and  $r_S$  are the iminodibenzyl peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.1% of iminodibenzyl is found. Calculate the percentage of each other impurity in the portion of Imipramine Hydrochloride taken by the formula:

$$5(C / W)(r_i / r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Imipramine Hydrochloride RS in the *Standard solution*;  $W$  is the weight, in mg, of Imipramine Hydrochloride taken to prepare the *Test solution*;  $r_i$  is the peak response of each individual impurity, excluding iminodibenzyl, obtained from the *Test solution*, and  $r_S$  is the peak response of imipramine obtained from the *Standard solution*: not more than 0.1% of *N*-(dimethylaminopropyl)iminostilbene is found; not more than 0.2% of any other impurity is found; and the total of all impurities found is not more than 1.0%.

**Assay**—[NOTE—Use low-actinic glassware throughout the following procedure.]

*Mobile phase*—Prepare a filtered and degassed mixture of 0.06 M sodium perchlorate, acetonitrile, and triethylamine (625:375:1), and adjust with perchloric acid to a pH of 2.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability solution*—Transfer about 15 mg of USP Imipramine Hydrochloride RS and about 15 mg of USP Desipramine Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with a mixture of water and acetonitrile (5:3) to volume, and mix.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Imipramine Hydrochloride RS in a mixture of water and acetonitrile (5:3) to obtain a solution having a known concentration of about 0.3 mg per mL.

*Assay preparation*—Transfer about 30 mg of Imipramine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with a mixture of water and acetonitrile (5:3) to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 269-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The column temperature is maintained at 40°, and the flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the imipramine and desipramine peaks is not less than 1.3. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0% for imipramine.

*Procedure*—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of  $\text{C}_{19}\text{H}_{24}\text{N}_2 \cdot \text{HCl}$  in the portion of Imipramine Hydrochloride taken by the formula:

$$100C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Imipramine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the imipramine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Imipramine Hydrochloride Injection

» Imipramine Hydrochloride Injection is a sterile solution of Imipramine Hydrochloride in Water for Injection. It contains, in each mL, not less than 11.5 mg and not more than 13.5 mg of  $C_{19}H_{24}N_2 \cdot HCl$ .

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Imipramine Hydrochloride RS

**Identification**—Transfer 10 mL of Injection to a separator, add 2 mL of 2 N hydrochloric acid, extract with 10 mL of chloroform, filter, and evaporate the chloroform solution to about 2 mL. Carefully add ether until the liquid becomes turbid, heat on a steam bath to produce a clear solution, then cool, and allow to stand. Filter the crystalline precipitate, wash with ether, and dry in vacuum at 105° for 30 minutes: the precipitate so obtained responds to *Identification test A* under *Imipramine Hydrochloride*.

**Bacterial endotoxins** (85)—It contains not more than 5.0 USP Endotoxin Units per mg of imipramine hydrochloride.

**pH** (791): between 4.0 and 5.0.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Transfer an accurately measured volume of Injection, equivalent to about 25 mg of imipramine hydrochloride, to a 100-mL volumetric flask, add 0.5 N hydrochloric acid to volume, and mix. Pipet 10 mL of this solution into a separator, add 10 mL of 1 N sodium hydroxide, and extract with four 20-mL portions of ether, shaking each portion for 2 minutes and collecting the extracts in a second separator. Extract the combined ether extracts with four 20-mL portions of 0.5 N hydrochloric acid, and combine the extracts in a 250-mL beaker. Aerate this solution with nitrogen to remove residual ether, then transfer to a 100-mL volumetric flask, and rinse the beaker with 0.5 N hydrochloric acid, collecting the rinsings in the flask. Add the 0.5 N acid to volume, and mix. Dissolve an accurately weighed quantity of USP Imipramine Hydrochloride RS in 0.5 N hydrochloric acid, and dilute quantitatively and stepwise with the same solvent to obtain a Standard solution having a known concentration of about 25 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 250 nm, with a suitable spectrophotometer, using 0.5 N hydrochloric acid as the blank. Calculate the quantity, in mg, of  $C_{19}H_{24}N_2 \cdot HCl$  in each mL of the Injection taken by the formula:

$$(C/V)(A_U/A_S)$$

in which *C* is the concentration, in µg per mL, of USP Imipramine Hydrochloride RS in the Standard solution; *V* is the volume, in mL, of Injection taken; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solution from the Injection and the Standard solution, respectively.

## Imipramine Hydrochloride Tablets

» Imipramine Hydrochloride Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of imipramine hydrochloride ( $C_{19}H_{24}N_2 \cdot HCl$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Imipramine Hydrochloride RS

**Identification**—Powder a suitable number of Tablets, equivalent to about 100 mg of imipramine hydrochloride, and macerate the powder with 10 mL of chloroform. Filter the chloroform extract through paper into a wide-mouth test tube, and evaporate the filtrate to about 3 mL. Carefully add ether until the liquid becomes turbid, heat on a steam bath to produce a clear solution, then cool, and allow to stand. The precipitate that is formed may be recrystallized from acetone. Filter the crystalline precipitate, wash with ether, and dry in vacuum at 105° for 30 minutes: the precipitate so obtained meets the requirements for *Identification test A* under *Imipramine Hydrochloride*.

**Dissolution** (711)—

*Medium*: 0.01 N hydrochloric acid; 900 mL.

*Apparatus 1*: 100 rpm.

*Time*: 45 minutes.

**Procedure**—Determine the amount of  $C_{19}H_{24}N_2 \cdot HCl$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 250 nm on filtered portions of the solution under test, suitably diluted with *Medium*, in comparison with a Standard solution having a known concentration of USP Imipramine Hydrochloride RS in the same *Medium*.

**Tolerances**—Not less than 75% (*Q*) of the labeled amount of  $C_{19}H_{24}N_2 \cdot HCl$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Procedure for content uniformity**—Transfer 1 finely powdered Tablet to a 100-mL volumetric flask with the aid of 70 mL of dilute hydrochloric acid (1 in 100), and shake by mechanical means for 30 minutes. Add dilute hydrochloric acid (1 in 100) to volume, mix, and filter, if necessary, discarding the first 20 mL of the filtrate. Transfer an aliquot of the filtrate, equivalent to about 2.5 mg of imipramine hydrochloride, to a 100-mL volumetric flask, add dilute hydrochloric acid (1 in 100) to volume, and mix. Dissolve an accurately weighed quantity of USP Imipramine Hydrochloride RS in dilute hydrochloric acid (1 in 100), and dilute quantitatively and stepwise with the same solvent to obtain a Standard solution having a known concentration of about 25 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 250 nm, with a suitable spectrophotometer, using dilute hydrochloric acid (1 in 100) as the blank. Calculate the quantity, in mg, of  $C_{19}H_{24}N_2 \cdot HCl$  in the Tablet by the formula:

$$10(C/V)(A_U/A_S)$$

in which *C* is the concentration, in µg per mL, of USP Imipramine Hydrochloride RS in the Standard solution; *V* is the volume, in mL, of the aliquot taken of the solution from the Tablet; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solution from the Tablet and the Standard solution, respectively.

**Assay**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of imipramine hydrochloride, to a 200-mL volumetric flask, add about 100 mL of dilute hydrochloric acid (1 in 25), and shake vigorously by mechanical means for 1 hour. Add the dilute acid to volume, mix, and filter, discarding the first 20 mL of the filtrate. Pipet 5 mL of the filtrate into a separator, and proceed as directed in the Assay under *Imipramine Hydrochloride Injection*, beginning with "add 10 mL of 1 N sodium hydroxide." Calculate

the quantity, in mg, of imipramine hydrochloride ( $C_{19}H_{24}N_2 \cdot HCl$ ) in the portion of Tablets taken by the formula:

$$4C(A_U / A_S)$$

in which C is the concentration, in  $\mu g$  per mL, of USP Imipramine Hydrochloride RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Tablets and the Standard solution, respectively.

## Inamrinone

$C_{10}H_9N_3O$  187.20  
[3,4'-Bipyridin]-6(1H)-one, 5-amino-  
5-Amino[3,4'-bipyridin]-6(1H)-one [60719-84-8].

» Inamrinone contains not less than 98.0 percent and not more than 102.0 percent of  $C_{10}H_9N_3O$ , calculated on the anhydrous basis.

*Caution—Inamrinone is a cardiotonic agent.*

**Packaging and storage**—Preserve in well-closed containers, protected from light. Store at  $25^\circ$ , excursions permitted between  $15^\circ$  and  $30^\circ$ .

### USP Reference standards (11)—

USP Inamrinone RS

USP Inamrinone Related Compound A RS

5-Carboxamide[3,4'-bipyridin]-6(1H)-one.

$C_{11}H_9N_3O_2$  215.21

### Identification—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

*pH 8.9 Buffer*—Dissolve 107 g of dibasic sodium phosphate in water, adjust, if necessary, with 0.1 M sodium hydroxide or 0.1 M phosphoric acid to a pH of  $8.9 \pm 0.1$ , dilute with water to 1000 mL, and mix.

*Solution:* 6  $\mu g$  per mL, prepared as follows. Dissolve 100 mg in 20 mL of water and 1.0 mL of 1 N hydrochloric acid in a 100-mL volumetric flask, dilute with water to volume, and mix. Dilute 5.0 mL of this solution to 50.0 mL with 0.01 N hydrochloric acid, mix, and transfer 3.0 mL to a 50-mL volumetric flask. Dilute with *pH 8.9 Buffer* to volume, and mix.

*Ratio:*  $A_{237} / A_{318}$  do not differ by more than 3.0%.

**Water, Method I** (921): not more than 1.0%.

**Residue on ignition** (281): not more than 0.2%.

**Heavy metals, Method II** (231): 0.002%.

### Chromatographic purity—

*Solution A*—Dissolve 6.8 g of monobasic potassium phosphate in 1000 mL of water, add 2 mL of triethylamine, and adjust with phosphoric acid to a pH of 2.5. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Solution B*—Prepare a mixture of *Solution A* and acetonitrile (85:15).

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*.

*Diluting solution*—Dissolve 0.25 g of sodium metabisulfite in 1000 mL of *Solution A*.

*Standard stock solution*—Dissolve an accurately weighed quantity of USP Inamrinone RS in *Diluting solution* to obtain

a solution having a known concentration of about 2 mg per mL.

*Standard solution*—Dilute a suitable volume of *Standard stock solution* quantitatively, and stepwise if necessary, with *Diluting solution* to obtain a solution having a known concentration of 4  $\mu g$  of USP Inamrinone RS per mL.

*System suitability solution*—Prepare a solution of USP Inamrinone Related Compound A RS in *Diluting solution* having a concentration of 2 mg per mL. Transfer 5.0 mL of this solution and 5.0 mL of the *Standard stock solution* to a 50-mL volumetric flask, dilute with *Diluting solution* to volume, and mix.

*Test solution*—Transfer about 100 mg of Inamrinone, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Diluting solution* to volume, and mix.

[NOTE—Use this solution within 1 hour after preparation.]

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 315-nm detector and a 4.0-mm  $\times$  25-cm analytical column that contains packing L1 and is fitted with a guard column that contains packing L1. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	87	13	equilibration
0–1	87	13	isocratic
1–29	87→0	13→100	linear gradient
29–30	0	100	isocratic

Allow the system to equilibrate at the original conditions before making subsequent injections. Chromatograph 15  $\mu L$  of the *System suitability solution*, record the chromatograms, and measure the peak responses as described for *Procedure*: the relative retention times are 0.6 for inamrinone and 1.0 for inamrinone related compound A; and the resolution,  $R$ , between inamrinone and inamrinone related compound A is not less than 4.0. Chromatograph about 15  $\mu L$  of the *Standard solution*, and record the peak responses for inamrinone as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 5.0%.

*Procedure*—Separately inject equal volumes (about 15  $\mu L$ ) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms allowing the *Test solution* to elute for not less than five times the retention times of inamrinone, and measure the areas of all the peaks observed in the chromatogram of the *Test solution*. Calculate the percentage of each impurity in the portion of Inamrinone taken by the formula:

$$5000(C/W)(r_i / r_s)$$

in which C is the concentration, in mg per mL, of USP Inamrinone RS in the *Standard solution*; W is the weight, in mg, of inamrinone taken for the *Test solution*;  $r_i$  is the response of each impurity peak; and  $r_s$  is the mean response for the *Standard solution*: not more than 0.2% of any individual impurity is found; and the sum of all impurities is not more than 1.0%.

**Assay**—Weigh accurately about 500 mg of Inamrinone, and proceed as directed under *Nitrite Titration* (451). Each mL of 0.1 M sodium nitrite is equivalent to 18.72 mg of  $C_{10}H_9N_3O$ .

## Inamrinone Injection

» Inamrinone Injection is a sterile solution of Inamrinone in Water for Injection, prepared with the aid of Lactic Acid. It contains not less than

90.0 percent and not more than 110.0 percent of the labeled amount of inamrinone ( $C_{10}H_9N_3O$ ).

**Caution**—Inamrinone is a cardiotonic agent.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass, protected from light. Store at room temperature.

**USP Reference standards** (11)—

USP Inamrinone RS

USP Inamrinone Related Compound B RS

*N*-(1,6-Dihydro-6-oxo-(3,4'-bipyridine)-5-yl)-2-hydroxypropanamide.

$C_{13}H_{13}N_3O_3$  259.3

USP Inamrinone Related Compound C RS

1,6-Dihydro-6-oxo-(3,4'-bipyridine)-5-carbonitrile.

$C_{11}H_7N_3O$  197.20

**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** Transfer a volume of Injection, equivalent to about 50 mg of inamrinone, to a glass-stoppered container. Add about 2 g of 50- to 100-mesh sulfonic acid cation-exchange resin, and shake for about 2 minutes or until the supernatant becomes essentially colorless. Filter, and collect the filtrate in an arsine generator flask (see *Apparatus* under *Arsenic* (211)). Add 5 mL of diluted sulfuric acid, and boil gently on a hot plate for 5 to 10 minutes. Cool to room temperature. Add 10 mL of potassium permanganate TS, attach the scrubber unit and absorber tube, and place the apparatus on a warm hot plate. Add 1 mL of indicator solution (freshly prepared by dissolving 250 mg of sodium nitroferriyanide in sufficient water to make 9 mL and mixing with 1 mL of morpholine) to the absorber tube. Heat gently, allowing the vapors to bubble through the indicator: the indicator turns blue within 5 minutes (*presence of lactate*).

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mg of inamrinone.

**pH** (791): between 3.2 and 4.0.

**Lactic acid content**—

**Ion-exchange column**—Place a small pledget of glass wool at the bottom of a 100- × 6-mm glass column, equipped with a stopcock and a 25-mL reservoir. Soak a suitable quantity of 50- to 100-mesh sulfonic acid cation-exchange resin in 6 N hydrochloric acid for several minutes. Wash with water until the wash is neutral to wide-range pH indicator paper. Fill the column with the prepared resin to the base of the reservoir. Wash the column with about 50 mL of water in several portions, draining each wash to the top of the resin before adding the next portion. Discard the washes.

**Procedure**—Place a 125-mL conical flask below the *ion-exchange column*. Pipet a volume of Injection, equivalent to about 50 mg of inamrinone, onto the column. Allow the specimen to pass through the column at the rate of about 0.5 mL to 1 mL per minute, draining the specimen to the top of the column and collecting the eluate in the flask. Wash the column with five 5-mL portions of water, collecting the washings in the flask. Add several small glass beads to the solution in the flask, and boil on a hot plate for about 10 minutes. Add 10.0 mL of 0.1 N sodium hydroxide, and boil for 20 minutes. Add phenolphthalein TS, and titrate the warm solution with 0.1 N hydrochloric acid VS. Perform a blank determination (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 0.1 N hydrochloric acid is equivalent to 9.008 mg of  $C_3H_5O_3$ : the lactic acid content is between 5.0 and 7.5 mg per mL of Injection.

**Chromatographic purity**—

**Mobile phase**—Dilute 11.4 mL of phosphoric acid with water to 990 mL. Prepare a filtered and degassed mixture of the dilute phosphoric acid and acetonitrile (99:1). Make ad-

justments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Transfer accurately weighed quantities of about 10 mg of USP Inamrinone RS and about 25 mg of USP Inamrinone Related Compound B RS to a 100-mL volumetric flask, add about 60 mL of lactic acid solution (1 in 85), and sonicate for about 2 minutes to effect solution. Cool, dilute with lactic acid solution (1 in 85) to volume, and mix. Pipet 10.0 mL of this solution into a 250-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Test solution**—Immediately before use, pipet a volume of Injection, equivalent to about 100 mg of inamrinone, into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 313-nm detector and a 4-mm × 15-cm column that contains base-deactivated packing L7. The column temperature is maintained at a temperature between 30° and 35°, and the flow rate is about 2 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between inamrinone and inamrinone related compound B is not less than 10; and the relative standard deviation for replicate injections is not more than 10%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the peak responses. Calculate the percentage of inamrinone related compound B relative to inamrinone in the volume of Injection taken by the formula:

$$5(C/W)(r_U/r_S)$$

in which *C* is the concentration, in  $\mu$ g per mL, of USP Inamrinone Related Compound B RS in the *Standard solution*; *W* is the weight, in mg, of inamrinone in the volume of Injection taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the inamrinone related compound B peak responses obtained from the *Test solution* and the *Standard solution*, respectively. Separately calculate the percentage of any other impurity present in the volume of Injection taken by the formula:

$$5(C/W)(r_i/r_S)$$

in which *r<sub>i</sub>* is the peak response for each impurity, and the other terms are as previously defined. Not more than 2.0% of inamrinone related compound B and not more than 0.5% of any other individual impurity is found, and the sum of all impurities is not more than 3.0%.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—[NOTE—Prepare all inamrinone-containing solutions immediately before injection into the chromatograph.]

**pH 7 sodium borate buffer, 0.5 M**—Transfer 31 g of boric acid to a beaker containing approximately 800 mL of water. Slowly add sodium hydroxide solution (1 in 5) in small quantities, stirring well after each addition, until all of the boric acid is dissolved and the pH is constant at  $7.0 \pm 0.3$ . Transfer this solution to a 1000-mL volumetric flask, dilute with water to volume, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of water, methanol, and *pH 7 sodium borate buffer, 0.5 M* (500:480:20). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Dissolve accurately weighed quantities of USP Inamrinone RS and USP Inamrinone Related Compound C RS in *Mobile phase* to obtain a solution containing about 50  $\mu$ g of each per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Inamrinone RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase*

to obtain a solution having a known concentration of about 50 µg per mL.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 5 mg of inamrinone, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution* and the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are 0.6 for inamrinone related compound C and 1.0 for inamrinone; the resolution, *R*, between the inamrinone related compound C and inamrinone peaks is not less than 3; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of amrinone (C<sub>10</sub>H<sub>9</sub>N<sub>3</sub>O) in each mL of the Injection taken by the formula:

$$(0.1 C / V)(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of USP Inamrinone RS in the *Standard preparation*; *V* is the volume, in mL, of Injection taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Indapamide

C<sub>16</sub>H<sub>16</sub>ClN<sub>3</sub>O<sub>3</sub>S 365.83

Benzamide, 3-(aminosulfonyl)-4-chloro-*N*-(2,3-dihydro-2-methyl-1*H*-indol-1-yl)-.

4-Chloro-*N*-(2-methyl-1-indolyl)-3-sulfamoylbenzamide [26807-65-8].

» Indapamide contains not less than 98.0 percent and not more than 101.0 percent of C<sub>16</sub>H<sub>16</sub>ClN<sub>3</sub>O<sub>3</sub>S, calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—

USP Indapamide RS

**Identification**—

**A:** Infrared Absorption <197K>.

**B:** Ultraviolet Absorption <197U>—

*Solution:* 5 µg per mL.

*Medium:* methanol.

**Loss on drying** <731>—Dry it at 105° for 4 hours: it loses not more than 3.0% of its weight.

**Residue on ignition** <281>: not more than 0.1%.

**Chromatographic purity**—[Caution—Minimize exposure to light while weighing the samples and spotting on the thin-layer chromatographic plate. Use low-actinic glassware or wrap the

glassware with aluminum foil and protect all the chromatographic solutions from light. Place the chromatographic tanks in a dark room or cover them with aluminum foil during the development. The paperlined chamber should be saturated with solvent vapor for 1 hour before development of the plates.]

**Standard preparations**—Dissolve USP Indapamide RS in methanol, and mix to obtain *Standard preparation A* having a known concentration of 0.30 mg per mL. Dilute quantitatively with methanol to obtain *Standard preparation B* and *Standard preparation C* containing 0.15 mg and 0.075 mg of USP Indapamide RS per mL, respectively.

**Test preparation**—Dissolve an accurately weighed quantity of Indapamide in methanol, and dilute quantitatively with methanol to obtain a solution containing 30 mg per mL.

**Procedure**—Apply separately 10 µL of the *Test preparation* and 10 µL of each *Standard preparation* to a suitable thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Position the plate in a chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of toluene, ethyl acetate, and glacial acetic acid (70:30:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry under a current of air. Examine the plate under short-wavelength UV light, and compare the intensities of any secondary spots observed in the chromatogram of the *Test preparation* with those of the principal spots in the chromatograms of the *Standard preparations*: no secondary spot from the chromatograms of the *Test preparation* is larger or more intense than the principal spot obtained from *Standard preparation B* (0.5%), and the sum of the intensities of the secondary spots obtained from the *Test preparation* corresponds to not more than 2.0%.

**Assay**—[NOTE—Where peak responses are indicated, use peak areas.]

**Mobile phase**—Prepare a filtered and degassed mixture consisting of water, acetonitrile, methanol, and glacial acetic acid (650:175:175:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Internal standard solution**—Dissolve a suitable quantity of *p*-chloroacetanilide in methanol to obtain a solution having a concentration of about 5.0 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Indapamide RS in *Internal standard solution*, and dilute quantitatively with *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL of the Reference Standard and about 0.25 mg per mL of the internal standard.

**Assay preparation**—Transfer about 100 mg of Indapamide, accurately weighed, to a 100-mL volumetric flask, dissolve in 5.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the resolution, *R*, between any peak of interest and any adjacent peak is not less than 2.0, the tailing factor for the analyte peak is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The retention time, relative to indapamide, is about 0.65 for *p*-chloroacetanilide.

Calculate the quantity, in mg, of  $C_{16}H_{16}ClN_3O_3S$  in the portion of Indapamide taken by the formula:

$$100C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Indapamide RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak area of indapamide to the peak area of internal standard in the *Assay preparation* and the *Standard preparation*, respectively.

## Indapamide Tablets

» Indapamide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{16}H_{16}ClN_3O_3S$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Indapamide RS

**Identification**—

**A:** Crush a quantity of Tablets, equivalent to about 15 mg of indapamide, remove and discard any coating material, and finely powder the remaining tablet cores. Agitate the powdered tablets with two 30-mL portions of 0.2 N sodium hydroxide in a centrifuge tube for 10 minutes. Centrifuge each mixture, and combine the supernatants in a 250-mL separator. Acidify the liquid with about 12 mL of dilute hydrochloric acid (1 in 10). Extract the acidic solution with two 4.0-mL portions of ether, filter the extracts through anhydrous sodium sulfate contained in a filter paper, and evaporate the ether, with the aid of a current of dry air, on a water bath. Dry the crystals at 105° for 1 hour: the crystals so obtained respond to *Identification test A* under *Indapamide*.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* obtained as directed in the *Assay*.

**Dissolution** (711)—

**Medium:** 0.05 M pH 6.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 45 minutes.

Determine the amount of  $C_{16}H_{16}ClN_3O_3S$  dissolved by employing the following method.

**Mobile phase**—Proceed as directed in the *Assay*.

**Standard solution**—Dissolve an accurately weighed quantity of USP Indapamide RS in methanol, and dilute quantitatively, and stepwise if necessary, with a mixture of *Medium* and methanol (99:1) to obtain a solution having a known concentration equivalent to the solution under test.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 242-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50 µL) of a filtered portion of the solution under test and the *Standard solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount of  $C_{16}H_{16}ClN_3O_3S$  dissolved.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{16}H_{16}ClN_3O_3S$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**Mobile phase**—Dissolve 1.08 g of sodium 1-octanesulfonate in 700 mL of water, add 10 mL of glacial acetic acid, and mix. Add 300 mL of acetonitrile, mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Prepare a solution of 2'-chloroacetophenone in acetonitrile having a concentration of about 0.25 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Indapamide RS in acetonitrile to obtain a solution having a known concentration of about 0.1 mg per mL. Transfer 5.0 mL of this solution and 3.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with a mixture of water and acetonitrile (50:10) to volume, and mix.

**Assay preparation**—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of powder, equivalent to about 2.5 mg of indapamide, to a 50-mL volumetric flask, add about 25 mL of acetonitrile, and sonicate for about 20 minutes. Cool, dilute with acetonitrile to volume, and mix. Transfer this solution to a 50-mL centrifuge tube, and centrifuge at 2000 rpm for about 10 minutes. Transfer 10.0 mL of the supernatant to a 50-mL volumetric flask, add 3.0 mL of *Internal standard solution*, dilute with a mixture of water and acetonitrile (70:4) to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 242-nm detector and a 4.5-mm × 10-cm column that contains a 3-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the analyte peak and the internal standard peak is not less than 3.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The retention time, relative to indapamide, is about 1.18 for the internal standard. Calculate the quantity, in mg, of  $C_{16}H_{16}ClN_3O_3S$  in the portion of Tablets taken by the formula:

$$250C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Indapamide RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses of indapamide to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Indigotindisulfonate Sodium

$C_{16}H_8N_2Na_2O_8S_2$  466.35

1*H*-Indole-5-sulfonic acid, 2-(1,3-dihydro-3-oxo-5-sulfo-2*H*-indol-2-ylidene)-2,3-dihydro-3-oxo-, disodium salt.

Sodium 3,3'-dioxo[Δ<sup>2,2'</sup>-biindoline]-5,5'-disulfonate [860-22-0].

» Indigotindisulfonate Sodium contains not less than 96.0 percent and not more than 102.0 per-

cent of sodium indigotinsulfonates, calculated on the dried basis as  $C_{16}H_8N_2Na_2O_8S_2$ .

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** (11)—  
USP Indigotindisulfonate Sodium RS

**Identification**—

**A:** Incinerate a portion of it: the residue responds to the tests for *Sodium* (191) and for *Sulfate* (191).

**B:** The addition of hydrochloric acid to a solution of it changes the color to bluish violet, and further dilution with water restores the original color.

**C:** The addition of 1 N sodium hydroxide to a solution of it changes the color to yellow or olive-brown.

**D:** The addition of sodium chloride to a solution of it produces a blue precipitate.

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 5.0% of its weight.

**Water-insoluble substances**—Dissolve 1.0 g in 100 mL of water, pass through a tared filtering crucible, wash with water until the filtrate is practically colorless, and dry the residue at 105° for 1 hour: the weight of the residue does not exceed 5 mg.

**Arsenic, Method II** (211): 8 ppm.

**Lead**—Place 4.0 g in a Kjeldahl flask, moisten with water, and add 10 mL of sulfuric acid and 5 mL of nitric acid. As soon as the first violent reaction subsides, heat until most of the brown fumes are expelled. Repeat the addition of nitric acid, 1 to 3 mL at a time, and heat until the Indigotindisulfonate Sodium is practically decomposed and most of the organic matter is in solution. Then add, *cautiously and in small portions*, 5 mL of perchloric acid. When the violent reaction subsides, continue the addition of small amounts of nitric acid, and heat as before until a colorless solution is obtained. (If the solution fails to become clear in 10 to 20 minutes after the addition of the perchloric acid, add 1 to 3 mL more of this acid, and continue the nitric acid treatment until the solution is colorless.) Boil for 10 to 15 minutes, cool, and neutralize with 1 N sodium hydroxide. Transfer to a 100-mL volumetric flask, and dilute with water to volume. Five mL of this solution contains not more than 2 µg of lead (corresponding to not more than 0.001%) when tested according to the limit test for *Lead* (251), 3 mL of *Ammonium Citrate Solution*, 1 mL of *Potassium Cyanide Solution*, and 0.5 mL of *Hydroxylamine Hydrochloride Solution* being used.

**Sulfur content**—Place about 25 mg, accurately weighed, in halide-free filter paper measuring about 4 cm square, and fold the paper to enclose it. Proceed as directed under *Oxygen Flask Combustion* (471), using a 1-L flask and using a mixture of 25 mL of water and 5 mL of hydrogen peroxide TS as the absorbing liquid. When the combustion is complete, place a few mL of water in the cup, loosen the stopper, then rinse the stopper, the specimen holder, and the sides of the flask with about 20 mL of water. Add 2 mL of hydrochloric acid, dilute with water to 250 mL, heat to boiling, and slowly add 10 mL of barium chloride TS. Heat the mixture on a steam bath for 1 hour, collect the precipitate of barium sulfate on a filter, wash it until free from chloride, dry, ignite, and weigh. Each g of residue is equivalent to 137.4 mg of sulfur (S). Between 13.0% and 14.0%, calculated on the dried basis, of S is found.

**Assay**—Dissolve about 500 mg of Indigotindisulfonate Sodium, accurately weighed, in dilute hydrochloric acid (1 in 100), and dilute quantitatively and stepwise with the dilute acid to obtain a solution containing about 10 µg per mL. Concomitantly determine the absorbances of this solution and a Standard solution of USP Indigotindisulfonate Sodium RS in the same medium having a known concentration of about 10 µg per mL, in 1-cm cells at the wavelength of

maximum absorbance at about 610 nm, with a suitable spectrophotometer, using dilute hydrochloric acid (1 in 100) as the blank. Calculate the quantity, in mg, of  $C_{16}H_8N_2Na_2O_8S_2$  in the portion of Indigotindisulfonate Sodium taken by the formula:

$$50C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Indigotindisulfonate Sodium RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the solution of Indigotindisulfonate Sodium and the Standard solution, respectively.

## Indigotindisulfonate Sodium Injection

» Indigotindisulfonate Sodium Injection is a sterile solution of Indigotindisulfonate Sodium in Water for Injection. It contains not less than 90.0 percent and not more than 105.0 percent of the labeled amount of  $C_{16}H_8N_2Na_2O_8S_2$ .

**Packaging and storage**—Preserve in single-dose, light-resistant containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Indigotindisulfonate Sodium RS

**Identification**—It responds to *Identification* tests B, C, and D under *Indigotindisulfonate Sodium*.

**Bacterial endotoxins** (85)—It contains not more than 5.0 USP Endotoxin Units per mg of indigotindisulfonate sodium.

**pH** (791): between 3.0 and 6.5.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Quantitatively dilute a portion of Injection, equivalent to about 40 mg of indigotindisulfonate sodium, with dilute hydrochloric acid (1 in 100) to obtain a solution having a known concentration of about 10 µg of indigotindisulfonate sodium per mL. Proceed as directed in the *Assay* under *Indigotindisulfonate Sodium*, beginning with "Concomitantly determine the absorbances." Calculate the quantity, in mg, of  $C_{16}H_8N_2Na_2O_8S_2$  in each mL of the Injection taken by the formula:

$$4(C / V)(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Indigotindisulfonate Sodium RS in the Standard solution; V is the volume, in mL, of Injection taken; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Injection and the Standard solution, respectively.

## Indinavir Sulfate

$C_{36}H_{47}N_5O_4 \cdot H_2SO_4$

711.87

D-erythro-Pentonamide, 2,3,5-trideoxy-N-(2,3-dihydro-2-hydroxy-1H-inden-1-yl)-5-[2-[[[1,1-dimethylethyl]amino]]

carbonyl]-4-(3-pyridinylmethyl)-1-piperazinyl]-2-(phenylmethyl)-, [1(1*S*,2*R*),5(*S*)]-, sulfate (1:1) (salt); ( $\alpha$ *R*, $\gamma$ *S*,2*S*)- $\alpha$ -Benzyl-2-(*tert*-butylcarbamoyl)- $\gamma$ -hydroxy-*N*-[(1*S*,2*R*)-2-hydroxy-1-indanyl]-4-(3-pyridinylmethyl)-1-piperazinevaleramide sulfate (1:1) (salt) [157810-81-6].

## DEFINITION

Indinavir Sulfate contains NLT 98.5% and NMT 101.5% of  $C_{36}H_{47}N_5O_4 \cdot H_2SO_4$ , calculated on the anhydrous, solvent-free basis.

## IDENTIFICATION

- A. INFRARED ABSORPTION** (197M): Maxima at about 3.0–3.1, 5.9, 6.2, and 13.6  $\mu$ m
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- C. IDENTIFICATION TESTS—GENERAL, Sulfate** (191): Meets the requirements  
*Sample solution*: A solution of 10 mg/mL in water

## ASSAY

### PROCEDURE

**Solution A**: Dibutyl ammonium phosphate and water (1:50). Adjust with sodium hydroxide TS to a pH of 6.5  $\pm$  0.5.

**Mobile phase**: Acetonitrile and *Solution A* (9:11)

**Standard solution**: 0.5 mg/mL of USP Indinavir RS in *Mobile phase*

**Sample solution**: 0.6 mg/mL of Indinavir Sulfate in *Mobile phase*

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode**: LC

**Detector**: UV 260 nm

**Column**: 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L7

**Column temperature**: 40°

**Flow rate**: 1 mL/min

**Injection size**: 10  $\mu$ L

### System suitability

**Sample**: *Standard solution*

### Suitability requirements

**Column efficiency**: NLT 4000 theoretical plates

**Tailing factor**: Less than 2.0

**Relative standard deviation**: NMT 1.0%

### Analysis

**Samples**: *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{36}H_{47}N_5O_4 \cdot H_2SO_4$  in the portion taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Indinavir RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Indinavir Sulfate in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of indinavir sulfate, 711.87

$M_{r2}$  = molecular weight of indinavir, 613.79

**Acceptance criteria**: 98.5%–101.5% on the anhydrous, solvent-free basis

## OTHER COMPONENTS

### PROCEDURE 1: CONTENT OF SULFATE

**Solution A**: Methanol and formaldehyde (1000:0.3)

**Diluent**: *Solution A* and water (1:1)

**Sample solution**: 6.25 mg/mL of Indinavir Sulfate in *Diluent*

**Analysis**: Titrate with 0.1 M lead perchlorate VS, using a lead-specific electrode in conjunction with a suitable reference electrode. Each mL of 0.1 M lead perchlorate VS is equivalent to 9.604 mg of sulfate.

**Acceptance criteria**: 13.2%–14.4%, calculated on the anhydrous and solvent-free basis

### PROCEDURE 2: CONTENT OF ALCOHOL

**Standard solution**: 0.001 mL/mL of dehydrated alcohol, in water. [NOTE—Dehydrated alcohol is at 20°.]

**Sample solution**: 4 mg/mL of Indinavir Sulfate in water

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode**: GC

**Detector**: Flame ionization

**Column**: 0.53-mm  $\times$  30-m capillary column with a

1.0- $\mu$ m film of phase G14

### Temperature

**Column**: 35°

**Injector**: 140°

**Detector**: 220°

[NOTE—At the end of each 5-min isothermal run, increase the oven temperature to 200° before adjusting the column temperature to 35° for the next injection.]

**Flow rate**: 10 mL/min

**Carrier gas**: Helium

**Injection size**: 0.1  $\mu$ L

### System suitability

**Sample**: *Standard solution*

### Suitability requirements

**Relative standard deviation**: NMT 2.0%

### Analysis

**Samples**: *Standard solution* and *Sample solution*

Calculate the percentage of alcohol in the portion of Indinavir Sulfate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times D \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of dehydrated alcohol in the *Standard solution* (mL/mL)

$C_U$  = concentration of Indinavir Sulfate in the *Sample solution* (mg/mL)

$D$  = density of alcohol at 20°, 790 mg/mL

**Acceptance criteria**: 5.0%–8.0%

## IMPURITIES

### Inorganic Impurities

- RESIDUE ON IGNITION** (281): NMT 0.1%

### HEAVY METALS (231)

**Standard solution**: Transfer 2 mL of *Standard Lead Solution* (10  $\mu$ g/mL) to a 50-mL color-comparison tube, and dilute with water to 25 mL. Using a pH meter or short-range pH indicator paper as an external indicator, adjust with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 3.0 and 4.0. Dilute with water to 40 mL.

**Sample solution**: Transfer 2 g of Indinavir Sulfate to a 50-mL color-comparison tube, and dissolve in 25 mL of water. Using a pH meter or a suitable short-range pH indicator paper as an external indicator, adjust with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 3.0 and 4.0. Dilute with water to 40 mL.

**Blank solution**: To a 50-mL color-comparison tube, add 25 mL of water. Using a pH meter or a suitable short-range pH indicator paper as an external indicator, adjust with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 3.0 and 4.0. Dilute with water to 40 mL.

**Analysis**: To each tube, add 10 mL of hydrogen sulfide TS, allow to stand for 5 min, and view downward over a white surface.

**Acceptance criteria**: The color of the *Sample solution* is not darker than that of the *Standard solution*, and the intensity of the color of the *Blank solution* is less than or equal to the intensity of that of the *Sample solution*.

### Organic Impurities

#### PROCEDURE

**Solution A**: 0.27 g/L of monobasic potassium phosphate and 1.395 g/L of dibasic potassium phosphate, in water

**Solution B:** Acetonitrile

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	80	20
40	30	70
45	30	70
47	80	20
52	80	20

Diluent: *Solution A* and *Solution B* (1:1)System suitability solution: 0.4 mg/mL of USP Indinavir System Suitability RS in *Diluent*Sample solution: 0.5 mg/mL of Indinavir Sulfate in *Diluent***Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection size: 20 μL

**System suitability**Sample: *System suitability solution***Suitability requirements**

Resolution: NLT 1.8 between indinavir and indinavir related compound C

Tailing factor: More than 0.95 and less than 2.0, determined from the indinavir peak

**Analysis**Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Indinavir Sulfate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

 $r_U$  = peak area response for each impurity $r_T$  = sum of the responses of all the peaks**Acceptance criteria**Individual impurities: See *Impurity Table 1*.

Total impurities: NMT 0.5%

**Impurity Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
<i>cis</i> -Aminoindanol <sup>a</sup>	0.18	0.1
Desnicotinyl indinavir <sup>b</sup>	0.80	0.1
<i>threo</i> -Indinavir <sup>c</sup>	0.98	0.1
Indinavir lactone <sup>d</sup>	1.14	0.1

- OPTICAL ROTATION, Specific Rotation <781S>:** +122° to +129°, at 365 nm, determined on the anhydrous, solvent-free basis

Sample solution: 10 mg/mL in water

- WATER DETERMINATION, Method I <921>:** NMT 1.5%, using 0.25 g

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in tight containers, protected from moisture. Store at 25°, excursions permitted between 15° and 30°.
- USP REFERENCE STANDARDS <11>**  
USP Indinavir RS  
USP Indinavir System Suitability RS

**Indium In 111 Capromab Pendetide Injection**

» Indium In 111 Capromab Pendetide Injection is a sterile, nonpyrogenic, murine monoclonal antibody, 7E11-C 5.3, (CYT-351), an immunoconjugate prepared by specific modification of the carbohydrate groups and covalent binding to the tripeptide linker chelator, glycytyrosyl-(*N*, *E*-diethylenetriaminepentaacetic acid)-lysine hydrochloride that is complexed with <sup>111</sup>In. It contains not less than 90.0 percent and not more than 110.0 percent of the specified amount of <sup>111</sup>In capromab pendetide, expressed in megabecquerels (or millicuries) per mL at the time indicated in the labeling. Other chemical forms of radioactivity do not exceed 10.0 percent of the total radioactivity. Immediately prior to use, the radiolabeling is performed with Indium In 111 Chloride Solution in the presence of a sodium acetate buffer. It contains sodium chloride and buffering agents as stabilizers. The immuno-reactive fraction, determined by a validated method, is not less than 70 percent. The monomer content is not less than 95 percent determined by a validated electrophoretic mobility method.

**Packaging and storage**—Preserve in adequately shielded single-dose containers at controlled room temperature for not more than 8 hours.

**Labeling**—Label it to include the following in addition to the information specified for *Labeling* under *Injections* <1>: the time and date of calibration; the amount of <sup>111</sup>In capromab pendetide as total MBq (or mCi) and concentration of MBq (or mCi) per mL, at the time of calibration; the expiration date and time; and the storage temperature and the statement, "Caution—Radioactive Material." The labeling indicates that, in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of <sup>111</sup>In is 67.2 hours.

**USP Reference standards <11>—**

USP Endotoxin RS

**Bacterial endotoxins <85>—**The limit of endotoxin content is not more than 175/V USP Endotoxin Units per mL of the Injection, when compared with the USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

**pH <791>:** between 5.0 and 7.0.**Radiochemical purity—**

Absorbent: 1-cm × 8-cm instant silica gel strip.

Test solution: a mixture of the Injection and 0.05 M pentetic acid (1:1).

Application volume: 10 μL.

Developing solvent system: 0.9% sodium chloride solution.

**Procedure**—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621) by ascending chromatography. Determine the distribution of radioactivity on the chromatogram by scanning with a suitable collimated radiochromatogram strip scanner, and determine the percentage of radiochemical purity of the test specimen. Not less than 90% of the In 111 activity is present as a band between the  $R_f$  values of 0 and 0.1.

**Other requirements**—It meets the requirements for *Radionuclide identification* and *Radionuclidic purity* under *Indium In 111 Chloride Solution*. It meets also the requirements under *Injections* (1), except that the radioactive component may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the date of manufacture.

**Assay for radioactivity** (821)—Using a suitable counting assembly (see *Selection of a Counting Assembly*), determine the total radioactivity, in MBq (or  $\mu$ Ci), of the unshielded Injection by use of a calibrated system.

## Indium In 111 Chloride Solution

Indium Chloride ( $^{111}\text{InCl}_3$ ).

Indium ( $^{111}\text{In}$ ) trichloride [10025-82-8].

» Indium In 111 Chloride Solution is a sterile, nonpyrogenic solution of radioactive indium ( $^{111}\text{In}$ ) in dilute hydrochloric acid suitable for the radiolabeling of proteins such as monoclonal antibodies, peptides, or small biologically active organic molecules. The concentration of acid and  $^{111}\text{In}$  per mL of Indium In 111 Chloride Solution may require adjustment for the specific antibody or peptide being labeled. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{111}\text{In}$  expressed as megabecquerels (or millicuries) per mL at the time indicated in the labeling. Other chemical forms of radioactivity do not exceed 10.0 percent of the total radioactivity. [NOTE—Indium In 111 Chloride Solution is generally recommended for use with specific antibodies or peptides. Consult the product labeling for recommendations and applications for radiolabeling.]

**Specific activity:** not less than 1.85 gigabecquerels (50 millicuries) per  $\mu\text{g}$  of indium at the date and time of calibration.

**Packaging and storage**—Preserve in single-unit containers at controlled room temperature.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* (1): the time and date of calibration; the amount of  $^{111}\text{In}$  as labeled chloride expressed as total megabecquerels (or millicuries) and the concentration as megabecquerels per mL (or as millicuries per mL) on the date and time of calibration; the expiration date; the statement, "Not for direct administration. Use only as an ingredient for radiolabeling;" and the statement, "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of  $^{111}\text{In}$  is 67.3 hours.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Identification**—Add 1 drop of it to 2 drops of 0.1 M silver nitrate in a glass test tube: a white precipitate is formed (presence of chloride).

**Bacterial endotoxins** (85)—It contains not more than 175/V USP Endotoxin Unit per mL, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

**Acidity**—Pipet 20  $\mu\text{L}$  of Solution into a plastic tube containing 1 drop of bromocresol green, and titrate with 0.0025 N sodium carbonate to a blue endpoint. Calculate the acidity of the Solution by the formula:

$$0.0025 V_T / 20$$

in which  $V_T$  is the volume of titrant consumed: the molarity of the Solution is between 0.035 and 0.045.

**Radionuclide identification** (821)—Its gamma-ray spectrum is identical to that of a specimen of  $^{111}\text{In}$  that exhibits major photopeaks having energies of 0.171 and 0.245 MeV.

**Radionuclidic purity** (821)—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radioactivity of each radionuclidic impurity, in kBq per MBq ( $\mu\text{Ci}$  per mCi) of  $^{111}\text{In}$ , in the Solution by use of a calibrated system as directed under *Radioactivity* (821).

**INDIUM 110M**—The limit of  $^{110\text{m}}\text{In}$  is 3 kBq per MBq (or 3  $\mu\text{Ci}$  per mCi) of  $^{111}\text{In}$ . The presence of  $^{110\text{m}}\text{In}$  in the Solution is demonstrated by a characteristic gamma-ray spectrum with prominent photopeaks having energies of 0.66 and 0.91 MeV.  $^{110\text{m}}\text{In}$  decays with a half-life of 4.9 hours.

**INDIUM 114M**—The limit of  $^{114\text{m}}\text{In}$  is 3 kBq per MBq (or 3  $\mu\text{Ci}$  per mCi) of  $^{111}\text{In}$ .  $^{114\text{m}}\text{In}$  is quantified by counting the beta emissions of ground state  $^{114}\text{In}$  with a beta-liquid scintillation counter having a high-energy channel set to discriminate against all counts arising from  $^{111}\text{In}$ .

**ZINC 65**—The limit of  $^{65}\text{Zn}$  is 3 kBq per MBq (or 3  $\mu\text{Ci}$  per mCi) of  $^{111}\text{In}$ . The presence of  $^{65}\text{Zn}$  in the Solution is demonstrated by a characteristic gamma-ray spectrum with a prominent photopeak at 1.116 MeV.  $^{65}\text{Zn}$  decays with a radioactive half-life of 243.9 days.

**Radiochemical purity**—

**Adsorbent:** instant thin-layer chromatography (ITLC) strips (2.5 cm  $\times$  10 cm).<sup>1</sup>

**Test solution**—Dispense about 50  $\mu\text{L}$  of Solution into 1 mL of 0.05 M hydrochloric acid, taking care to use polypropylene tips prewashed in 0.05 M hydrochloric acid for all dispensings.

**Application volume:** 2  $\mu\text{L}$ . The amount of  $^{111}\text{In}$  spotted should be between 0.5  $\mu\text{Ci}$  and 30  $\mu\text{Ci}$  as of the day of the test.

**Developing solvent system:** a mixture of a 1 in 10 solution of ammonium acetate and methanol (1:1).

**Procedure**—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). Examine the plate with an appropriate scanner, and determine the percentage of radiochemical purity of the *Test solution*. The indium chloride will remain at the origin. Not less than 95% of indium is present as ionic indium.

**Chemical purity**—

**Copper**—Determine the copper, in  $\mu\text{g}$  per mL, in the Solution by atomic absorption spectrometry (see *Spectrophotometry and Light-scattering* (851)), using a graphite furnace to volatilize the copper, as directed by the manufacturer of the instrument used, and measuring the absorbance at 324.8 nm against a standard.

**Nickel**—Determine the nickel, in  $\mu\text{g}$  per mL, in the Solution by atomic absorption spectrometry (see *Spectrophotometry and Light-scattering* (851)), using a graphite furnace to volatilize the nickel, as directed by the manufacturer of the instrument used, and measuring the absorbance at 232.0 nm against a standard.

<sup>1</sup>Type SG impregnated glass microfiber sheet (Gelman Sciences, Ann Arbor, MI).

**Cadmium**—Determine the cadmium, in  $\mu\text{g}$  per mL, in the Solution by atomic absorption spectrometry (see *Spectrophotometry and Light-scattering* (851)), using a graphite furnace to volatilize the cadmium, as directed by the manufacturer of the instrument used, and measuring the absorbance at 228.8 nm against a standard.

**Lead**—Determine the lead, in  $\mu\text{g}$  per mL, in the Solution by atomic absorption spectrometry (see *Spectrophotometry and Light-scattering* (851)), using a graphite furnace to volatilize the lead, as directed by the manufacturer of the instrument used, and measuring the absorbance at 217.0 nm against a standard.

**Mercury**—Determine the mercury, in  $\mu\text{g}$  per mL, in the Solution by atomic absorption spectrometry (see *Spectrophotometry and Light-scattering* (851)), using a graphite furnace to volatilize the mercury, as directed by the manufacturer of the instrument used, and measuring the absorbance at 253.7 nm against a standard.

**Iron**—Determine the iron, in  $\mu\text{g}$  per mL, in the Solution by atomic absorption spectrometry (see *Spectrophotometry and Light-scattering* (851)), using a graphite furnace to volatilize the iron, as directed by the manufacturer of the instrument used, and measuring the absorbance at 248.3 nm against a standard.

**Zinc**—Prepare a zinc stock solution in dilute hydrochloric acid (1 in 100) having a concentration of 1  $\mu\text{g}$  of zinc per mL. Pipet 10 mL of the zinc stock solution into a 100-mL volumetric flask, dilute with water to volume, and mix to obtain a solution having a concentration of 0.1  $\mu\text{g}$  of zinc per mL (*Standard solution A*). Pipet 20 mL of the zinc stock solution into a 100-mL volumetric flask, dilute with water to volume, and mix to obtain a solution having a concentration of 0.2  $\mu\text{g}$  of zinc per mL (*Standard solution B*). Pipet 0.1 mL of Indium Chloride In 111 Solution into a 10-mL volumetric flask, dilute with water to volume, and mix to obtain the test solution. Determine the absorbances of the *Standard solutions* and the test solution at the zinc emission line at 213.9 nm with an atomic absorption spectrophotometer (see *Spectrophotometry and Light-scattering* (851)) equipped with a zinc hollow-cathode lamp and an air-acetylene flame, using water as the blank. Determine the quantity of zinc, in  $\mu\text{g}$  per mL, in the Solution.

The composite total metal ion content is not greater than 1.0  $\mu\text{g}$  per mL.

**Other requirements**—It meets the requirements under *Injections* (1), except that the Solution may be distributed or dispensed prior to completion of the test for *Sterility* (71), the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.

**Assay for radioactivity** (821)—Using a suitable counting assembly (see *Selection of a Counting Assembly*), determine the radioactivity, in MBq (or in microcuries or millicuries) per mL, of the Solution, by the use of a calibrated system.

## Indium In 111 Ibritumomab Tiuxetan Injection

» Ibritumomab Tiuxetan is the immunoconjugate resulting from a stable thiourea covalent bond between the monoclonal antibody Ibritumomab and the linker-chelator tiuxetan [*N*-[2-bis(carboxymethyl)amino]-3-(*p*-isothiocyanato phenyl)propyl]-[*N*-[2-bis(carboxymethyl)amino]-2-(methyl)ethyl]glycine. This chelate provides a high-affinity, conformationally restricted chelation site for Yttrium-90 and Indium-111. The approxi-

mate molecular weight of Ibritumomab Tiuxetan is 148 kD.

Ibritumomab is a murine IgG<sub>1</sub> kappa monoclonal antibody directed against the CD20 antigen, which is found on the surface of normal and malignant B lymphocytes. Ibritumomab is produced in Chinese hamster ovary cells and is composed of two murine gamma 1 heavy chains of 445 amino acids each and two kappa light chains of 213 amino acids each.

Indium In 111 Ibritumomab Tiuxetan Injection is a sterile, nonpyrogenic preparation of the immunoconjugate of ibritumomab and tiuxetan that is labeled with <sup>111</sup>In and is suitable for intravenous administration. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of <sup>111</sup>In as the ibritumomab complex, expressed in megabecquerels (or millicuries) per mL at the time indicated in the labeling. It may contain buffers and stabilizers. It contains no antimicrobial agents. Other chemical forms of radioactivity do not exceed 5 percent of the total radioactivity. The immunoreactive fraction, as determined by a validated method, is not less than 90 percent.

**Packaging and storage**—Preserve in single-dose containers, and store in a refrigerator for not more than 12 hours. [NOTE—Translucent protein particles may develop, which are removed by filtration prior to administration using a 0.22 micron low-protein-binding filter.]

**Labeling**—Label it to include the following in addition to the information specified for *Labeling* under *Injections* (1): the time and date of calibration; the amount of <sup>111</sup>In Ibritumomab Tiuxetan as total MBq (or mCi) and concentration of MBq (or mCi) per mL at the time of calibration; the expiration date and time; the storage temperature; and the statement, "Caution—Radioactive Material." The labeling indicates that, in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of <sup>111</sup>In is 67.3 hours.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Bacterial endotoxins** (85)—The limit of endotoxin content is not more than 175/V USP Endotoxin Units per mL of the Injection, when compared with the USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

**pH** (791): between 5.5 and 7.5.

**Radiochemical purity**—

*Absorbent*: 1- × 8-cm instant silica gel strip.

*Test solution*: the Injection.

*Application volume*: 10  $\mu\text{L}$ .

*Developing solvent system*: 0.9 % sodium chloride solution.

**Procedure**—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621) by ascending chromatography. Determine the distribution of radioactivity on the chromatogram by scanning with a suitable collimated radiochromatogram strip scanner, and determine the percentage of radiochemical purity of the test specimen. Not less than 95% of the In 111 activity is present as a band between the *R<sub>f</sub>* values of 0 and 0.1.

**Other requirements**—It meets the requirements for *Radioisotope identification* and *Radionuclidic purity* under *Indium In 111 Chloride Solution*. It meets also the requirements under *Injections* (1), except that the radioactive component may

be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the date of manufacture.

**Assay for radioactivity** (821)—Using a suitable counting assembly (see *Selection of a Counting Assembly*), determine the total radioactivity, in MBq (or  $\mu\text{Ci}$ ) of the unshielded Injection by use of a calibrated system.

### Indium In 111 Oxyquinoline Solution

» Indium In 111 Oxyquinoline Solution is a sterile, nonpyrogenic, isotonic aqueous solution suitable for the radiolabeling of blood cells, especially leukocytes and platelets, containing radioactive indium ( $^{111}\text{In}$ ) in the form of a complex with 8-hydroxyquinoline, the latter being present in excess. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{111}\text{In}$  as the 8-hydroxyquinoline complex expressed as megabecquerels (millicuries) per mL at the time indicated in the labeling. It may contain sodium chloride, surfactants, and buffers. Other chemical forms of radioactivity do not exceed 10.0 percent of the total radioactivity.

**Specific activity:** not less than 1.85 GBq (50 millicuries) per  $\mu\text{g}$  of indium.

**Packaging and storage**—Preserve in single-unit containers at a temperature between  $15^\circ$  and  $25^\circ$ .

**Labeling**—Label it to contain the following, in addition to the information specified for *Labeling* under *Injections* (1): the time and date of calibration; the amount of  $^{111}\text{In}$  as the 8-hydroxyquinoline complex expressed as total megabecquerels (millicuries) and concentration as megabecquerels (millicuries) per mL on the date and time of calibration; the expiration date; the statement "Not for direct administration. Use only for radiolabeling of leukocytes in vitro. Administer radiolabeled cells subsequently by intravenous injection," and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of  $^{111}\text{In}$  is 67.9 hours.

**Pyrogen**—It meets the requirements of the *Pyrogen Test* (151).

**pH** (791): between 6.5 and 7.5.

**Radionuclide identification** (see *Radioactivity* (821))—Its gamma-ray spectrum is identical to that of a specimen of  $^{111}\text{In}$  that exhibits major photopeaks having energies of 0.171 and 0.245 MeV.

**Radiochemical purity**—Place a suitable volume, about 100  $\mu\text{L}$ , of Solution, dilute with 3 mL of 0.9 percent sodium chloride solution in a separator, and extract with 6 mL of *n*-octanol by vigorous shaking. Allow the phases to separate and then drain the lower, aqueous layer into a suitable stoppered counting tube. Drain the residual, organic layer into a similar counting tube. Rinse the separator with 1 mL of *n*-octanol, and drain this rinse into the counting tube containing the organic layer. Rinse the separator with 5 mL of 2 N hydrochloric acid, and drain this rinse into a third counting tube. Insert the stopper and measure the radioactivity in each of the three tubes in a suitable gamma counter or

ionization chamber calibrated for  $^{111}\text{In}$ . The radiochemical purity is calculated by the formula:

$$(A / B)$$

where *A* is the radioactivity measured in the organic layer and *B* is the sum of the radioactivity measured in the organic, aqueous, and acid solutions. The radioactivity of the 8-hydroxyquinoline complex is not less than 90.0% of the total radioactivity and is found in the organic layer.

**Radionuclidic purity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radioactivity of each radionuclidic impurity, in kBq per MBq ( $\mu\text{Ci}$  per mCi) of  $^{111}\text{In}$ , in the Solution by use of a calibrated system as directed under *Radioactivity* (821).

**INDIUM 114m**—The limit of  $^{114m}\text{In}$  is 3 kBq per MBq (3  $\mu\text{Ci}$  per mCi) of  $^{111}\text{In}$ .  $^{114m}\text{In}$  is quantified by counting the beta emissions of ground state  $^{114}\text{In}$  using a beta-liquid scintillation counter with a high-energy channel set to discriminate against all counts arising from  $^{111}\text{In}$ .

**ZINC 65**—The limit of  $^{65}\text{Zn}$  is 3 kBq per MBq (3  $\mu\text{Ci}$  per mCi) of  $^{111}\text{In}$ . The presence of  $^{65}\text{Zn}$  in the Solution is demonstrated by a characteristic gamma-ray spectrum with a prominent photopeak at 1.116 MeV.  $^{65}\text{Zn}$  decays with a radioactive half-life of 243.9 days.

**Assay for radioactivity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radioactivity, in MBq (mCi) per mL, of Solution by the use of a calibrated system as directed under *Radioactivity* (821).

### Indium In 111 Pentetate Injection

» Indium In 111 Pentetate Injection is a sterile, isotonic solution suitable for intrathecal administration, containing radioactive indium ( $^{111}\text{In}$ ) in the form of a chelate of pentetic acid. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{111}\text{In}$  as the pentetic acid complex expressed in megabecquerels (microcuries or millicuries) per mL at the time indicated in the labeling. It may contain sodium chloride and buffers. Other chemical forms of radioactivity do not exceed 10.0 percent of the total radioactivity.

**Packaging and storage**—Preserve in single-dose containers.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* (1): the time and date of calibration; the amount of  $^{111}\text{In}$  as labeled pentetic acid complex expressed as total megabecquerels (millicuries or microcuries) and concentration as megabecquerels (microcuries or millicuries) per mL on the date and time of calibration; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of  $^{111}\text{In}$  is 2.83 days.

**USP Reference standards** (11)—

USP Endotoxin RS

**Bacterial endotoxins** (85)—It contains not more than 14/V USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which *V* is the maximum recommended total dose, in mL, at the expiration date or time.

**pH** (791): between 7.0 and 8.0.

**Radionuclide identification** (see *Radioactivity* (821))—Its gamma-ray spectrum is identical to that of a specimen of  $^{111}\text{In}$  that exhibits major photopeaks having energies of 0.173 and 0.247 MeV.

**Radiochemical purity**—Place 2  $\mu\text{L}$  to 5  $\mu\text{L}$  of Injection about 17 mm from one end of a 65-  $\times$  97-mm piece of silica gel-impregnated glass microfiber sheet (see under *Reagents* in the section *Reagents, Indicators, and Solutions*) (see also *Chromatography* (621)), and allow to dry. Repeat applications may be made to obtain a suitable count rate. Develop the chromatogram over a suitable period of time by ascending chromatography, using dilute methanol (8.5 in 10), and dry in an oven at  $105 \pm 5^\circ$  for 5 minutes. Determine the radioactivity distribution by scanning the chromatogram with a suitable collimated radiation detector. The radioactivity of the indium pentetic acid complex band is not less than 90.0% of the total radioactivity, and the  $R_f$  value is between 0.8 and 1.0.

**Radionuclidic purity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radioactivity of each radionuclidic impurity, in kBq per MBq ( $\mu\text{Ci}$  per mCi) of  $^{111}\text{In}$ , in the Injection by use of a calibrated system as directed under *Radioactivity* (821).

**INDIUM 114m**—The presence of  $^{114\text{m}}\text{In}$  in the Injection is demonstrated by a characteristic gamma-ray spectrum with prominent photopeaks having energies of 0.192, 0.558, and 0.724 MeV.  $^{114\text{m}}\text{In}$  decays with a radioactive half-life of 49.5 days. The amount of  $^{114\text{m}}\text{In}$  is not greater than 3 kBq per MBq (3  $\mu\text{Ci}$  per mCi) of  $^{111}\text{In}$ .

**ZINC 65**—The presence of  $^{65}\text{Zn}$  in the Injection is demonstrated by a characteristic gamma-ray spectrum with a prominent photopeak at 1.115 MeV.  $^{65}\text{Zn}$  decays with a radioactive half-life of 243.9 days. The amount of  $^{65}\text{Zn}$  is not greater than 3 kBq per MBq (3  $\mu\text{Ci}$  per mCi) of  $^{111}\text{In}$ .

**Other requirements**—It meets the requirements under *Injections* (1), except that the Injection may be distributed or dispensed prior to the completion of the test for *Sterility*, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.

**Assay for radioactivity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radioactivity, in MBq per mL, of Injection by use of a calibrated system as directed under *Radioactivity* (821).

## Indium In 111 Pentetreotide Injection

» Indium In 111 Pentetreotide Injection is a sterile solution, suitable for intravenous administration, containing radioactive indium ( $^{111}\text{In}$ ) in the form of a chelate of pentetreotide. It contains not less than 90.0 percent and not more than 110 percent of the labeled amount of  $^{111}\text{In}$  as the pentetreotide complex expressed in megabecquerels (or in millicuries) per mL at the time indicated in the labeling. It may contain sodium chloride, stabilizers, and buffers. Other forms of radioactivity do not exceed 10.0 percent of the total radioactivity.

**Packaging and storage**—Preserve in single-dose containers.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* (1):

the time and date of calibration; the amount of  $^{111}\text{In}$  as labeled pentetreotide complex expressed as total megabecquerels (or millicuries) and the concentration expressed as megabecquerels (or millicuries) per mL on the date and time of calibration; the expiration date; and the statement, "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and states that the radioactive half-life of  $^{111}\text{In}$  is 67.3 hours.

**USP Reference standards** (11)—

USP Endotoxin RS

**Radionuclide identification** (see *Radioactivity* (821))—Its gamma-ray spectrum is identical to that of a specimen of  $^{111}\text{In}$  that exhibits major photopeaks having energies of 0.171 and 0.245 MeV.

**Bacterial endotoxins** (85)—It contains not more than 175/V USP Endotoxin Unit per mL, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

**pH** (791): between 3.8 and 4.3.

**Radiochemical purity**—

**Solution A**—Dissolve 6.8 g of sodium acetate in 500 mL of water. Adjust with glacial acetic acid to a pH of 5.5, dilute with water to 1000 mL, and mix. Filter through a filter having a porosity of 0.5  $\mu\text{m}$  or less, and degas.

**Solution B**—Use methanol.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed under *Chromatographic system*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 3.9-mm  $\times$  30-cm stainless steel column that contains 10- $\mu\text{m}$  packing L1. It is also equipped with a flow-through gamma-ray detector having a cell volume of about 50  $\mu\text{L}$  and calibrated to provide a linear response within the range of 0.5 to 15 MBq (14 to 400  $\mu\text{Ci}$ ). The column temperature is maintained at  $35^\circ$ . The chromatograph is programmed to provide variable mixtures of *Solution A* and *Solution B*, and the initial flow rate is about 1 mL per minute. The column is equilibrated for at least 15 minutes with a mobile phase consisting of 60% *Solution A* and 40% *Solution B*. After injection, the composition of the mobile phase is changed linearly to 20% *Solution A* and 80% *Solution B* at 20 minutes, then changed to 100% *Solution B* over the next 0.1 minute, and is held at that percentage while the flow rate is increased linearly from 1 to 2 mL over the next 5 minutes, which is the end of the run. Counts are recorded and charted for 25 minutes at about 2-second intervals.

**Procedure**—Constitute the Injection, and allow to stand for 30 minutes. Inject a volume of Injection having an activity of 0.5 to 15 MBq (14 to 400  $\mu\text{Ci}$ ) into the chromatograph, and record the chromatogram. The retention time of the  $^{111}\text{In}$  pentetreotide peak (which should elute as a double peak) is between 4 and 5 relative to that of unbound  $^{111}\text{In}$ . Record the counts for the  $^{111}\text{In}$  pentetreotide, unbound  $^{111}\text{In}$ , other impurity peaks, and a representative baseline segment, and calculate the percentage of radioactivity from  $^{111}\text{In}$  pentetreotide by the formula:

$$100P / (P + O)$$

in which P is the count of the  $^{111}\text{In}$  pentetreotide peak, and O is the count for all other peaks, each being corrected for its corresponding baseline count. The radioactivity of  $^{111}\text{In}$  pentetreotide is not less than 90% of the total radioactivity.

**Radionuclidic purity** (821)—Using a suitable counting assembly (see *Selection of a Counting Assembly*), determine the radioactivity of each radionuclidic impurity, in kBq per MBq (or  $\mu\text{Ci}$  per mCi) of  $^{111}\text{In}$ , in the Injection by use of a calibrated system.

**INDIUM 114m**—The presence of  $^{114\text{m}}\text{In}$  in the Injection is demonstrated by a characteristic gamma-ray spectrum with prominent photopeaks having energies of 0.192, 0.558, and

0.724 MeV.  $^{114m}\text{In}$  decays with a radioactive half-life of 49.5 days. The amount of  $^{114m}\text{In}$  is not greater than 3 kBq per MBq (3  $\mu\text{Ci}$  per mCi) of  $^{111}\text{In}$ .

**ZINC 65**—The presence of  $^{65}\text{Zn}$  in the Injection is demonstrated by a characteristic gamma-ray spectrum with a prominent photopeak at 1.115 MeV.  $^{65}\text{Zn}$  decays with a radioactive half-life of 243.9 days. The amount of  $^{65}\text{Zn}$  is not greater than 3 kBq per MBq (3  $\mu\text{Ci}$  per mCi) of  $^{111}\text{In}$ .

**Other requirements**—It meets the requirements under *Injections* (1), except that the Injection may be distributed or dispensed prior to the completion of the test for *Sterility* (71), the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.

**Assay for radioactivity** (821)—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radioactivity, in MBq per mL of Injection, by use of a calibrated system.

## Indium In 111 Satumomab Pendetide Injection

» Indium In 111 Satumomab Pendetide Injection is a sterile, nonpyrogenic, virus-free preparation of monoclonal antibody B72.3 that is labeled with  $^{111}\text{In}$ . Satumomab pendetide is prepared by site-specific conjugation of the linker-chelator, glycyl-tyrosyl-(*N*,*E*-diethylene triamine pentaacetic acid)-lysine hydrochloride to the oxidized oligosaccharide component of the monoclonal antibody B72.3. Satumomab pendetide is radio-labeled by the addition of a sterile, nonpyrogenic solution of a buffered Indium In 111 Chloride solution. [NOTE—Other chemical forms of indium are not to be used in the radiolabeling.] It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{111}\text{In}$  as labeled satumomab pendetide expressed in megabecquerels (or in millicuries) per mL at the time indicated in the labeling. Other chemical forms of radioactivity do not exceed 10.0 percent of the total radioactivity. It may contain buffers and stabilizers. The immunoreactive fraction, as determined by a validated method, is not less than 60 percent.

**Packaging and storage**—Preserve in adequately shielded single-dose containers, at controlled room temperature.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* (1): the time and date of calibration; the amount of  $^{111}\text{In}$  as labeled satumomab pendetide expressed as total megabecquerels (or millicuries) and concentration as megabecquerels (or millicuries) per mL at the time of calibration; the expiration date; and the statement, "Caution—Radioactive Material." The labeling indicates that, in making dosage calculations, correction is to be made for radioactive decay and also indicates that the radioactive half-life of  $^{111}\text{In}$  is 67.3 hours.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Bacterial endotoxins** (85)—It contains not more than 175/V USP Endotoxin Units per mL of the Injection, when compared with USP Endotoxin RS, in which V is the maxi-

mum recommended total dose, in mL, at the expiration date or time.

**pH** (791): between 5.5 and 6.5.

**Radiochemical purity**—Mix equal parts of Injection with 0.05 M diethylenetriamine pentaacetic acid in a clean glass vial. Apply a drop of this solution 1 cm from the bottom of a 1-cm  $\times$  8-cm instant thin-layer chromatographic silica gel strip. Allow the spot to air-dry, and develop the strip by ascending chromatography, using 0.9% sodium chloride solution as the solvent. Allow the solvent front to migrate 6 cm from the origin. Remove the strip from the solvent, and air-dry. Determine the distribution of radioactivity on the chromatogram by scanning with a suitable collimated radiochromatogram strip scanner, or cut the strip 1.6 cm from the bottom and determine the radioactivity of each piece in a suitable detector. Not less than 90% of the In-111 activity must be present as a band between  $R_f = 0$  and 0.1.

**Other requirements**—It meets the requirements of the tests for *Radionuclide identification* and *Radionuclidic purity* under *Indium In 111 Chloride Solution*. It meets also the requirements under *Injections* (1), except that it may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.

**Assay for radioactivity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radioactivity, in MBq (or  $\mu\text{Ci}$ ) per mL of the Injection by use of a calibrated system, as directed under *Radioactivity* (821).

## Indocyanine Green

$\text{C}_{43}\text{H}_{47}\text{N}_2\text{NaO}_6\text{S}_2$  774.96

1-*H*-Benz[e]indolium, 2-[7-[1,3-dihydro-1,1-dimethyl-3-(4-sulfobutyl)-2*H*-benz[e]indol-2-ylidene]-1,3,5-heptatrienyl]-1,1-dimethyl-3-(4-sulfobutyl)-, hydroxide, inner salt, sodium salt.

2-[7-[1,1-Dimethyl-3-(4-sulfobutyl)benz[e]indolin-2-ylidene]-1,3,5-heptatrienyl]-1,1-dimethyl-3-(4-sulfobutyl)-1*H*-benz[e]indolium hydroxide, inner salt, sodium salt [3599-32-4].

» Indocyanine Green contains not less than 89.0 percent and not more than 100.0 percent of  $\text{C}_{43}\text{H}_{47}\text{N}_2\text{NaO}_6\text{S}_2$ , calculated on the dried basis. It contains not more than 5.0 percent of sodium iodide, calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—  
USP Endotoxin RS  
USP Indocyanine Green RS

**Identification—**

**A:** Incinerate a portion of it: the residue responds to the tests for *Sodium* (191) and for *Sulfate* (191).

**B:** To a solution (1 in 20,000) add 10 drops of 1 N sodium hydroxide, and heat to about 60°. Add 10 drops of hydrogen peroxide TS, and mix: a red color develops within about 4 minutes and, on standing, fades to a pale orange.

**Loss on drying** (731)—Dry it in vacuum at 50° for 3 hours: it loses not more than 6.0% of its weight.

**Arsenic, Method II** (211): 8 ppm.

**Lead**—A 5-mL portion of the solution prepared for the test for *Arsenic* (211) contains not more than 2 µg of lead (corresponding to not more than 0.001%) when tested by the limit test for *Lead* (251), 3 mL of *Ammonium Citrate Solution*, 1 mL of *Potassium Cyanide Solution*, and 0.5 mL of *Hydroxylamine Hydrochloride Solution* being used.

**Sodium iodide**—Dissolve about 200 mg, accurately weighed, in 100 mL of water, add 1 mL of nitric acid, mix, and titrate with 0.01 N silver nitrate VS, determining the endpoint potentiometrically, using silver and glass electrodes. Each mL of 0.01 N silver nitrate is equivalent to 1.499 mg of sodium iodide. Not more than 5.0% of sodium iodide, calculated on the dried basis, is found.

**Other requirements**—Where the label states that Indocyanine Green is sterile, it meets the requirements for *Sterility Tests* (71) and for *Bacterial endotoxins* under *Indocyanine Green for Injection*. Where the label states that Indocyanine Green must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Indocyanine Green for Injection*.

**Assay**—Dissolve a quantity of Indocyanine Green, equivalent to about 100 mg of dried indocyanine green and accurately weighed, in methanol, and dilute quantitatively and stepwise with methanol to obtain a solution containing about 2 µg per mL. Dissolve a quantity of USP Indocyanine Green RS, accurately weighed, in methanol, and dilute quantitatively and stepwise with methanol to obtain a Standard solution having a known concentration of about 2 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 785 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg, of  $C_{43}H_{47}N_2NaO_6S_2$  in the Indocyanine Green taken by the formula:

$$50C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Indocyanine Green RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the solution of Indocyanine Green and the Standard solution, respectively.

## Indocyanine Green for Injection

» Indocyanine Green for Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{43}H_{47}N_2NaO_6S_2$ .

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Endotoxin RS

USP Indocyanine Green RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

**Bacterial endotoxins** (85)—It contains not more than 7.1 USP Endotoxin Units per mg of indocyanine green.

**pH** (791): between 5.5 and 7.5, in a solution (1 in 200).

**Content variation**—Transfer the contents of each of 5 containers individually to separate 100-mL volumetric flasks with the aid of methanol. To each flask add methanol to volume. Dilute the solutions quantitatively and stepwise with methanol, to obtain a concentration of about 2.5 µg per mL. Proceed as directed in the *Assay* under *Indocyanine Green*, beginning with "Concomitantly determine the absorbances." The requirements are met if the content of each of not less than 4 of the containers tested is within the limits specified under *Uniformity of Dosage Units* (905).

**Other requirements**—It responds to the *Identification* tests, and meets the requirements for *Arsenic*, *Lead*, *Sodium iodide*, and *Assay* under *Indocyanine Green*. It meets also the requirements for *Sterility Tests* (71) and for *Labeling* under *Injections* (1).

## Indomethacin

$C_{19}H_{16}ClNO_4$  357.79

1*H*-Indole-3-acetic acid, 1-(4-chlorobenzoyl)-5-methoxy-2-methyl-

1-(*p*-Chlorobenzoyl)-5-methoxy-2-methylindole-3-acetic acid [53-86-1].

» Indomethacin contains not less than 98.0 percent and not more than 101.0 percent of  $C_{19}H_{16}ClNO_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Indomethacin RS

**Identification—**

**A:** *Infrared Absorption* (197M).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 25 µg per mL.

*Medium:* hydrochloric acid in methanol (1 in 120).

Absorptivities at 318 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** Its X-ray diffraction pattern (see *X-ray Diffraction* (941)) conforms to that of USP Indomethacin RS.

**Loss on drying** (731)—Dry it at a pressure below 5 mm of mercury at 100° for 2 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Heavy metals, Method II** (231): 0.002%.

**Assay—**

*Mobile phase*—Prepare a suitable solution of 0.01 M monobasic sodium phosphate and 0.01 M dibasic sodium phosphate in acetonitrile and water (approximately 1:1).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Indomethacin RS in *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

*Assay preparation*—Weigh accurately about 100 mg of Indomethacin, and transfer to a 100-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Pipet 10 mL of this solution into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains 10-μm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency determined from the analyte peak is not less than 500 theoretical plates, and the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>19</sub>H<sub>16</sub>ClNO<sub>4</sub> in the portion of Indomethacin taken by the formula:

$$1000C(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Indomethacin RS in the *Standard preparation*; and *r<sub>u</sub>* and *r<sub>s</sub>* are the peak responses obtained at equivalent retention times from the *Assay preparation* and the *Standard preparation*, respectively.

## Indomethacin Capsules

» Indomethacin Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>19</sub>H<sub>16</sub>ClNO<sub>4</sub>.

**Packaging and storage**—Preserve in well-closed containers.

### USP Reference standards <11>—

USP Indomethacin RS

### Identification—

**A:** Shake a portion of the contents of Capsules, equivalent to about 50 mg of indomethacin, with 10 mL of acetone for about 2 minutes, and filter. Transfer 5 mL of the filtrate to a stoppered flask, add 20 mL of water, and shake for about 2 minutes until a precipitate forms and crystallizes. Filter, and collect the crystals. Dry the crystals in air, then dry at a pressure below 5 mm of mercury at 100° for 2 hours: the IR absorption spectrum of a potassium bromide dispersion of the dried residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Indomethacin RS that has been similarly recrystallized from a solution of 25 mg in 5 mL of acetone.

**B:** Shake a portion of the contents of Capsules, equivalent to about 25 mg of indomethacin, with 25 mL of methanol, and filter. Separately apply 2 μL of the filtrate so obtained (test solution) and 2 μL of a Standard solution in methanol containing 1 mg of USP Indomethacin RS per mL to a suitable thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture, and dry the spots with the aid of a current of air. Develop the chromatogram in a solvent system consisting of a mixture of chloroform and methanol (4:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow it to dry, and locate the spots under short-wavelength UV light: the intensity and *R<sub>F</sub>* value of the principal spot obtained from the test solution correspond to that obtained from the Standard solution.

### Dissolution <711>—

**Medium:** 1 volume of pH 7.2 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*) mixed with 4 volumes of water; 750 mL.

**Apparatus 1:** 100 rpm.

**Time:** 20 minutes.

**Procedure**—Determine the amount of C<sub>19</sub>H<sub>16</sub>ClNO<sub>4</sub> dissolved from UV absorbances at the wavelength of maximum absorbance at about 318 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Indomethacin RS in the same medium.

**Tolerances**—Not less than 80% (*Q*) of the labeled amount of C<sub>19</sub>H<sub>16</sub>ClNO<sub>4</sub> is dissolved in 20 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Procedure for content uniformity**—Transfer the contents of 1 Capsule to a 100-mL volumetric flask, add 10 mL of water, and allow to stand for 10 minutes, swirling occasionally. Add 60 mL of methanol, shake for 10 minutes, dilute with methanol to volume, mix, and centrifuge. Dilute a portion of the clear solution quantitatively and stepwise, if necessary, with a mixture of equal volumes of methanol and pH 7.0 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*) to obtain a solution containing about 25 μg of indomethacin per mL. Concomitantly determine the absorbances of this solution and a Standard solution of USP Indomethacin RS, in the methanol and pH 7.0 phosphate buffer mixture (1:1) having a known concentration of about 25 μg per mL, in 1-cm cells at the wavelength of maximum absorbance at about 318 nm, with a suitable spectrophotometer, using the methanol and pH 7.0 phosphate buffer mixture as the blank. Calculate the quantity, in mg, of C<sub>19</sub>H<sub>16</sub>ClNO<sub>4</sub> in the Capsule taken by the formula:

$$(TC / D)(A_u / A_s)$$

in which *T* is the labeled quantity, in mg, of indomethacin in the Capsule, *C* is the concentration, in μg per mL, of USP Indomethacin RS in the Standard solution, *D* is the concentration, in μg per mL, of indomethacin in the test solution, based upon the labeled quantity per Capsule and the extent of dilution, and *A<sub>u</sub>* and *A<sub>s</sub>* are the absorbances of the solution from the Capsule and the Standard solution, respectively.

### Assay—

**Standard preparation**—Transfer about 25 mg of USP Indomethacin RS, accurately weighed, to a 200-mL volumetric flask, dissolve in 2 mL of methanol, dilute with pH 7.2 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*) to volume, and mix. Transfer 25.0 mL of this solution to a separator, and extract with three 25-mL portions of methylene chloride. Filter the extracts through a pledget of cotton into a 100-mL volumetric flask, rinse the filter with methylene chloride, dilute with methylene chloride to volume, and mix to obtain a *Standard preparation* having a known concentration of about 31 μg per mL.

**Assay preparation**—Transfer, as completely as possible, the contents of not less than 20 Capsules to a suitable tared container, and determine the average content weight per Capsule. Mix the combined contents, and transfer an accurately weighed portion, equivalent to about 25 mg of indomethacin, to a 200-mL volumetric flask, add 2 mL of methanol, shake for 10 minutes, dilute with pH 7.2 phosphate buffer to volume, and mix. Transfer about 50 mL to a centrifuge tube, and centrifuge for 15 minutes. Transfer 25.0 mL of the supernatant to a 125-mL separator, and extract with three 25-mL portions of methylene chloride. Filter the extracts through a pledget of cotton into a 100-mL vol-

umetric flask, rinse the filter with methylene chloride, dilute with methylene chloride to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 318 nm, with a suitable spectrophotometer, using methylene chloride as the blank. Calculate the quantity, in mg, of  $C_{19}H_{16}ClNO_4$  in the portion of Capsules taken by the formula:

$$0.8C(A_U / A_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP Indomethacin RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Indomethacin Extended-Release Capsules

### DEFINITION

Indomethacin Extended-Release Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of indomethacin ( $C_{19}H_{16}ClNO_4$ ).

### IDENTIFICATION

- A.** **Standard solution:** 5 mg/mL of USP Indomethacin RS in acetone

**Sample solution:** Shake a portion of Capsule contents, nominally equivalent to 50 mg of indomethacin, with 10 mL of acetone for about 2 min, and filter.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Transfer 5 mL of each of the *Samples* to individual stoppered flasks, add 20 mL of water to each flask, and shake for 2 min until a precipitate forms and crystallizes. Filter and collect the crystals. Dry the crystals in air, then dry at a pressure below 5 mm of mercury at 100° for 2 h.

**Acceptance criteria:** The IR absorption spectrum of a potassium bromide dispersion of the dried crystals from the *Sample solution* so obtained exhibits maxima only at the same wavelengths as that of a similar preparation from the *Standard solution*.

- B.** **Standard solution:** 1 mg/mL of USP Indomethacin RS in methanol

**Sample solution:** Shake a portion of Capsule contents, nominally equivalent to 25 mg of indomethacin, with 25 mL of methanol, and filter.

#### Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 2  $\mu\text{L}$

**Developing solvent system:** Chloroform and methanol (4:1)

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Dry the spots with the aid of a current of air. Develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow it to dry, and locate the spots under short-wavelength UV light.

**Acceptance criteria:** The intensity and  $R_f$  value of the principal spot of the *Sample solution* correspond to those of the *Standard solution*.

### C.

**Sample solution:** Equivalent to 1 mg/mL of indomethacin in sodium hydroxide solution (0.4 mg/mL) from powdered Capsule contents

**Analysis:** Shake the *Sample solution* for 5 min, and filter. To 1 mL of the clear filtrate add 1 mL of 1 mg/mL sodium nitrite solution, mix, and allow to stand for 5 min. Add 0.5 mL of sulfuric acid.

**Acceptance criteria:** A golden yellow color develops.

### ASSAY

#### PROCEDURE

**Mobile phase:** Methanol, water, and phosphoric acid (600: 400: 0.8)

**Diluent:** Phosphoric acid and water (1:99)

**Standard solution A:** 0.8 mg/mL of USP Indomethacin RS, prepared by dissolving 60% of the flask volume in acetonitrile and diluting with *Diluent* to volume

**Standard stock solution B:** 0.18 mg/mL of 4-chlorobenzoic acid in acetonitrile

**Standard solution B:** 0.0036 mg/mL of 4-chlorobenzoic acid in *Diluent*, from *Standard stock solution B*

**Sample solution:** Weigh and finely powder the contents of NLT 20 Capsules. Transfer a portion of the powder, nominally equivalent to 75 mg of indomethacin, to a 100-mL volumetric flask, add 40 mL of *Diluent*, and shake for 1 h. Sonicate for 15 min, add 40 mL of acetonitrile, sonicate for 15 min, and dilute with acetonitrile to volume. Centrifuge a portion of this solution, and use the filtrate.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 20  $\mu\text{L}$

#### System suitability

**Samples:** *Standard solution A* and *Standard solution B*

#### Suitability requirements

**Column efficiency:** NLT 1000 theoretical plates from the indomethacin peak, *Standard solution A*

**Tailing factor:** NMT 2.0 for the indomethacin peak, *Standard solution A*

**Capacity factor,  $k'$ :** NLT 4.0 for the indomethacin peak, *Standard solution A*; and NLT 0.9 for the 4-chlorobenzoic acid peak, *Standard solution B*

**Relative standard deviation:** NMT 2.0%, *Standard solution A*

#### Analysis

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

Calculate the percentage of indomethacin in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from *Standard solution A*

$C_S$  = concentration of USP Indomethacin RS in *Standard solution A* (mg/mL)

$C_U$  = nominal concentration of indomethacin in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### DISSOLUTION <711>

**Test 1:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

**Medium:** pH 6.2 phosphate buffer (see *Reagents, Indicators, and Solutions*); 750 mL

**Apparatus 1:** 75 rpm

**Times:** 1, 2, 4, 6, 12, and 24 h

**Sample solution:** Sample per *Dissolution* <711>. Dilute with *Medium* as necessary, filtered.

**Standard solution:** USP Indomethacin RS at a known concentration in *Medium*

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** UV

**Analytical wavelength:** 318 nm

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

**Tolerances:** See *Table 1*.

**Table 1**

Time (h)	Amount Dissolved
1	10%–25%
2	20%–40%
4	35%–55%
6	45%–65%
12	60%–80%
24	NLT 80%

The percentages of the labeled amount of indomethacin ( $C_{19}H_{16}ClNO_4$ ) dissolved at the times specified conform to *Acceptance Table 2*.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Apparatus, Sample solution, Standard solution, and**

**Analysis:** Proceed as directed in *Test 1*.

**Medium:** pH 6.2 phosphate buffer (see *Reagents, Indicators, and Solutions*); 900 mL

**Tolerances:** See *Table 2*.

**Table 2**

Time (h)	Amount Dissolved
1	12%–32%
2	27%–52%
4	50%–80%
12	NLT 80%

The percentages of the labeled amount of indomethacin ( $C_{19}H_{16}ClNO_4$ ) dissolved at the times specified conform to *Acceptance Table 2*.

**Test 3:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

**Medium:** pH 6.8 phosphate buffer (see *Reagents, Indicators, and Solutions*); 750 mL

**Apparatus, Sample solution, Standard solution, and**

**Analysis:** Proceed as directed in *Test 1*.

**Tolerances:** See *Table 3*.

**Table 3**

Time (h)	Amount Dissolved
1	15%–40%
2	35%–55%
4	55%–75%
6	65%–85%
12	NLT 75%
24	NLT 85%

The percentages of the labeled amount of indomethacin ( $C_{19}H_{16}ClNO_4$ ) dissolved at the times specified conform to *Acceptance Table 2*.

**Test 4:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

**Medium:** pH 6.2 phosphate buffer (see *Reagents, Indicators, and Solutions*); 900 mL

**Apparatus 1:** 75 rpm

**Times:** 1, 2, 4, 12, and 24 h

**Mobile phase:** Acetonitrile and 0.1% phosphoric acid (60:40)

**Standard stock solution:** 0.4 mg/mL of USP Indomethacin RS in solution prepared as follows. Transfer a suitable amount of USP Indomethacin RS into a suitable volumetric flask. Add 10% of the flask volume of acetonitrile, and sonicate to promote dissolution, if necessary. Dilute with *Medium* to volume.

**Standard solution:** (L/900) mg/mL of USP Indomethacin RS in *Medium* from the *Standard stock solution*, where L is the label claim, in mg

**Sample solution:** Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 235 nm

**Column:** 4.6-mm × 100-mm; 3.5-μm packing L1

**Column temperature:** 40°

**Flow rate:** 1.2 mL/min

**Injection volume:** 10 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 3%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the concentration ( $C_i$ ) of indomethacin ( $C_{19}H_{16}ClNO_4$ ) in the sample withdrawn from the vessel at each time point ( $i$ ):

$$\text{Result} = (r_U/r_S) \times C_S$$

$r_U$  = peak response of indomethacin from the *Sample solution*

$r_S$  = peak response of indomethacin from the *Standard solution*

$C_S$  = concentration of USP Indomethacin RS in the *Standard solution*

Calculate the percentages of the labeled amount ( $Q_i$ ) of indomethacin ( $C_{19}H_{16}ClNO_4$ ) dissolved at each time point  $i$ :

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + [C_1 \times V_S]\} \times (1/L) \times 100$$

$$\text{Result}_i = \{[C_i \times (V - ([i - 1] \times V_S))] + [(C_{[i-1]} + C_{[i-2]} + \dots + C_1) \times V_S]\} \times (1/L) \times 100$$

$C_i$  = concentration of indomethacin in the portion of sample withdrawn at time point  $i$  (mg/mL)

$V$  = volume of the *Medium*, 900 mL

$L$  = label claim of indomethacin (mg/Capsule)

$V_S$  = volume of the *Sample solution* withdrawn from the *Medium* (mL)

**Tolerances:** See *Table 4*.

**Table 4**

Time (h)	Time Point (i)	Amount Dissolved
1	1	10%–30%
2	2	20%–40%
4	3	35%–55%
12	4	60%–80%
24	5	NLT 75%

The percentages of the labeled amount of indomethacin ( $C_{19}H_{16}ClNO_4$ ) dissolved at the times specified conform to *Acceptance Table 2*.

• **UNIFORMITY OF DOSAGE UNITS** (905)

**Analysis for content uniformity**

**Solution A:** Dissolve 17.42 g of dibasic potassium phosphate in 800 mL of water, adjusting with phosphoric acid to a pH of 7.5, and diluting with water to 1000 mL (pH 7.5 phosphate buffer).

**Standard solution:** 25 µg/mL of USP Indomethacin RS in a mixture of methanol and *Solution A* (1:1)

**Sample solution:** 25 µg/mL of indomethacin in a mixture of methanol and *Solution A* (1:1). Prepare as follows. Transfer the contents of 1 Capsule to a 200-mL volumetric flask, and add 100 mL of a mixture of methanol and *Solution A* (1:1). Sonicate until the contents are dispersed, dilute with the methanol and *Solution A* mixture (1:1) to volume, and centrifuge. Dilute a portion of the clear solution with the methanol and *Solution A* mixture (1:1) to obtain the above concentration.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** UV

**Analytical wavelength:** 318 nm

**Cell:** 1 cm

**Blank:** Methanol and *Solution A* (1:1)

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of indomethacin ( $C_{19}H_{16}ClNO_4$ ) in the Capsule taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of USP Indomethacin RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of indomethacin in the *Sample solution* (µg/mL)

**Acceptance criteria:** Meet the requirements

**IMPURITIES**

• **LIMIT OF 4-CHLOROBENZOIC ACID**

**Mobile phase, Diluent, Standard solution A, Standard solution B, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Analysis**

**Samples:** *Standard solution B* and *Sample solution*

Using the peak responses measured and recorded in the *Assay*, calculate the percentage of 4-chlorobenzoic acid ( $C_7H_5ClO_2$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of 4-chlorobenzoic acid in *Standard solution B* (mg/mL)

$C_U$  = measured concentration of indomethacin in the *Sample solution* as determined from the *Assay* (mg/mL)

**Acceptance criteria:** NMT 0.44%

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **LABELING:** The labeling indicates the *Dissolution Test* with which the product complies.

• **USP REFERENCE STANDARDS** (11)

USP Indomethacin RS

## Indomethacin Topical Gel

» Indomethacin Topical Gel contains not less than 0.90 g and not more than 1.10 g of Indomethacin in 100 mL of gel. Prepare Indomethacin Topical Gel as follows:

Indomethacin . . . . .	1.0 g
Carbomer 941 . . . . .	2.0 g
Purified Water . . . . .	10 mL
Alcohol (95% ethyl alcohol), a sufficient quantity to make . . . . .	100 mL

Transfer the Indomethacin to a suitable beaker, and dissolve it in 55 mL of Alcohol. Transfer this solution to a glass mortar, and slowly add the Carbomer 941 so that it is thoroughly distributed. Press out any white lumps until a smooth gel is formed. Slowly add the Purified Water with mixing. Add a sufficient quantity of Alcohol to obtain a final volume of 100 mL, and mix. Transfer the Gel to a wide-mouth container or ointment jar.

**Packaging and storage**—Preserve in tight, light-resistant, wide-mouth containers or ointment jars. Store at controlled room temperature.

**Labeling**—Label it to state that it is for topical, external use only, that it should be used only as directed, and that the container should be kept tightly closed.

**Beyond-use date**—Thirty days after the day on which it was compounded.

## Indomethacin Suppositories

» Indomethacin Suppositories contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{19}H_{16}ClNO_4$ .

**Packaging and storage**—Preserve in well-closed containers, at controlled room temperature.

**USP Reference standards** (11)—

USP Indomethacin RS

**Identification**—

**Standard preparation**—Prepare a solution, containing about 125 µg of USP Indomethacin RS per mL, by first dissolving the Reference Standard in a volume of methanol that is one one-hundredth of the volume of the solution to be prepared, then adding ether to volume, and mixing.

**Test preparation**—Use the ether extract contained in the 200-mL volumetric flask obtained as directed under *Assay preparation* in the *Assay*.

**Procedure**—Separately apply 10 µL each of the *Test preparation* and the *Standard preparation* to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of chloroform and glacial acetic acid (19:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, air-dry, and examine under short-wavelength UV light: the  $R_f$  value of

the principal spot in the chromatogram of the *Test preparation* corresponds to that obtained from the *Standard preparation*.

#### Dissolution <711>—

**Medium:** 0.1 M, pH 7.2 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 60 minutes.

**Procedure**—Determine the amount of  $C_{19}H_{16}ClNO_4$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 320 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Indomethacin RS in the same medium.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{19}H_{16}ClNO_4$  is dissolved in 60 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Procedure for content uniformity**—Place 1 Suppository into a 100-mL volumetric flask containing 80 mL of a solution of methanol and glacial acetic acid (199:1), shake by mechanical means until the Suppository is dissolved, dilute with the methanol-glacial acetic acid solution to volume, and mix. Filter a portion of the solution, discarding the first 15 mL of the filtrate, and dilute an accurately measured volume of the clear filtrate quantitatively and stepwise, if necessary, with the methanol-glacial acetic acid solution to obtain a solution containing about 25 µg of indomethacin per mL. Concomitantly determine the absorbances of this solution and of a Standard solution of USP Indomethacin RS in the same medium having a known concentration of about 25 µg per mL at the wavelength of maximum absorbance at about 320 nm, with a suitable spectrophotometer, using the methanol-glacial acetic acid solution as the blank. Calculate the quantity, in mg, of  $C_{19}H_{16}ClNO_4$  in the Suppository taken by the formula:

$$(TC / D)(A_U / A_S)$$

in which *T* is the labeled quantity, in mg, of indomethacin in the Suppository; *C* is the concentration, in µg per mL, of USP Indomethacin RS in the Standard solution; *D* is the concentration, in µg per mL, of indomethacin in the solution from the Suppository, on the basis of the labeled quantity per Suppository and the extent of dilution; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solution from the Suppository and the Standard solution, respectively.

#### Assay—

**Solvent mixture**—Prepare a solution of methanol and glacial acetic acid (199:1).

**Standard preparation**—Prepare a solution, having a known concentration of about 165 µg of USP Indomethacin RS per mL, by first dissolving an accurately weighed quantity of the Reference Standard in a volume of methanol that is one one-hundredth of the nominal volume of the volumetric flask being used, then adding ether to volume, and mixing. Transfer 15.0 mL of the resulting solution to a 100-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix to obtain a *Standard preparation* having a known concentration of about 25 µg of USP Indomethacin RS per mL.

**Assay preparation**—Weigh, mash, and then mix not less than 10 Suppositories. Transfer an accurately weighed portion of the mass, equivalent to about 25 mg of indomethacin, to a 125-mL separator, add 15 mL of water and 50 mL of ether, and shake until the mass is dissolved. Transfer the ether layer to a 200-mL volumetric flask, extract the aqueous layer with two additional 50-mL portions of ether, and combine the ether extracts in the 200-mL volumetric flask. Discard the aqueous layer. Dilute with *Solvent mixture* to

volume, and mix. Pipet 10 mL of this solution into a 50-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* at the wavelength of maximum absorbance at about 320 nm, with a suitable spectrophotometer, using *Solvent mixture* as a blank. Calculate the quantity, in mg, of  $C_{19}H_{16}ClNO_4$  in the portion of Suppositories taken by the formula:

$$C(A_U / A_S)$$

in which *C* is the concentration, in µg per mL, of USP Indomethacin RS in the *Standard preparation*; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Indomethacin Oral Suspension

» Indomethacin Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of indomethacin ( $C_{19}H_{16}ClNO_4$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards <11>—

USP Indomethacin RS

#### Identification—

**A:** Mix a portion of Oral Suspension, equivalent to about 25 mg of indomethacin, with 25 mL of a 1 in 200 solution of glacial acetic acid in methanol, and filter. Separately apply 2 µL of the filtrate so obtained (test solution) and 2 µL of a Standard solution in methanol containing 1 mg of USP Indomethacin RS per mL to a suitable thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture, and dry the spots with the aid of a current of air. Develop the chromatogram in a solvent system consisting of a mixture of chloroform and glacial acetic acid (19:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow it to dry, and locate the spots under short-wavelength UV light: the intensity and *R<sub>F</sub>* value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**B:** The retention time of the indomethacin peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the Assay.

#### Dissolution <711>—

**Medium:** 0.01 M pH 7.2 phosphate buffer prepared by dissolving 1.36 g of monobasic potassium phosphate in 1 L of water and adjusting with 0.1 N sodium hydroxide to a pH of 7.2 ± 0.1; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 20 minutes.

**Procedure**—Transfer to the surface of the *Medium* in the dissolution vessel an accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, equivalent to about 25 mg of indomethacin. Determine the amount of  $C_{19}H_{16}ClNO_4$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 320 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Indomethacin RS in the same *Medium*. [NOTE—An amount of methanol not to exceed 1.0% of the volume of the Stan-

dard solution may be used to bring the USP Reference Standard into solution prior to dilution with *Medium*, and the solution may be sonicated to effect complete dissolution of the USP Reference Standard.]

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{19}H_{16}ClNO_4$  is dissolved in 20 minutes.

**Uniformity of dosage units** (905)—

FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 2.5 and 5.0.

**Limit of 4-chlorobenzoic acid**—Using the chromatograms obtained as directed for the Assay, calculate the percentage of 4-chlorobenzoic acid ( $C_7H_5ClO_2$ ) in the Oral Suspension taken by the formula:

$$5(C_4 / C_A)(r_A / r_4)$$

in which  $C_4$  is the concentration, in  $\mu\text{g}$  per mL, of 4-chlorobenzoic acid in the *Standard 4-chlorobenzoic acid preparation*;  $C_A$  is the quantity, in mg, of indomethacin ( $C_{19}H_{16}ClNO_4$ ) in the portion of Oral Suspension taken to prepare the *Assay preparation*, determined as directed in the Assay; and  $r_A$  and  $r_4$  are the 4-chlorobenzoic acid peak responses obtained from the *Assay preparation* and the *Standard 4-chlorobenzoic acid preparation*, respectively: not more than 0.44% is found.

**Content of sorbic acid (if present)**—Using the chromatograms obtained as directed for the Assay, calculate the quantity, in mg, of sorbic acid ( $C_6H_8O_2$ ) in each mL of the Oral Suspension taken by the formula:

$$50(C/V)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of sorbic acid in the *Standard indomethacin preparation*;  $V$  is the volume, in mL, of Oral Suspension taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the sorbic acid peak responses obtained from the *Assay preparation* and the *Standard indomethacin preparation*, respectively. It contains between 80% and 120% of the labeled amount.

**Assay**—

**Phosphoric acid solution**—Dilute 2 mL of phosphoric acid with water to make 1000 mL of solution.

**Solvent mixture**—Prepare a solution consisting of a mixture of dehydrated alcohol and butyl alcohol (8:5).

**Mobile phase**—Prepare a suitable mixture of *Phosphoric acid solution* and *Solvent mixture* (610:390), pass through a suitable filter having a 0.5- $\mu\text{m}$  or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard indomethacin preparation**—Transfer about 40 mg of USP Indomethacin RS, accurately weighed, to a 50-mL volumetric flask. Where the Oral Suspension is represented as containing a stated amount of sorbic acid, add 40/ $J$  mg of sorbic acid, accurately weighed,  $J$  being the ratio of the labeled amount, in mg, of sorbic acid to the labeled amount, in mg, of indomethacin per mL of the Oral Suspension. Add 10 mL of *Phosphoric acid solution* and 15 mL of *Solvent mixture*, and sonicate for 5 minutes. Dilute with *Phosphoric acid solution* to volume, and mix. This solution contains about 0.8 mg of USP Indomethacin RS and, where added, about 0.8/ $J$  mg of sorbic acid.

**Standard 4-chlorobenzoic acid preparation**—[NOTE—Prepare this *Standard 4-chlorobenzoic acid preparation* and chromatograph it as directed under *Chromatographic system* and *Procedure* only if the test for *Limit of 4-Chlorobenzoic acid* is being performed.] Dissolve a suitable quantity of 4-chlorobenzoic acid, accurately weighed, in *Solvent mixture* to obtain a solution having a known concentration of about

0.09 mg per mL. Transfer 1.0 mL of this solution to a 50-mL volumetric flask containing 15 mL of *Solvent mixture*, dilute with *Phosphoric acid solution* to volume, and mix. This solution contains about 1.8  $\mu\text{g}$  of 4-chlorobenzoic acid per mL.

**Assay preparation**—Transfer an accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, equivalent to about 40 mg of indomethacin, to a 50-mL volumetric flask, add 15 mL of *Solvent mixture*, and sonicate for 10 minutes. Dilute with *Phosphoric acid solution* to volume, mix, and pass through a suitable filter having a 0.5- $\mu\text{m}$  or finer porosity.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 240-nm detector and an 8-mm  $\times$  10-cm column that contains packing L1. The flow rate is about 3 mL per minute. Chromatograph the *Standard indomethacin preparation*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , for indomethacin is not less than 2.5; the column efficiency determined from the analyte peak is not less than 500 theoretical plates; the resolution,  $R$ , between sorbic acid (where present) and indomethacin is not less than 4.0; the tailing factor for the analyte peak(s) is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph the *Standard 4-chlorobenzoic acid preparation*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , for the 4-chlorobenzoic acid peak, is not less than 1.0; and the relative standard deviation for replicate injections is not more than 2.5%.

**Procedure**—Separately inject equal volumes (about 15  $\mu\text{L}$ ) of the *Standard indomethacin preparation*, the *Standard 4-chlorobenzoic acid preparation*, and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of indomethacin ( $C_{19}H_{16}ClNO_4$ ) in each mL of the Oral Suspension taken by the formula:

$$50(C/V)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Indomethacin RS in the *Standard indomethacin preparation*;  $V$  is the volume, in mL, of Oral Suspension taken; and  $r_U$  and  $r_S$  are the peak responses of the analyte obtained from the *Assay preparation* and the *Standard indomethacin preparation*, respectively.

## Indomethacin Sodium

$C_{19}H_{15}ClNNaO_4 \cdot 3H_2O$  433.82  
1*H*-Indole-3-acetic acid, 1-(4-chlorobenzoyl)-5-methoxy-2-methyl-, sodium salt, trihydrate.  
Sodium 1-(*p*-chlorobenzoyl)-5-methoxy-2-methylindole-3-acetate, trihydrate [74252-25-8].  
Anhydrous 379.78

» Indomethacin Sodium contains not less than 98.0 percent and not more than 101.0 percent of  $C_{19}H_{15}ClNNaO_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must

be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Indomethacin RS

**Identification—**

**A:** It responds to *Identification test B* under *Indomethacin for Injection*.

**B:** Ignite a small amount of it on a platinum wire in a non-luminous flame: an intense yellow flame is produced.

**C:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* as obtained in the *Assay*.

**Loss on drying** (731)—Dry it at 100° for 2 hours at a pressure not exceeding 5 mm of mercury: it loses between 11.5% and 13.5% of its weight.

**Heavy metals, Method II** (231): 0.002%.

**Limit of acetone—**

**Standard solution**—Transfer 1.0 mL of acetone to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 200-mL volumetric flask, dilute with water to volume, and mix. Insert the stopper, and cool in an ice bath.

**Test solution**—Transfer about 100 mg of Indomethacin Sodium, accurately weighed, to a 15-mL centrifuge tube, and dissolve in 1.0 mL of cool water. While vortexing this solution, add 1.0 mL of 0.24 N hydrochloric acid, centrifuge promptly, and filter the supernatant. Collect the filtrate in a suitable tube, cap, and cool in an ice bath.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 3-mm × 1.8-m column that contains support S3. The column temperature is maintained at 165°. The carrier gas is nitrogen. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the capacity factor, *K'*, for acetone is between 4 and 7; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Using the solvent flush technique, with water as the flushing agent, separately inject equal volumes (about 3 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for 6 minutes, and measure the areas for the acetone peaks. Calculate the percentage of acetone in the portion of Indomethacin Sodium taken by the formula:

$$0.79(10 / W_U)(r_U / r_S)$$

in which 0.79 is the specific gravity of acetone; *W<sub>U</sub>* is the quantity, in mg, of Indomethacin Sodium taken to prepare the *Test solution*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the acetone peak areas obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.1% is found.

**Chromatographic purity—**

**Mobile phase, Diluent, and Chromatographic system**—Proceed as directed in the *Assay*.

**Standard preparation**—Transfer 2.0 mL of the *Stock impurity solution*, prepared as directed in the *Assay*, to a 200-mL volumetric flask, dilute with *Diluent* to volume, and mix. Each mL of this *Standard preparation* contains 0.002 mg of 4-chlorobenzoic acid and 0.002 mg of 5-methoxy-2-methyl-3-indoleacetic acid.

**Test preparation**—Use the stock solution used to prepare the *Assay preparation* as directed in the *Assay*.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Test preparation*, record the chromatograms for 25 minutes, and measure the response for the peaks having retention times corresponding to the major peaks obtained in the chromatogram of the *Standard preparation*. The relative standard deviation for replicate injections of the *Standard preparation* is not more than

5.0%. Calculate the percentages of 4-chlorobenzoic acid and of 5-methoxy-2-methyl-3-indoleacetic acid in the portion of Indomethacin Sodium taken by the formula:

$$20(r_U / r_S) / [W_U(1.00 - 0.01L)]$$

in which *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses of the corresponding analytes obtained from the *Test preparation* and the *Standard preparation*, respectively; *W<sub>U</sub>* is the quantity, in mg, of Indomethacin Sodium taken to prepare the *Assay preparation*, as described in the *Assay*; and *L* is the percentage of weight loss obtained in the test for *Loss on drying*: the sum of the percentages of 4-chlorobenzoic acid and 5-methoxy-2-methyl-3-indoleacetic acid does not exceed 0.2%. Calculate the percentage of each peak other than the solvent peak, the main indomethacin peak, the 4-chlorobenzoic acid peak, and the 5-methoxy-2-methyl-3-indoleacetic acid peak in the chromatogram of the *Test preparation* taken by the formula:

$$100r_i / r_t$$

in which *r<sub>i</sub>* is the response of each other peak; and *r<sub>t</sub>* is the sum of the responses of all the peaks, excluding that of the solvent peak: not more than 0.5% of any individual peak is found, and the sum of these individual peaks is not more than 1.0%.

**Other requirements**—Where the label states that Indomethacin Sodium is sterile, it meets the requirements for *Sterility Tests* (71) and for *Pyrogen* under *Indomethacin for Injection*. Where the label states that Indomethacin Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Pyrogen* under *Indomethacin for Injection*.

**Assay—**

**Mobile phase**—Prepare a suitable filtered and degassed mixture of methanol, water, acetonitrile, and phosphoric acid (550: 300:150:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Prepare a sufficient quantity of a mixture of acetonitrile and water (3:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Indomethacin RS quantitatively in *Diluent* to obtain a stock solution containing 0.80 mg per mL. Dilute an accurately measured volume of this stock solution quantitatively with *Diluent* to obtain a solution containing 0.16 mg per mL (*Standard preparation*).

**Assay preparation**—Transfer about 100 mg of Indomethacin Sodium, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix. Transfer 10.0 mL of this stock solution to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**Stock impurity solution**—Dissolve accurately weighed quantities of 4-chlorobenzoic acid and 5-methoxy-2-methyl-3-indoleacetic acid quantitatively in *Diluent* to obtain a solution containing 0.20 mg of each per mL.

**Resolution solution**—Prepare a mixture of the stock solution used to prepare the *Diluent*, the *Standard preparation*, and the *Stock impurity solution* (7:2:1).

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing L1, and is maintained at a temperature of 35 ± 1°. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed under *Procedure*: the capacity factor, *K'*, for the indomethacin peak is not less than 2.5, the column efficiency determined from the indomethacin peak is not less than 3500 theoretical plates, the tailing factor for the indomethacin peak is not more than 1.3, and the resolution, *R*, between the 4-chlorobenzoic acid peak and the 5-methoxy-2-methyl-3-indoleacetic acid peak is not less than 3.5. Chromatograph the *Standard preparation*, and record the peak re-

sponses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

*Procedure*—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of indomethacin sodium ( $C_{19}H_{15}ClNNaO_4$ ) in the portion of Indomethacin Sodium taken by the formula:

$$(379.78 / 357.79)(500C)(r_U / r_S)$$

in which 379.78 and 357.79 are the molecular weights of anhydrous indomethacin sodium and indomethacin, respectively;  $C$  is the concentration, in mg per mL, of USP Indomethacin RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Indomethacin for Injection

» Indomethacin for Injection contains an amount of Indomethacin Sodium equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of indomethacin ( $C_{19}H_{16}ClNO_4$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Endotoxin RS

USP Indomethacin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** *Thin-Layer Chromatographic Identification Test* (201)—

*Test solution*—Dissolve Indomethacin for Injection in methanol to obtain a solution having a concentration of about 5 mg of indomethacin per mL.

*Standard solution:* 5 mg per mL in methanol.

*Developing solvent system:* a mixture of chloroform and glacial acetic acid (19:1).

*Procedure*—Proceed as directed in the chapter, except to dry the spots with the aid of a current of air. The intensity and  $R_f$  value of the principal spot obtained from the *Test solution* correspond to those obtained from the *Standard solution*.

**Bacterial endotoxins**—Using a test solution, prepared by dissolving Indomethacin for Injection in LAL Reagent Water to obtain a concentration of 1.0 mg of indomethacin per mL, proceed as directed under *Bacterial Endotoxins Test* (85). It contains not more than 20.0 USP Endotoxin Units per mg of indomethacin.

**pH** (791): between 5.0 and 7.0, in a solution in water (1 in 2000) containing 0.3 mL of saturated potassium chloride solution per 100 mL.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Limit of 4-chlorobenzoic acid**—

*Mobile phase and Solvent mixture*—Prepare as directed in the *Assay*.

*Standard preparation*—Dissolve a suitable quantity of 4-chlorobenzoic acid, accurately weighed, in acetonitrile to

obtain a solution having a known concentration of about 0.22 mg per mL. Transfer 1.0 mL of this solution to a 500-mL volumetric flask, add 150 mL of acetonitrile, dilute with water to volume, and mix. This solution contains about 0.44  $\mu$ g of 4-chlorobenzoic acid per mL.

*Test preparation*—Use the *Assay preparation*.

*Chromatographic system*—Prepare as directed in the *Assay*. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , for the 4-chlorobenzoic acid peak is not less than 1.0.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the 4-chlorobenzoic acid peak areas. Calculate the percentage of 4-chlorobenzoic acid in the portion of Indomethacin for Injection taken by the formula:

$$10(C_4 / NC_A)(r_U / r_S)$$

in which  $C_4$  is the concentration, in  $\mu$ g per mL, of 4-chlorobenzoic acid in the *Standard preparation*;  $N$  is the number of containers of Indomethacin for Injection taken;  $C_A$  is the quantity, in mg, of indomethacin ( $C_{19}H_{16}ClNO_4$ ) in each container of Indomethacin for Injection taken, determined as directed herein; and  $r_U$  and  $r_S$  are the 4-chlorobenzoic acid peak areas obtained from the *Test preparation* and the *Standard preparation*, respectively: not more than 2.2%, equivalent to not more than 5.0%, calculated as indomethacin, is found.

**Other requirements**—It meets the requirements under *Sterility Tests* (71), *Uniformity of Dosage Units* (905), and for *Labeling* under *Injections* (1).

**Assay**—

*Mobile phase*—Prepare a suitable mixture of methanol, water, and phosphoric acid (600:400:1), and pass through a suitable filter having a 0.5- $\mu$ m or finer porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Solvent mixture*—Prepare a mixture of water, acetonitrile, and phosphoric acid (700:300:1).

*Standard preparation*—Transfer about 20 mg of USP Indomethacin RS, accurately weighed, to a 200-mL volumetric flask, and dissolve in 60 mL of acetonitrile. Dilute with water to volume, and mix.

*Assay preparation*—Select an accurately counted number of containers of Indomethacin for Injection, equivalent to a total of about 10 mg of indomethacin, and constitute each with a volume of *Solvent mixture* sufficient to obtain solutions containing the equivalent of about 0.5 mg of indomethacin per mL. Wash the contents of these containers with the aid of the *Solvent mixture* into a 100-mL volumetric flask. Dilute with *Solvent mixture* to volume, mix, and pass through a filter having a 0.5- $\mu$ m or finer porosity. Use the filtrate as the *Assay preparation*.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 240-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the indomethacin peak is not less than 1500 theoretical plates; the capacity factor,  $k'$ , for the indomethacin peak is not less than 3.5; the tailing factor for the indomethacin peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity,  $C_A$ ,

in mg, of indomethacin ( $C_{19}H_{16}ClNO_4$ ) in each container of Indomethacin for Injection taken by the formula:

$$100(C/N)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Indomethacin RS in the *Standard preparation*;  $N$  is the number of containers of Indomethacin for Injection taken; and  $r_U$  and  $r_S$  are the indomethacin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Insulin

$C_{256}H_{381}N_{65}O_{76}S_6$  5777.54  
Insulin (pig) [12584-58-6].

$C_{254}H_{377}N_{65}O_{75}S_6$  5733.49  
Insulin (ox) [11070-73-8].

» Insulin is a protein that affects the metabolism of glucose. It is obtained from the pancreas of healthy bovine or porcine animals, or both, used for food by humans. Its potency, calculated on the dried basis, is not less than 26.5 USP Insulin Units in each mg; Insulin labeled as purified contains not less than 27.0 USP Insulin Units in each mg, calculated on the dried basis. The proinsulin content, determined by a validated method, is not more than 10 ppm.

NOTE—One USP Insulin Unit is equivalent to 0.0342 mg of pure Insulin derived from beef or 0.0345 mg of pure Insulin derived from pork.

**Packaging and storage**—Preserve in tight containers. Store, protected from light, in a freezer.

**Labeling**—Label it to indicate the one or more animal species to which it is related, as pork, as beef, or as a mixture of pork and beef. If the Insulin is purified, label it as such.

### USP Reference standards (11)—

USP Endotoxin RS  
USP Insulin RS  
USP Insulin (Beef) RS  
USP Insulin (Pork) RS

### Identification—

**A:** The retention time of the insulin peak in the chromatogram of the *Assay preparation* corresponds to the retention time of the appropriate species in the chromatogram of the *Identification preparation*, as obtained in the *Assay*. [NOTE—It may be necessary to inject a mixture of *Assay preparation* and *Identification preparation*.]

**B:** Proceed as directed for *Identification test B* under *Insulin Human*, except to use 1 mg of USP Insulin Reference Standard of the appropriate species to prepare the *Standard digest solution*, to use 1 mg of Insulin to prepare the *Test digest solution*, and to obtain a resolution,  $R$ , between digest fragments II and III of not less than 1.9: meets the requirements.

**Microbial enumeration tests (61) and Tests for specified microorganisms (62)**—The total bacterial count does

not exceed 300 per g, the test being made on a portion of about 0.2 g, accurately weighed.

**Bioidentity**—It meets the requirements of the *Bioidentity test* under *Insulin Assays* (121).

**Bacterial endotoxins (85)**—It contains not more than 10 USP Endotoxin Units in each mg.

**Loss on drying (731)**—Dry about 200 mg, accurately weighed, at 105° for 16 hours: it loses not more than 10.0% of its weight.

### Related compounds—

**Solvent**—Dissolve 28.4 g of anhydrous sodium sulfate in 1000 mL of water. Pipet 2.7 mL of phosphoric acid into this solution, adjust, if necessary, with ethanolamine to a pH of 2.3, and mix.

**Solution A**—Prepare a filtered and degassed mixture of *Solvent* and acetonitrile (82:18).

**Solution B**—Prepare a filtered and degassed mixture of *Solvent* and acetonitrile (50:50).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Proceed as directed in the *Assay*.

**Standard solution A**—Dissolve an accurately weighed quantity of USP Insulin RS of the appropriate species in 0.01 N hydrochloric acid to obtain a solution having a known concentration of about 3.75 mg per mL.

**Standard solution B**—Pipet 1 mL of *Standard solution A* into a 10-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix.

**Standard solution C**—Pipet 1 mL of *Standard solution B* into a 10-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix. [NOTE—These three *Standard solutions* may be stored at room temperature for up to 12 hours and in a refrigerator for up to 48 hours.]

**Test solution**—Transfer about 7.5 mg of Insulin to a suitable capped vial, and add 2.0 mL of 0.01 N hydrochloric acid. Cap the vial, and shake gently to dissolve. Store this solution for not more than 2 hours at room temperature or for not more than 12 hours in a refrigerator.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The column temperature is maintained at 40°, and the flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	81	19	equilibration
0–60	81	19	isocratic
60–85	81→36	19→64	linear gradient
85–91	36	64	isocratic
91–92	36→81	64→19	linear gradient

Adjust the *Mobile phase* composition and the duration of the isocratic elution to obtain a retention time of about 31 minutes for insulin, with the A-21 desamido insulin eluting just prior to the start of the gradient elution phase. Chromatograph *Standard solutions A, B, and C*, record the chromatograms, and measure the peak responses as directed for *Procedure*: calculate the factor  $X_1$  by the formula:

$$10(r_B / r_A)$$

in which  $r_B$  and  $r_A$  are the areas of the peak responses obtained for *Standard solution B* and *Standard solution A*, re-

spectively. The value of  $X_1$  is between 0.91 and 1.09. Calculate the factor  $X_2$  by the formula:

$$100(r_C / r_A)$$

in which  $r_C$  and  $r_A$  are the areas of the peak responses obtained for *Standard solution C* and *Standard solution A*, respectively. The value of  $X_2$  is between 0.7 and 1.3. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between insulin and A-21 desamido insulin is not less than 2.0; and the tailing factor for the insulin peak is not more than 1.8.

**Procedure**—Inject a volume (about 20  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas of the responses for the main insulin peak, the A-21 desamido insulin peak, and the peaks from any other impurities. Calculate the percentage of insulin, %, in the portion of Insulin taken by the formula:

$$100(r_I / r_S)$$

in which  $r_I$  is the peak response for insulin, and  $r_S$  is the sum of the responses for all of the peaks. Calculate the percentage of A-21 desamido insulin, %D, in the portion of Insulin taken by the formula:

$$100(r_D / r_S)$$

in which  $r_D$  is the peak response for A-21 desamido insulin, and  $r_S$  is the sum of the responses for all of the peaks. Calculate the percentage of other insulin related compounds in the portion of Insulin taken by the formula:

$$100 - (\%I + \%D).$$

Not more than 10.0% of A-21 desamido insulin is found, and not more than 5.0% of other insulin related compounds is found. For Insulin derived from a single species, measure the responses of any peaks corresponding to beef or pork insulin, and calculate their concentration as a percentage of  $r_S$ : the amount of cross-contamination is not more than 1.0%.

#### Limit of high molecular weight proteins—

**Arginine solution**—Prepare a solution of L-arginine in water containing 1 mg per mL.

**Mobile phase**—Prepare a filtered and degassed mixture of *Arginine solution*, acetonitrile, and glacial acetic acid (65:20:15). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Resolution solution**—Dissolve 4 mg of Insulin containing more than 0.4% high molecular weight proteins in 1 mL of 0.01 N hydrochloric acid. Store this solution in a refrigerator, and use within 7 days. [NOTE—Insulin containing the indicated percentage of high molecular weight proteins may be prepared by allowing Insulin to stand at room temperature for about 5 days.]

**Test solution**—Transfer about 4 mg of Insulin to a small vial, add 1 mL of 0.01 N hydrochloric acid, and mix to dissolve. Store in a refrigerator, and use within 7 days.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 276-nm detector and a 7.8-mm  $\times$  30-cm column that contains packing L20. The flow rate is about 0.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the retention times are between 13 and 17 minutes for the polymeric insulin complexes, about 17.5 minutes for the covalent insulin dimer, and between 18 and 22 minutes for the insulin monomer, with salts eluting after the insulin monomer; and the ratio of the height of the covalent insulin dimer peak to the height of the valley between the covalent insulin dimer peak and the insulin monomer peak is not less than 2.0.

**Procedure**—Inject a volume (about 100  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas of the peak responses, disregarding any peaks having retention times greater than that of the insulin monomer. Calculate the percentage of high molecular weight proteins in the portion of Insulin taken by the formula:

$$100\Sigma r_H / (\Sigma r_H + r_M)$$

in which  $\Sigma r_H$  is the sum of the responses for all peaks having retention times less than that of the insulin monomer, and  $r_M$  is the peak response of the insulin monomer: not more than 1.0% is found.

**Zinc content** (591)—Determine the zinc content of about 10 mg of it, accurately weighed: not more than 1.0% is found, calculated on the dried basis.

#### Assay—

**Mobile phase**—Dissolve 28.4 g of anhydrous sodium sulfate in 1000 mL of water, pipet 2.7 mL of phosphoric acid into the solution, and adjust with ethanolamine to a pH of 2.3 if necessary. Prepare a filtered and degassed mixture of this solution and acetonitrile (74:26). The acetonitrile is warmed to a temperature equal to or higher than 20° to avoid precipitation. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Dissolve about 1.5 mg of Insulin in 1.0 mL of 0.01 N hydrochloric acid. Allow to stand at room temperature for not less than 3 days to obtain a solution containing not less than 5% of A-21 desamido insulin.

NOTE—The following *Identification preparation*, *Standard preparation*, and *Assay preparation* may be stored at room temperature for up to 12 hours or in a refrigerator for up to 48 hours.

**Identification preparation**—Prepare a solution of USP Insulin (Pork) RS and USP Insulin (Beef) RS in 0.01 N hydrochloric acid containing about 0.6 mg of each per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Insulin RS of the appropriate species in 0.01 N hydrochloric acid to obtain a solution having a known concentration of about 1.5 mg per mL.

**Assay preparation**—Transfer about 15 mg of Insulin, accurately weighed, to a 10-mL volumetric flask, and dissolve in and dilute with 0.01 N hydrochloric acid to obtain a solution having a concentration of about 1.5 mg per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L1. The column temperature is maintained at 40°, and the flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.6%. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between insulin and A-21 desamido insulin is not less than 2.0; and the tailing factor for the insulin peak is not more than 1.8.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Assay preparation*, the *Identification preparation*, and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the peak responses for insulin and A-21 desamido insulin, using the chromatogram of the *Identification preparation* to identify the insulin peaks. For Insulin derived from a single species, calculate the potency on the undried basis, in USP Insulin Units per mg, of the Insulin in the *Assay preparation* by the formula:

$$(C_S / C_U)(\Sigma r_U / \Sigma r_S)$$

in which  $C_S$  is the concentration, in USP Insulin Units per mL, of USP Insulin RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of Insulin in the *Assay preparation*; and  $\Sigma r_U$  and  $\Sigma r_S$  are the sums of the areas of the insulin

and A-21 desamido insulin peaks obtained from the chromatograms of the *Assay preparation* and the *Standard preparation*, respectively. From the value obtained in the test for *Loss on drying*, calculate the potency on the dried basis. For Insulin derived from a mixture of beef and pork, calculate the total potency as the sum of the potencies of the beef- and pork-derived insulins, determined separately.

## Insulin Injection

» Insulin Injection is an isotonic, sterile solution of Insulin. It has a potency of not less than 95.0 percent and not more than 105.0 percent of the potency stated on the label, expressed in USP Insulin Units.

**Packaging and storage**—Preserve in the unopened multiple-dose container provided by the manufacturer. Do not repack. Store in a refrigerator, protect from sunlight, and avoid freezing.

**Labeling**—Label it to indicate the one or more animal species to which it is related, as pork, as beef, or as a mixture of pork and beef. If the Insulin Injection is made from Insulin that is purified, label it as such. Label it to state that it is to be stored in a refrigerator and that freezing is to be avoided. The label states the potency in USP Insulin Units per mL.

### USP Reference standards (11)—

USP Endotoxin RS  
USP Insulin RS  
USP Insulin (Beef) RS  
USP Insulin (Pork) RS

**Identification**—The retention time of the insulin peak in the chromatogram of the *Assay preparation* corresponds to the retention time of the appropriate species in the chromatogram of the *Identification preparation*, as obtained in the *Assay*. [NOTE—It may be necessary to inject a mixture of *Assay preparation* and *Identification preparation*.]

**Bacterial endotoxins** (85)—It contains not more than 80 USP Endotoxin Units for each 100 USP Insulin Units.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 7.0 and 7.8, determined potentiometrically.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Zinc content** (591): between 10 and 40 µg for each 100 USP Insulin Units of appropriate species.

### Limit of high molecular weight proteins—

*Arginine solution, Mobile phase, System suitability solution, and Chromatographic system*—Proceed as directed in the test for *Limit of high molecular weight proteins* under *Insulin*.

*Test solution*—Quantitatively add 4 µL of 6 N hydrochloric acid per mL of an accurately measured volume of Injection, and mix.

*Procedure*—Proceed as directed for *Procedure* in the test for *Limit of high molecular weight proteins* under *Insulin*. Not more than 2.0% is found.

**Other requirements**—It meets the requirements under *Injections* (1).

### Assay—

*Mobile phase, Identification preparation, Standard preparation, System suitability solution, and Chromatographic system*—Proceed as directed in the *Assay* under *Insulin*.

NOTE—The *Identification preparation*, *Standard preparation*, and *Assay preparation* may be stored at room temperature for up to 12 hours or in a refrigerator for up to 48 hours.

*Assay preparation 1* (for Injection labeled as containing 40 USP Insulin Units per mL)—Add 2.5 µL of 9.6 N hydrochloric acid per mL of an accurately measured volume of Injection. Allow the suspension, if present, to clarify, and mix.

*Assay preparation 2* (for Injection labeled as containing 100 USP Insulin Units per mL)—Add 2.5 µL of 9.6 N hydrochloric acid per mL of an accurately measured volume of Injection. Allow the suspension, if present, to clarify, and mix. [NOTE—Pooling of several package units may be necessary to obtain sufficient volume of the test specimen.] Pipet 2 mL of this solution into a 5-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix.

*Procedure*—Separately inject equal volumes (about 20 µL) of the appropriate *Assay preparation*, the *Identification preparation*, and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the peak responses for insulin and A-21 desamido insulin, using the chromatogram of the *Identification preparation* to identify the insulin peaks. For Insulin Injection prepared from a single species, calculate the potency, in USP Insulin Units per mL, of the Injection taken by the formula:

$$(CD)(\Sigma r_U / \Sigma r_S)$$

in which C is the concentration, in USP Insulin Units per mL, of USP Insulin RS in the *Standard preparation*; D is the dilution factor; and  $\Sigma r_U$  and  $\Sigma r_S$  are the sums of the areas of the insulin and A-21 desamido insulin peaks obtained from the chromatograms of the *Assay preparation* and the *Standard preparation*, respectively. For Injection prepared from a mixture of beef and pork insulins, calculate the total potency as the sum of the potencies of both beef and pork insulins, determined as directed above.

## Insulin Human

C<sub>257</sub>H<sub>383</sub>N<sub>65</sub>O<sub>77</sub>S<sub>6</sub> 5807.57  
Insulin (human) [11061-68-0].

» Insulin Human is a protein corresponding to the active principle elaborated in the human pancreas that affects the metabolism of carbohydrate (particularly glucose), fat, and protein. It is derived by enzymatic modification of insulin from pork pancreas in order to change its amino acid sequence appropriately, or produced by microbial synthesis via a recombinant DNA process. Its potency, calculated on the dried basis, is not less than 27.5 USP Insulin Human Units in each mg. The proinsulin content of Insulin Human derived from pork, determined by a validated method, is not more than 10 ppm. The host cell derived proteins content of Insulin Human derived from a recombinant DNA process, determined by an appropriate and validated method, is not more than 10 ppm. The host cell or vector derived DNA content and limit of Insulin Human derived from a recombinant DNA process that utilizes eukaryotic host cells are determined by a validated method.

NOTE—One USP Insulin Human Unit is equivalent to 0.0347 mg of pure Insulin Human.

**Packaging and storage**—Preserve in tight containers. Store in a freezer, and protect from light.

**Labeling**—Label it to indicate that it has been prepared by microbial synthesis or that it is derived by enzymatic modification of insulin from pork pancreas.

**USP Reference standards** (11)—  
USP Endotoxin RS  
USP Insulin Human RS

**Identification—**

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** Determine the peptide fragments, using the following peptide mapping procedure.

*Sulfate buffer*—Mix equal volumes of 2.0 M ammonium sulfate and 0.5 M sulfuric acid, and filter.

*Enzyme solution*—Prepare a solution of *Staphylococcus aureus* V-8 protease in water having an activity of 500 units per mL.

*HEPES buffer*—Dissolve 2.38 g of HEPES (N-2-hydroxyethylpiperazine-N'-2-ethanesulfonic acid) in about 90 mL of water in a 100-mL volumetric flask. Adjust with 5 M sodium hydroxide to a pH of 7.5, dilute with water to volume, and mix.

*Solution A*—Prepare a filtered and degassed mixture of 100 mL of acetonitrile, 700 mL of water, and 200 mL of *Sulfate buffer*.

*Solution B*—Prepare a filtered and degassed mixture of 400 mL of acetonitrile, 400 mL of water, and 200 mL of *Sulfate buffer*.

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments, if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard digest solution*—Dissolve about 6 mg of USP Insulin Human RS in 3 mL of 0.01 N hydrochloric acid, and transfer 500 µL of the resulting solution to a clean vial. Add 2.0 mL of *HEPES buffer* and 400 µL of *Enzyme solution*, and incubate at 25° for 6 hours. Quench the digestion by adding 2.9 mL of *Sulfate buffer*.

*Test digest solution*—To 1 mg of Insulin Human add 500 µL of 0.01 N hydrochloric acid, and mix to dissolve. Proceed as directed for *Standard digest solution*, beginning with "Add 2.0 mL of *HEPES buffer*".

*Chromatographic system* (see *Chromatography* (621))—A liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 10-cm column that contains packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	90	10	equilibration
0–60	90→30	10→70	linear gradient
60–65	30→0	70→100	linear gradient
65–70	0	100	isocratic
70–71	0→90	100→10	linear gradient
71–86	90	10	re-equilibration

Chromatograph the *Standard digest solution*, and record the peak responses as directed for *Procedure*: the chromatogram of the *Standard digest solution* corresponds to that of the standard chromatogram provided with USP Insulin Human RS. For the chromatogram of the *Standard digest* the tailing

factor is not greater than 1.5; and the resolution, *R*, is not less than 3.4 for digest fragments II and III.

[NOTE\*—Fragment I elutes at the same time in insulin derived from pork and Insulin Human; Fragment II elutes at the same time in all insulins; and Fragment III elutes at the same time in insulin derived from beef and pork.]

*Procedure*—Using the gradient program, run a blank. Inject equal volumes of the *Standard digest solution* and the *Test digest solution* into the chromatograph, and record the chromatograms. The chromatographic profile of the *Test digest solution* corresponds to that of the *Standard digest solution*.

**Bioidentity**—It meets the requirements of the *Bioidentity test* under *Insulin*.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—The total bacterial count does not exceed 300 cfu per g, the test being performed on a portion of about 0.2 g, accurately weighed.

**Bacterial endotoxins** (85)—It contains not more than 10 USP Endotoxin Units in each mg.

**Loss on drying** (731)—Dry about 200 mg, accurately weighed, at 105° for 16 hours: it loses not more than 10.0% of its weight.

**Related compounds**—Proceed as directed for the *Related compounds test* under *Insulin* except to use the following gradient elution program. The program initially calls for isocratic elution for about 36 minutes with a *Mobile phase* consisting of a mixture of 78% *Solution A* and 22% *Solution B*. Following the gradient elution phase, the system is returned to the initial conditions of 78% *Solution A* and 22% *Solution B*. Adjust the composition of the *Mobile phase* so that the retention time of the main insulin human peak is between 15 and 25 minutes. The content of A-21 desamido insulin and of other insulin related compounds is not more than 2.0% each of the total amount of insulin and total related compounds.

**Limit of high molecular weight proteins**—Proceed as directed in the test for *Limit of high molecular weight proteins* under *Insulin*. Not more than 1.0% is found.

**Other requirements**—It meets the requirements for *Zinc content* under *Insulin*.

**Assay—**

*Mobile phase*, *Standard preparation*, *Assay preparation*, *System suitability solution*, *Chromatographic system*, and *Procedure*—Proceed as directed in the *Assay* under *Insulin* except to use USP Insulin Human RS and otherwise substitute Insulin Human for Insulin throughout.

**Insulin Human Injection**

» Insulin Human Injection is an isotonic sterile solution of Insulin Human in Water for Injection. It has a potency of not less than 95.0 percent and not more than 105.0 percent of the potency stated on the label, expressed in USP Insulin Human Units in each mL.

**Packaging and storage**—Preserve in a refrigerator. Protect from sunlight. Avoid freezing. Dispense it in the unopened, multiple-dose container in which it was placed by the manufacturer.

**Labeling**—The labeling states that it has been prepared either with Insulin Human derived by enzyme modification of

\*Fragment I consists of amino acids A5 to A17 and B1 to B13. Fragment II consists of amino acids A18 to A21 and B14 to B21. Fragment III consists of amino acids B22 to B30. Fragment IV consists of amino acids A1 to A4. A refers to the A-chain of Insulin Human, and B refers to the B-chain of Insulin Human.

pork pancreas Insulin or with Insulin Human obtained from microbial synthesis, whichever is applicable. Label it to state that it is to be stored in a refrigerator and that freezing is to be avoided. The label states the potency in USP Insulin Human Units per mL.

**USP Reference standards** <11>—

USP Endotoxin RS

USP Insulin Human RS

USP Insulin (Pork) RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** <85>—It contains not more than 80 USP Endotoxin Units for each 100 USP Insulin Human Units.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Particulate matter** <788>: meets the requirements for small-volume injections.

**Limit of high molecular weight proteins**—Proceed as directed in the test for *Limit of high molecular weight proteins* under *Insulin Injection*: not more than 1.7% is found.

**Other requirements**—It meets the requirements under *Injections* <1> and for *pH* and *Zinc content* under *Insulin Injection*.

**Assay**—

*Mobile phase, System suitability solution, and Chromatographic system*—Proceed as directed in the *Assay* under *Insulin*.

*Standard preparation*—Prepare as directed in the *Assay* under *Insulin Human*.

*Assay preparations*—Prepare as directed in the *Assay* under *Insulin Injection*.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the appropriate *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the peak responses for insulin and A-21 desamido insulin. Calculate the potency, in USP Insulin Human Units per mL, of the *Injection* taken by the formula:

$$(CD)(\Sigma r_U / \Sigma r_S)$$

in which *C* is the concentration, in USP Insulin Human Units per mL, of USP Insulin Human RS in the *Standard preparation*; *D* is the dilution factor; and  $\Sigma r_U$  and  $\Sigma r_S$  are the sums of the areas of the insulin and A-21 desamido insulin peaks obtained from the chromatograms of the *Assay preparation* and the *Standard preparation*, respectively.

## Human Insulin Isophane Suspension and Human Insulin Injection

» Human Insulin Isophane Suspension and Human Insulin Injection is a sterile buffered suspension of Insulin Human, complexed with Protamine Sulfate, in a solution of Insulin Human. Its potency, based on the sum of its insulin and desamido insulin components, as determined in the *Assay*, is not less than 95.0 percent and not more than 105.0 percent of the potency stated on the label, expressed in USP Insulin Human Units in each mL.

**Packaging and storage**—Preserve in the unopened, multiple-dose container provided by the manufacturer. Store in a refrigerator, protect from sunlight, and avoid freezing.

**Labeling**—The *Injection* container label states that the *Injection* is to be properly resuspended before use. Label it to indicate that it has been prepared with Insulin Human of semisynthetic origin (i.e., derived by enzyme modification of pork pancreas insulin) or with Insulin Human of recombinant DNA origin (i.e., obtained from microbial synthesis), whichever is applicable. Label it to state that it is to be stored in a refrigerator and that freezing is to be avoided. The label states the potency in USP Insulin Human Units per mL and the percent ratio of human insulin isophane suspension to soluble human insulin *Injection*.

**USP Reference standards** <11>—

USP Endotoxin RS

USP Insulin Human RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** <85>—It contains not more than 80 USP Endotoxin Units per 100 USP Insulin Human Units.

**Sterility** <71>—It meets the requirements of the test for *Sterility* under *Isophane Insulin Suspension*.

**pH** <791>: between 7.0 and 7.8, determined potentiometrically.

**Zinc content** <591>: between 0.02 mg and 0.04 mg for each 100 USP Insulin Human Units.

**Limit of high molecular weight proteins**—Proceed as directed in the test for *Limit of high molecular weight proteins* under *Insulin Injection*: not more than 3.0% is found.

**Soluble insulin human content**—[NOTE—Use one of the two methods listed below.]

METHOD 1—

*Mobile phase, System suitability solution, and Chromatographic system*—Proceed as directed in the *Assay* under *Insulin*.

*Soluble insulin test solution*—Maintain the temperature at  $25 \pm 1^\circ$  throughout the procedure. Transfer 5.0 mL of the *Injection* to a centrifuge tube. Add 20  $\mu$ L of 1 N sodium hydroxide, and adjust with 0.05 N hydrochloric acid or 0.05 N sodium hydroxide to a pH of  $8.20 \pm 0.02$  if the total zinc concentration is approximately 20  $\mu$ g per mL or adjust to a pH of  $8.35 \pm 0.02$  if the total zinc concentration is approximately 30  $\mu$ g per mL. Record the volume, in  $\mu$ L, of acid or base needed to adjust the pH. Mix, and allow to stand for 1 hour. Centrifuge, transfer the supernatant to another centrifuge tube, and repeat the centrifugation. Transfer 2 mL of the supernatant to another tube, add 5  $\mu$ L of 9.6 N hydrochloric acid, and mix.

*Total insulin test solution*—Transfer 2 mL of *Injection* to a suitable vessel, add 5  $\mu$ L of 9.6 N hydrochloric acid, and allow the suspension to clarify. Dilute the resulting solution with 0.01 N hydrochloric acid to the same theoretical concentration of insulin as the *Soluble insulin test solution* (e.g., if the *Injection* is labeled to contain 20% soluble insulin, the dilution factor is  $100/20 = 5$ ).

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Soluble insulin test solution* and *Total insulin test solution* into the chromatograph, record the chromatograms, and measure the peak responses for insulin and A-21 desamido insulin. Calculate the amount of soluble insulin human as a percent of the total insulin content of the *Injection* by the formula:

$$(100/D)[(5020 + V_A)/5000](r_S / r_T)$$

in which *D* is the dilution factor for the *Total insulin test solution*; *V<sub>A</sub>* is the number of  $\mu$ L added to adjust the pH of the *Soluble insulin test solution*; and *r<sub>S</sub>* and *r<sub>T</sub>* are the responses of the *Soluble insulin test solution* and the *Total insulin test solution*, respectively. The percent of soluble insulin human is in the range  $L \pm 5$ , where *L* is the percent of soluble insulin human stated on the product label.

## METHOD 2—

**Mobile phase**—Proceed as directed in the Assay under Insulin.

**0.1 M Tris buffer solution**—Dissolve  $3.54 \pm 0.01$  g of Tris(hydroxymethyl)aminomethane hydrochloride and  $3.34 \pm 0.01$  g of Tris(hydroxymethyl)aminomethane in 500 mL of water. The pH of the 0.1 M Tris buffer solution must be between 8.15 and 8.35. If the pH is outside of this range, discard the solution and prepare fresh; do not adjust the pH.

**System suitability solution**—Dissolve about 0.14 mg of Insulin in 1.0 mL of 0.01 N hydrochloric acid. Allow to stand at room temperature for not less than 3 days to obtain a solution containing not less than 5% of A-21 desamido insulin.

**Soluble insulin test solution**—Dilute a suitable volume of Injection with 0.1 M Tris buffer solution to obtain a solution containing about 6 USP Insulin Human Units of soluble insulin per mL (e.g., 2 mL of 70/30 Human Insulin Isophane Suspension and Human Insulin Injection containing 100 USP Insulin Human Units per mL would be diluted with 8 mL of 0.1 M Tris buffer solution to obtain a filtrate that contains 6 USP Insulin Human Units of soluble insulin per mL). Immerse the container in a water bath at  $25 \pm 1^\circ$  for  $30 \pm 2$  minutes. Immediately pass this solution through a 0.2- $\mu$ m filter using a disposable syringe. Transfer 2 parts of the filtrate to a suitable vessel, and add 1 part 0.2 N hydrochloric acid (e.g., the dilution factor for the Soluble insulin test solution that contains 30% soluble insulin is  $5 \times 3/2 = 7.5$ ).

**Total insulin test solution**—For each mL of Injection, add 3.0  $\mu$ L of 9.6 N hydrochloric acid, mix, and allow the suspension to clarify. Dilute the resulting solution with 0.01 N hydrochloric acid to 4 USP Insulin Human Units per mL (e.g., if the product is labeled to contain a total of 100 USP Insulin Human Units per mL, the dilution factor is 25).

**Chromatographic system**—Proceed as directed in the Assay under Insulin. Make adjustments as necessary (see Chromatography <621>) to obtain a retention time for human insulin between 10 and 17 minutes. Chromatograph five replicate injections of the System suitability solution, and record the peak responses as directed for Procedure: the resolution,  $R$ , between human insulin and A-21 desamido human insulin is not less than 2.0; the tailing factor for the human insulin peak is between 0.8 and 1.5; and the relative standard deviation for replicate injections is not more than 1.6%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the Soluble insulin test solution and the Total insulin test solution, record the chromatograms, and measure the peak responses for insulin and A-21 desamido insulin. Calculate the amount of soluble insulin human as a percent of the total human insulin content of the Injection by the formula:

$$(100D_s / D_T)(r_s / r_T)$$

in which  $D_s$  and  $D_T$  are the dilution factors for the Soluble insulin test solution and Total insulin test solution, respectively; and  $r_s$  and  $r_T$  are the human insulin peak responses obtained from the Soluble insulin test solution and the Total insulin test solution, respectively. The percent of soluble insulin human is in the range  $L \pm 5$ , where  $L$  is the percent of soluble insulin human stated on the product label.

**Assay**—Proceed as directed in the Assay under Insulin Human Injection.

for Injection, combined in a manner such that the solid phase of the suspension consists of crystals composed of insulin, protamine, and zinc. The Protamine Sulfate is prepared from the sperm or from the mature testes of fish belonging to the genus *Oncorhynchus* Suckley, or *Salmo* Linné (Fam. Salmonidae). Its potency, based on the sum of its insulin and desamido insulin components, is NLT 95.0% and NMT 105.0% of the potency stated on the label, expressed in USP Insulin Units in each mL.

## IDENTIFICATION

- A.** The retention time of the insulin peak in the chromatogram of the Sample solution corresponds to the retention time of the appropriate species in the chromatogram of the Identification solution, as obtained in the Assay. [NOTE—It may be necessary to inject a mixture of Sample solution A or Sample solution B and Identification solution.]

## ASSAY

## • PROCEDURE

**Solution A:** Dissolve 28.4 g of anhydrous sodium sulfate in 1000 mL of water. Pipet 2.7 mL of phosphoric acid into this solution, and adjust, if necessary, with ethanolic ammonia to a pH of 2.3.

**Mobile phase:** Acetonitrile and Solution A (26:74).

[NOTE—The acetonitrile is warmed to a temperature equal to or higher than  $20^\circ$  to avoid precipitation.]

**System suitability solution:** Dissolve about 1.5 mg of insulin in 1.0 mL of 0.01 N hydrochloric acid. Allow to stand at room temperature for NLT 3 days to obtain a solution containing NLT 5% of A-21 desamido insulin.

**Identification solution:** Prepare a solution of USP Insulin (Pork) RS and USP Insulin (Beef) RS in 0.01 N hydrochloric acid containing about 0.6 mg/mL of each.

**Standard solution:** 1.5 mg/mL of USP Insulin Human RS in 0.01 N hydrochloric acid. [NOTE—The Identification solution, Standard solution, and Sample solutions may be stored at room temperature for up to 12 h or in a refrigerator for up to 48 h.]

**Sample solution A** (for Suspension labeled as containing 40 USP Insulin Units/mL): Add 2.5  $\mu$ L of 9.6 N hydrochloric acid per mL of a volume of Suspension. Allow the suspension to clarify, and mix.

**Sample solution B** (for Suspension labeled as containing 100 USP Insulin Units/mL): Add 2.5  $\mu$ L of 9.6 N hydrochloric acid per mL of a volume of Suspension. Allow the suspension, if present, to clarify, and mix. [NOTE—Pooling of several package units may be necessary to obtain a sufficient volume of the sample.] Pipet 2 mL of this solution into a 5-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix.

**Chromatographic system**

(See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 4.6-mm  $\times$  15-cm; packing L1

**Column temperature:**  $40^\circ$

**Flow rate:** 1 mL/min

**Injection volume:** 20  $\mu$ L

**System suitability**

**Samples:** System suitability solution and Standard solution

**Suitability requirements**

**Resolution:** NLT 2.0 between the insulin and A-21 desamido insulin peaks, System suitability solution

**Tailing factor:** NMT 1.8 for the insulin peak, System suitability solution

**Relative standard deviation:** NMT 1.6% for replicate injections of the Standard solution

**Analysis**

**Samples:** Standard solution and Sample solution A or Sample solution B

**Isophane Insulin Suspension****DEFINITION**

Isophane Insulin Suspension is a sterile suspension of zinc-insulin crystals and Protamine Sulfate in buffered Water

From the measured chromatographic responses for insulin and A-21 desamido insulin, calculate the potency, in USP Insulin Units/mL, of Suspension taken:

$$\text{Result} = (\Sigma r_U / \Sigma r_S) \times (C \times D)$$

$\Sigma r_U$  = sum of the peak areas of insulin and A-21 desamido insulin from the *Sample solution*

$\Sigma r_S$  = sum of the peak areas of insulin and A-21 desamido insulin from the *Standard solution*

$C$  = concentration of USP Insulin Human RS in the *Standard solution* (USP Insulin Units/mL)

$D$  = dilution factor

For Suspension prepared from a mixture of beef and pork insulins, calculate the total potency as the sum of the potencies of both beef and pork insulins, determined as directed above.

**Acceptance criteria:** 95.0%–105.0% of the potency stated on the label, expressed in USP Insulin Units in each mL

## OTHER COMPONENTS

- **ZINC DETERMINATION (591):** 10–40 µg for each 100 USP Insulin Units

## IMPURITIES

- **LIMIT OF HIGH MOLECULAR WEIGHT PROTEINS**

**Solution A:** 1 mg/mL of L-arginine in water

**Mobile phase:** Acetonitrile, *Solution A*, and glacial acetic acid (20:65:15)

**Resolution solution:** Dissolve 4 mg of insulin containing more than 0.4% high molecular weight proteins in 1 mL of 0.01 N hydrochloric acid. Store this solution in a refrigerator, and use within 7 days. [NOTE—Insulin containing the indicated percentage of high molecular weight proteins may be prepared by allowing insulin to stand at room temperature for about 5 days.]

**Sample solution:** Quantitatively add 4 µL of 6 N hydrochloric acid per mL of a volume of Suspension, and mix.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 276 nm

**Column:** 7.8-mm × 30-cm; packing L20

**Flow rate:** About 0.5 mL/min

**Injection volume:** 100 µL

### System suitability

**Sample:** *Resolution solution*

[NOTE—The relative retention times for the polymeric insulin complexes, for the covalent insulin dimer, and for the insulin monomer, with salts eluting after the insulin monomer, are 13–17, about 17.5, and 18–22 min, respectively.]

### Suitability requirements

**Resolution:** NLT 2.0 for the ratio of the height of the covalent insulin dimer peak to the height of the valley between the covalent insulin dimer peak and the insulin monomer peak

### Analysis

**Sample:** *Sample solution*

Inject the *Sample solution*, and measure the peak area responses, disregarding any peaks having retention times greater than the insulin monomer.

Calculate the percentage of high molecular weight proteins in the portion of Suspension taken:

$$\text{Result} = 100 \Sigma r_H / (\Sigma r_H + r_M)$$

$\Sigma r_H$  = sum of the peak responses for all peaks having retention times less than that of the insulin monomer

$r_M$  = peak response of the insulin monomer

**Acceptance criteria:** NMT 3.0% for the insulin monomer

## SPECIFIC TESTS

### INSULIN IN THE SUPERNATANT

**Sample solution:** Centrifuge 10 mL of the Suspension at  $1500 \times g$  for 10 min. Use the supernatant.

**Analysis:** Determine the insulin content of the *Sample solution* by a suitable method.

**Acceptance criteria:** NMT 1.0 USP Insulin Unit/mL

- **PH <791>:** 7.0–7.8, determined potentiometrically

- **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 80 USP Endotoxin Units/100 USP Insulin Units.

### Change to read:

- **STERILITY TESTS <71>:** It meets the requirements, when tested as directed for *Test for Sterility of the Product to Be Examined*, *Membrane Filtration*, and the Suspension being filtered immediately after it has been put into solution using a validated suitable solvent. • (RB 1-Jul-2012)

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in the unopened multiple-dose container provided by the manufacturer. Do not repackage. Store in a refrigerator, protect from sunlight, and avoid freezing.

- **LABELING:** Label it to indicate the one or more animal species to which it is related, as porcine, as bovine, or as a mixture of porcine and bovine. Where it is purified, label it as such. The Suspension container label states that the Suspension is to be shaken carefully before use. The label states the potency in USP Insulin Units/mL. Label it to state that it is to be stored in a refrigerator and that freezing is to be avoided.

USP Insulin (Pork) RS

## Isophane Insulin Human Suspension

### DEFINITION

Isophane Insulin Human Suspension is a sterile suspension of zinc–insulin human crystals and Protamine Sulfate in buffered Water for Injection, combined in a manner such that the solid phase of the suspension consists of crystals composed of insulin human, protamine, and zinc. The Protamine Sulfate is prepared from the sperm or from the mature testes of fish belonging to the genus *Oncorhynchus* Suckley, or *Salmo* Linné (Fam. Salmonidae). Its potency, based on the sum of its insulin and desamido insulin components, as in the Assay, is NLT 95.0% and NMT 105.0% of the potency stated on the label, expressed in USP Insulin Human Units in each mL.

### IDENTIFICATION

- **A.** The retention time of the major peak of *Sample solution A* or *Sample solution B* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### PROCEDURE

**Solution A:** Dissolve 28.4 g of anhydrous sodium sulfate in 1000 mL of water. Pipet 2.7 mL of phosphoric acid into this solution, and adjust, if necessary, with ethanolamine to a pH of 2.3.

**Mobile phase:** Acetonitrile and *Solution A* (26:74).

[NOTE—The acetonitrile is warmed to a temperature equal to or higher than 20° to avoid precipitation.]

**System suitability solution:** Dissolve about 1.5 mg of insulin in 1.0 mL of 0.01 N hydrochloric acid. Allow to stand at room temperature for NLT 3 days to obtain a solution containing NLT 5% of A-21 desamido insulin.

**Standard solution:** 1.5 mg/mL of USP Insulin Human RS in 0.01 N hydrochloric acid

**Sample solution A** (for Suspension labeled as containing 40 USP Insulin Human Units/mL): Add 2.5  $\mu$ L of 9.6 N hydrochloric acid per mL of a volume of Suspension. Allow the suspension to clarify, and mix.

**Sample solution B** (for Suspension labeled as containing 100 USP Insulin Human Units/mL): Add 2.5  $\mu$ L of 9.6 N hydrochloric acid per mL of a volume of Suspension. Allow the suspension, if present, to clarify, and mix. [NOTE—Pooling of several package units may be necessary to obtain sufficient volume of the sample.] Pipet 2 mL of this solution into a 5-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix.

[NOTE—The *Standard solution* and *Sample solutions* may be stored at room temperature for up to 12 h or in a refrigerator for up to 48 h.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

USP Insulin (Pork) RS  
USP Insulin Human RS

## Insulin Lispro

C<sub>257</sub>H<sub>383</sub>N<sub>65</sub>O<sub>77</sub>S<sub>6</sub> 5807.57

Insulin (human), 28<sup>B</sup>-L-lysine-29<sup>B</sup>-L-proline-

28<sup>B</sup>-L-Lysine-29<sup>B</sup>-L-prolineinsulin (human) [133107-64-9].

» Insulin Lispro is identical in structure to Insulin Human, except that it has lysine and proline at positions 28 and 29, respectively, of chain B, whereas this sequence is reversed in Insulin Human. Insulin Lispro is produced by microbial synthesis via a recombinant DNA process. Its potency is not less than 27.0 USP Insulin Lispro Units per mg, calculated on the dried basis. The proinsulin content of Insulin Lispro, determined by an appropriate and validated method, is not more than 10 ppm. The host cell-derived protein content, determined by an appropriate and validated method, is not more than 10 ppm.

NOTE—One USP Insulin Lispro Unit is equivalent to 0.0347 mg of pure Insulin Lispro.

**Packaging and storage**—Preserve in tight containers, protected from light, and store in a freezer.

**Labeling**—Label it to indicate that it has been prepared by microbial synthesis.

**USP Reference standards** (11)—

USP Endotoxin RS  
USP Insulin Lispro RS

**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** Determine the peptide fragments, using the following peptide mapping procedure.

*Sulfate buffer, HEPES buffer, Mobile phase, Test digest solution, and Procedure*—Proceed as directed for *Identification test B* under *Insulin Human*.

*Standard digest solution*—Proceed as directed for *Identification test B* under *Insulin Human*, except to use USP Insulin Lispro RS instead of USP Insulin Human RS.

*Chromatographic system*—Proceed as directed for *Identification test B* under *Insulin Human*, except to use the following elution program.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–3	95	5	isocratic
3–30	95→41	5→59	linear gradient
30–35	41→20	59→80	linear gradient
35–40	20→95	80→5	return to initial
40–50	95	5	re-equilibration

The flow rate is about 0.8 mL per minute.

**Bioidentity**—Proceed as directed for *Bioidentity Test* under *Insulin Assays* (121), except to obtain the first blood speci-

men at 45 minutes, instead of 1 hour, after the time of injection: meets the requirements.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—The total aerobic microbial count does not exceed 100 per g, a portion of about 0.3 g, accurately weighed, being used.

**Bacterial endotoxins** (85): not more than 10 USP Endotoxin Units per mg, the kinetic-chromogenic method under *Photometric Techniques* being used.

**Loss on drying** (731)—Dry about 300 mg, accurately weighed, at 105° for 16 hours: it loses not more than 10.0% of its weight.

**Limit of high molecular weight proteins**—Proceed as directed in the test for *Limit of high molecular weight proteins* under *Insulin*: not more than 0.25% is found.

**Related compounds**—

*Solvent*—Proceed as directed in the *Assay*.

*Solution A*—Prepare a filtered and degassed mixture of *Solvent* and acetonitrile (82:18).

*Solution B*—Prepare a filtered and degassed mixture of *Solvent* and acetonitrile (50:50).

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability solution*—Dissolve an accurately weighed quantity of Insulin Lispro in 0.01 N hydrochloric acid to obtain a solution containing about 3.5 mg per mL. Allow to stand at room temperature to obtain a solution containing between 0.8% and 11% A-21 desamido insulin lispro.

*Test solution*—Dissolve about 3.5 mg of Insulin Lispro in 1.0 mL of 0.01 N hydrochloric acid. Store this solution for not more than 56 hours in a refrigerator.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The column temperature is maintained at 40°, and the flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–60	81	19	isocratic
60–83	81→51	19→49	linear gradient
83–84	51→81	49→19	linear gradient
84–94	81	19	re-equilibration

Adjust the *Mobile phase* composition and duration of the isocratic elution to obtain a retention time of about 41 minutes for insulin lispro, with A-21 desamido insulin lispro eluting near the start of the linear gradient phase. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between insulin lispro and A-21 desamido insulin lispro is not less than 2.5; and the tailing factor for the insulin lispro peak is not more than 2.0.

*Procedure*—Proceed as directed for *Procedure* in the test for *Related compounds* under *Insulin*: not more than 1.00% of A-21 desamido insulin lispro is found; not more than 0.50% of any other individual insulin lispro related compound is found; and not more than 2.00% of total impurities, excluding A-21 desamido insulin lispro, is found.

**Zinc content** (591)—Determine the zinc content of about 20 mg of Insulin Lispro, accurately weighed: between 0.30% and 0.60% is found, calculated on the dried basis.

**Assay**—

*Solvent*—Dissolve 28.4 g of anhydrous sodium sulfate in 1000 mL of water, mix, and adjust with phosphoric acid to a pH of 2.3.

**Mobile phase**—Mix 745 mL of *Solvent* and 255 mL of acetonitrile. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability solution**—Dissolve an accurately weighed quantity of Insulin Lispro in 0.01 N hydrochloric acid to obtain a solution having a concentration of about 1 mg per mL. Allow to stand at room temperature to obtain a solution containing between 0.8% and 11% A-21 desamido insulin lispro.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Insulin Lispro RS in 0.01 N hydrochloric acid to obtain a solution having a known concentration of about 0.7 mg per mL.

**Assay preparation**—Dissolve an accurately weighed portion of Insulin Lispro in 0.01 N hydrochloric acid to obtain a solution having a concentration of about 0.8 mg per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 10-cm column that contains packing L1. The column temperature is maintained at 40°, and the flow rate is about 0.8 mL per minute. Adjust the *Mobile phase* to provide a retention time of about 24 minutes for the main insulin lispro peak. Chromatograph three replicate injections of the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between insulin lispro and A-21 desamido insulin lispro is not less than 3.0; the tailing factor for the insulin lispro peak is not more than 1.5; and the relative standard deviation for replicate injections is not more than 1.1%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the potency, in USP Insulin Lispro Units per mg, on the as-is basis by the formula:

$$(C_S / C_U)(r_U / r_S)$$

in which *C<sub>S</sub>* is the concentration, in USP Insulin Lispro Units per mL, of USP Insulin Lispro RS in the *Standard preparation*; *C<sub>U</sub>* is the concentration, in mg per mL, of Insulin Lispro in the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the insulin lispro peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively. From the value obtained in the test for *Loss on drying*, calculate the potency on the dried basis.

## Insulin Lispro Injection

» Insulin Lispro Injection is an isotonic, sterile solution of Insulin Lispro in Water for Injection. It has a potency of not less than 95.0 percent and not more than 105.0 percent of the potency stated on the label, expressed as USP Insulin Lispro Units in each mL.

**Packaging and storage**—Preserve in tight, multiple-dose containers, and store in a refrigerator. Avoid freezing. Protect from sunlight. Dispense it in the unopened, multiple-dose container provided by the manufacturer.

**Labeling**—The labeling states that it has been prepared with Insulin Lispro obtained from microbial synthesis. Label it to state that it is to be stored in a refrigerator and that freezing is to be avoided. The label states the potency in USP Insulin Lispro Units per mL.

**USP Reference standards** <11>—

USP Endotoxin RS

USP Insulin Lispro RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** <85>: not more than 80 USP Endotoxin Units per 100 USP Insulin Lispro Units, the kinetic-chromogenic method under *Photometric Techniques* being used.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** <791>: between 7.0 and 7.8.

**Particulate matter** <788>: meets the requirements for small-volume injections.

**Limit of high molecular weight proteins**—

*Arginine solution, Mobile phase, Resolution solution, Test solution, and Chromatographic system*—Proceed as directed in the test for *Limit of high molecular weight proteins* under *Insulin Injection*.

*Procedure*—Proceed as directed for *Procedure* in the test for *Limit of high molecular weight proteins* under *Insulin*: not more than 1.50% is found.

**Related compounds**—

*Test solution*—Acidify each mL of Injection with 3 µL of 9.6 N hydrochloric acid.

*Solvent, System suitability solution, Mobile phase, Chromatographic system, and Procedure*—Proceed as directed in the test for *Related compounds* under *Insulin Lispro*. Not more than 1.50% A-21 desamido insulin lispro is found; and not more than 4.00% of total impurities, excluding A-21 desamido insulin lispro, is found.

**Zinc content** <591>: between 14 and 35 µg for each 100 USP Insulin Lispro Units.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay**—

*Solvent, Mobile phase, System suitability solution, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Insulin Lispro*.

*Assay preparation*—Acidify each mL of Injection with 3 µL of 9.6 N hydrochloric acid. Quantitatively dilute a portion of the acidified solution with 0.01 N hydrochloric acid to obtain a solution containing about 20 USP Insulin Lispro Units per mL.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the potency, in USP Insulin Lispro Units, in each mL of the Injection taken by the formula:

$$CD(r_U / r_S)$$

in which *C* is the concentration, in USP Insulin Lispro Units per mL, of USP Insulin Lispro RS in the *Standard preparation*; *D* is the dilution factor used to prepare the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the insulin lispro peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Insulin Zinc Suspension

Insulin zinc.

Insulin zinc [8049-62-5].

» Insulin Zinc Suspension is a sterile suspension of Insulin in buffered Water for Injection, modified by the addition of a suitable zinc salt in a

manner such that the solid phase of the suspension consists of a mixture of crystalline and amorphous insulin in a ratio of approximately 7 parts of crystals to 3 parts of amorphous material. Its potency, based on the sum of its insulin and desamido insulin components, is not less than 95.0 percent and not more than 105.0 percent of the potency stated on the label, expressed in USP Insulin Units per mL.

**Packaging and storage**—Preserve in the unopened multiple-dose container provided by the manufacturer. Do not repackage. Store in a refrigerator, protect from sunlight, and avoid freezing.

**Labeling**—Label it to indicate the one or more animal species to which it is related, as porcine, as bovine, or as a mixture of porcine and bovine. Where it is purified, label it as such. The Suspension container label states that the Suspension is to be shaken carefully before use. The label states the potency in USP Insulin Units per mL. Label it to state that it is to be stored in a refrigerator and that freezing is to be avoided.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Insulin (Beef) RS

USP Insulin (Pork) RS

**Identification**—It meets the requirements of the *Identification* test under *Insulin Injection*.

**Bacterial endotoxins** (85)—It contains not more than 80 USP Endotoxin Units per 100 USP Insulin Units.

**pH** (791): between 7.0 and 7.8, determined potentiometrically.

**Zinc content** (591): between 0.12 mg and 0.25 mg for each 100 USP Insulin Units.

**Zinc in the supernatant**—Centrifuge a portion of Suspension sufficient for the test, and determine the zinc content of the clear supernatant as directed under *Zinc Determination* (591): the zinc concentration, in mg per mL, is between 20% and 65% of the zinc concentration of the Suspension.

**Insulin not extracted by buffered acetone solution**—Centrifuge an amount of Suspension representing 1000 USP Insulin Units, and discard the supernatant. Suspend the residue in 8.4 mL of water, quickly add 16.6 mL of buffered acetone TS, shake or stir vigorously, and centrifuge within 3 minutes after the addition of the buffered acetone TS. Discard the supernatant, repeat the treatment with water and buffered acetone TS, centrifuge, and discard the supernatant. Dissolve the crystalline residue in 5 mL of dilute hydrochloric acid (1 in 100), transfer to a 25-mL flask, and dilute with water to volume. The insulin concentration, determined by an appropriate method, is between 63% and 77% of the insulin content of an equal amount of the Suspension.

**Limit of high molecular weight proteins**—Proceed as directed in the test for *Limit of high molecular weight proteins* under *Insulin Injection*: not more than 1.5% is found.

**Other requirements**—It meets the requirements in the tests for *Sterility* and *Insulin in the supernatant* under *Iso-phane Insulin Suspension*.

**Assay**—Proceed as directed in the *Assay* under *Insulin Injection*.

---

## Extended Insulin Zinc Suspension

---

» Extended Insulin Zinc Suspension is a sterile suspension of Insulin in buffered Water for Injection, modified by the addition of a suitable zinc salt in a manner such that the solid phase of the suspension is predominantly crystalline. Its potency, based on the sum of its insulin and desamido insulin components, is not less than 95.0 percent and not more than 105.0 percent of the potency stated on the label, expressed in USP Insulin Units per mL.

**Packaging and storage**—Preserve in the unopened multiple-dose container provided by the manufacturer. Do not repackage. Store in a refrigerator, protect from sunlight, and avoid freezing.

**Labeling**—Label it to indicate the one or more animal species to which it is related, as porcine, as bovine, or as a mixture of porcine and bovine. Where it is purified, label it as such. Its container label states that the Suspension is to be shaken carefully before use. The label states the potency in USP Insulin Units per mL. Label it to state that it is to be stored in a refrigerator and that freezing is to be avoided.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Insulin (Beef) RS

USP Insulin (Pork) RS

**Identification**—It meets the requirements of the *Identification* test under *Insulin Injection*.

**Bacterial endotoxins** (85)—It contains not more than 80 USP Endotoxin Units per 100 USP Insulin Units.

**pH** (791): between 7.0 and 7.8, determined potentiometrically.

**Insulin not extracted by buffered acetone solution**—Proceed as directed under *Insulin Zinc Suspension*: the insulin concentration, determined by an appropriate method, is not less than 90% of the insulin content of an equal amount of the Suspension.

**Limit of high molecular weight proteins**—Proceed as directed in the test for *Limit of high molecular weight proteins* under *Insulin Injection*: not more than 1.5% is found.

**Other requirements**—It meets the requirements in the tests for *Sterility* and *Insulin in the supernatant* under *Iso-phane Insulin Suspension* and for *Zinc content* and *Zinc in the supernatant* under *Insulin Zinc Suspension*.

**Assay**—Proceed as directed in the *Assay* under *Insulin Injection*.

---

## Prompt Insulin Zinc Suspension

---

» Prompt Insulin Zinc Suspension is a sterile suspension of Insulin in buffered Water for Injection, modified by the addition of a suitable zinc salt in a manner such that the solid phase of the suspension is amorphous. Its potency, based on the sum of its insulin and desamido insulin components, is not less than 95.0 percent and not more than 105.0 percent of the potency stated on the label, expressed in USP Insulin Units per mL.

**Packaging and storage**—Preserve in the unopened multiple-dose container provided by the manufacturer. Do not

repackage. Store in a refrigerator, protect from sunlight, and avoid freezing.

**Labeling**—Label it to indicate the one or more animal species to which it is related, as porcine, as bovine, or as a mixture of porcine and bovine. Where it is purified, label it as such. Its container label states that the Suspension is to be shaken carefully before use. The label states the potency in USP Insulin Units per mL. Label it to state that it is to be stored in a refrigerator and that freezing is to be avoided.

**USP Reference standards** <11>—

USP Endotoxin RS

USP Insulin (Beef) RS

USP Insulin (Pork) RS

**Identification**—It meets the requirements of the *Identification* test under *Insulin Injection*.

**Bacterial endotoxins** <85>—It contains not more than 80 USP Endotoxin Units per 100 USP Insulin Units.

**pH** <791>: between 7.0 and 7.8, determined potentiometrically.

**Insulin not extracted by buffered acetone solution**—

Centrifuge 15 mL (40-Unit), 8 mL (80-Unit), or 6 mL (100-Unit) of Suspension, and discard the supernatant. Suspend the residue in 8.4 mL of water, quickly add 16.6 mL of buffered acetone TS, shake or stir vigorously, and centrifuge within 3 minutes after the addition of the buffered acetone TS. Discard the supernatant, repeat the treatment with water and buffered acetone TS, centrifuge, and discard the supernatant: no crystalline residue remains.

**Limit of high molecular weight proteins**—Proceed as directed in the test for *Limit of high molecular weight proteins* under *Insulin Injection*: not more than 1.5% is found.

**Other requirements**—It meets the requirements in the tests for *Sterility* and *Insulin in the supernatant* under *Iso-phane Insulin Suspension* and for *Zinc content* and *Zinc in the supernatant* under *Insulin Zinc Suspension*.

**Assay**—Proceed as directed in the *Assay* under *Insulin Injection*.

## Insulin Human Zinc Suspension

» Insulin Human Zinc Suspension is a sterile suspension of Insulin Human in buffered Water for Injection, modified by the addition of a suitable zinc salt in a manner such that the solid phase of the Suspension consists of a mixture of crystalline and amorphous insulin in a ratio of approximately 7 parts of crystals to 3 parts of amorphous material. Its potency, based on the sum of its insulin and desamido insulin components, is not less than 95.0 percent and not more than 105.0 percent of the potency stated on the label, expressed in USP Insulin Human Units in each mL.

**Packaging and storage**—Preserve in the unopened multiple-dose container provided by the manufacturer. Do not repackage. Store in a refrigerator, protect from sunlight, and avoid freezing.

**Labeling**—Label it to indicate that it has been prepared with Insulin Human of semisynthetic origin (i.e., derived by enzyme modification of pork pancreas insulin) or with Insulin Human of recombinant DNA origin (i.e., obtained from microbial synthesis), whichever is applicable. The Suspension container label states that the Suspension is to be shaken carefully before use. Label it to state that it is to be stored in

a refrigerator and that freezing is to be avoided. The label states the potency in USP Insulin Human Units per mL.

**USP Reference standards** <11>—

USP Endotoxin RS

USP Insulin Human RS

USP Insulin (Pork) RS

**Bacterial endotoxins** <85>—It contains not more than 80 USP Endotoxin Units per 100 USP Insulin Human Units.

**pH** <791>: between 7.0 and 7.8, determined potentiometrically.

**Limit of high molecular weight proteins**—Proceed as directed in the test for *Limit of high molecular weight proteins* under *Insulin Injection*: not more than 1.5% is found.

**Other requirements**—It meets the requirements in the tests for *Identification*, *Sterility*, and *Insulin in the supernatant* under *Iso-phane Insulin Human Suspension* and for *Zinc content*, *Zinc in the supernatant*, and *Insulin not extracted by buffered acetone solution* under *Insulin Zinc Suspension*.

**Assay**—Proceed as directed in the *Assay* under *Insulin Human Injection*.

## Extended Insulin Human Zinc Suspension

» Extended Insulin Human Zinc Suspension is a sterile suspension of Insulin Human in buffered Water for Injection, modified by the addition of a suitable zinc salt in a manner such that the solid phase of the Suspension is predominantly crystalline. Its potency, based on the sum of its insulin and desamido insulin components, is not less than 95.0 percent and not more than 105.0 percent of the potency stated on the label, expressed in USP Insulin Human Units per mL.

**Packaging and storage**—Preserve in the unopened multiple-dose container provided by the manufacturer. Do not repackage. Store in a refrigerator, protect from sunlight, and avoid freezing.

**Labeling**—Label it to indicate that it has been prepared with Insulin Human of semisynthetic origin (i.e., derived by enzyme modification of pork pancreas insulin) or with Insulin Human of recombinant DNA origin (i.e., obtained from microbial synthesis), whichever is applicable. The Suspension container label states that the Suspension is to be shaken carefully before use. Label it to state that it is to be stored in a refrigerator and that freezing is to be avoided. The label states the potency in USP Insulin Human Units per mL.

**Limit of high molecular weight proteins**—Proceed as directed in the *Limit of high molecular weight proteins* test under *Insulin Injection*: not more than 1.5% is found.

**Other requirements**—It meets the requirements in the tests for *Identification*, *Sterility*, and *Insulin in the supernatant* under *Iso-phane Insulin Human Suspension*, for *Zinc content* and *Zinc in the supernatant* under *Insulin Zinc Suspension*, and for *Insulin not extracted by buffered acetone solution* under *Extended Insulin Zinc Suspension*.

**Assay**—Proceed as directed in the Assay under *Insulin Human Injection*.

## Inulin

$C_6H_{11}O_5(C_6H_{10}O_5)_nOH$   
Inulin.  
Inulin [9005-80-5].

» Inulin is a polysaccharide which, on hydrolysis, yields mainly fructose. It contains not less than 94.0 percent and not more than 102.0 percent of  $C_6H_{11}O_5(C_6H_{10}O_5)_nOH$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

### USP Reference standards (11)—

USP Dextrose RS  
USP Fructose RS

**Completeness of solution**—Dissolve 10 g in 20 mL of boiling water in a 200-mL volumetric flask, add 150 mL of water, allow to cool, dilute with water to volume, and mix; the solution is clear.

**Specific rotation** (781S): between −32.0° and −40.0°.

*Test solution*: 100 mg per mL, in 0.012 N ammonium hydroxide.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli* and for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*; the total aerobic microbial count is less than 1000 per g.

**Loss on drying** (731): not more than 10.0% after it has been dried at 105° for 2 hours, 2 g of the finely ground powder being used for the test.

**Residue on ignition** (281)—Multiply the percentage of Calcium found by 3.4. The residue on ignition does not exceed this percentage by more than 0.05%.

**pH, Chloride, Iron, and Reducing sugars**—Dissolve 10.0 g in 20 mL of boiling water in a 100-mL volumetric flask, allow to cool, dilute with water to volume, and mix. Use the solution for the following tests.

**pH** (791)—The pH of the solution is between 4.5 and 7.0.

**Chloride** (221)—A 10-mL portion of the solution shows no more chloride than corresponds to 0.20 mL of 0.020 N hydrochloric acid (0.014%).

**Iron**—To 10 mL of the solution add 0.5 mL of hydrochloric acid and 3 drops of potassium ferrocyanide TS: the solution does not become blue within 1 minute.

**Reducing sugars**—To 2 mL of the solution add 5 mL of alkaline cupric tartrate TS: no reduction occurs at room temperature, and only slight reduction occurs after 1 minute of boiling.

**Calcium**—Heat 10.0 g in 100 mL of water to dissolve. Cool to room temperature, add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Not more than 5.0 mL is required: not more than 0.10% calcium is found.

**Sulfate** (221)—A 1.0 g portion shows no more sulfate than corresponds to 0.5 mL of 0.020 N sulfuric acid (0.05%). [NOTE—Inulin should be dissolved in 30 to 40 mL of water with gentle warming, prior to dilution to final volume.]

**Heavy metals** (231)—Dissolve 4.0 g in 20 mL of boiling water, allow to cool, and dilute with water to 25 mL: the limit is 5 ppm.

### Free fructose—

**Blue tetrazolium solution**—Dissolve 50 mg of blue tetrazolium in 10 mL of alcohol, and mix.

**Tetramethylammonium hydroxide solution**—Prepare a mixture of 1 volume of tetramethylammonium hydroxide TS and 9 volumes of alcohol.

**Standard stock solution**—Prepare an aqueous solution having a known concentration of about 250 µg of USP Fructose RS per mL. Store at about 4°.

**Standard preparation**—On the day of use, quantitatively dilute a portion of the *Standard stock solution* with alcohol to obtain a solution having a known concentration of about 2.5 µg per mL. Store at about 4°.

**Test preparation**—Transfer about 2.5 g of Inulin, accurately weighed, to a 100-mL volumetric flask, add about 75 mL of water, heat on a steam bath until solution is complete, cool to room temperature, dilute with water to volume, and mix. Pipet 1 mL into a 100-mL volumetric flask, dilute with alcohol to volume, and mix. If the solution is turbid, pass through fine-porosity filter paper.

**Procedure**—Pipet 10 mL of the *Test preparation* and 10 mL of the *Standard preparation* into separate glass-stoppered centrifuge tubes. Into each of the tubes, and into a similar tube containing 10.0 mL of alcohol to provide the blank, pipet 1 mL of *Blue tetrazolium solution*, and mix. Then into each tube pipet 1 mL of *Tetramethylammonium hydroxide solution*, mix, and allow to stand in the dark for 60 minutes. Without delay, concomitantly determine the absorbances of the solutions from the *Test preparation* and the *Standard preparation* at 530 nm, with a suitable spectrophotometer, against the blank. Calculate the percentage, *F*, of free fructose in the Inulin taken by the formula:

$$F = (C/W)(A_U / A_S)$$

in which *C* is the concentration, in µg per mL, of USP Fructose RS in the *Standard preparation*; *W* is the quantity, in g, of Inulin taken; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively. The limit is 2.0%, calculated on the dried basis.

### Content of combined glucose—

**Standard stock solution**—Transfer about 50 mg of USP Dextrose RS, accurately weighed, to a 100-mL volumetric flask, dissolve in a solution of benzoic acid (1.7 in 1000), dilute with the same solution to volume, and mix. Allow to stand at room temperature for not less than 3 hours before using. This solution is stable for 1 month at about 4°.

**Standard preparation**—Pipet 7 mL of *Standard stock solution* into a 100-mL volumetric flask, dilute with water to volume, mix, and use at once.

**Assay preparation**—Transfer about 0.5 g of Inulin, accurately weighed, to a 100-mL volumetric flask, add 5.0 mL of water, dissolve by heating on a steam bath, cool to room temperature, add 0.5 mL of 8 N hydrochloric acid, and mix. Place the flask in a boiling water bath for 5 minutes, cool, dilute with water to volume, and mix. Pipet 2 mL of this solution into a 10-mL volumetric flask, dilute with water to volume, and mix. [NOTE—This solution is used also for preparing the *Assay preparation* in the *Assay for inulin*.]

**Procedure**—Pipet 3-mL portions of glucose oxidase-chromogen TS into 3 separate test tubes, and bring to a temperature of 37 ± 0.5° in a water bath. Pipet 2 mL of *Standard preparation* into one of the tubes, pipet 2 mL of *Assay preparation* into another, and pipet 2 mL of water into

the third tube to provide the blank. Maintain at  $37 \pm 0.5^\circ$  for an additional 10 minutes, then remove the tubes, and allow them to cool. Determine the absorbances of the solutions from the *Assay preparation* and the *Standard preparation* at about 505 nm, with a suitable spectrophotometer, using the reagent blank as a reference. Calculate the percentage of combined glucose,  $G$ , in the Inulin taken by the formula:

$$G = 50(C/W)(A_U / A_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Dextrose RS in the *Standard preparation*;  $W$  is the amount, in g, of Inulin taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively. Not less than 2.0% and not more than 5.0%, calculated on the dried basis, is found.

#### Assay for inulin—

*Thiobarbituric acid solution*—Dissolve 250 mg of thiobarbituric acid in 100 mL of 8 N hydrochloric acid, and mix. This solution is stable for 2 weeks at a temperature of about  $4^\circ$ .

*Standard stock solution*—Quantitatively dissolve an accurately weighed quantity of USP Fructose RS in an aqueous solution of benzoic acid (1.7 in 1000) to obtain a solution having a known concentration of about 1 mg of USP Fructose RS per mL. [NOTE—This solution is stable for 1 month at about  $4^\circ$ .]

*Standard preparation*—Quantitatively dilute the *Standard stock solution* with water to one-fiftieth of its concentration. Use immediately.

*Assay preparation*—Pipet 4 mL of the *Assay preparation* from the *Content of combined glucose* into a 200-mL volumetric flask, add water to volume, and mix.

*Procedure*—Pipet 1-mL portions of the *Standard preparation* and the *Assay preparation* into separate glass-stoppered tubes. Pipet 1 mL of water into a third tube to provide the blank. Pipet 5-mL portions of *Thiobarbituric acid solution* into each tube, and mix. Place all of the tubes simultaneously in a water bath maintained at a temperature of about  $83^\circ$ , and allow them to stay immersed for 5 minutes, accurately timed. Remove the tubes simultaneously, and allow them to cool in a dark place for 30 minutes. Determine the absorbances of the solutions from the *Assay preparation* and the *Standard preparation* at about 435 nm, with a suitable spectrophotometer, using the reagent blank as a reference. Calculate the percentage of  $C_6H_{11}O_5(C_6H_{10}O_5)_nOH$  in the Inulin taken by the formula:

$$0.900[2.5(C/W)(A_U / A_S) - F] + G$$

in which 0.900 is the ratio of the formula weight of an anhydrofructose unit of inulin to that of fructose;  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Fructose RS in the *Standard preparation*;  $W$  is the quantity, in g, of Inulin weighed for the *Content of combined glucose*;  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively;  $F$  is the percentage of free fructose; and  $G$  is the percentage of combined glucose.

### Inulin in Sodium Chloride Injection

» Inulin in Sodium Chloride Injection is a sterile solution, which may be supersaturated, of Inulin and Sodium Chloride in Water for Injection. It may require heating before use if crystallization has occurred. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $(C_6H_{12}O_6)_n$  and not less than

95.0 percent and not more than 105.0 percent of the labeled amount of NaCl. It contains no anti-microbial agents.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I or Type II glass.

#### USP Reference standards (11)—

USP Dextrose RS

USP Endotoxin RS

USP Fructose RS

**Clarity**—If particulate matter is present, heat at  $100^\circ$  for 30 minutes: the resulting solution is free from turbidity and particulate matter.

NOTE—Before applying the following tests, dissolve any solid matter by heating, and cool to room temperature.

**Bacterial endotoxins** (85)—It contains not more than 0.1 USP Endotoxin Unit per mg of inulin.

**pH** (791): between 4.0 and 7.0.

#### Free fructose—

*Blue tetrazolium solution*, *Tetramethylammonium hydroxide solution*, *Standard stock solution*, and *Standard preparation*—Proceed as directed in the test for *Free fructose* under *Inulin*.

*Test preparation*—Transfer an accurately measured volume of Injection, equivalent to about 2.5 g of inulin, to a 100-mL volumetric flask, add water to volume, and mix. Just prior to use, pipet 1 mL of this solution into a 100-mL volumetric flask, dilute with alcohol to volume, mix, and, if the solution is turbid, pass through fine-porosity filter paper.

*Procedure*—Proceed as directed for *Procedure* in the test for *Free fructose* under *Inulin*. Calculate the quantity,  $F$ , in mg, of free fructose in each mL of the Injection taken by the formula:

$$10(C / V)(A_U / A_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Fructose RS in the *Standard preparation*;  $V$  is the volume, in mL, of Injection taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively. The limit is 2.2 mg per mL.

**Other requirements**—It meets the other requirements under *Injections* (1).

#### Assay for inulin—

*Content of combined glucose*—Proceed as directed in the *Content of combined glucose* under *Inulin*, but in preparing the *Assay preparation* use, instead of 0.5 g of inulin, an accurately measured volume of the Injection equivalent to about 0.5 g of inulin. Calculate the quantity, in mg, of combined glucose,  $G$ , in each mL of the Injection taken by the formula:

$$500(C / V)(A_U / A_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Dextrose RS in the *Standard preparation*;  $V$  is the volume, in mL, of Injection taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

*Procedure*—Proceed as directed in the *Assay for inulin* under *Inulin*. Calculate the quantity, in mg, of  $(C_6H_{12}O_6)_n$  in each mL of the Injection taken by the formula:

$$0.900[25(C / V)(A_U / A_S) - F] + G$$

in which 0.900 is the ratio of the formula weight of an anhydrofructose unit of inulin to that of fructose;  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Fructose RS in the *Standard preparation*;  $V$  is the volume, in mL, of Injection taken;  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively; and  $F$  is the quantity, in mg, of free fructose in each mL of Injection, and the other terms are as defined therein.

**Assay for sodium chloride**—Pipet a volume of Injection, equivalent to about 90 mg of sodium chloride, into a porcelain casserole, and add 140 mL of water and 1 mL of *dichlorofluorescein* TS. Mix, and titrate with 0.1 N silver nitrate VS until the silver chloride flocculates and the mixture acquires a faint pink color. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of NaCl.

## Iodine

I<sub>2</sub> 253.81  
Iodine [7553-56-2].

### DEFINITION

Iodine contains NLT 99.8% and NMT 100.5% of I.

### IDENTIFICATION

- **A.** Solutions (1 in 1000) in chloroform and in carbon disulfide have a violet color.
- **B.**  
**Analysis:** To a saturated solution add starch–potassium iodide TS.  
**Acceptance criteria:** A blue color is produced. When the mixture is boiled, the color vanishes but reappears as the mixture cools, unless it has been subjected to prolonged boiling.

### ASSAY

#### PROCEDURE

**Sample:** 500 mg of powdered Iodine

**Analysis:** Place the *Sample* in a tared, glass-stoppered flask, insert the stopper, and add 1 g of potassium iodide dissolved in 5 mL of water. Dilute with water to 50 mL, add 1 mL of 3 N hydrochloric acid, and titrate with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Each mL of 0.1 N sodium thiosulfate is equivalent to 12.69 mg of Iodine (I).

**Acceptance criteria:** 99.8%–100.5%

### IMPURITIES

#### LIMIT OF CHLORIDE OR BROMIDE

**Sample solution:** Triturate 250 mg of finely powdered Iodine with 10 mL of water, and filter the solution.

**Analysis:** To the *Sample solution* add, dropwise, sulfurous acid (free from chloride), previously diluted with several volumes of water, until the iodine color just disappears. Add 5 mL of 6 N ammonium hydroxide, followed by 5 mL of silver nitrate TS in small portions. Filter, and acidify the filtrate with nitric acid.

**Acceptance criteria:** The resulting liquid is not more turbid than a control made with the same quantities of the same reagents to which 0.10 mL of 0.020 N hydrochloric acid has been added, the sulfurous acid being omitted (0.028% as chloride).

#### LIMIT OF NONVOLATILE RESIDUE

**Analysis:** Place 5.0 g in a tared porcelain dish, heat on a steam bath until the iodine has been driven off, and dry at 105° for 1 h.

**Acceptance criteria:** NMT 0.05% of the residue remains.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

## Iodine Topical Solution

» Iodine Topical Solution contains, in each 100 mL, not less than 1.8 g and not more than 2.2 g of iodine (I), and not less than 2.1 g and not more than 2.6 g of sodium iodide (NaI).

Iodine . . . . .	20 g
Sodium Iodide . . . . .	24 g
Purified Water, a sufficient quantity, to make . . . . .	1000 mL

Dissolve the Iodine and the Sodium Iodide in 50 mL of Purified Water, then add Purified Water to make 1000 mL.

**Packaging and storage**—Preserve in tight, light-resistant containers, at a temperature not exceeding 35°.

### Identification—

**A:** Add 1 drop to a mixture of 1 mL of starch TS and 9 mL of water: a deep blue color is produced.

**B:** Evaporate a few mL on a steam bath to dryness: the residue responds to the flame test for *Sodium* (191) and to the tests for *Iodide* (191).

**Assay for iodine**—Transfer 10.0 mL of Topical Solution into a glass-stoppered, 500-mL flask, and dilute with 10 mL of water. Titrate with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Each mL of 0.1 N sodium thiosulfate is equivalent to 12.69 mg of I.

**Assay for sodium iodide**—Transfer 10.0 mL of Topical Solution to a glass-stoppered 500-mL flask, add 30 mL of water and 50 mL of hydrochloric acid, cool to room temperature, and titrate with 0.05 M potassium iodate VS until the dark brown solution that is produced becomes pale brown. Add 1 mL of amaranth TS, and continue the titration slowly until the red color just changes to yellow. The difference between the number of mL of 0.05 M potassium iodate used and half the number of mL of 0.1 N sodium thiosulfate used in the *Assay for iodine*, multiplied by 14.99, represents the number of mg of NaI in the volume of Topical Solution taken.

## Strong Iodine Solution

» Strong Iodine Solution contains, in each 100 mL, not less than 4.5 g and not more than 5.5 g of iodine (I), and not less than 9.5 g and not more than 10.5 g of potassium iodide (KI).

Strong Iodine Solution may be prepared by dissolving 50 g of Iodine and 100 g of Potassium Iodide in 100 mL of Purified Water, then adding Purified Water to make the product measure 1000 mL.

**Packaging and storage**—Preserve in tight containers, preferably at a temperature not exceeding 35°.

### Identification—

**A:** Dilute 1 drop with 10 mL of water, and add 1 mL of starch TS: a deep blue color is produced.

**B:** Evaporate a few mL on a steam bath to dryness, and ignite gently to volatilize any free iodine: the residue responds to the tests for *Potassium* (191) and for *Iodide* (191).

**Assay for iodine**—Transfer 10.0 mL of Solution into a glass-stoppered, 500-mL flask, add 10 mL of water, and titrate with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Each mL of 0.1 N sodium thiosulfate is equivalent to 12.69 mg of I.

**Assay for potassium iodide**—Transfer 10.0 mL of Solution to a glass-stoppered, 500-mL flask, add 30 mL of water and 50 mL of hydrochloric acid, cool to room temperature, and titrate with 0.05 M potassium iodate VS until the dark brown solution that is produced becomes pale brown. Add 1 mL of amaranth TS, and continue the titration slowly until the red color just changes to yellow. The difference between the number of mL of 0.05 M potassium iodate used and half the number of mL of 0.1 N sodium thiosulfate used in the *Assay for iodine*, multiplied by 16.60, represents the number of mg of KI in the volume of the Solution taken.

## Iodine Tincture

» Iodine Tincture contains, in each 100 mL, not less than 1.8 g and not more than 2.2 g of iodine (I), and not less than 2.1 g and not more than 2.6 g of sodium iodide (NaI).

Iodine Tincture may be prepared by dissolving 20 g of Iodine and 24 g of Sodium Iodide in 500 mL of Alcohol and then adding Purified Water to make the product measure 1000 mL.

**Packaging and storage**—Preserve in tight containers.

### Identification—

**A:** Add 1 drop to a mixture of 1 mL of starch TS and 9 mL of water: a deep blue color is produced.

**B:** Evaporate a few mL on a steam bath to dryness: the residue responds to the flame test for *Sodium* <191>, and to the tests for *Iodide* <191>.

**Alcohol content** <611>: between 44.0% and 50.0% of C<sub>2</sub>H<sub>5</sub>OH.

**Assay for iodine**—Proceed as directed in the *Assay for iodine* under *Iodine Topical Solution*, using 10 mL of Iodine Tincture.

**Assay for sodium iodide**—Proceed as directed in the *Assay for sodium iodide* under *Iodine Topical Solution*, using 10 mL of Iodine Tincture. The difference between the number of mL of 0.05 M potassium iodate used and half the number of mL of 0.1 N sodium thiosulfate used in the *Assay for iodine*, multiplied by 14.99, represents the number of mg of NaI in the volume of Iodine Tincture taken.

## Strong Iodine Tincture

» Strong Iodine Tincture contains, in each 100 mL, not less than 6.8 g and not more than 7.5 g of iodine (I), and not less than 4.7 g and not more than 5.5 g of potassium iodide (KI).

Strong Iodine Tincture may be prepared by dissolving 50 g of Potassium Iodide in 50 mL of Purified Water, adding 70 g of Iodine, and agitating until solution is effected, and then adding Alcohol to make the product measure 1000 mL.

**Packaging and storage**—Preserve in tight, light-resistant containers.

### Identification—

**A:** Add 1 drop to a mixture of 1 mL of starch TS and 9 mL of water: a deep blue color is produced.

**B:** Evaporate a few mL on a steam bath to dryness: the residue responds to the flame test for *Potassium* <191> and to the tests for *Iodide* <191>.

**Alcohol content** <611>: between 82.5% and 88.5% of C<sub>2</sub>H<sub>5</sub>OH.

**Assay for iodine**—Proceed as directed in the *Assay for iodine* under *Strong Iodine Solution*, using 10 mL of Strong Iodine Tincture.

**Assay for potassium iodide**—Proceed as directed in the *Assay for potassium iodide* under *Strong Iodine Solution*, using 10 mL of Strong Iodine Tincture. The difference between the number of mL of 0.05 M potassium iodate used and half the number of mL of 0.1 N sodium thiosulfate used in the *Assay for iodine*, multiplied by 16.60, represents the number of mg of KI in the volume of Strong Iodine Tincture taken.

## Iobenguane I 123 Injection

(C<sub>8</sub>H<sub>10</sub><sup>123</sup>I<sub>2</sub>)<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub>

[[3-(Iodo-<sup>123</sup>I)-phenyl]methyl]guanidine sulfate (2:1).

(*m*-Iodo-<sup>123</sup>I)-benzyl]guanidine sulfate (2:1) [139755-80-9].

» Iobenguane I 123 Injection is a sterile solution containing iobenguane sulfate in which a portion of the molecules contain radioactive iodine (<sup>123</sup>I) in the molecular structure. Iobenguane I 123 Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of I 123 as iobenguane expressed in megabecquerels (or in millicuries) per mL at the time indicated in the labeling. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of iobenguane. It may contain preservatives or stabilizers.

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers that are adequately shielded. Store in a freezer.

**Labeling**—Label it to include the following: the time and date of calibration; the amount of <sup>123</sup>I as iobenguane expressed as total megabecquerels (or millicuries) per mL at the time of calibration; the name and quantity of any added preservative or stabilizer; the expiration time; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of <sup>123</sup>I is 13.2 hours.

**USP Reference standards** <11>—

USP Endotoxin RS

**Radionuclidic identification** (see *Radioactivity* <821>)—Its gamma-ray spectrum is identical to that of a specimen of <sup>123</sup>I of known purity that exhibits a major photopeak having an energy of 159 KeV.

**Bacterial endotoxins** <85>—It contains not more than 175/V USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration time.

**pH** (791): between 6.0 and 7.5.

**Radionuclidic purity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radionuclidic purity of the Injection: not less than 97% of the total radioactivity is present as  $^{131}\text{I}$ .

**Radiochemical purity**—

**METHOD 1** (High-pressure liquid chromatographic method)—

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay for iobenguane sulfate*, except that the liquid chromatograph is also equipped with a collimated radiation detector (see *Radioactivity* (821)).

*Test preparation*—Use *Iobenguane I 123 Injection*.

*Procedure*—Inject a volume (about 20  $\mu\text{L}$ ) of Injection, equivalent to 1.6 to 2.7 MBq (44 to 64  $\mu\text{Ci}$ ) of the Injection into the chromatograph, record the chromatogram, and measure the areas for the major peaks. The radioactivity of the iobenguane  $^{123}\text{I}$  peak is not less than 90% of the total radioactivity measured, and its retention time is within 10% of that in the chromatogram of the *Standard preparation* obtained in the *Assay for iobenguane sulfate*.

**METHOD 2** (Thin-layer chromatographic method)—Apply 0.2 to 0.4  $\mu\text{L}$  of the Injection 10 mm from one end of a 20- $\times$  200-mm silica gel glass plate (see *Chromatography* (621)), and allow to dry. Develop the chromatogram by ascending chromatography until the solvent front has moved 100 mm from the origin (about 20 minutes), using a solvent system consisting of a mixture of alcohol, ethyl acetate, and ammonium hydroxide (20:20:1). Air-dry the chromatogram, and determine the radioactivity distribution by scanning the chromatogram with a collimated radiation detector: not less than 90% of the total radioactivity is found as  $^{123}\text{I}$  at the origin.

**Other requirements**—It meets the requirements under *Injections* (1), except that the Injection may be distributed or dispensed prior to the completion of the test for *Sterility* (71), the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.

**Assay for iobenguane sulfate**—

*Mobile phase*—Prepare a filtered and degassed mixture of water and acetonitrile (900:100). Add 3.04 g of triethylamine per liter, and adjust with phosphoric acid to a pH of 4. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Using an accurately weighed quantity of iobenguane sulfate, prepare a solution in water having a known concentration of about 1 mg per mL.

*Assay preparation*—Use the Injection, which has not yet been brought to full volume with bacteriostatic saline.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 229-nm detector and a 4.6-mm  $\times$  25-cm column that contains 10- $\mu\text{m}$  packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 1.2, and the relative standard deviation for replicate injections is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of iobenguane sulfate in each mL of the Injection taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of iobenguane sulfate in the *Standard preparation*; and  $r_U$  and  $r_S$  are the iobenguane peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for radioactivity**—Using a counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radioactivity, in MBq (or  $\mu\text{Ci}$ ), per mL, of the Injection by use of a calibrated system as directed under *Radioactivity* (821).

## Iobenguane I 131 Injection

$(\text{C}_8\text{H}_{10}^{131}\text{IN}_3)_2 \cdot \text{H}_2\text{SO}_4$   
[[3-(Iodo- $^{131}\text{I}$ )-phenyl]methyl]guanidine sulfate (2:1).  
[(*m*-Iodo- $^{131}\text{I}$ )-benzyl]guanidine sulfate (2:1).

» Iobenguane I 131 Injection is a sterile solution containing iobenguane sulfate in which a portion of the molecules contain radioactive iodine ( $^{131}\text{I}$ ) in the molecular structure. Iobenguane I 131 Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{131}\text{I}$  as iobenguane sulfate expressed in megabecquerels (or in millicuries) per mL at the time indicated in the labeling. It may contain preservatives or stabilizers.

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers that are adequately shielded. Store in a freezer.

**Labeling**—Label it to include the following: the date of calibration; the amount of  $^{131}\text{I}$  as iobenguane sulfate expressed as total megabecquerels (or millicuries) per mL at the time of calibration; the name and quantity of any added preservative or stabilizer; the expiration date; and the statement, "Caution—Radioactive Material." The labeling indicates that, in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of  $^{131}\text{I}$  is 8.04 days.

**USP Reference standards** (11)—

USP Endotoxin RS

**Radionuclidic identification** (see *Radioactivity* (821))—Its gamma-ray spectrum is identical to that of a specimen of  $^{131}\text{I}$  of known purity that exhibits a major photopeak having an energy of 0.364 MeV.

**Bacterial endotoxins** (85)—It contains not more than 175/V USP Endotoxin Unit per mL of the Injection, when compared with USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

**pH** (791): between 4.5 and 7.5.

**Radionuclidic purity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radionuclidic purity of the Injection: not less than 99% of the total radioactivity is present as  $^{131}\text{I}$ .

**Radiochemical purity**—

*Mobile phase*—Prepare a filtered and degassed mixture of water and acetonitrile (900:100). Add 3.04 g of triethylamine per liter, and adjust with phosphoric acid to a pH of 4.0  $\pm$  0.4. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of iobenguane sulfate in water to obtain a solution having a known concentration of about 1 mg per mL.

*Test preparation*—Use Iobenguane I 131 Injection.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 229-nm detector, a collimated radiation detector (see *Radioactivity* <821>), and a 3.9-mm × 30-cm column that contains 10-μm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 1.2, and the relative standard deviation for replicate injections is not more than 1.5%.

*Procedure*—Inject a volume (about 20 μL) of Injection, equivalent to between 1.6 and 2.7 MBq (or between 44 and 64 μCi) into the chromatograph, record the chromatograms, and measure the areas for the major peaks. The radioactivity of the iobenguane <sup>131</sup>I peak is not less than 90% of the total radioactivity measured, and its retention time is within 10% of that of the *Standard preparation*, similarly chromatographed. The retention time of the iobenguane <sup>131</sup>I peak obtained from the Injection is also within 10% of that obtained from the *Standard preparation*.

**Other requirements**—It meets the requirements under *Injections* <1>, except that the Injection may be distributed or dispensed prior to the completion of the test for *Sterility* <71>, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation for *Container Content*.

**Assay for radioactivity**—Using a counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* <821>), determine the radioactivity, in MBq (or μCi), per mL, of Injection by use of a calibrated system as directed under *Radioactivity* <821>.

## Iodohippurate Sodium I 123 Injection

C<sub>9</sub>H<sub>7</sub><sup>123</sup>INNaO<sub>3</sub>

Glycine, N-[2-(iodo-<sup>123</sup>I)benzoyl]-, monosodium salt.  
Sodium o-iodo-<sup>123</sup>I-hippurate [56254-07-0].

» Iodohippurate Sodium I 123 Injection is a sterile, aqueous solution containing o-iodohippurate sodium in which a portion of the molecules contain radioactive iodine (<sup>123</sup>I) in the molecular structure. It may contain a preservative or stabilizer.

Iodohippurate Sodium I 123 Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of I 123 as iodohippurate sodium expressed in megabecquerels (microcuries or millicuries) per mL at the time indicated in the labeling. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of o-iodohippuric acid. Other chemical forms of radioactivity do not exceed 3.0 percent of total radioactivity.

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers that are adequately shielded.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* <1>: the time and date of calibration; the amount of I 123 as iodohippurate sodium expressed as total megabecquerels

(microcuries or millicuries) per mL at the time of calibration; the name and quantity of any added preservative or stabilizer; the expiration time; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of I 123 is 13.2 hours.

### USP Reference standards <11>—

USP Endotoxin RS

USP o-Iodohippuric Acid RS

C<sub>9</sub>H<sub>8</sub>INO<sub>3</sub> 305.07

**Radionuclidic identification** (see *Radioactivity* <821>)—Its gamma-ray spectrum is identical to that of a specimen of I 123 of known purity that exhibits a major photopeak having an energy of 159 keV.

**Bacterial endotoxins** <85>—The limit of endotoxin content is not more than 175/V USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration time.

**pH** <791>: between 7.0 and 8.5.

**Radionuclidic purity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* <821>), determine the radionuclidic purity of the Injection: not less than 85% of the total radioactivity is present as I 123.

### Radiochemical purity—

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay for o-iodohippuric acid*, except to provide that the liquid chromatograph is also equipped with a radioactivity detector (see *Radioactivity* <821>).

*Procedure*—Inject about 50 μL equivalent to 1.8 to 3.7 MBq (50 to 100 μCi) of Injection into the chromatograph, record the chromatogram, and measure the area of all radioactivity peaks. The radioactivity under the o-iodohippuric acid I 123 peak is not less than 97.0% of the total area of all peaks observed, and its retention time is within ±10% of the value obtained for USP o-Iodohippuric Acid RS.

**Biological distribution**—Inject intravenously between 0.75 and 22 MBq (20 and 600 μCi) of the Injection, in a volume of 0.10 mL to 0.15 mL, into the caudal vein of each of three 125-g to 225-g anesthetized rats. Clamp the opening of the urethra with a hemostat. Sacrifice the animals 1 hour after administration, and carefully remove the intact bladder and contents and thyroid by dissection. Place each organ and remaining carcass (excluding the tail) in separate, suitable counting containers, and determine the radioactivity, in counts per minute, in each container with an appropriate detector using the same counting geometry. Determine the percentage of radioactivity in each organ: not less than 75% of the administered dose is found in the bladder, and not more than 3% of the administered dose is found in the thyroid in two of the rats.

**Other requirements**—It meets the requirements under *Injections* <1>, except that the Injection may be distributed or dispensed prior to the completion of the test for *Sterility*, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.

### Assay for o-iodohippuric acid—

*Mobile phase*—Prepare a filtered and degassed mixture of water, methanol, and glacial acetic acid (75:25:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Standard preparation*—Using an accurately weighed quantity of USP o-Iodohippuric Acid RS, prepare a solution in water having a known concentration of about 2 mg per mL.

*Assay preparation*—Use Iodohippurate Sodium I 123 Injection.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 265-nm detector and an 8-mm × 10-cm column that contains packing L11. The flow rate is about 5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency determined from the analyte peak is not less than 500 theoretical plates, the tailing factor for the analyte peak is not more than 1.5, and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatogram, and measure the responses for the major peaks. Calculate the quantity, in mg, of o-iodohippuric acid in each mL of Injection taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP o-iodohippuric Acid RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the o-iodohippuric acid peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for radioactivity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* <821>), determine the radioactivity in MBq (µCi or mCi) per mL of Injection by use of a calibrated system as directed under *Radioactivity* <821>.

## Sodium Iodide I 123 Capsules

Sodium iodide (Na<sup>123</sup>I).

Sodium iodide (Na<sup>123</sup>I) [41927-88-2].

» Sodium Iodide I 123 Capsules contain radioactive iodine (<sup>123</sup>I) processed in the form of Sodium Iodide obtained from the bombardment of enriched tellurium 124 with protons or of enriched tellurium 122 with deuterons, or by proton irradiation of enriched xenon 124, or by the decay of xenon 123 in such manner that it is carrier-free. Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of <sup>123</sup>I as iodide expressed in megabecquerels (microcuries or millicuries) at the time indicated in the labeling. Other chemical forms of radioactivity do not exceed 5 percent of the total radioactivity. The Capsules may contain a stabilizer.

**Packaging and storage**—Preserve in well-closed containers that are adequately shielded.

**Labeling**—Label the Capsules to include the following: the name of the Capsules; the name, address, and batch or lot number of the manufacturer; the time and date of calibration; the amount of <sup>123</sup>I as iodide expressed in megabecquerels (microcuries or millicuries) per Capsule at the time of calibration; the name and quantity of any added preservative or stabilizer; a statement indicating that the Capsules are for oral use only; the expiration date and time; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of <sup>123</sup>I is 13.2 hours.

**Radionuclide identification**—A solution or suspension of 1 or more Capsules in water responds to the test for *Radionuclide identification* under *Sodium Iodide I 123 Solution*.

**Uniformity of dosage units** <905>: meet the requirements.

**Procedure for content uniformity**—Determine the instrument response of each of 20 Capsules by measurement in a suitable counting assembly and under identical geometric conditions. Calculate the mean radioactivity value per Capsule: the requirements of the test are met if not less than 19 of the Capsules are within the limits of 96.5% and 103.5% of the mean radioactivity value.

**Radionuclidic purity**—A solution or suspension of 1 or more Capsules in water responds to the test for *Radionuclidic purity* under *Sodium Iodide I 123 Solution*.

**Radiochemical purity**—Homogenize 1 Capsule in 3 mL of water, add 3 mL of methanol, and centrifuge: the supernatant so obtained meets the requirements of the test for *Radiochemical purity* under *Sodium Iodide I 123 Solution*.

**Other requirements**—A solution or suspension prepared by homogenizing 1 or more Capsules in water to yield a concentration of not less than 1 MBq (25 µCi) per mL meets the requirements of the *Assay for radioactivity* under *Sodium Iodide I 123 Solution*.

## Sodium Iodide I 123 Solution

Sodium iodide (Na<sup>123</sup>I).

Sodium iodide (Na<sup>123</sup>I) [41927-88-2].

» Sodium Iodide I 123 Solution is a solution, suitable for oral or for intravenous administration, containing radioactive iodine (<sup>123</sup>I) processed in the form of Sodium Iodide, obtained from the bombardment of enriched tellurium 124 with protons or of enriched tellurium 122 with deuterons, or by proton irradiation of enriched xenon 124, or by the decay of xenon 123 in such manner that it is carrier-free.

Sodium Iodide I 123 Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of <sup>123</sup>I as iodide expressed in megabecquerels (microcuries or millicuries) per mL at the time indicated in the labeling. Other chemical forms of radioactivity do not exceed 5 percent of the total radioactivity. The Solution may contain a preservative or stabilizer.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers that previously have been treated to prevent adsorption, if necessary.

**Labeling**—Label it to include the following: the time and date of calibration; the amount of <sup>123</sup>I as iodide expressed as total megabecquerels (microcuries or millicuries) per mL at the time of calibration; the name and quantity of any added preservative or stabilizer; a statement to indicate whether the contents are intended for oral or for intravenous use; the expiration date and time; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of <sup>123</sup>I is 13.2 hours.

**USP Reference standards** <11>—

USP Endotoxin RS

**Radionuclide identification** (see *Radioactivity* <821>)—Its gamma-ray spectrum is identical to that of a specimen of <sup>123</sup>I of known purity that exhibits a major photoelectric peak having an energy of 0.159 MeV.

**Radionuclidic purity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* <821>), determine the radionuclidic purity of the Solution: not less than 90% of the total radioactivity is present as I 123.

**Bacterial endotoxins** <85>—Solution intended for intravenous use meets the requirements of the *Bacterial Endotoxins Test* <85>; and the limit of endotoxin content is not more than 175/V USP Endotoxin Unit per mL of the Injection, when compared with USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

**pH** <791>: between 7.5 and 9.0 for solutions intended for intravenous administration; between 7.5 and 10.0 for solutions intended for oral administration.

**Radiochemical purity**—Place a measured volume of a solution, containing 100 mg of potassium iodide, 200 mg of potassium iodate, and 1 g of sodium bicarbonate in each 100 mL, 25 mm from one end of a 25- × 300-mm strip of chromatographic paper (see *Chromatography* <621>), and allow to dry. To the same area add a similar volume of appropriately diluted Solution such that it provides a count rate of about 20,000 counts per minute, and allow to dry. Develop the chromatogram over a period of about 4 hours by ascending chromatography, using dilute methanol (7 in 10). Dry the chromatogram in air, and determine the radioactivity distribution by scanning with a suitable collimated radiation detector: the radioactivity of the iodide <sup>123</sup>I band is not less than 95.0% of the total radioactivity, and its *R<sub>f</sub>* value falls within ±5.0% of the value found for sodium iodide when determined under similar conditions. Confirmation of the identity of the iodide band is made by the addition to the suspected iodide band of 6 drops of acidified hydrogen peroxide solution (prepared by adding 6 drops of 1 N hydrochloric acid to 10 mL of hydrogen peroxide solution) followed by the dropwise addition of starch TS: the development of a blue color indicates the presence of iodide.

**Other requirements**—Solution intended for intravenous use meets the requirements under *Injections* <1>, except that it may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.

**Assay for radioactivity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* <821>), determine the radioactivity, in MBq (μCi) per mL, of Solution by use of a calibrated system as directed under *Radioactivity* <821>.

## Iodinated I 125 Albumin Injection

Albumin labeled with iodine-125.

» Iodinated I 125 Albumin Injection is a sterile, buffered, isotonic solution containing normal human albumin adjusted to provide not more than 37 megabecquerels (1 millicurie) of radioactivity per mL. It is derived by mild iodination of normal human albumin with the use of radioactive iodine (<sup>125</sup>I) to introduce not more than one gram-atom of iodine for each gram-molecule (60,000 g) of albumin.

Iodinated I 125 Albumin Injection contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of <sup>125</sup>I as iodinated albumin, expressed in megabecquerels (microcuries or in millicuries) per mL at the time indicated in the labeling. Other forms of radioac-

tivity do not exceed 3 percent of the total radioactivity. Its production and distribution are subject to federal regulations (see *Biologics* <1041> and *Radioactivity* <821>).

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, at a temperature between 2° and 8°.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* <1>: the date of calibration; the amount of <sup>125</sup>I as iodinated albumin, expressed as total megabecquerels (microcuries or millicuries), and concentration as megabecquerels (microcuries or millicuries) per mL on the date of calibration; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of <sup>125</sup>I is 60 days.

**USP Reference standards** <11>—  
USP Endotoxin RS

**Radionuclide identification** (see *Radioactivity* <821>)—Its gamma-ray spectrum is identical to that of a specimen of <sup>125</sup>I of known purity that exhibits a major photopeak having an energy of 0.0355 MeV.

**Bacterial endotoxins** <85>—The limit of endotoxin content is not more than 175/V USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

**pH** <791>: between 7.0 and 8.5.

**Radiochemical purity**—Place a measured volume, diluted with a suitable diluent so that it provides a count rate of about 20,000 counts per minute, about 25 mm from one end of a 25- × 300-mm strip of chromatographic paper (see *Chromatography* <621>), and allow to dry. Develop the chromatogram over a period of about 4 hours by ascending chromatography, using dilute methanol (7 in 10), and air-dry. Determine the radioactivity distribution by scanning the chromatogram with a suitable collimated radiation detector: not less than 97.0% of the total activity is found as albumin (at the point of application).

**Other requirements**—It meets the requirements under *Biologics* <1041> and under *Injections* <1>, except that it is not subject to the recommendation on *Container Content*. It meets all other applicable requirements of the FDA.

**Assay for radioactivity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* <821>), determine the radioactivity, in MBq (μCi) per mL, of Injection by use of a calibrated system as directed under *Radioactivity* <821>.

## Iothalamate Sodium I 125 Injection

» Iothalamate Sodium I 125 Injection is a sterile solution of Iothalamic Acid in Water for Injection prepared with the aid of Sodium Bicarbonate. A portion of the molecules contain radioactive iodine (<sup>125</sup>I) in the molecular structure. It may contain small amounts of suitable buffers or a stabilizer.

Iothalamate Sodium I 125 Injection contains not less than 90.0 percent and not more than 110.0 percent of the concentration of Iothalamate Sodium and of the labeled amount of <sup>125</sup>I as Iothalamate Sodium expressed in kilobecquerels (or in microcuries) per mL at the time indi-

cated in the labeling. Other chemical forms of radioactivity do not exceed 2.0 percent of the total radioactivity.

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers that are adequately shielded.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* (1): the time and date of calibration; the amount of  $^{125}\text{I}$  as iohalamate sodium expressed as total megabecquerels (microcuries or millicuries equivalent) per mL at the time of calibration; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of  $^{125}\text{I}$  is 60 days.

**Bacterial endotoxins** (85)—It contains not more than 175/V USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

**pH** (791): between 7.0 and 8.5.

**Radionuclide identification** (see *Radioactivity* (821))—Its gamma-ray spectrum is identical to that of a specimen of  $^{125}\text{I}$  of known purity that exhibits a major photoelectric peak having an energy of 0.035 MeV.

**Radiochemical purity**—Place a measured volume of Injection, diluted with a suitable diluent so that it provides a count rate of about 20,000 counts per minute, about 25 mm from one end of a 25- × 300-mm strip of chromatographic paper (see *Chromatography* (621)), and allow to dry. Develop the chromatogram over a period of about 4 hours by ascending chromatography, using methanol and ammonium hydroxide (100:1.5) adjusted with 2 N sulfuric acid to a pH of 3 to 6, and air-dry. Determine the radioactivity distribution with a suitable collimated radiation detector. The radioactivity under the free radioiodide peak is not more than 2% of the total area of all peaks: not less than 98% of the total activity is found at the point of application (as iohalamate sodium).

**Other requirements**—It meets the requirements under *Injections* (1), except that it is not subject to the recommendation in *Container Content*.

**Assay for radioactivity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radioactivity, in kilobecquerels (or  $\mu\text{Ci}$ ) per mL, of the Injection by use of a calibrated system as directed under *Radioactivity* (821).

### Iodinated I 131 Albumin Injection

Albumin labeled with iodine-131.

» Iodinated I 131 Albumin Injection is a sterile, buffered, isotonic solution containing normal human albumin adjusted to provide not more than 37 MBq (1 mCi) of radioactivity per mL. It is derived by mild iodination of normal human albumin with the use of radioactive iodine ( $^{131}\text{I}$ ) to introduce not more than one gram-atom of iodine for each gram-molecule (60,000 g) of albumin.

Iodinated I 131 Albumin Injection contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $^{131}\text{I}$  as iodinated albumin, expressed in megabecquerels

(microcuries or in millicuries) per mL at the time indicated in the labeling. Other forms of radioactivity do not exceed 3 percent of the total radioactivity. Its production and distribution are subject to federal regulations (see *Biologics* (1041) and *Radioactivity* (821)).

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* (1): the date of calibration; the amount of  $^{131}\text{I}$  as iodinated albumin, expressed as total megabecquerels (millicuries or microcuries), and concentration as megabecquerels (microcuries or millicuries) per mL on the date of calibration; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of  $^{131}\text{I}$  is 8.08 days.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Radionuclide identification** (see *Radioactivity* (821))—Its gamma-ray spectrum is identical to that of a specimen of  $^{131}\text{I}$  of known purity that exhibits a major photopeak having an energy of 0.364 MeV.

**Other requirements**—It meets the requirements for *Packaging and storage*, *Bacterial endotoxins*, *pH*, *Radiochemical purity*, and *Assay for radioactivity* under *Iodinated I 125 Albumin Injection*. It meets also the requirements under *Biologics* (1041), and the requirements under *Injections* (1), except that it is not subject to the recommendation on *Container Content*. It meets all other applicable requirements of the FDA.

### Iodinated I 131 Albumin Aggregated Injection

Albumin labeled with iodine-131.

» Iodinated I 131 Albumin Aggregated Injection is a sterile aqueous suspension of Albumin Human that has been iodinated with  $^{131}\text{I}$  and denatured to produce aggregates of controlled particle size. Each mL of the suspension contains not less than 300  $\mu\text{g}$  and not more than 3.0 mg of aggregated albumin with a specific activity of not less than 7.4 megabecquerels (200 microcuries) per mg and not more than 44.4 megabecquerels (1.2 millicuries) per mg of aggregated albumin. Iodinated I 131 Albumin Aggregated Injection contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $^{131}\text{I}$ , as aggregated albumin, expressed in megabecquerels (microcuries) per mL or megabecquerels (millicuries) per mL at the time indicated in the labeling. Other chemical forms of radioactivity do not exceed 6 percent of the total radioactivity. Its production and distribution are subject to federal regulations (see *Biologics* (1041) and *Radioactivity* (821)).

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, at a temperature between 2° and 8°.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* (1): the time and date of calibration; the amount of  $^{131}\text{I}$  as aggregated albumin expressed as total megabecquerels (microcuries or millicuries) and as aggregated albumin in mg per mL on the date of calibration; the expiration date; and the statement “Caution—Radioactive Material.” The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of  $^{131}\text{I}$  is 8.08 days; in addition, the labeling states that it is not to be used if clumping of the albumin is observed and directs that the container be agitated before the contents are withdrawn into a syringe.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Radionuclide identification**—Its gamma-ray spectrum is identical to that of a specimen of  $^{131}\text{I}$  of known purity that exhibits a major photopeak having an energy of 0.364 MeV.

**pH** (791): between 5.0 and 6.0.

**Other requirements**—It meets the requirements under *Biologics* (1041) and under *Injections* (1), except that it is not subject to the recommendation on *Container Content*. It meets also the requirements for *Particle size*, *Bacterial endotoxins*, and *Radiochemical purity* under *Technetium Tc 99m Albumin Aggregated Injection*, except that in the test for *Radiochemical purity*, not more than 6% of the radioactivity is found in the supernatant following centrifugation.

**Assay for radioactivity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radioactivity, in MBq ( $\mu\text{Ci}$ ) per mL, of Injection by use of a calibrated system as directed under *Radioactivity* (821).

## Iodohippurate Sodium I 131 Injection

$\text{C}_9\text{H}_7^{131}\text{INNaO}_3$

Glycine, *N*-[2-(iodo- $^{131}\text{I}$ -benzoyl)-], monosodium salt.  
Monosodium *o*-iodo- $^{131}\text{I}$ -hippurate [881-17-4].

» Iodohippurate Sodium I 131 Injection is a sterile solution containing *o*-iodohippurate sodium in which a portion of the molecules contain radioactive iodine ( $^{131}\text{I}$ ) in the molecular structure.

Iodohippurate Sodium I 131 Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{131}\text{I}$  as iodohippurate sodium expressed in megabecquerels (microcuries or millicuries) per mL at the time indicated in the labeling. Other chemical forms of radioactivity do not exceed 3.0 percent of the total radioactivity.

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* (1): the time and date of calibration; the amount of  $^{131}\text{I}$  as iodohippurate sodium expressed as total megabecquerels (microcuries or millicuries) and as megabecquerels (microcuries or millicuries) per mL at the time of calibration; the expiration date; and the statement “Caution—Radioactive Material.” The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay,

and also indicates that the radioactive half-life of  $^{131}\text{I}$  is 8.08 days.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Radionuclide identification** (see *Radioactivity* (821))—Its gamma-ray spectrum is identical to that of a specimen of iodine-131 of known purity that exhibits a major photopeak having an energy of 0.364 MeV.

**Bacterial endotoxins** (85)—The limit of endotoxin content is not more than 175/V USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

**pH** (791): between 7.0 and 8.5.

**Radiochemical purity**—Place 1 drop of a solution containing 0.2 percent potassium iodide, 1.0 percent sodium bicarbonate, and 1.0 percent sodium thiosulfate, about 45 mm from one end of each of two 25- × 300-mm strips of chromatographic paper (see *Chromatography* (621)), and allow to dry. Superimpose on one of the spots a measured volume of Injection, appropriately diluted, such that it provides a count rate of about 20,000 counts per minute, on this point of application, and allow to air-dry. Superimpose on the second spot 100  $\mu\text{L}$  of a solution prepared by dissolving 50 mg of non-radioactive iodohippurate sodium in 10 mL of alcohol, and allow to air-dry. Develop the chromatogram over a period of about 2½ hours by descending chromatography, using the upper layer obtained by shaking together 2 volumes of benzene, 2 volumes of glacial acetic acid, and 1 volume of water. Use the aqueous layer to equilibrate the apparatus prior to the start of development. Dry the chromatogram in air, and determine the radioactivity distribution by scanning the chromatogram with a suitable collimated radiation detector. Locate the position of the non-radioactive spot by viewing the chromatogram under short-wavelength UV light. The radioactivity under the iodohippuric acid band is not less than 97.0% of the total radioactivity, and its  $R_f$  value is within  $\pm 10\%$  of that of the non-radioactive spot.

**Other requirements**—It meets the requirements under *Injections* (1), except that the Injection may be distributed or dispensed prior to the completion of the test for *Sterility*, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.

**Assay for radioactivity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radioactivity, in MBq ( $\mu\text{Ci}$ ) per mL, of Injection by use of a calibrated system as directed under *Radioactivity* (821).

## Rose Bengal Sodium I 131 Injection

$\text{C}_{20}\text{H}_2\text{Cl}_4^{131}\text{I}_4\text{Na}_2\text{O}_5$

Spiro[isobenzofuran-1(3*H*),9'-[9*H*]-xanthene]-3-one, 4,5,6,7-tetrachloro-3',6'-dihydroxy-2',4',5',7'-tetraiodo-, disodium salt, labeled with iodine-131.

4,5,6,7-Tetrachloro-2',4',5',7'-tetraiodofluorescein disodium salt- $^{131}\text{I}$  [24916-55-0; 50291-21-9; 15251-14-6].

» Rose Bengal Sodium I 131 Injection is a sterile solution containing rose bengal sodium in which a portion of the molecules contain radioactive iodine ( $^{131}\text{I}$ ) in the molecular structure. It may contain a suitable buffer.

Rose Bengal Sodium I 131 Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{131}\text{I}$  as rose bengal sodium expressed in megabecquerels (microcuries or in millicuries) per mL at the time indicated in the labeling. The rose bengal sodium content is not less than 90.0 percent and not more than 110.0 percent of the labeled amount. Other chemical forms of radioactivity do not exceed 10.0 percent of the total radioactivity.

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* (1): the time and date of calibration; the amount of  $^{131}\text{I}$  as rose bengal sodium expressed as total megabecquerels (microcuries or millicuries) and as megabecquerels (microcuries or millicuries) per mL on the date of calibration; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of  $^{131}\text{I}$  is 8.08 days.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Radionuclide identification** (see *Radioactivity* (821))—Its gamma-ray spectrum is identical to that of a specimen of  $^{131}\text{I}$  of known purity that exhibits a major photopeak having an energy of 0.364 MeV.

**Bacterial endotoxins** (85)—The limit of endotoxin content is not more than  $175/V$  USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which  $V$  is the maximum recommended total dose, in mL, at the expiration date or time.

**pH** (791): between 7.0 and 8.5.

**Radiochemical purity**—Place a measured volume of a solution containing 100 mg of potassium iodide, 200 mg of potassium iodate, and 1 g of sodium bicarbonate in each 100 mL about 25 mm from one end of a  $25 \times 300$ -mm strip of chromatographic paper (see *Chromatography* (621)), and allow to dry. To the same area add a similar volume of appropriately diluted Injection such that it provides a count rate of about 20,000 counts per minute, and allow to dry. Develop the chromatogram over a period of about 2 hours by ascending chromatography, using 1 N acetic acid. Dry the chromatogram in air, and determine the radioactivity distribution by scanning the chromatogram with a suitable collimated radiation detector. The radioactivity under the rose bengal band is not less than 90.0% of the total radioactivity. The rose bengal band is at the point of application.

**Other requirements**—It meets the requirements under *Injections* (1), except that the Injection may be distributed or dispensed prior to the completion of the test for *Sterility*, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.

**Assay for rose bengal sodium**—Determine the absorbance of Injection, appropriately diluted, in a 1-cm cell at 550 nm, with a suitable spectrophotometer, using a sodium bicarbonate solution adjusted to a pH of 8.0 as the blank.

Calculate the quantity, in mg, of rose bengal sodium per mL of the Injection taken by the formula:

$$0.004D(A_U / A_S)$$

in which  $D$  is the dilution factor;  $A_U$  is the absorbance of the solution; and  $A_S$  is the absorbance, similarly determined, of a solution of rose bengal sodium adjusted to a pH of 8.0 by the addition of sodium bicarbonate and containing 4  $\mu\text{g}$  of rose bengal sodium per mL.

**Assay for radioactivity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radioactivity, in MBq ( $\mu\text{Ci}$ ) per mL, of Injection by use of a calibrated system as directed under *Radioactivity* (821).

## Sodium Iodide I 131 Capsules

Sodium iodide ( $\text{Na}^{131}\text{I}$ ).

Sodium iodide ( $\text{Na}^{131}\text{I}$ ) [7790-26-3].

» Sodium Iodide I 131 Capsules contain radioactive iodine ( $^{131}\text{I}$ ) processed in the form of Sodium Iodide from products of uranium fission or the neutron bombardment of tellurium in such a manner that it is essentially carrier-free and contains only minute amounts of naturally occurring iodine 127. Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{131}\text{I}$  as iodide expressed in megabecquerels (microcuries or millicuries) at the time indicated in the labeling. Other chemical forms of radioactivity do not exceed 5 percent of the total radioactivity. The Capsules may contain a stabilizing agent.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label the Capsules to include the following: the date of calibration; the amount of  $^{131}\text{I}$  as iodide expressed in megabecquerels (microcuries or millicuries) per Capsule at the time of calibration; a statement of whether the contents are intended for diagnostic or therapeutic use; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of  $^{131}\text{I}$  is 8.08 days.

**Radionuclide identification**—A solution or suspension of 1 or more Capsules in water responds to the test for *Radionuclide identification* under *Sodium Iodide I 131 Solution*.

**Uniformity of dosage units** (905): meet the requirements.

**Procedure for content uniformity**—Determine the instrument response of each of 20 Capsules by measurement in a suitable counting assembly and under identical geometric conditions. Calculate the mean radioactivity value per Capsule. The requirements are met if not fewer than 19 of the Capsules are within the limits of 96.5% and 103.5% of the mean radioactivity value.

**Radiochemical purity**—Homogenize 1 Capsule in 3 mL of water, add 3 mL of methanol, and centrifuge. The supernatant meets the requirements of the test for *Radiochemical purity* under *Sodium Iodide I 131 Solution*.

**Other requirements**—A solution or suspension prepared by homogenizing 1 or more Capsules in sufficient water to yield a concentration of not less than 1 MBq (25  $\mu\text{Ci}$ ) per

mL meets the requirements of the *Assay for radioactivity* under *Sodium Iodide I 131 Solution*.

## Sodium Iodide I 131 Solution

Sodium iodide ( $\text{Na}^{131}\text{I}$ ).  
Sodium iodide ( $\text{Na}^{131}\text{I}$ ) [7790-26-3].

» Sodium Iodide I 131 Solution is a solution suitable for either oral or intravenous administration, containing radioactive iodine ( $^{131}\text{I}$ ) processed in the form of Sodium Iodide from the products of uranium fission or the neutron bombardment of tellurium in such a manner that it is essentially carrier-free and contains only minute amounts of naturally occurring iodine 127.

Sodium Iodide I 131 Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{131}\text{I}$  as iodide expressed in megabecquerels (microcuries or in millicuries) per mL at the time indicated in the labeling. Other chemical forms of radioactivity do not exceed 5 percent of the total radioactivity. The Solution may contain a preservative or stabilizer.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers that previously have been treated to prevent adsorption.

**Labeling**—Label it to include the following: the time and date of calibration; the amount of  $^{131}\text{I}$  as iodide expressed as total megabecquerels (microcuries or millicuries) and as megabecquerels (microcuries or millicuries) per mL at the time of calibration; the name and quantity of any added preservative or stabilizer; a statement of the intended use, whether oral or intravenous; a statement of whether the contents are intended for diagnostic or therapeutic use; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of  $^{131}\text{I}$  is 8.08 days.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Radionuclide identification** (see *Radioactivity* (821))—Its gamma-ray spectrum is identical to that of a specimen of iodine 131 of known purity that exhibits a major photopeak having an energy of 0.364 MeV.

**Bacterial endotoxins** (85)—Solution intended for intravenous use meets the requirements of the *Bacterial Endotoxins Test* (85), the limit of endotoxin content being not more than 175/V USP Endotoxin Unit per mL of the Solution, when compared with the USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

**pH** (791): between 7.5 and 9.0 for solutions intended for intravenous administration; between 7.5 and 10.0 for solutions intended for oral administration.

**Radiochemical purity**—Place a measured volume of a solution containing 100 mg of potassium iodide, 200 mg of potassium iodate, and 1 g of sodium bicarbonate in each 100 mL, 25 mm from one end of a 25- × 300-mm strip of chromatographic paper (see *Chromatography* (621)), and allow to dry. To the same area add a similar volume of appropriately diluted Solution such that it provides a count rate of about 20,000 counts per minute, and allow to dry. Develop the chromatogram over a period of about 4 hours by as-

cending chromatography, using dilute methanol (7.0 in 10). Dry the chromatogram in air, and determine the radioactivity distribution by scanning with a suitable collimated radiation detector: the radioactivity of the iodide  $^{131}\text{I}$  band is not less than 95% of the total radioactivity, and its  $R_f$  value falls within  $\pm 5\%$  of the value found for sodium iodide when determined under parallel conditions. Confirmation of the identity of the iodide band is made by the addition to the suspected iodide band of 6 drops of acidified hydrogen peroxide solution (prepared by adding 6 drops of 1 N hydrochloric acid to 10 mL of hydrogen peroxide solution) followed by the dropwise addition of starch TS; the development of a blue color indicates presence of iodide.

**Other requirements**—Solution intended for intravenous use meets the requirements under *Injections* (1), except that the Solution may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.

**Assay for radioactivity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radioactivity, in MBq ( $\mu\text{Ci}$ ) per mL, of Solution by use of a calibrated system as directed under *Radioactivity* (821).

## Iodipamide

$\text{C}_{20}\text{H}_{14}\text{I}_6\text{N}_2\text{O}_6$  1139.76  
Benzoic acid, 3,3'-[(1,6-dioxo-1,6-hexanediyl)diimino]bis  
[2,4,6-triiodo-  
3,3'-(Adipoyl)diimino]bis[2,4,6-triiodobenzoic acid]  
[606-17-7].

» Iodipamide contains not less than 98.0 percent and not more than 102.0 percent of  $\text{C}_{20}\text{H}_{14}\text{I}_6\text{N}_2\text{O}_6$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** (11)—  
USP 3-Amino-2,4,6-triiodobenzoic Acid RS

$\text{C}_7\text{H}_4\text{I}_3\text{NO}_2$  514.83

USP Iodipamide RS

**Identification**—

**A:** It responds to the *Thin-Layer Chromatographic Identification Test* (201), the test solution and the Standard solution being prepared at a concentration of 1 mg per mL in an 0.8 in 1000 solution of sodium hydroxide in methanol, the solvent mixture being a mixture of chloroform, methanol, and ammonium hydroxide (20:10:2), and short-wavelength UV light being used to locate the spots.

**B:** Heat about 500 mg in a suitable crucible: violet vapors are evolved.

**Water, Method I** (921): not more than 1.0%.

**Residue on ignition** (281): not more than 0.1%.

**Free aromatic amine**—Transfer 1.0 g to a 50-mL volumetric flask, and add 12.5 mL of water and 2.5 mL of 1 N sodium hydroxide. To a second 50-mL volumetric flask transfer 4 mL of water, 10 mL of 0.1 N sodium hydroxide, and 1.0 mL of a Standard solution prepared by dissolving a suitable quantity of USP 3-Amino-2,4,6-triiodobenzoic Acid RS in 0.1 N sodium hydroxide (use 0.2 mL of the 0.1 N sodium hydroxide for each 5.0 mg of the Reference standard) and

by diluting with water to obtain a solution having a known concentration of 500 µg per mL. Proceed as directed in the test for *Free aromatic amine* under *Diatrizoate Meglumine*, beginning with "To a third 50-mL volumetric flask add 5 mL of water."

**Other requirements**—It meets the requirements of the tests for *Iodine and iodide* and *Heavy metals* under *Diatrizoic Acid*.

**Assay**—Transfer about 300 mg of Iodipamide, accurately weighed, to a glass-stoppered, 125-mL conical flask, add 30 mL of 1.25 N sodium hydroxide and 500 mg of powdered zinc, connect the flask to a reflux condenser, and reflux the mixture for 30 minutes. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the filter and the flask thoroughly, adding the rinsings to the filtrate. Add 5 mL of glacial acetic acid and 1 mL of tetrabromophenolphthalein ethyl ester TS, and titrate with 0.05 N silver nitrate VS until the yellow precipitate just turns green. Each mL of 0.05 N silver nitrate is equivalent to 9.498 mg of  $C_{20}H_{14}I_6N_2O_6$ .

## Iodipamide Meglumine Injection

$C_{20}H_{14}I_6N_2O_6 \cdot 2C_7H_{17}NO_5$  1530.19

Benzoic acid, 3,3'-[(1,6-dioxo-1,6-hexanedyl)diimino]bis [2,4,6-triiodo-, compd. with 1-deoxy-1-(methylamino)-D-glucitol(1:2).

1-Deoxy-1-(methylamino)-D-glucitol 3,3'-(adipoyldiimino)bis [2,4,6-triiodobenzoate] (2:1) (salt) [3521-84-4].

» Iodipamide Meglumine Injection is a sterile solution of Iodipamide in Water for Injection, prepared with the aid of Meglumine. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of iodipamide meglumine ( $C_{20}H_{14}I_6N_2O_6 \cdot 2C_7H_{17}NO_5$ ). It may contain small amounts of suitable buffers and of Edetate Calcium Disodium or Edetate Disodium as a stabilizer. Iodipamide Meglumine Injection intended for intravascular use contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I or Type III glass, protected from light.

**Labeling**—Label containers of Injection intended for intravascular injection to direct the user to discard any unused portion remaining in the container. Label containers of Injection intended for other than intravascular injection to show that the contents are not intended for intravascular injection.

**USP Reference standards** (11)—

USP 3-Amino-2,4,6-triiodobenzoic Acid RS  
 $C_7H_4I_3NO_2$  514.83

USP Endotoxin RS

USP Iodipamide RS

### Identification—

**A:** Dilute a volume of the Injection, if necessary, with a 0.8 in 1000 solution of sodium hydroxide in methanol to obtain a test solution having a concentration of 1 mg per mL. The test solution responds to the *Thin-layer Chromatographic Identification Test* (201), the Standard solution being prepared at a concentration of 1 mg of USP Iodipamide RS per mL in a 0.8 in 1000 solution of sodium hydroxide in methanol, the solvent mixture being a mixture of chloroform, methanol, and ammonium hydroxide (20:10:2), and short-wavelength UV light being used to locate the spots.

**B:** Evaporate a volume of Injection, equivalent to about 500 mg of iodipamide, to dryness, and heat the residue so obtained in a suitable crucible: violet vapors are evolved.

**Bacterial endotoxins** (85)—It contains not more than 3.6 USP Endotoxin Units per mL.

**pH** (791): between 6.5 and 7.7.

**Free aromatic amine**—Transfer an accurately measured volume of Injection, equivalent to 1 g of iodipamide meglumine, to a 50-mL volumetric flask, dilute with water to 5 mL, and add 10 mL of 0.1 N sodium hydroxide. To a second 50-mL volumetric flask add 10 mL of 0.1 N sodium hydroxide, 4 mL of water, and 1.0 mL of a Standard solution prepared by dissolving a suitable quantity of USP 3-Amino-2,4,6-triiodobenzoic Acid RS in 0.1 N sodium hydroxide (use 0.2 mL of the 0.1 N sodium hydroxide for each 5.0 mg of the Reference Standard) and diluting with water to obtain a solution having a known concentration of 500 µg per mL. Proceed as directed in the test for *Free aromatic amine* under *Diatrizoate Meglumine*, beginning with "To a third 50-mL volumetric flask add 5 mL of water."

**Meglumine content**—Proceed as directed in the test for *Meglumine content* under *Diatrizoate Meglumine Injection*. The meglumine content is not less than 23.5% and not more than 26.8% of the labeled amount of iodipamide meglumine.

**Other requirements**—It meets the requirements of the tests for *Iodine and iodide* and *Heavy metals* under *Diatrizoate Meglumine Injection*. It meets also the requirements under *Injections* (1).

**Assay**—Pipet a volume of Injection, equivalent to about 5 g of iodipamide meglumine, into a 100-mL volumetric flask, add 1.25 N sodium hydroxide to volume, and mix. Pipet 10 mL of the solution into a glass-stoppered, 250-mL flask, add 20 mL of the sodium hydroxide solution and 500 mg of powdered zinc, and proceed as directed in the Assay under *Diatrizoate Meglumine Injection*, beginning with "connect the flask to a reflux condenser." Each mL of 0.05 N silver nitrate is equivalent to 12.75 mg of  $C_{20}H_{14}I_6N_2O_6 \cdot 2C_7H_{17}NO_5$ .

## Iodixanol

$C_{35}H_{44}I_6N_6O_{15}$  1550.18

1,3-Benzenedicarboxamide, 5,5'-[(2-hydroxy-1,3-propanediyl)bis(acetylimino)]bis[*N,N'*-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-].

5,5'-[(2-Hydroxytrimethylene)bis(acetylimino)]bis[*N,N'*-bis(2,3-dihydroxypropyl)-2,4,6-triiodoisophthalamide] [92339-11-2].

» Iodixanol contains not less than 98.6 percent and not more than 101.0 percent of  $C_{35}H_{44}I_6N_6O_{15}$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** (11)—

USP Iodixanol RS

USP Iohexol Related Compound B RS

5-Amino-*N,N'*-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzenedicarboxamide.

USP Iodixanol Related Compound C RS

5-[Acetyl[3-[[3,5-bis[(2,3-dihydroxypropyl)amino]carbonyl]-2,4,6-triiodophenyl]amino]-2-hydroxypropyl]amino]-*N,N'*-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzenedicarboxamide.

USP Iodixanol Related Compound D RS

5-[Acetyl(2-hydroxy-3-methoxypropyl)amino]-*N,N'*-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzenedicarboxamide.

USP Iodixanol Related Compound E RS

5-[[3-[[3-[(2,3-Dihydroxypropyl)amino]carbonyl]-5-[[amino]carbonyl]-2,4,6-triiodophenyl](acetylmino)]-2-hydroxypropyl]-(acetylmino)]-*N,N'*-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzenedicarboxamide.

**Identification**—

**A: Infrared Absorption** (197K).

**B:** The retention times of the two principal peaks in the chromatogram of the *Test solution* correspond to those in the chromatogram of *Standard solution 2*, as obtained in *Related compounds, Test 2*. [NOTE—A third isomer may appear as a minor peak.]

**C:** Heat 0.5 g in a crucible: violet vapors are evolved.

**Specific rotation** (781S): between −0.5° and +0.5°.

*Test solution:* 50 mg per mL.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—Proceed as directed for *Plate Method under Total Aerobic Microbial Count*: not more than 100 cfu per g.

**Water, Method I** (921): not more than 4.0%.

**Heavy metals, Method I** (231): 0.001%.

**Free iodine**—Transfer 2 g to a glass-stoppered tube, add about 20 mL of water, 5 mL of toluene, and 5 mL of 2 N sulfuric acid, shake vigorously, and allow the phases to separate: the toluene layer shows no red or pink color.

**Limit of free iodide**—Transfer 5.0 g to a suitable container, add about 30 mL of water, and titrate with 0.001 N silver nitrate VS, determining the endpoint potentiometrically. Each mL of 0.001 N silver nitrate is equivalent to 126.9 µg of iodine. Not more than 0.39 mL of 0.001 N silver nitrate is required: not more than 10 µg of iodide per g is found.

**Limit of free aromatic amine**—

*N*-(1-Naphthyl)ethylenediamine dihydrochloride solution—Prepare a fresh solution of *N*-(1-naphthyl)ethylenediamine dihydrochloride (3 in 1000) in a mixture of propylene glycol and water (70:30).

*Blank solution*—Add 15 mL of water to a 25-mL volumetric flask.

*Standard stock solution*—Dissolve an accurately weighed quantity of USP Iohexol Related Compound B RS, and quantitatively dilute with water to obtain a solution having a known concentration of about 10 µg per mL.

*Standard solution*—Transfer 10.0 mL of the *Standard stock solution* and 5 mL of water to a 25-mL volumetric flask.

*Test solution*—Transfer about 200 mg of Iodixanol, accurately weighed, to a 25-mL volumetric flask, add 15 mL of water, and mix.

**Procedure**—Treat the *Standard solution*, the *Test solution*, and the *Blank solution* as follows. Place the flask in an ice bath for 5 minutes. Add 1.5 mL of 6 N hydrochloric acid, mix by swirling, add 1.0 mL of sodium nitrite solution (2 in 100), mix, and allow to stand in the ice bath for 4 minutes. Remove the flask from the ice bath, add 1.0 mL of 4% sulfamic acid solution, and swirl gently until gas evolution ceases. Add 1.0 mL of *N*-(1-Naphthyl)ethylenediamine dihydrochloride solution, mix, dilute with water to volume, mix, and allow to stand for 5 minutes. Transfer the solution obtained from the *Test solution* and the solution obtained from the *Standard solution* to separate color-comparison tubes. The solution obtained from the *Test solution* is lighter than the solution obtained from the *Standard solution*: not more than 0.05% is found. If the solution obtained from the *Test solution* is about the same color or darker than the solution obtained from the *Standard solution*, proceed as follows. Concomitantly determine the absorbances of the solution obtained from the *Test solution*, the solution obtained from the *Standard solution*, and the solution obtained from the *Blank solution* in 5-cm cells, at the wavelength of maximum absorbance at about 495 nm, using the solution obtained from the *Blank solution* to zero the spectrophotometer. Calculate the percentage of free aromatic amine in the portion of Iodixanol taken by the formula:

$$(C/W)[(A_U - A_B)/(A_S - A_B)]$$

in which *C* is the concentration, in µg per mL, of USP Iohexol Related Compound B RS in the *Standard solution*; *W* is the weight, in mg, of Iodixanol taken to prepare the *Test solution*; and *A<sub>U</sub>*, *A<sub>B</sub>*, and *A<sub>S</sub>* are the absorbances of the final solutions obtained from the *Test solution*, the *Blank solution*, and the *Standard solution*, respectively: not more than 0.05% is found.

**Limit of calcium**—

*Internal standard solution*—Accurately weigh about 3.067 g of scandium oxide, and dissolve in 1 L of water (each mL contains 2.0 mg of scandium). Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Blank solution*—Transfer 5.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with water to volume, and mix.

*Standard solutions*—Prepare a solution having a concentration of 10 µg of calcium per mL. Add 0.5, 2.5, 5.0, and 10.0 mL of this solution to separate 50-mL volumetric flasks. To each flask, add 5.0 mL of *Internal standard solution*, dilute with water to volume, and mix.

*Test solution*—Transfer about 2 g of Iodixanol, accurately weighed, to a 20-mL volumetric flask, add about 10 mL of water, and mix. Add 2.0 mL of *Internal standard solution*, dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of each *Standard solution* and the *Test solution* at 393.366 nm, the calcium emission line, and at 361.38 nm, the scandium emission line, with an atomic absorption spectrophotometer, using the *Blank solution* as the blank. Plot a standard curve of the ratio of the calcium absorption to the scandium absorption versus the respective calcium concentrations. From the graph so obtained, determine the calcium concentration, *C*, in µg per mL, in the *Test solution*. Calculate the content of calcium, in µg per g, in the portion of Iodixanol taken by the formula:

$$20(C/W)$$

in which *C* is as obtained above; and *W* is the weight, in g, of Iodixanol taken to prepare the *Test solution*: not more than 5 µg per g is found.

**Limit of ionic compounds**—[NOTE—Rinse all glassware with water.] Prepare a solution of Iodixanol in water (2 in 100). The specific conductance of this solution is not greater

than that of a sodium chloride solution having a concentration of 4 µg per mL (equivalent to not more than 0.02% of ionic compounds, as NaCl).

**Limit of methanol, isopropyl alcohol, and methoxyethanol—**

*Internal standard stock solution*—Transfer about 500 mg of secondary butyl alcohol to a 500-mL volumetric flask, dilute with water to volume, and mix.

*Internal standard solution*—Transfer 1.0 mL of *Internal standard stock solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Standard solution*—Transfer about 500 mg of methanol, accurately weighed, and about 1000 mg each of isopropyl alcohol and methoxyethanol, both accurately weighed, to a 500-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution and 1.0 mL of *Internal standard stock solution* to a second 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 1.0 mL to a headspace vial, and seal the vial with a septum and a crimp cap. This solution contains about 0.005 mg of methanol and about 0.01 mg each of isopropyl alcohol and methoxyethanol per mL.

*Test solution*—Transfer about 250 mg of Iodixanol, accurately weighed, to a headspace vial. Add 1.0 mL of *Internal standard solution*, seal the vial with a septum and a crimp cap, and mix until dissolved.

*Chromatographic system* (see *Chromatography* <621>)—The gas chromatograph is equipped with a headspace injector and a 0.54-mm × 30-m capillary column coated with a 1-µm layer of phase G16. The carrier gas is helium, flowing at a rate of about 11 mL per minute. The column temperature is maintained at 40° for 3.0 minutes, then it is increased linearly at a rate of 8° per minute to 100°, and is maintained at 100° for 1 minute. The temperatures of the headspace injector and the detector are maintained at 150° and 200°, respectively. The *Standard solution* and the *Test solution* are maintained at about 105°, and the needle temperature and transfer temperature are maintained at about 130° and 140°, respectively. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the elution order is methanol, isopropyl alcohol, secondary butyl alcohol, and methoxyethanol; the resolution, *R*<sub>s</sub> between methanol and isopropyl alcohol is not less than 1.0; and the relative standard deviation, determined from peak area ratios, for replicate injections is not more than 5% for methanol and isopropyl alcohol and not more than 10% for methoxyethanol.

*Procedure*—Using a heated, gas-tight syringe, separately inject equal volumes (about 1 mL) of the headspace of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of methanol, isopropyl alcohol, and methoxyethanol in the portion of Iodixanol taken by the formula:

$$100(C/W)(R_i / R_s)$$

in which *C* is the concentration, in mg per mL, of the relevant analyte in the *Standard solution*; *W* is the weight, in mg, of Iodixanol taken to prepare the *Test solution*; and *R*<sub>i</sub> and *R*<sub>s</sub> are the peak area ratios of the corresponding analyte to the internal standard obtained from the *Test solution* and the *Standard solution*, respectively: not more than 50 µg per g each of methanol, isopropyl alcohol, or methoxyethanol is found.

**Related compounds—**

TEST 1—

*Solution A*—Prepare a solution containing 500 mL of acetonitrile and 500 mL of water, and degas.

*Solution B*—Use 1000 mL of degassed water.

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Blank solution*—Use water.

*Standard stock solution 1*—Quantitatively dissolve an accurately weighed quantity of USP Iodixanol RS in water to obtain a solution having a known concentration of about 12.5 mg of anhydrous iodixanol per mL.

*Standard stock solution 2*—Quantitatively dissolve an accurately weighed quantity of USP Iodixanol Related Compound C RS in water to obtain a solution having a known concentration of about 0.25 mg of anhydrous iodixanol related compound C per mL.

*Standard stock solution 3*—Quantitatively dissolve an accurately weighed quantity of USP Iodixanol Related Compound D RS in water to obtain a solution having a known concentration of about 0.025 mg of anhydrous iodixanol related compound D per mL.

*Standard solution 1*—Dilute 2.0 mL of *Standard stock solution 1* in water to 10.0 mL, and mix.

*Standard solution 2*—Transfer 5.0 mL of *Standard stock solution 1*, 2.5 mL of *Standard stock solution 2*, and 2.5 mL of *Standard stock solution 3* to a 25-mL volumetric flask, dilute with water to volume, and mix.

*Test solution 1*—Dissolve an amount of Iodixanol, equivalent to about 500 mg of anhydrous iodixanol, in water, dilute with water to 20.0 mL, and mix.

*Test solution 2*—Dilute 5.0 mL of *Test solution 1* with water to 50.0 mL.

*Control solution*—Dilute 5.0 mL of *Test solution 1* and 2.5 mL of *Standard stock solution 2* with water to 50 mL.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	6	94	equilibration (for about 20 minutes)
0–30	6→20	94→80	linear gradient
30–70	20→100	80→0	linear gradient
70–80	100	0	isocratic
80–81	100→6	0→94	linear gradient
81–90	6	94	isocratic

Chromatograph the solutions as directed for *Procedure*, in the following injection sequence: *Blank solution*, *Standard solution 1*, *Control solution*, and at least three replicates of *Standard solution 2*.

The chromatogram obtained from *Standard solution 1* exhibits two or three principal unresolved peaks. If the chromatogram exhibits two principal peaks, their relative areas are about 60% and 40%. If the chromatogram exhibits three principal peaks, their relative areas are about 60%, 38%, and 2%. The chromatogram obtained from *Standard solution 2* exhibits two resolved peaks due to iodixanol related compound D that elute before the iodixanol peaks and one iodixanol related compound C peak between the two principal iodixanol peaks. The area of the two iodixanol related compound D peaks is between 0.075% and 0.125% of the total area. [NOTE—Disregard any peak due to the solvent front and any peak corresponding to those obtained from the *Blank solution*.] Add the areas of the two isomer peaks for iodixanol related compound D from each of the three injections of *Standard solution 2*, and calculate the relative standard deviation for the three summed areas: the relative standard deviation is not more than 5%. Measure

the height of the iodixanol related compound C peak, and, if necessary, adjust the sensitivity of the amplifier to obtain a peak height between 80% and 100% of the full scale. Measure the height,  $A$ , above the baseline of the iodixanol related compound C peak and the height,  $B$ , above the baseline of the lowest part of the curve separating this peak from the first principal iodixanol peak:  $A$  is not less than 1.3 $B$ . In the chromatogram obtained from the *Control solution*, iodixanol related compound C exhibits a measurable peak.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Blank solution*, *Test solution 1*, and *Test solution 2*.

**HIGH-LOW CHROMATOGRAPHY**—Where it is specified to proceed as directed for *High-low chromatography*, for the chromatogram obtained from *Test solution 1*, calculate the percentage of each specified related compound in the portion of iodixanol taken by the formula:

$$(10X)/(0.1Y + Z)$$

in which  $X$  is the peak area for each of the specified related compounds obtained from *Test solution 1*;  $Y$  is the total area of all the peaks eluted before and after iodixanol obtained from *Test solution 1*, disregarding any peaks due to injection noise or solvent; and  $Z$  is the sum of peak areas of iodixanol and any related compounds which are eluted together with, and between, the principal iodixanol peaks obtained from *Test solution 2*.

**IOHEXOL**—If iohehexol is present, it exhibits two peaks, with retention times of about 0.37 and 0.39 relative to the main iodixanol peak, in the chromatogram obtained from *Test solution 1*. Draw a baseline at the height of the baseline obtained from the *Blank solution*. Calculate the total area of the two peaks and the percentage of iohehexol in the portion of iodixanol taken as directed for *High-low chromatography*.

**IODIXANOL RELATED COMPOUND B<sup>1</sup>**—If iodixanol related compound B is present, it elutes as a single peak with a retention time of about 0.34 relative to the main iodixanol peak, in the chromatogram obtained from *Test solution 1*. Draw a baseline at the height of the baseline obtained from the *Blank solution*. Calculate the area of the peak and the percentage of iodixanol related compound B in the portion of iodixanol taken as directed for *High-low chromatography*.

**IODIXANOL RELATED COMPOUND C**—If iodixanol related compound C is present, only the first and larger peak, with a retention time of about 1.07 relative to the main iodixanol peak, is seen between the two principal iodixanol peaks in the chromatogram obtained from *Test solution 1*; the second iodixanol related compound C peak co-elutes with iodixanol. The area of the first and larger peak corresponds to about 80% of the total area of iodixanol related compound C. Draw a vertical line through the minimum before the first and larger peak. Draw a horizontal baseline at the minimum after the first and larger peak. This encompasses the iodixanol related compound C peak area,  $X_2$ . Calculate the percentage of iodixanol related compound C in the portion of iodixanol taken by the formula:

$$12.5X_2/(0.1Y + Z)$$

in which  $Y$  and  $Z$  are as defined for *High-low chromatography*.

**IODIXANOL RELATED COMPOUND F<sup>2</sup>**—If iodixanol related compound F is present, only the first and smaller peak with a retention time of about 0.8 relative to the main iodixanol peak, can be seen in the chromatogram obtained from *Test solution 1*; the second peak co-elutes with iodixanol. The area of the first and smaller peak corresponds to about 25%

of the total area of iodixanol related compound F. Draw the baseline at the height of the baseline obtained from the *Blank solution*. Calculate the percentage of iodixanol related compound F in the portion of iodixanol taken by the formula:

$$40X_1/(0.1Y + Z)$$

in which  $X_1$  is the actual observed area of the peak of iodixanol related compound F obtained from *Test solution 1*; and  $Y$  and  $Z$  are as defined for *High-low chromatography*.

**IODIXANOL RELATED COMPOUND G<sup>3</sup>**—If iodixanol related compound G is present, the second and larger peak, with a retention time of about 1.18 relative to the last iodixanol peak, is seen in the chromatogram obtained from *Test solution 1*; the first peak co-elutes with iodixanol. The area of the second peak corresponds to about 85% of the total area of iodixanol related compound G. Draw the baseline at the height of the baseline obtained from the *Blank solution*. Calculate the percentage of iodixanol related compound G in the portion of iodixanol taken by the formula:

$$10X_3/[0.85(0.1Y + Z)]$$

in which  $X_3$  is the peak area of iodixanol related compound G; and  $Y$  and  $Z$  are as defined for *High-low chromatography*.

**OVERALKYLATED RELATED COMPOUNDS**—These compounds elute after iodixanol related compound G, with a retention time greater than 1.18 relative to the last iodixanol peak. Draw the baseline at the height of the baseline obtained from the *Blank solution*, and determine the peak areas. Calculate the percentage of overalkylated related compounds as directed for *High-low chromatography*.

**UNSPECIFIED RELATED COMPOUNDS**—Examine the chromatograms obtained from *Test solution 1* and the area of each peak eluting before or after iodixanol, other than those of iodixanol, specified related compounds, specified impurities, and overalkylated related compounds. Draw the baseline at the height of the baseline obtained from the *Blank solution*. Calculate the percentage of the largest of these peaks as directed for *High-low chromatography*.

**OTHER UNSPECIFIED RELATED COMPOUNDS**—Determine the area of any unspecified peak eluting between those of iodixanol. Draw the baseline between minima, and calculate the percentage as directed for *High-low chromatography*.

Not more than 0.2% of iodixanol related compound B is found; not more than 0.4% of iodixanol related compound C is found; not more than 0.2% of iodixanol related compound F is found; not more than 0.2% of iodixanol related compound G is found; not more than 0.6% of iohehexol is found; not more than 1.0% of overalkylated related compounds is found; not more than 0.2% of any individual unspecified related compound is found; not more than 0.5% of total unspecified related compounds is found; and not more than 1.5% of total related compounds is found.

**TOTAL RELATED COMPOUNDS**—From each of the chromatograms obtained from *Test solution 1*, calculate the percentage of all related compounds as the sum of the results for the peaks appearing between the two principal iodixanol peaks, and the area percent obtained by the formula:

$$[100(Y - X_1 - X_3 + X_1/0.25 + X_2/0.8 + X_3/0.85)]/10(0.1Y + Z)$$

in which the variables are as defined above.

#### TEST 2—

**Solution A**—Use 1000 mL of filtered and degassed acetonitrile.

**Solution B and Mobile phase**—Proceed as directed for *Test 1*.

<sup>1</sup>5-(acetylamino)- $N,N'$ -bis(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzenedicarboxamide

<sup>2</sup>2-[[acetyl[3,5-bis[(2,3-dihydroxypropyl)amino]carbonyl]-2,4,6-triiodophenyl]amino]methyl]- $N,N'$ -bis(2,3-dihydroxypropyl)-2,3-dihydro-5,7-diiodo-4 $H$ -1,4-benzoxazine-6,8-dicarboxamide

<sup>3</sup>4-acetyl-2-[[acetyl[3,5-bis[(2,3-dihydroxypropyl)amino]carbonyl]-2,4,6-triiodophenyl]amino]methyl]- $N,N'$ -bis(2,3-dihydroxypropyl)-2,3-dihydro-5,7-diiodo-4 $H$ -1,4-benzoxazine-6,8-dicarboxamide

*Blank solution*—Use water.

*Standard stock solution 1*—Quantitatively dissolve an accurately weighed quantity of USP Iodixanol RS in water to obtain a solution having a known concentration of about 12.5 mg of anhydrous iodixanol per mL.

*Standard stock solution 2*—Quantitatively dissolve an accurately weighed quantity of USP Iodixanol Related Compound D RS, equivalent to about 0.125 g of anhydrous iodixanol related compound D, in water, and dilute with water to 100.0 mL. Dilute 2.0 mL of this solution with water to 100.0 mL.

*Standard stock solution 3*—Quantitatively dissolve an accurately weighed quantity of USP Iodixanol Related Compound E RS in water to obtain a solution having a known concentration of about 2.5 mg per mL.

*Standard solution 1*—Dilute 2.0 mL of *Standard stock solution 1* with water to 10.0 mL.

*Standard solution 2*—Transfer 5.0 mL of *Standard stock solution 1* and 2.5 mL of *Standard stock solution 2* to a 25-mL volumetric flask, dilute with water to volume, and mix.

*Standard solution 3*—Transfer 1.0 mL of *Standard solution 1* and 1.0 mL of *Standard stock solution 3* to a 10-mL volumetric flask, dilute with water to volume, and mix.

*Test solution*—Dissolve an accurately weighed quantity of Iodixanol, equivalent to about 125 mg of anhydrous iodixanol, in water, dilute with water to 50.0 mL, and mix.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L8. The flow rate is about 2.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	85	15	equilibration
0–25	85→66	15→34	linear gradient

Chromatograph the solutions as directed for *Procedure*. The chromatogram obtained from *Standard solution 1* exhibits three principal unresolved peaks: the relative areas are about 62%, 35%, and 3%; and the retention time of the last iodixanol peak is not more than 14 minutes.

The chromatogram obtained from *Standard solution 2* exhibits two partially unresolved peaks due to iodixanol related compound D, with relative retention times of about 0.33 and 0.39, that elute before the iodixanol peaks: the peak area of iodixanol related compound D is between 0.075% and 0.125% of the total area. Disregard any peak due to the solvent.

Determine the sum of the peak areas of the two isomers of iodixanol related compound D for each of the three chromatograms obtained from *Standard solution 2*: the relative standard deviation for replicate injections is not more than 5%.

The chromatogram obtained from *Standard solution 3* exhibits two unresolved peaks due to iodixanol related compound E, with relative retention times of about 0.67 and 0.72, that elute before the iodixanol peaks. Adjust the sensitivity of the amplifier so that the peak heights are between 90% and 100% of full scale of the highest peak: the resolution, *R*, between the first and largest iodixanol related compound E peak and the first principal iodixanol peak is not less than 5.0.

*Procedure*—Separately inject equal volumes (about 10 μL) of *Standard solution 1*, three times *Standard solution 2*, *Standard solution 3*, and the *Test solution*. For the first chromatogram obtained from *Standard solution 2*, adjust the sensitivity of the amplifier to obtain a peak height of about 15% of the first and larger peak that corresponds to iodixanol related compound D. Use this sensitivity setting for the subsequent injections.

Compare the retention times of the peaks obtained from *Standard solution 3* to those obtained from the *Test solution*. Iodixanol related compound E exhibits two peaks, the second of which may partly overlap with another peak; use only the area of the first and larger peak, which corresponds to about 60% of the total area of iodixanol related compound E. Draw a baseline at the height of the baseline obtained from the *Blank solution*. Calculate the percentage of iodixanol related compound E by dividing the area obtained from the *Test solution* by 0.6 and using area percent.

Iodixanol related compound H<sup>4</sup> appears as a single peak, with a shoulder, on the tail of the iodixanol peak. Calculate the percentage of iodixanol related compound H by using area percent. Not more than 0.3% of iodixanol related compound E is found; and not more than 0.6% of iodixanol related compound H is found.

**Assay**—Transfer about 500 mg of Iodixanol, accurately weighed, to a glass-stoppered, 125-mL conical flask, add 25 mL of a sodium hydroxide solution (5 in 100) and 500 mg of powdered zinc, connect the flask to a reflux condenser, and reflux for 1 hour. Cool the flask to room temperature, and rinse the condenser with 20 mL of water, adding the rinsing to the refluxed solution. Filter the mixture, rinsing the flask and the filter with several small portions of water, and adding the filtered rinsings to the filtrate. Add 5 mL of glacial acetic acid, titrate with 0.1 N silver nitrate VS, and determine the endpoint potentiometrically. Each mL of 0.1 N silver nitrate is equivalent to 25.84 mg of C<sub>35</sub>H<sub>44</sub>I<sub>6</sub>N<sub>6</sub>O<sub>15</sub>.

## Iodixanol Injection

### DEFINITION

Iodixanol Injection is a sterile solution of Iodixanol in Water for Injection. It contains NLT 95.0% and NMT 105.0% of the labeled amount of iodixanol (C<sub>35</sub>H<sub>44</sub>I<sub>6</sub>N<sub>6</sub>O<sub>15</sub>), as organically bound iodine. It may contain stabilizers and buffers. It contains no antimicrobial agents.

### IDENTIFICATION

- A.** The retention times of the two major peaks of the *Sample solution* correspond to those of *Standard solution B*, as obtained in *Organic Impurities, Procedure 2*.

### ASSAY

#### PROCEDURE

**Sample solution:** Transfer 2 mL of the Injection to a glass-stoppered, 125-mL conical flask, add 50 mL of 5% sodium hydroxide solution and 1.0 g of powdered zinc, connect the flask to a reflux condenser, and reflux for 1 h. Cool the flask to room temperature, and rinse the condenser with 20 mL of water, adding the rinsing to the refluxed solution. Filter the mixture, rinsing the flask and the filter with several small portions of water, and adding the filtered rinsings to the filtrate. Add 20 mL of glacial acetic acid, dilute with water to 200.0 mL, and transfer 100.0 mL of this solution to a 250-mL conical flask.

**Analysis:** Titrate with 0.1 N silver nitrate VS using autotitration. Each mL of 0.1 N silver nitrate is equivalent to 25.84 mg of C<sub>35</sub>H<sub>44</sub>I<sub>6</sub>N<sub>6</sub>O<sub>15</sub>. [NOTE—The result must be corrected for any inorganic halides that may be present due to added stabilizers or buffers.]

<sup>45</sup>-[[[3-[[[3-[[[3-[[[3,5-bis-[[[2,3-dihydroxypropyl]amino]carbonyl]-2,4,6-triiodophenyl](acetylimino)]-2-hydroxypropyl](acetylimino)]-5-[[[2,3-dihydroxypropyl]amino]carbonyl]-2,4,6-triiodophenyl]carbonyl]amino]-2-hydroxypropyl]oxy]-2-hydroxypropyl](acetylimino)]-N,N'-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzendicarboxamide

Acceptance criteria: 95.0%–105.0%

## IMPURITIES

### • ORGANIC IMPURITIES, PROCEDURE 1

**Solution A:** Acetonitrile and water (1:1)

**Solution B:** Water

**Blank solution:** Water

**Mobile phase:** See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	6	94
30	20	80
70	100	0
80	100	0
81	6	94
90	6	94

**Standard stock solution A:** 12.5 mg/mL of anhydrous iodixanol from USP Iodixanol RS in water

**Standard stock solution B:** 0.25 mg/mL of anhydrous iodixanol related compound C from USP Iodixanol Related Compound C RS in water

**Standard stock solution C:** 0.025 mg/mL of anhydrous iodixanol related compound D from USP Iodixanol Related Compound D RS in water

**Standard solution A:** 2.5 mg/mL of *Standard stock solution A* in water

**Standard solution B:** *Standard stock solution A*, *Standard stock solution B*, *Standard stock solution C*, and water (5: 2.5: 2.5: 15)

**Sample solution A:** 25 mg/mL of iodixanol obtained from a volume of Injection in water

**Sample solution B:** 2.5 mg/mL of iodixanol obtained from a volume of Injection in water

**Control solution:** *Sample solution A*, *Standard stock solution B*, and water (5: 2.5: 42.5)

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 10 μL

### System suitability

**Samples:** *Blank solution*, *Standard solution A*, at least three replicates of *Standard solution B*, and *Control solution*

Chromatograph the solutions as mentioned above. The chromatogram from *Standard solution A* exhibits two or three principal unresolved peaks. If the chromatogram exhibits two principal peaks, their relative areas are 60% and 40%. If the chromatogram exhibits three principal peaks, their relative areas are 60%, 38%, and 2%. The chromatogram from *Standard solution B* exhibits two resolved peaks due to iodixanol related compound D that elute before the iodixanol peaks and one iodixanol related compound C peak between the two principal iodixanol peaks. The area of the two iodixanol related compound D peaks is between 0.075% and 0.125% of the total area. Add the areas of the two isomer peaks for iodixanol related compound D from each of the three injections of *Standard solution B*, and calculate the relative standard deviation for the three summed areas: the relative standard deviation is NMT 5%. Measure the height of the iodixanol related compound C peak, and, if necessary, adjust the sensitivity of the amplifier to obtain a peak height between 80% and 100% of the full scale. Measure the height, A, above the baseline of the iodixanol related compound C peak and the height, B, above the baseline of the lowest part of the curve sep-

arating this peak from the first principal iodixanol peak: A is NLT 1.3B. In the chromatogram from the *Control solution*, iodixanol related compound C exhibits a measurable peak.

### Analysis

**Samples:** *Blank solution*, *Sample solution A*, and *Sample solution B*

**High-low chromatography:** Where it is specified to proceed as directed for *High-low chromatography*, for the chromatogram from *Sample solution A*, calculate the percentage of each specified related compound in the portion of Injection taken:

$$\text{Result} = (10X)/(0.1Y + Z)$$

X = peak area for each of the specified related compounds from *Sample solution A*

Y = total area of all the peaks eluted before and after iodixanol from *Sample solution A*, disregarding any peaks due to injection noise or solvent

Z = sum of peak areas of iodixanol and any related compounds that are eluted together with, and between, the principal iodixanol peaks from *Sample solution B*

**Iohexol:** If iohexol is present, it exhibits two peaks, with retention times of 0.37 and 0.39 relative to the main iodixanol peak, in the chromatogram from *Sample solution A*. Draw a baseline at the height of the baseline from the *Blank solution*.

Calculate the total area of the two peaks and the percentage of iohexol in the portion of Injection taken as directed for *High-low chromatography*.

**Iohexol related compound A:** If iohexol related compound A is present, it elutes as a single peak with a retention time of 0.34 relative to the main iodixanol peak, in the chromatogram from *Sample solution A*. Draw a baseline at the height of the baseline from the *Blank solution*.

Calculate the area of the peak and the percentage of iohexol related compound A in the portion of Injection taken as directed for *High-low chromatography*.

**Iodixanol related compound C:** If iodixanol related compound C is present, only the first and larger peak, with a retention time of 1.07 relative to the main iodixanol peak, is seen between the two principal iodixanol peaks in the chromatogram from *Sample solution A*; the second iodixanol related compound C peak co-elutes with iodixanol. The area of the first and larger peak corresponds to 80% of the total area of iodixanol related compound C. Draw a vertical line through the minimum before the first and larger peak. Draw a horizontal baseline at the minimum after the first and larger peak.

Calculate the percentage of iodixanol related compound C in the portion of Injection taken:

$$\text{Result} = 12.5X_2/(0.1Y + Z)$$

X<sub>2</sub> = iodixanol related compound C peak area

Y = total area of all the peaks eluted before and after iodixanol from *Sample solution A*, disregarding any peaks due to injection noise or solvent

Z = sum of peak areas of iodixanol and any related compounds that are eluted together with, and between, the principal iodixanol peaks from *Sample solution B*

**Iodixanol related compound F:** If iodixanol related compound F is present, only the first and smaller peak with a retention time of 0.8 relative to the main iox-

<sup>1</sup> 5-(Acetyl(amino))-N,N'-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzenedicarboxamide.

<sup>2</sup> 2-[[Acetyl[3,5-bis[[[(2,3-dihydroxypropyl)amino]carbonyl]-2,4,6-triiodophenyl]amino]methyl]-N,N'-bis(2,3-dihydroxypropyl)-2,3-dihydro-5,7-diiodo-4H-1,4-benzoxazine-6,8-dicarboxamide.

anol peak can be seen in the chromatogram from *Sample solution A*; the second peak co-elutes with iodixanol. The area of the first and smaller peak corresponds to 25% of the total area of iodixanol related compound F. Draw the baseline at the height of the baseline from the *Blank solution*.

Calculate the percentage of iodixanol related compound F in the portion of Injection taken:

$$\text{Result} = 40X_1 / (0.1Y + Z)$$

- $X_1$  = actual observed area of the peak of iodixanol related compound F from *Sample solution A*  
 $Y$  = total area of all the peaks eluted before and after iodixanol from *Sample solution A*, disregarding any peaks due to injection noise or solvent  
 $Z$  = sum of peak areas of iodixanol and any related compounds that are eluted together with, and between, the principal iodixanol peaks from *Sample solution B*

**Iodixanol related compound G<sup>3</sup>:** If iodixanol related compound G is present, the second and larger peak, with a retention time of 1.18 relative to the last iodixanol peak, is seen in the chromatogram from *Sample solution A*; the first peak co-elutes with iodixanol. The area of the second peak corresponds to 85% of the total area of iodixanol related compound G. Draw the baseline at the height of the baseline from the *Blank solution*.

Calculate the percentage of iodixanol related compound G in the portion of Injection taken:

$$\text{Result} = 10X_3 / [0.85(0.1Y + Z)]$$

- $X_3$  = peak area of iodixanol related compound G  
 $Y$  = total area of all the peaks eluted before and after iodixanol from *Sample solution A*, disregarding any peaks due to injection noise or solvent  
 $Z$  = sum of peak areas of iodixanol and any related compounds that are eluted together with, and between, the principal iodixanol peaks from *Sample solution B*

**Overalkylated related compounds:** These compounds elute after iodixanol related compound G, with a retention time greater than 1.18 relative to the last iodixanol peak. Draw the baseline at the height of the baseline from the *Blank solution*, and determine the peak areas.

Calculate the percentage of overalkylated related compounds as directed for *High-low chromatography*.

**Unspecified related compounds:** Examine the chromatograms from *Sample solution A* and the area of each peak eluting before or after iodixanol, other than those of iodixanol, specified related compounds, specified impurities, and overalkylated related compounds. Draw the baseline at the height of the baseline from the *Blank solution*.

Calculate the percentage of the largest of these peaks as directed for *High-low chromatography*.

**Other unspecified related compounds:** Determine the area of any unspecified peak eluting between those of iodixanol. Draw the baseline between minima, and calculate the percentage as directed for *High-low chromatography*.

<sup>3</sup> 4-Acetyl-2-[[acetyl[[3,5-bis[(2,3-dihydroxypropyl)amino]carbonyl]-2,4,6-triiodophenyl]amino]methyl]-N,N'-bis(2,3-dihydroxypropyl)-2,3-dihydro-5,7-diiodo-4H-1,4-benzoxazine-6,8-dicarboxamide.

**Individual impurities:** See *Table 2*.

**Table 2**

Name	Acceptance Criteria, NMT (%)
Iohexol related compound A	0.2
Iodixanol related compound C	0.4
Iodixanol related compound F	0.2
Iodixanol related compound G	0.2
Iohexol	0.6
Overalkylated related compounds	1.0
Any individual unspecified related compound	0.2
Total unspecified related compounds	0.5

**Total related compounds:** From each of the chromatograms from *Sample solution A*, calculate the percentage of all related compounds as the sum of the results for the peaks appearing between the two principal iodixanol peaks, and the area percent:

$$\text{Result} = [100(Y - X_1 - X_3 + X_1/0.25 + X_2/0.8 + X_3/0.85)] / 10(0.1Y + Z)$$

- $Y$  = total area of all the peaks eluted before and after iodixanol from *Sample solution A*, disregarding any peaks due to injection noise or solvent  
 $X_1$  = actual observed area of the peak of iodixanol related compound F from *Sample solution A*  
 $X_3$  = peak area of iodixanol related compound G  
 $X_2$  = iodixanol related compound C peak area  
 $Z$  = sum of peak areas of iodixanol and any related compounds that are eluted together with, and between, the principal iodixanol peaks from *Sample solution B*

**Total impurities:** NMT 1.5%

• **ORGANIC IMPURITIES, PROCEDURE 2**

**Solution A:** Acetonitrile

**Solution B:** Water

**Blank solution:** Water

**Mobile phase:** See *Table 3*.

**Table 3**

Time (min)	Solution A (%)	Solution B (%)
0	85	15
25	66	34

**Standard stock solution A:** 12.5 mg/mL of anhydrous iodixanol from USP Iodixanol RS

**Standard stock solution B:** 0.025 mg/mL of anhydrous iodixanol related compound D from USP Iodixanol Related Compound D RS

**Standard stock solution C:** 2.5 mg/mL of anhydrous iodixanol related compound E from USP Iodixanol Related Compound E RS

**Standard solution A:** 2.5 mg/mL of anhydrous iodixanol from *Standard stock solution A* diluted with water

**Standard solution B:** 2.5 mg/mL of anhydrous iodixanol and 0.0025 mg/mL of anhydrous iodixanol related compound D from *Standard stock solution A* and *Standard stock solution B*, respectively, diluted with water

**Standard solution C:** 2.5 mg/mL of anhydrous iodixanol and 0.25 mg/mL of anhydrous iodixanol related compound E from *Standard stock solution A* and *Standard stock solution C*, respectively, diluted with water

**Sample solution:** 2.5 mg/mL of iodixanol from a volume of Injection

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 254 nm**Column:** 4.6-mm × 25-cm; 5-μm packing L8**Flow rate:** 2.5 mL/min**Injection volume:** 10 μL**System suitability**

**Samples:** *Standard solution A*, three times of *Standard solution B*, *Standard solution C*, and *Sample solution*

The chromatogram from *Standard solution A* exhibits three principal unresolved peaks: the relative areas are 62%, 35%, and 3%; and the retention time of the last iodixanol peak is NMT 14 min. The chromatogram from *Standard solution B* exhibits two partially unresolved peaks due to iodixanol related compound D, with relative retention times of 0.33 and 0.39, that elute before the iodixanol peaks: the peak area of iodixanol related compound D is between 0.075% and 0.125% of the total area. Disregard any peak due to the solvent.

Determine the sum of the peak areas of the two isomers of iodixanol related compound D for each of the three chromatograms from *Standard solution B*.

**Relative standard deviation:** NMT 5%

The chromatogram from *Standard solution C* exhibits two unresolved peaks due to iodixanol related compound E, with relative retention times of 0.67 and 0.72, that elute before the iodixanol peaks. Adjust the sensitivity of the amplifier so that the peak heights are between 90% and 100% of full scale of the highest peak.

**Resolution, R:** NLT 5.0 between the first and largest iodixanol related compound E peak and the first principal iodixanol peak

**Analysis**

**Samples:** *Standard solution A*, three times of *Standard solution B*, *Standard solution C*, and *Sample solution*

For the first chromatogram from *Standard solution B*, adjust the sensitivity of the amplifier to obtain a peak height of 15% of the first and larger peak that corresponds to iodixanol related compound D. Use this sensitivity setting for the subsequent injections.

Compare the retention times of the peaks from *Standard solution C* to those from the *Sample solution*. Iodixanol related compound E exhibits two peaks, the second of which may partly overlap with another peak; use only the area of the first and larger peak, which corresponds to 60% of the total area of iodixanol related compound E. Draw a baseline at the height of the baseline from the *Blank solution*.

Calculate the percentage of iodixanol related compound E by dividing the area from the *Sample solution* by 0.6 and using area percent.

**Iodixanol related compound H<sup>4</sup>:** Appears as a single peak, with a shoulder, on the tail of the iodixanol peak.

Calculate the percentage of iodixanol related compound H by using area percent.

**Acceptance criteria:** NMT 0.3% of iodixanol related compound E is found and NMT 0.6% of iodixanol related compound H is found.

**SPECIFIC TESTS**

- **pH** <791>: 6.8–7.7
- **BACTERIAL ENDOTOXINS TEST** (85): NMT 0.2 USP Endotoxin Unit/50 mg of iodine
- **OSMOLALITY AND OSMOLARITY**, *Osmolality* <785>: 270–310 mOsmol/kg

<sup>4</sup> 5-[[3-[[[3-[[[3-[[[3-5-Bis-[[[2,3-dihydroxypropyl]amino]carbonyl]-2,4,6-triiodophenyl](acetylimino)]-2-hydroxypropyl](acetylimino)]-5-[[[2,3-dihydroxypropyl]amino]carbonyl]-2,4,6-triiodophenyl]carbonyl]amino]-2-hydroxypropyl]oxy]-2-hydroxypropyl](acetylimino)]-N,N'-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzendicarboxamide.

- **INJECTIONS** <1>: Meets the requirements

**• LIMIT OF FREE IODIDE****Sample:** 5.0 mL of Injection

**Analysis:** Transfer *Sample* to a suitable container, add 2.0 mL of acetic acid solution (1:5 glacial acetic acid in water) and 30 mL of water, and titrate with 0.001 N silver nitrate VS. Each mL of 0.001 N silver nitrate is equivalent to 0.1269 mg of iodine. NMT 15.0 mL of 0.001 N silver nitrate is required.

**Acceptance criteria:** NMT 0.02% based on the content of iodixanol

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in single-dose or multi-dose plastic or Type I glass containers. Store at controlled room temperature, protected from light. Do not freeze.
- **LABELING** Label containers of Injection to direct the user to discard any unused portion. The labeling states also that it is not to be used if it is discolored or contains a precipitate. Label it to state its routes of administration. Label it to indicate "not approved for intrathecal use".
- **USP REFERENCE STANDARDS** <11>
  - USP Iodixanol RS
  - USP Iodixanol Related Compound C RS
 

5-[Acetyl[3-[[[3,5-bis[[[2,3-dihydroxypropyl]amino]carbonyl]-2,4,6-triiodophenyl]amino]-2-hydroxypropyl]amino]N,N'-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzenedicarboxamide.
  - USP Iodixanol Related Compound D RS
 

5-[Acetyl(2-hydroxy-3-methoxypropyl)amino]-N,N'-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzenedicarboxamide.
  - USP Iodixanol Related Compound E RS
 

5-[[3-[[[3-[[[2,3-Dihydroxypropyl]amino]carbonyl]-5-[[[amino]carbonyl]-2,4,6-triiodophenyl](acetylimino)]-2-hydroxypropyl]-(acetylimino)]-N,N'-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzenedicarboxamide.

**Iodoform**CHI<sub>3</sub>

Triiodomethane 393.73 [75-47-8].

» Iodoform, previously dried over silica gel for 24 hours, contains not less than 99.0 percent and not more than 100.5 percent of CHI<sub>3</sub>.

**Packaging and storage**—Preserve in tight, light-resistant containers, store at controlled room temperature, and prevent exposure to excessive heat.

**Labeling**—Label it to indicate that it is intended for use in compounding dosage forms for topical, periodontal, nasal, and intracavitary use only.

**Identification**—Heat 0.1 g: a purple gas is evolved.

**Loss on drying** <731>—Dry it over silica gel for 24 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Coloring matter, acids, and alkalis**—Shake about 2 g of it with 5 mL of water for 1 minute, and filter: the filtrate is colorless and is neutral to litmus.

**Chloride** <221>—Shake 3.0 g of powdered Iodoform with 75 mL of water for 1 minute, allow to stand, and filter the supernatant. To 25 mL of the filtrate add 6 mL of 3 N nitric acid, and dilute with water to 40 mL. This solution shows no more chloride than corresponds to 0.15 mL of 0.020 N hydrochloric acid (0.011%).

**Sulfate** <221>—To 25 mL of the filtrate obtained in the test for *Chloride* add 1 mL of 3 N hydrochloric acid, and dilute with water to 40 mL. This solution shows no more sulfate

than corresponds to 0.17 mL of 0.020 N sulfuric acid (0.017%).

**Assay**—Transfer about 200 mg of Iodoform, previously dried over silica gel for 24 hours and accurately weighed, to a 500-mL glass-stoppered conical flask. Add 20 mL of alcohol, and swirl to dissolve. Add 30.0 mL of 0.1 N silver nitrate VS and 10 mL of nitric acid, insert the stopper, and allow it to stand in a dark place for 16 hours. Add 150 mL of water and 5 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Perform a blank determination (see *Titrimetry* <541>). Each mL of 0.1 N silver nitrate is equivalent to 13.124 mg of  $\text{CHI}_3$ .

## Iodoquinol

$\text{C}_9\text{H}_5\text{I}_2\text{NO}$  396.95  
8-Quinolinol, 5,7-diiodo-.  
5,7-Diiodo-8-quinolinol [83-73-8].

» Iodoquinol contains not less than 96.0 percent and not more than 100.5 percent of  $\text{C}_9\text{H}_5\text{I}_2\text{NO}$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—  
USP Iodoquinol RS

### Identification—

**A:** Prepare a 1 in 200 solution in carbon disulfide, warming slightly, if necessary, to effect complete solution: the IR absorption spectrum of this solution, in a 3-mm sodium chloride cell, carbon disulfide being used as the blank, in the region from 7  $\mu\text{m}$  to 11  $\mu\text{m}$  exhibits absorption maxima and minima only at the same wavelengths as that of a similar solution of USP Iodoquinol RS, concomitantly measured.

**B:** Warm a small quantity of it with 1 mL of sulfuric acid: violet vapors of iodine are evolved.

**Loss on drying** <731>—Dry it over silica gel for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Free iodine and iodide**—Shake 1.0 g with 20 mL of water for 30 seconds, allow to stand for 5 minutes, and filter. To 10 mL of the filtrate add 1 mL of 2 N sulfuric acid, then add 2 mL of chloroform, and shake: no violet color appears in the chloroform (*free iodine*). To the mixture add 5 mL of 2 N sulfuric acid and 1 mL of potassium dichromate TS, and shake for 15 seconds: the color in the chloroform layer is not deeper than that produced in a control test made in the following manner. Dilute 2 mL of potassium iodide solution (1 in 6000) with water to 10 mL, add 6 mL of 2 N sulfuric acid, 1 mL of potassium dichromate TS, and 2 mL of chloroform, and shake for 15 seconds (0.05% of *iodide*).

**Assay**—Using about 14 mg of Iodoquinol, accurately weighed, proceed as directed under *Oxygen Flask Combustion* <471>, using a mixture of 10 mL of sodium hydroxide solution (1 in 100) and 1 mL of freshly prepared sodium bisulfite solution (1 in 100) as the absorbing liquid. When the combustion is complete, place a few mL of water around the stopper of the flask, loosen the stopper, then rinse the stopper, the specimen holder, and the sides of the flask with about 20 mL of water, added in small portions. Add 1 mL of an oxidizing solution prepared by adding 5 mL

of bromine to 100 mL of a 1 in 10 solution of sodium acetate in glacial acetic acid. Insert the stopper in the flask, and shake vigorously for 1 minute. Add 0.5 mL of formic acid, replace the stopper, and shake vigorously for 1 minute. Remove the stopper, and rinse the stopper, the specimen holder, and the sides of the flask with several small portions of water. Bubble nitrogen through the flask to remove the oxygen and excess bromine, add 500 mg of potassium iodide, swirl to dissolve, add 3 mL of 2 N sulfuric acid, swirl to mix, and allow to stand for 2 minutes. Titrate with 0.02 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Each mL of 0.02 N sodium thiosulfate is equivalent to 0.6616 mg of  $\text{C}_9\text{H}_5\text{I}_2\text{NO}$ .

## Iodoquinol Tablets

» Iodoquinol Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $\text{C}_9\text{H}_5\text{I}_2\text{NO}$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—  
USP Iodoquinol RS

### Identification—

**A:** Shake a portion of finely powdered Tablets, equivalent to about 5 mg of iodoquinol, with 10 mL of carbon disulfide, and filter: the filtrate responds to *Identification test A* under *Iodoquinol*.

**B:** Place a portion of the powdered Tablets prepared for the Assay, equivalent to about 50 mg of iodoquinol, in a dry test tube, add 1 mL of sulfuric acid, and warm gently: violet vapors of iodine are evolved.

**Disintegration** <701>: 1 hour.

**Uniformity of dosage units** <905>: meet the requirements.

**Soluble iodides**—Digest a quantity of powdered Tablets, equivalent to 100 mg of iodoquinol, with 5 mL of water for 10 minutes, cool, and filter. To the filtrate add 1 mL of 3 N hydrochloric acid, 2 drops of ferric chloride TS, and 2 mL of chloroform, shake gently, and allow to separate: any violet color in the chloroform is not more intense than that in a blank to which 0.2 mg of potassium iodide has been added.

**Assay**—Weigh and finely powder not less than 20 Tablets. Using a portion of the powder, accurately weighed and equivalent to about 14 mg of iodoquinol, proceed as directed in the Assay under *Iodoquinol*. Each mL of 0.02 N sodium thiosulfate is equivalent to 0.6616 mg of  $\text{C}_9\text{H}_5\text{I}_2\text{NO}$ .

## Iohexol

$\text{C}_{19}\text{H}_{26}\text{I}_3\text{N}_3\text{O}_9$  821.14  
1,3-Benzenedicarboxamide, 5-[acetyl(2,3-dihydroxypropyl)amino]-N,N'-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-N,N'-Bis(2,3-dihydroxypropyl)-5-[N-(2,3-dihydroxypropyl)acetamido]-2,4,6-triiodoisophthalamide  
[66108-95-0].

» Iohexol contains not less than 98.0 percent and not more than 102.0 percent of  $C_{19}H_{26}I_3N_3O_9$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** (11)—

USP Iohexol RS

USP Iohexol Related Compound C RS

*N,N'*-Bis(2,3-dihydroxypropyl)-5-nitro-1,3-benzenedicarboxamide.

**Color of solution**—Transfer 16.18 g to a 25-mL volumetric flask, dilute with water to volume, and mix. Pass through a filter having a porosity of 0.22  $\mu$ m. The absorbances of this solution, determined in 1-cm cells at 400 nm, 420 nm, and 450 nm, with a suitable spectrophotometer and using water as the blank, are not greater than 0.180, 0.030, and 0.015, respectively.

**Identification**—

**A:** The IR absorption spectrum of a potassium bromide dispersion of it exhibits maxima only at the same wavelengths as that of a similar preparation of USP Iohexol RS.

**B:** The UV absorption spectrum of a 1 in 100,000 solution in water exhibits a maximum and a minimum at the same wavelengths as that of a similar solution of USP Iohexol RS, concomitantly measured.

**C:** It responds to the *Thin-layer Chromatographic Identification Test* (201), the test solution and the Standard solution of USP Iohexol RS being prepared at a concentration of 10 mg per mL in methanol, the solvent system being a mixture of *n*-butyl alcohol, water, and glacial acetic acid (50:25:11), and short-wavelength UV light being used to locate the spots. The presence of *exo*- and *endo*-isomers in the test solution is shown by the appearance of two spots, each of which corresponds in size and intensity to the corresponding principal spot, at the same  $R_f$  value from the Standard solution. The spot having the  $R_f$  value is the *endo*-isomer.

**D:** Heat about 500 mg in a crucible: violet vapors are evolved.

**Specific rotation** (781S): between  $-0.5^\circ$  and  $+0.5^\circ$ .

*Test solution:* 50 mg per mL, in water.

**Water**, Method I (921): not more than 4.0%.

**Heavy metals**, Method I (231): 0.002%.

**Free aromatic amine**—Transfer 200 mg to a 50-mL volumetric flask, add 15 mL of water, and mix to dissolve. To a second 50-mL volumetric flask transfer 5 mL of water and 10.0 mL of a Standard solution prepared by dissolving an accurately weighed quantity of USP Iohexol Related Compound B RS in water to obtain a solution having a known concentration of 10  $\mu$ g per mL. To a third 50-mL volumetric flask add 15 mL of water to provide a blank. Place the three flasks in an ice bath, and chill for 5 minutes. [NOTE—In conducting the following steps, keep the flasks in the ice bath as much as possible until all of the reagents have been added.] Treat each flask as follows. Add 3.0 mL of 5 N hydrochloric acid, and swirl to mix. Add 2.0 mL of sodium nitrite solution (1 in 50), mix, and allow to stand for 4 minutes. Add 2.0 mL of sulfamic acid solution (1 in 25), shake, and allow to stand for 1 minute. [Caution—Considerable pressure is produced.]

Remove the flasks from the ice bath. To each flask add 2.0 mL of a freshly prepared 1 in 1000 solution of *N*-(1-naphthyl)ethylenediamine dihydrochloride in dilute pro-

pylene glycol (7 in 10), and mix. Dilute with water to volume, mix, and allow to stand for 5 minutes.

Concomitantly determine the absorbances of the test solution and the Standard solution in 5-cm cells at the wavelength of maximum absorbance at about 495 nm, with a suitable spectrophotometer, against the blank. The absorbance of the solution from the Iohexol is not greater than that of the Standard solution (0.05%).

**Free iodine**—Transfer 2.1 g to a 50-mL centrifuge tube provided with a stopper, add 20 mL of water, and shake vigorously to dissolve. [NOTE—The solution may be heated gently to assist in dissolving the sample. Cool to room temperature before proceeding.] Add 5.0 mL of toluene and 5 mL of 2 N sulfuric acid, shake, and centrifuge at high speed for 15 minutes: the toluene layer shows no red or pink color.

**Free iodide**—Transfer 5.0 g to a suitable container, add about 20 mL of water to dissolve, and titrate with 0.001 N silver nitrate VS using a silver electrode in combination with an appropriate reference electrode, determining the endpoint potentiometrically. Each mL of 0.001 N silver nitrate is equivalent to 126.9  $\mu$ g of I (0.001%).

**Ionic compounds**—[NOTE—Rinse all glassware five times with distilled water.] Measure the specific resistance, ( $R_{sp}$ ), at 20° of a solution in water (1 in 50), using a suitable water purity meter. Calculate the specific conductance,  $\kappa$ , taken by the formula:

$$(1/R_{sp})10^6.$$

The specific conductance of the solution is not greater than that of a 0.0002% solution of sodium chloride (equivalent to 0.01% ionic compounds).

**Limit of methanol, isopropyl alcohol, and methoxyethanol—**

*Internal standard solution*—Prepare a solution of secondary butyl alcohol in water containing about 0.05 mg per mL.

*Reference solution 1*—Transfer about 0.6 g of methanol, accurately weighed, to a 1000-mL volumetric flask, add about 100 mL of water, and mix. Add about 0.6 g of isopropyl alcohol, accurately weighed, and about 100 mL of water, and mix. Add 0.6 g of methoxyethanol, accurately weighed, and about 100 mL of water, and mix. Dilute with water to volume, and mix.

*Reference solution 2*—Transfer 10.0 mL of *Reference solution 1* to a 50-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of the solution so obtained to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Reference solution 3*—Transfer 5.0 mL of *Reference solution 1* to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Reference solution 4*—Transfer 10.0 mL of *Reference solution 1* to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Reference solution 5*—Transfer 10.0 mL of *Reference solution 4* and 10.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with water to volume, and mix. Transfer 6.0 mL of the solution so obtained to a vial fitted with a septum and crimp cap, and seal. Heat the sealed vial at 95° for 15 minutes.

*Test solution 1*—Transfer about 6.25 g of Iohexol, accurately weighed, to a 25-mL volumetric flask. Add 5.0 mL of *Internal standard solution*, dilute with water to volume, and mix.

*Test solution 2*—Transfer 5.0 mL of *Test solution 1* and 1.0 mL of water to a vial fitted with a septum and crimp cap, and seal. Heat the sealed vial at 95° for 15 minutes.

*Test solution 3*—Transfer 5.0 mL of *Test solution 1* and 1.0 mL of *Reference solution 2* to a vial fitted with a septum

and crimp cap, and seal. Heat the sealed vial at 95° for 15 minutes.

**Test solution 4**—Transfer 5.0 mL of *Test solution 1* and 1.0 mL of *Reference solution 3* to a vial fitted with a septum and crimp cap, and seal. Heat the sealed vial at 95° for 15 minutes.

**Test solution 5**—Transfer 5.0 mL of *Test solution 1* and 1.0 mL of *Reference solution 4* to a vial fitted with a septum and crimp cap, and seal. Heat the sealed vial at 95° for 15 minutes.

**Chromatographic system** (see *Chromatography* <621>)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m fused-silica column coated with a 3-μm phase G43. The carrier gas is helium, flowing at a rate of about 14 mL per minute. The chromatograph is programmed as follows. Initially the column temperature is equilibrated at 40° for 5 minutes, then the temperature is increased at a rate of 10° per minute to 100°, and is maintained at that temperature for 1 minute. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Inject the headspace from *Reference solution 5* into the chromatograph, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.3 for methanol, 0.5 for isopropyl alcohol, 1.0 for secondary butyl alcohol, and 1.3 for methoxyethanol; the resolution, *R*, between methanol and isopropyl alcohol is not less than 2.5; and the relative standard deviation determined from individual peak responses from replicate injections is not more than 5%.

**Procedure**—Using a gas-tight syringe, separately inject equal volumes (about 2 mL) of the headspace of *Test solutions 2, 3, 4, 5*, and *Reference solution 5* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the peak area ratio for each analyte to the internal standard. Plot the peak area ratios obtained from the *Test solutions* against the quantity of each individual analyte standard added per g of Iohexol. Extrapolate the line joining the points until it intercepts the concentration axis. The distance between this point and the intersection of the axis is the concentration, in mg per g, of methanol, isopropyl alcohol, or methoxyethanol in the portion of Iohexol taken. Not more than 0.005% each of methanol and isopropyl alcohol is found; and not more than 0.002% of methoxyethanol is found.

#### Limit of 3-chloro-1,2-propanediol—

**Test solution**—Dissolve about 1 g of Iohexol, accurately weighed, in 1.0 mL of water. Extract 4 times with 2 mL of ethyl acetate, and combine the extracts. Dry the combined extracts with anhydrous sodium sulfate. Filter, and wash the filter with a small amount of ethyl acetate. Combine the wash with the filtrate, and concentrate to a volume of 2.0 mL, using a warm water bath and a stream of nitrogen. Pass this solution through a membrane filter, and use the clear filtrate.

**Standard solution**—Quantitatively dissolve an accurately weighed quantity of 3-chloro-1,2-propanediol in ethyl acetate to obtain a solution having a known concentration of about 20 μg per mL.

**System suitability solution**—Dissolve 1 g of Iohexol containing less than 5 μg of chloropropanediol in 1 mL of water. Quantitatively dissolve an accurately weighed quantity of 3-chloro-1,2-propanediol in ethyl acetate to obtain a solution having a concentration of about 25 μg per mL. Add 2.0 mL of the ethyl acetate solution to the aqueous solution of Iohexol in a separator, and mix. Transfer the ethyl acetate layer to a separate container, and extract the aqueous layer three additional times with 2 mL of ethyl acetate, combining all four extracts. Dry the combined extracts using anhydrous sodium sulfate. Filter, and wash the filter with a small amount of ethyl acetate. Combine the wash with the filtrate, and concentrate and filter as directed under *Test solution*.

**Chromatographic system** (see *Chromatography* <621>)—The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm × 30-m fused-silica capillary column bonded with a 1-μm layer of phase G46. The injection port and detector temperatures are maintained at about 230° and 250°, respectively. The carrier gas is helium under 760 mm Hg pressure. The column temperature is held at 50° for 2 minutes and is programmed to increase at a rate of 10° per minute to 200°. Chromatograph the *Standard solution*, and record the responses as directed for *Procedure*: the relative standard deviation of replicate injections is not more than 10%. Chromatograph the *System suitability solution*, and record the responses as directed for *Procedure*. Calculate the percentage of 3-chloro-1,2-propanediol in the portion of Iohexol taken by the formula:

$$100(A_{RC} / A_{ST})(C_{ST} / C_{RS})$$

in which  $A_{RC}$  is the response of the analyte peak in the chromatogram obtained from the *System suitability solution*;  $A_{ST}$  is the response of the analyte peak in the chromatogram obtained from the *Standard solution*;  $C_{ST}$  is the concentration of 3-chloro-1,2-propanediol, in μg per mL, in the *Standard solution*; and  $C_{RS}$  is the concentration of 3-chloro-1,2-propanediol, in μg per mL, in the *System suitability solution*: not less than 60% and not more than 90% of 3-chloro-1,2-propanediol is found.

**Procedure**—Inject a volume (about 2 μL) of *Test solution* into the chromatograph, and record the chromatograms. Measure the areas for the major peaks due to the two chloropropanediol isomers, which elute at about 12 and 12.5 minutes. Calculate the quantity, in μg, of 3-chloro-1,2-propanediol in the portion of Iohexol taken by the formula:

$$100(A_{SA} / A_{ST})(2C_{ST} / R)$$

in which  $A_{SA}$  is the total of the peak responses of the two isomers in the chromatograph obtained from the *Test solution*;  $A_{ST}$  is the total of the peak responses of the two isomers in the chromatograph obtained from the *Standard solution*;  $C_{ST}$  is the concentration of 3-chloro-1,2-propanediol, in μg per mL, in the *Standard solution*; and  $R$  is the percentage recovery determined under *Chromatographic system*. Not more than 0.0025% of 3-chloro-1,2-propanediol is found.

#### Related compounds—

**Solution A**—Use acetonitrile.

**Solution B**—Use water.

**Mobile phase**—Use variable mixtures of a degassed mixture of *Solution A* and *Solution B* as directed for *Chromatographic system*.

**System suitability solution**—Dissolve accurately weighed quantities of USP Iohexol RS, USP Iohexol Related Compound A RS, and USP Iohexol Related Compound C RS in water to obtain a solution having known concentrations of about 1.5 mg per mL, 0.0075 mg per mL, and 0.0069 mg per mL, respectively.

**Test solution**—Transfer 75.0 mg of Iohexol, accurately weighed, to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm stainless steel column that contains packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed to provide variable mixtures of *Solution A* and *Solution B*: the percentage of *Solution A* increases from 1% to 13% at a rate of 0.2% per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the retention time for the O-alkylated compounds is between 1.1 and 1.4 relative to 1.0 for the *exo*-isomer of Iohexol; the resolution, *R*, between Iohexol related compound A and Iohexol related compound C is not less than 20.0; and the peak area of

iohexol related compound C is  $0.5\% \pm 0.1\%$  by comparison to the total area of all the peaks in the chromatogram.

**Procedure**—Inject a volume (about 10  $\mu\text{L}$ ) of the *Test solution* into the chromatograph, record the chromatogram, and measure all the peak responses. Calculate the percentage of O-alkylated compounds and any other individual impurity peak, excluding peaks with a retention time between 0.84 (relative to the *endo*-isomer of iohexol [first main peak]) and the *endo*-isomer of iohexol, in the portion of iohexol taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the response of each impurity; and  $r_s$  is the sum of the responses of all of the peaks: not more than 0.1% of any individual impurity is found; not more than 0.6% of O-alkylated compounds is found; and the sum of all impurities, other than O-alkylated compounds, is not more than 0.3%.

**Assay**—Transfer about 500 mg of iohexol, accurately weighed, to a glass-stoppered, 125-mL conical flask. Add 25 mL of 1.25 N sodium hydroxide and 500 mg of powdered zinc, connect the flask to a reflux condenser, and reflux the mixture for 1 hour. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the flask and the filter thoroughly with small portions of water, adding the rinsings to the filtrate. Add 5 mL of glacial acetic acid, and titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically. Each mL of 0.1 N silver nitrate is equivalent to 27.37 mg of  $\text{C}_{19}\text{H}_{26}\text{I}_3\text{N}_3\text{O}_9$ .

## Iohexol Injection

### DEFINITION

Iohexol Injection is a sterile solution of iohexol in Water for Injection. It contains NLT 95.0% and NMT 105.0% of the labeled amount of iohexol ( $\text{C}_{19}\text{H}_{26}\text{I}_3\text{N}_3\text{O}_9$ ) as organically bound iodine. It may contain small amounts of suitable buffers and Edetate Calcium Disodium as a stabilizer. Iohexol Injection intended for intravascular or intrathecal use contains no antimicrobial agents.

### IDENTIFICATION

- A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *System suitability solution*, as obtained in the test for *Organic Impurities*.

### ASSAY

#### PROCEDURE

**Sample:** A volume of Injection equivalent to 300 mg of iodine

**Analysis:** Transfer the *Sample* to a glass-stoppered, 250-mL conical flask. Add 25 mL of 1.25 N sodium hydroxide and 500 mg of powdered zinc, connect the flask to a reflux condenser, and reflux the solution for 1 h. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the flask and the filter thoroughly with small portions of water, adding the rinsings to the filtrate. Add 5 mL of glacial acetic acid, and titrate with 0.1 N silver nitrate VS. Each mL of 0.1 N silver nitrate is equivalent to 27.37 mg of  $\text{C}_{19}\text{H}_{26}\text{I}_3\text{N}_3\text{O}_9$ .

**Acceptance criteria:** 95.0%–105.0%

### IMPURITIES

#### ORGANIC IMPURITIES

**Solution A:** Acetonitrile

**Solution B:** Water

**Mobile phase:** The percentage of *Solution A* increases from 1% to 13% at a rate of 0.2%/min.

**System suitability solution:** 1.5 mg/mL, 0.0075 mg/mL, and 0.0069 mg/mL each of USP Iohexol RS, USP Iohexol Related Compound A RS, and USP Iohexol Related Compound C RS in water

**Sample solution:** 1.5 mg/mL of Iohexol

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  25-cm stainless steel column; packing L1

**Flow rate:** 1.0 mL/min

**Injection volume:** 10  $\mu\text{L}$

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times for the *exo*-isomer of iohexol and the O-alkylated compounds are 1.0 and between 1.1 and 1.4, respectively.]

[NOTE—The peak area of iohexol related compound C is  $0.5\% \pm 0.1\%$  compared to the total area of all the peaks in the chromatogram.]

#### Suitability requirements

**Resolution:** NLT 20.0 between iohexol related compound A and iohexol related compound C

#### Analysis

**Sample:** *Sample solution*

Excluding peaks with retention times between 0.84 (relative to the *endo*-isomer of iohexol, which is the first main peak) and 1.0, calculate the percentage of O-alkylated compounds and any other individual impurity peak, in the portion of Iohexol taken:

$$\text{Result} = (r_U / r_T) \times 100$$

$r_U$  = peak response of each impurity

$r_T$  = sum of all the peak responses

#### Acceptance criteria

**Individual impurity:** NMT 0.6% of O-alkylated compounds; NMT 0.1% of any other individual impurity

**Total impurities:** NMT 0.3%, excluding O-alkylated compounds

### SPECIFIC TESTS

- BACTERIAL ENDOTOXINS TEST (85):** NMT 0.2 USP Endotoxin Unit per 50 mg of iodine
- PH (791):** 6.8–7.7
- PARTICULATE MATTER IN INJECTIONS (788):** The Injection labeled for intrathecal use meets the requirements for small-volume injections.
- FREE IODIDE:** Transfer 5.0 mL of Injection to a suitable container, add 20 mL of water, and titrate with 0.001 N silver nitrate VS using a silver electrode in combination with an appropriate reference electrode. Each mL of 0.001 N silver nitrate is equivalent to 0.1269 mg of iodine.
- Acceptance criteria:** NMT 0.02%, based on the content of iohexol
- INJECTIONS (1):** Meets the requirements

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve Injection intended for intravascular or intrathecal use in single-dose or multiple-dose plastic or Type I glass containers. Store at controlled room temperature, protected from light. Do not freeze.
- LABELING:** Label containers of Injection to direct the user to discard any unused portion. The labeling states also that it is not to be used if it is discolored or contains a precipitate. Label it also to state its routes of administration. When the specific dose strength is not intended for intrathecal use, label it to indicate "serious injury can occur if given by intrathecal route".

• **USP REFERENCE STANDARDS** (11)

- USP Endotoxin RS
- USP Iohexol RS
- USP Iohexol Related Compound A RS
- 5-(Acetylamino)-*N,N'*-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-1,3-benzenedicarboxamide.
- USP Iohexol Related Compound C RS
- N,N'*-Bis(2,3-dihydroxypropyl)-5-nitro-1,3-benzenedicarboxamide.

## Iopamidol

$C_{17}H_{22}I_3N_3O_8$  777.09

1,3-Benzenedicarboxamide, *N,N'*-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-[(2-hydroxy-1-oxopropyl)amino]-2,4,6-triiodo-, (S)-  
(S)-*N,N'*-Bis[2-hydroxy-1-(hydroxymethyl)ethyl]-2,4,6-triiodo-5-lactamidoisophthalamide [60166-93-0].

» Iopamidol contains not less than 98.0 percent and not more than 101.0 percent of Iopamidol, calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** (11)—

- USP Iopamidol RS
- USP Iopamidol Related Compound A RS
- N,N'*-Bis-(1,3-dihydroxy-2-propyl)-5-amino-2,4,6-triiodoisophthalamide.
- $C_{14}H_{18}I_3N_3O_6$  705.03
- USP Iopamidol Related Compound C RS
- 4-Chloro-*N'*, *N'*-bis(1,3-dihydroxypropan-2-yl)-5-(S)-lactamido-2,6-diiodoisophthalamide.
- $C_{17}H_{22}ClI_2N_3O_8$  685.63

**Identification**—

**A:** Infrared Absorption (197K).

**B:** Heat about 500 mg in a suitable crucible: violet vapors are evolved.

**C:** The retention time of the major peak in the chromatogram of the *Identification solution* corresponds to that of the Iopamidol peak observed in the chromatogram of the *System suitability solution*, as obtained in the test for *Related compounds*.

**Specific rotation** (781S): between  $-4.6^\circ$  and  $-5.2^\circ$  ( $t = 20^\circ$ ;  $\lambda = 436$  nm).

**Test solution:** 400 mg per mL, in water, heating on a water bath, if necessary to effect solution, and passing through a membrane filter having a 3- $\mu$ m or finer porosity.

**Loss on drying** (731)—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Free aromatic amine**—Transfer 500 mg to a 25-mL volumetric flask, and add 20 mL of water, heating on a water bath, if necessary, to effect solution. To a second 25-mL volumetric flask transfer 18.4 mL of water and 1.6 mL of a Standard solution prepared by dissolving a suitable quantity of USP Iopamidol Related Compound A RS in water and diluting with water to obtain a solution having a concentra-

tion of 62.5  $\mu$ g per mL. To a third 25-mL volumetric flask add 20 mL of water to provide a blank. Treat each flask as follows. Place the flasks in an ice bath, protected from light, for 5 minutes. [NOTE—In conducting the following steps, keep the flasks in the ice bath and protected from light as much as possible until all of the reagents have been added.] Add slowly 1 mL of hydrochloric acid, mix, and allow to stand for 5 minutes. Add 1 mL of sodium nitrite solution (1 in 50), mix, and allow to stand for 5 minutes. Add 1 mL of ammonium sulfamate solution (3 in 25), shake, and allow to stand for 5 minutes. [Caution—Considerable pressure is produced.] Add 1 mL of *N*-(1-naphthyl)ethylenediamine dihydrochloride solution (1 in 1000), and mix. Remove the flasks from the ice bath, and allow to stand in a water bath at about 25° for 10 minutes. Dilute with water to volume, mix, and without delay (about 5 minutes from final dilution), concomitantly determine the absorbances of the solution from the substance under test and the Standard solution in 1-cm cells at the wavelength of maximum absorbance at about 500 nm, with a suitable spectrophotometer, against the prepared blank. The absorbance of the solution from the Iopamidol is not greater than that of the Standard solution (0.02%).

**Free iodine**—Transfer 2.0 g to a stoppered, 50-mL centrifuge tube, add sufficient water to dissolve, heating on a water bath, if necessary, to effect solution, and dilute with water to 25 mL. Add 5 mL of toluene and 5 mL of 2 N sulfuric acid, shake well, and centrifuge: the toluene layer shows no red color.

**Limit of free iodide**—Transfer about 6.0 g, accurately weighed, to a suitable container, dissolve in 50 mL of water, and add 2.0 mL of 0.001 M potassium iodide. Titrate with 0.001 N silver nitrate VS, determining the endpoint potentiometrically, using a silver indicator electrode and an appropriate reference electrode. Perform a blank determination, and make any necessary correction. Each mL of 0.001 N silver nitrate is equivalent to 126.9  $\mu$ g of iodide. Not more than 0.001% is found.

**Free acid or alkali**—Dissolve 10.0 g in 100 mL of freshly boiled and cooled water. Using a pH meter and a glass-calomel electrode system, determine the volume of 0.01 N hydrochloric acid VS or 0.01 N sodium hydroxide VS to bring the pH of the test solution to 7.0: not more than 1.37 mL of 0.01 N sodium hydroxide, equivalent to a free acid content of 5 mg of hydrochloric acid per 100 g, or not more than 0.75 mL of 0.01 N hydrochloric acid, equivalent to a free alkali content of 3 mg of sodium hydroxide per 100 g, is required.

**Heavy metals, Method II** (231): not more than 0.001%.

**Related compounds**—

*Solution A*—Use water.

*Solution B*—Prepare a filtered and degassed mixture of water and acetonitrile (1:1).

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability solution*—Dissolve accurately weighed quantities of USP Iopamidol RS and USP Iopamidol Related Compound C RS in water, and dilute with water to obtain a solution having concentration of about 20  $\mu$ g per mL of each.

*Standard solution*—Dissolve accurately weighed quantities of USP Iopamidol RS and USP Iopamidol Related Compound C RS in water, and dilute with water to obtain a solution having concentrations of about 20  $\mu$ g per mL and 50  $\mu$ g per mL, respectively.

**Test solution**—Transfer about 0.5 g of Iopamidol, accurately weighed, to a 50-mL volumetric flask, add water to volume, and mix.

**Identification solution**—Dilute a suitable volume of the *Test solution* with water to obtain a solution with a concentration of iopamidol of about 20 µg per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 240-nm detector and two 4.6-mm × 25-cm columns that contain packing L11, connected in series. The column temperature is maintained at 60°, and the flow rate is about 2.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–18	100	0	isocratic
18–40	100→62	0→38	linear gradient
40–45	62→50	38→50	linear gradient
45–50	50→100	50→0	linear gradient
50–60	100	0	isocratic

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between iopamidol related compound C and iopamidol is not less than 2.0. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor for each peak is between 0.7 and 1.5, and the relative standard deviation for replicate injections for either of the two peaks is not more than 2.0%. Chromatograph the *Identification solution*, and record the peak responses as directed for *Procedure* to obtain a chromatogram for *Identification test C*.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Identification solution*, the *System suitability solution*, the *Standard solution*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak area responses.

Calculate the total percentage of iopamidol related compound C and 2-chloro derivative in the portion of iopamidol taken by the formula:

$$100(C_1V/W)(r_i / r_s)$$

in which *C*<sub>1</sub> is the concentration, in mg per mL, of iopamidol related compound C in the *Standard solution*; *V* is the volume of the *Test solution*; *W* is the weight of iopamidol used to prepare the *Test solution*; *r*<sub>i</sub> is the total peak response for the iopamidol related compound C and 2-chloro derivative obtained from the *Test solution*; and *r*<sub>s</sub> is the peak response for iopamidol related compound C obtained from the *Standard solution*.

Calculate the total percentage of any other impurity in the portion of iopamidol taken by the formula:

$$100(C_2V/W)(r_i / r_s)$$

in which *C*<sub>2</sub> is the concentration of iopamidol, in mg per mL, in the *Standard solution*; *V* and *W* are as previously defined; *r*<sub>i</sub> is the peak response for the individual impurity obtained from the *Test solution*; and *r*<sub>s</sub> is the peak response for iopamidol obtained from the *Standard solution*. In addition to not exceeding the limits for each impurity shown in *Table 1*, not more than 0.1% of any other individual impurity is found; and not more than 0.20% of total impurities, other than iopamidol related compound C and 2-chloro derivative, is found.

Table 1

Name	Relative Retention Time	Limit (%)
Monocarboxylic acid <sup>1</sup>	0.1	0.1
Iopamidol related compound B <sup>2</sup>	0.6	0.1
Iopamidol related compound C <sup>3</sup> and 2-chloro derivative <sup>4</sup>	0.9	0.5*
Iopamidol	1.0	—
2,3-Dihydroxypropyl isomer <sup>5</sup>	1.1	0.1
Diiodo derivative <sup>6</sup>	1.2	0.1
Acetyl analog <sup>7</sup>	1.3	0.1
Hydroxyethyl derivative <sup>8</sup>	1.5	0.1
O-Acetyl iopamidol <sup>9</sup>	2.2	0.1
<i>N,N</i> -Dimethylamino derivative <sup>10</sup>	2.3	0.1

\*These peaks, appearing at a relative retention time of 0.9, are integrated together to determine conformance.

<sup>1</sup>3-(1,3-Dihydroxypropan-2-ylcarbamoyl)-5-(*S*)-lactamido-2,4,6-triiodobenzoic acid.

<sup>2</sup>5-Glycolamido-*N*<sup>1</sup>,*N*<sup>3</sup>-bis(1,3-dihydroxy-2-propyl)-2,4,6-triiodoisophthalamide.

<sup>3</sup>4-Chloro-*N*<sup>1</sup>,*N*<sup>3</sup>-bis(1,3-dihydroxypropan-2-yl)-5-(*S*)-lactamido-2,6-diiodoisophthalamide.

<sup>4</sup>2-Chloro-*N*<sup>1</sup>,*N*<sup>3</sup>-bis(1,3-dihydroxypropan-2-yl)-5-(*S*)-lactamido-4,6-diiodoisophthalamide.

<sup>5</sup>*N*<sup>1</sup>-(1,3-Dihydroxypropan-2-yl)-*N*<sup>3</sup>-(2,3-dihydroxypropyl)-5-(*S*)-lactamido-2,4,6-triiodoisophthalamide.

<sup>6</sup>*N*<sup>1</sup>,*N*<sup>3</sup>-Bis(1,3-dihydroxypropan-2-yl)-5-(*S*)-lactamido-2,4-diiodoisophthalamide.

<sup>7</sup>5-Acetamido-*N*<sup>1</sup>,*N*<sup>3</sup>-bis(1,3-dihydroxy-2-propyl)-2,4,6-triiodoisophthalamide.

<sup>8</sup>*N*<sup>1</sup>-(1,3-Dihydroxypropan-2-yl)-*N*<sup>3</sup>-(2-hydroxyethyl)-5-(*S*)-lactamido-2,4,6-triiodoisophthalamide.

<sup>9</sup>5-(*S*)-(2-Acetoxypentan-2-yl)-*N*<sup>1</sup>,*N*<sup>3</sup>-bis(1,3-dihydroxypropan-2-yl)-carbamoyl)-2,4,6-triiodoisophthalamide.

<sup>10</sup>*N*<sup>1</sup>-(1,3-Dihydroxypropan-2-yl)-5-(*S*)-lactamido-2,4,6-triiodo-*N*<sup>3</sup>,*N*<sup>3</sup>-dimethylisophthalamide.

**Assay**—Transfer about 300 mg of iopamidol, accurately weighed, to a glass-stoppered, 125-mL conical flask, add 40 mL of 1.25 N sodium hydroxide and 1 g of powdered zinc, connect the flask to a reflux condenser, and reflux the mixture for 30 minutes. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the flask and the filter thoroughly, adding the rinsings to the filtrate. Add 5 mL of glacial acetic acid, and titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically. Each mL of 0.1 N silver nitrate is equivalent to 25.90 mg of C<sub>17</sub>H<sub>22</sub>I<sub>3</sub>N<sub>3</sub>O<sub>8</sub>.

## Iopamidol Injection

» Iopamidol Injection is a sterile solution of iopamidol in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of iopamidol (C<sub>17</sub>H<sub>22</sub>I<sub>3</sub>N<sub>3</sub>O<sub>8</sub>). It may contain small amounts of suitable buffers and of Edetate Calcium Disodium as a stabilizer. Iopamidol Injection intended for intravascular or intrathecal use contains no antimicrobial agents.

**Packaging and storage**—Preserve Injection intended for intravascular or intrathecal use in single-dose containers, preferably of Type I glass, and protected from light.

**Labeling**—Label containers of Injection to direct the user to discard any unused portion remaining in the container and to check for the presence of particulate matter before using. Label it also to state its routes of administration.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Iopamidol RS

USP Iopamidol Related Compound A RS

*N,N'*-Bis-(1,3-dihydroxy-2-propyl)-5-amino-2,4,6-triiodoisophthalamide.

$C_{14}H_{18}I_3N_3O_6$  705.03

USP Iopamidol Related Compound B RS

5-Glycolamido-*N,N'*-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-2,4,6-triiodoisophthalamide.

$C_{16}H_{20}I_3N_3O_7$  747.07

**Identification**—

**A:** Evaporate a volume of Injection, equivalent to about 500 mg of iopamidol, to dryness, and heat the residue so obtained in a suitable crucible: violet vapors are evolved.

**B:** It responds to the *Thin-Layer Chromatographic Identification Test* (201), the test solution and the Standard solution being prepared at a concentration of 0.5 mg per mL in a mixture of methanol and water (9:1), the solvent mixture being chloroform, methanol, ammonium hydroxide, and water (60:30:9:1), and short-wavelength UV light being used to locate the spots.

**Bacterial endotoxins** (85)—It contains not more than 0.6 USP Endotoxin Unit per mg of iodine.

**pH** (791): between 6.5 and 7.5.

**Particulate matter** (788)—The Injection labeled for intrathecal use meets the requirements for small-volume injections.

**Free aromatic amine**—Transfer an accurately measured volume of Injection, equivalent to about 500 mg of iopamidol, to a 25-mL volumetric flask, dilute with water to 20 mL, and mix. To a second 25-mL volumetric flask transfer 16 mL of water and 4.0 mL of Standard solution prepared by dissolving a suitable quantity of USP Iopamidol Related Compound A RS in water and diluting with water to obtain a solution having a concentration of 62.5 µg per mL. Proceed as directed in the test for *Free aromatic amine* under *Iopamidol*, beginning with “to the third 25-mL volumetric flask add 20 mL of water.” The absorbance of the solution from the iopamidol is not greater than that of the Standard solution (0.05%).

**Free iodine**—Transfer a volume of Injection, equivalent to 2.0 g of iopamidol, to a glass-stoppered test tube. Add 2 mL of 2 N sulfuric acid and 1.0 mL of toluene, shake, and allow the layers to separate: the toluene layer shows no red color.

**Limit of free iodide**—Transfer 10.0 mL of Injection to a beaker, add 40 mL of water, and mix. Proceed as directed in the *Limit of free iodide* test under *Iopamidol* beginning with “add 2.0 mL of 0.001 M potassium iodide.” Not more than 3.1 mL of 0.001 N silver nitrate is required (0.04 mg of iodide per mL).

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Solution A*—Use water.

*Solution B*—Prepare a filtered and degassed mixture of water and methanol (3:1).

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Resolution solution*—Transfer 10.0 mg of USP Iopamidol Related Compound B RS and 10.0 mg of USP Iopamidol RS to a 1000-mL volumetric flask. Dissolve in and dilute with water to volume, and mix.

*Standard preparation*—Dissolve about 20 mg of USP Iopamidol RS, accurately weighed, in about 10 mL of water,

and dilute quantitatively and stepwise with water to obtain a solution having a known concentration of about 80 µg of USP Iopamidol RS per mL.

*Assay preparation*—Dilute an accurately measured volume of Injection, equivalent to about 1000 mg of iopamidol, quantitatively and stepwise with water to obtain a solution having a concentration of about 80 µg of iopamidol per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 25-cm stainless steel column that contains 5-µm packing L1. The column temperature is maintained at 35°, and the flow rate is about 1.5 mL per minute. The chromatograph is programmed to provide variable mixtures of *Solution A* and *Solution B*, the percentage of *Solution B* being 8.0% at the time of injection, and is held at that percentage for 6 minutes, then increased linearly to 35.0% at 18 minutes, after which it is changed to increase linearly to 92.0% at 30 minutes, maintained at that percentage for 4 minutes, and decreased linearly to 8.0% at 36 minutes, where it is held to the end of the run at 40 minutes. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between iopamidol related compound B and iopamidol is not less than 7.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of iopamidol ( $C_{17}H_{22}I_3N_3O_8$ ) in the portion of Injection taken by the formula:

$$12.5C(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of USP Iopamidol RS in the *Standard preparation*, and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Iopanoic Acid

$C_{11}H_{12}I_3NO_2$  570.93

Benzenepropanoic acid, 3-amino- $\alpha$ -ethyl-2,4,6-triiodo-, ( $\pm$ )-. ( $\pm$ )-3-Amino- $\alpha$ -ethyl-2,4,6-triiodohydrocinnamic acid [96-83-3].

» Iopanoic Acid contains an amount of iodine equivalent to not less than 97.0 percent and not more than 101.0 percent of  $C_{11}H_{12}I_3NO_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Identification**—Mix about 100 mg with 500 mg of sodium carbonate in a crucible, and heat until thoroughly charred. Cool, add 5 mL of hot water, heat on a steam bath for 5 minutes, and filter: the solution responds to the tests for *Iodide* (191).

**Melting range** (741): between 152° and 158°, with decomposition.

**Loss on drying** (731)—Dry it at 105° for 1 hour: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Free iodine**—Shake about 200 mg with 2 mL of water and 2 mL of chloroform for 1 minute: the chloroform layer shows no violet color.

**Halide ions**—Place about 500 mg in a glass-stoppered, 50-mL cylinder, add 10 mL of 2 N nitric acid and 15 mL of water, shake for 5 minutes, and filter through paper: 10 mL of the filtrate shows no greater turbidity than corresponds to 0.05 mL of 0.020 N hydrochloric acid (see *Chloride and Sulfate* (221)).

**Heavy metals, Method II** (231): 0.002%.

**Assay**—Transfer about 250 mg of Iopanoic Acid, accurately weighed, to a glass-stoppered, 250-mL conical flask. Add 30 mL of 1.25 N sodium hydroxide and 500 mg of powdered zinc, and reflux the mixture for 30 minutes. Cool to room temperature, wash the condenser with 20 mL of water, and filter the mixture. Wash the flask and the filter with small portions of water, adding the washings to the filtrate. Add to the filtrate 5 mL of glacial acetic acid and 1 mL of tetrabromophenolphthalein ethyl ester TS, and titrate with 0.05 N silver nitrate VS until the color of the yellow precipitate just changes to green. Each mL of 0.05 N silver nitrate is equivalent to 9.516 mg of  $C_{11}H_{12}I_3NO_2$ .

## Iopanoic Acid Tablets

» Iopanoic Acid Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_{11}H_{12}I_3NO_2$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Identification**—Triturate a quantity of finely powdered Tablets, equivalent to about 1 g of iopanoic acid, with two 10-mL portions of solvent hexane, and decant and discard the liquid. Allow the residue to dry spontaneously, triturate with 15 mL of acetone, and filter. Repeat the trituration with another 15-mL portion of acetone, evaporate the combined filtrates on a steam bath to a volume of not more than 1 mL, add, with constant stirring, 20 mL of water, filter, wash the precipitate with two 5-mL portions of water, and dry at 105° for 2 hours: the iopanoic acid so obtained melts between 150° and 158°, with decomposition, and responds to the *Identification* test under *Iopanoic Acid*.

**Disintegration** (701): 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Halide ions**—A portion of the powdered Tablets prepared for the *Assay*, equivalent to about 500 mg of iopanoic acid, meets the requirements of the test for *Halide ions* under *Iopanoic Acid*.

**Assay**—Weigh and finely powder not fewer than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 1 g of iopanoic acid, and triturate with 10 mL of solvent hexane. Allow the mixture to settle, decant the hexane through a small filter, repeat the trituration with 10 mL of solvent hexane, filter through the same filter, and discard the filtrates. Warm the residue with 10 mL of neutralized alcohol at 70°, filter through the same filter, and wash the undissolved residue with four 10-mL portions of neutralized alcohol at 70°, passing the washings through the same filter. Cool the combined filtrate and washings to room temperature, add 3 to 5 drops of thymol blue TS, and titrate with 0.1 N sodium hydroxide VS. Each mL of 0.1 N sodium hydroxide is equivalent to 57.09 mg of  $C_{11}H_{12}I_3NO_2$ .

## Iophendylate

$C_{19}H_{29}IO_2$  416.34

Benzenedecanoic acid, iodo-1-methyl-, ethyl ester.  
Ethyl 10-(iodophenyl)undecanoate [1320-11-2].

» Iophendylate is a mixture of isomers of ethyl iodophenylundecanoate, consisting chiefly of ethyl 10-(iodophenyl)undecanoate. It contains not less than 98.0 percent and not more than 102.0 percent of  $C_{19}H_{29}IO_2$ .

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**Identification**—Place about 1 mL of Iophendylate, 15 mL of water, and 7 g of potassium dichromate in a round-bottom, 50-mL flask. Carefully add 10 mL of sulfuric acid, moderating the ensuing vigorous reaction by cooling the flask with tap water. When the reaction has subsided, reflux the mixture for 2 hours. Pour the cooled contents of the flask into 25 mL of water, filter the mixture with suction, and wash the precipitate with a small quantity of cold water. Crystallize the precipitate from 10 mL of diluted alcohol, and sublime the solid so obtained: the sublimate of *p*-iodobenzoic acid melts between 268° and 272°.

**Specific gravity** (841): between 1.248 and 1.257.

**Refractive index** (831): between 1.524 and 1.526.

**Residue on ignition** (281): not more than 0.1%.

**Free acids**—Transfer about 4 g, accurately weighed, to a small flask, and add 20 mL of alcohol. Swirl to dissolve the test specimen, add 5 drops of phenolphthalein TS, and titrate with 0.050 N alcoholic potassium hydroxide to a pink color that persists for 30 seconds: not more than 0.60 mL of 0.050 N alcoholic potassium hydroxide is required for neutralization, correction being made for the amount of 0.050 N alcoholic potassium hydroxide consumed by a blank (0.3% as iodophenylundecanoic acid).

**Free iodine**—Determine its absorbance in a 4-cm cell, at 485 nm, with a suitable spectrophotometer, using water as the blank: the absorbance is not greater than 0.16 (7.5 ppm).

**Saponification value**—Transfer about 1 g, accurately weighed, to a 250-mL flask, add 25.0 mL of 0.5 N alcoholic potassium hydroxide VS, and reflux the mixture on a steam bath for 1 hour. Cool, add 25 mL of water and 0.7 mL of phenolphthalein TS, and titrate with 0.5 N hydrochloric acid VS. The saponification value (see *Fats and Fixed Oils* (401)) is between 132 and 142.

**Assay**—Dissolve about 50 mg of Iophendylate, accurately weighed, in 5 mL of toluene contained in a 125-mL separator fitted with a suitable, inert plastic stopcock. Add 15 mL of sodium biphenyl, and shake vigorously for 2 minutes. Extract gently with three 10-mL portions of 5 M phosphoric acid, combining the lower phases in a 125-mL iodine flask. Add 1 N sodium hypochlorite dropwise to the combined extracts until the solution turns brown, and then add an additional 0.5 mL. Shake intermittently for 3 minutes, add 5 mL of freshly prepared, saturated phenol solution, mix, and allow to stand for 1 minute, accurately timed. Add 1 g of potassium iodide, shake for 30 seconds, and titrate rapidly with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Each mL of 0.1 N sodium thiosulfate is equivalent to 6.939 mg of  $C_{19}H_{29}IO_2$ .

## Iophendylate Injection

» Iophendylate Injection is sterile Iophendylate.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass, protected from light.

**USP Reference standards** (11)—

USP Endotoxin RS

**Bacterial endotoxins** (85)—It contains not more than 0.9 USP Endotoxin Unit per mg of Iophendylate.

**Other requirements**—It conforms to the Definition, responds to the *Identification* test, and meets the requirements for *Specific gravity*, *Refractive index*, *Residue on ignition*, *Free acids*, *Free iodine*, *Saponification value*, and *Assay* under *Iophendylate*. It meets also the requirements under *Injections* (1).

## Iopromide

$C_{18}H_{24}I_3N_3O_8$  791.11

1,3-Benzenedicarboxamide, *N,N'*-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-5-[(methoxyacetyl)amino]-*N*-methyl-*N,N'*-Bis(2,3-dihydroxypropyl)-2,4,6-triiodo-5-(2-methoxyacetamido)-*N*-methylisophthalamide [73334-07-3].

» Iopromide contains not less than 97.0 percent and not more than 102.5 percent of  $C_{18}H_{24}I_3N_3O_8$ , calculated on the anhydrous and solvent-free basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Iopromide RS

USP Iopromide Related Compound A RS

USP Iopromide Related Compound B RS

5-(Acetylamino)-*N,N'*-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-*N*-methyl-1,3-benzenedicarboxamide.

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** The  $R_f$  value of the principal spot in the chromatogram, developed with the *Basic eluant*, obtained from the *Test solution* corresponds to that obtained from the *Standard solution* in the *Ordinary impurities* test.

**Water**, *Method I* (921): not more than 1.5%.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals**, *Method I* (231): not more than 0.002%.

**Test solution**—Transfer an accurately weighed quantity, about 1.00 g of Iopromide, to a 20-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Pipet 12.0 mL of this solution into a test tube, add 2.0 mL of pH 3.5 Acetate Buffer, and mix.

**Standard solution**—Pipet 1.0 mL of *Standard Lead Solution* (10 µg of lead), into a test tube, add 9.0 mL of water, 2.0 mL of the *Test solution*, and 2.0 mL of pH 3.5 Acetate Buffer, and mix.

**Thioacetamide-glycerin base solution color-comparison tubes**—Mix 15 mL of 1 N sodium hydroxide and 5 mL of

water, and add 20 mL of glycerin. Pipet 1.0 mL of this solution and 0.20 mL of thioacetamide TS into each of two color-comparison test tubes, and heat in a boiling water bath for 20 seconds. Use these tubes immediately.

**Procedure**—Immediately add the *Test solution* to one of the *Thioacetamide-glycerin base solution color-comparison tubes* and the *Standard solution* to the other. Mix, allow to stand for 2 minutes, and view downward over a white surface: the color of the solution from the *Test solution* is not darker than that of the solution from the *Standard solution*, treated in the same manner.

**Free iodine**—Transfer 2.0 g of Iopromide to a glass-stoppered test tube, and dissolve in 20 mL of water. Add 2 mL of toluene and 2 mL of diluted sulfuric acid, and shake vigorously: the toluene layer shows no red color.

**Limit of free iodide**—Transfer 10.0 g of Iopromide to a 150-mL conical flask, and dissolve in 70 mL of water. Adjust with 0.1 N sulfuric acid to a pH of  $3.5 \pm 0.5$ . Titrate with 0.001 N silver nitrate VS, determining the endpoint potentiometrically, using a silver or platinum electrode in combination with an appropriate reference electrode (see *Titrimetry* (541)). Each mL of 0.001 N silver nitrate is equivalent to 126.9 µg of I: the limit is 0.002%.

**Limit of free aromatic amine**—

**Test solution**—Transfer 500 mg of Iopromide to a 25-mL volumetric flask, add 20 mL of water, and mix.

**Standard solution**—Dissolve a suitable quantity of USP Iopromide Related Compound A RS in water, and dilute with water to obtain a stock solution having a known concentration of 0.25 mg per mL. Transfer 2.0 mL of this stock solution to a 25-mL volumetric flask, add 18.0 mL of water, and mix.

**Blank solution**—Transfer 20 mL of water to a 25-mL volumetric flask.

**Procedure**—Treat each flask as follows. Place the flasks in an ice bath, and protect from light. Add slowly 1.0 mL of 8 N hydrochloric acid, mix, and allow to stand for 5 minutes. Add 1.0 mL of sodium nitrite solution (1 in 50), mix, and allow to stand for 5 minutes. Add 0.50 mL of freshly prepared sulfamic acid solution, (8 in 100). Shake each flask vigorously several times within the next 5 minutes, venting off the gas that evolves. [Caution—Considerable pressure is produced.] Add 1.0 mL of freshly prepared *N*-(1-naphthyl)-ethylenediamine dihydrochloride solution, (1 in 1000) in a mixture of propylene glycol and water (70:30), and shake. Remove the flasks from the ice bath, and allow to stand in a water bath at about 25° for 10 minutes. Dilute with water to volume, mix, and degas with the aid of sonication for 1 minute. Concomitantly determine the absorbances of the *Test solution* and the *Standard solution* in 1-cm cells at the wavelength of maximum absorbance at about 495 nm, with a suitable spectrophotometer, using the *Blank solution*, treated in the same manner. The absorbance of the *Standard solution* is not less than 0.40. Calculate the percentage of free aromatic amine in the portion of Iopromide taken by the formula:

$$10(W_s / W_u)(A_u / A_s)$$

in which  $W_s$  is the quantity, in mg, of USP Iopromide Related Compound A RS taken to prepare the *Standard solution*;  $W_u$  is the quantity, in mg, of the Iopromide taken to prepare the *Test solution*; and  $A_u$  and  $A_s$  are the absorbances of the *Test solution* and the *Standard solution*, respectively: not more than 0.1% is found.

**Limit of alcohol**—

**Standard solution**—Prepare a solution of alcohol in dimethylformamide to obtain a solution having a known concentration of about 0.050 mg of alcohol ( $C_2H_5OH$ ) per mL.

**Test solution**—Dissolve an accurately weighed portion of Iopromide in dimethylformamide to obtain a concentration of about 50 mg per mL.

**Blank solution**—Use dimethylformamide.

**Chromatographic system** (see *Chromatography* <621>)—The gas chromatograph is equipped with a headspace injector, a flame-ionization detector, and a 0.25-mm × 30-m capillary column, the internal wall of which is coated with a 1.4-μm film of liquid phase G43. The column temperature is programmed according to the following steps: it is held at 40° for 10 minutes, then increased at a rate of 5° per minute to 70°; it is then increased at a rate of 30° per minute to 220°. The injector port is maintained at 160°; the headspace sampler is maintained at 80°; and the detector is maintained at 250°. Helium is used as the carrier gas at a flow rate of about 27 cm per second. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the retention time for alcohol is about 3 minutes; and the relative standard deviation for three injections of the *Standard solution* is not more than 4.0%. Chromatograph the *Blank solution*, and record the peak responses as directed for *Procedure*: the chromatogram shows no peak at the retention time for alcohol.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Transfer 2.0 mL each of the *Test solution*, the *Standard solution*, and the *Blank solution* to separate headspace vials, add 10 μL of 1 N hydrochloric acid to each vial, then seal the vials using a flanged cap so that the cap can no longer be turned. Record the chromatograms, and measure the responses for the alcohol peak. Calculate the concentration of alcohol in the portion of Iopromide taken by the formula:

$$(C/I)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of alcohol (C<sub>2</sub>H<sub>5</sub>OH) in the *Standard solution*; *I* is the quantity, in mg per mL, of Iopromide in the *Test solution*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the alcohol peak responses in the chromatograms obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.4% of alcohol (C<sub>2</sub>H<sub>5</sub>OH) is found. Use the percentage obtained to calculate the Assay result on the solvent-free basis.

**Limit of N-acetyl compound (iopromide related compound B)**—Using the chromatograms obtained in the Assay, calculate the percentage of N-acetyl compound in the Iopromide taken by the formula:

$$20(W_B/W)[(A_{Y1} + A_{Y2}) / (R_{Y1} + R_{Y2})]$$

in which *W<sub>B</sub>* is the quantity, in mg, of USP Iopromide Related Compound B RS taken to prepare the *Related compound B standard solution*; *W<sub>i</sub>* is the quantity, in mg, of Iopromide taken to prepare the *Assay preparation*; *A<sub>Y1</sub>* and *A<sub>Y2</sub>* are the peak responses for the Iopromide related compound B Y1- and Y2-isomers, respectively, in the chromatogram obtained from the *Assay preparation*; and *R<sub>Y1</sub>* and *R<sub>Y2</sub>* are the peak responses for the Iopromide related compound B Y1- and Y2-isomers, respectively, in the chromatogram obtained from the *Related compound B standard solution*: not more than 1.5% of N-acetyl compound is found.

**Ordinary impurities** <466>—

**Test solution**: a mixture of methanol and water (1:1).

**Standard solutions**: a mixture of methanol and water (1:1).

**Visualization solution**—

**SOLUTION A**—Dissolve 2.7 g of ferric chloride in 100 mL of 2.4 N hydrochloric acid. Store this solution in a refrigerator.

**SOLUTION B**—Dissolve 3.5 g of potassium ferricyanide in 100 mL of water. Store this solution in a refrigerator.

**SOLUTION C**—Dissolve 5.0 g of sodium arsenite in 30 mL of 1 N sodium hydroxide solution that has been cooled to 0°. While stirring, mix with 65 mL of 2.4 N hydrochloric acid, and store at room temperature. Use the clear supernatant.

**Procedure**—Mix 10 mL of *Solution A*, 10 mL of *Solution B*, and 2.0 mL of *Solution C*. Use within 30 minutes.

**Basic eluant**: a mixture of dioxane, water, and ammonium hydroxide (85:15:4).

**Acidic eluant**: a mixture of chloroform, methanol, water, and 96 percent formic acid (62:32:6:2).

**Procedure**—Apply 1 μL and 2 μL of the *Test solution* and 1 μL of each of the *Standard solutions* to two separate thin-layer chromatographic plates. Place one plate in a development chamber containing the *Acidic eluant*, and the second plate in a development chamber containing the *Basic eluant*. After the chromatograms have developed, remove the plates from the chambers, and allow to dry at room temperature.

**Visualization**—

**DETECTION 1**—Observe both plates under 254-nm UV light.

**DETECTION 2**—The plate developed with the *Acidic eluant* is exposed to ammonia vapors for 10 to 30 minutes and is air dried. Both plates are exposed to unfiltered 254-nm UV light for several minutes until the principal spots appear yellow. Overspray with *Visualization solution*, and examine the plates under ambient light. Determine the percentage of all secondary spots, except those due to free aromatic amine and to the N-acetyl compound.

**Limit**—The sum of all secondary spots observed in the chromatograms of the *Test solution*, except those due to the free aromatic amine and to the N-acetyl compound in addition to the percentage of N-acetyl compound obtained in the test for *Limit of N-Acetyl compound*, corresponds to not more than 3.0%.

**Isomer distribution**—Using the chromatogram of the Assay preparation obtained in the Assay, calculate the percentage of Iopromide E1- and Z1-isomers in the Iopromide taken by the formula:

$$100(r_{E1} + r_{Z1}) / (r_{E1} + r_{E2} + r_{Z1} + r_{Z2})$$

in which *r<sub>E1</sub>*, *r<sub>E2</sub>*, *r<sub>Z1</sub>*, and *r<sub>Z2</sub>* are the peak responses for Iopromide E1-, E2-, Z1-, and Z2-isomers, respectively, in the chromatogram obtained from the Assay preparation: between 40.0% and 51.0% of E1- and Z1-isomers is found. Calculate the percentages of Iopromide E2- and Z2-isomers in the Iopromide taken by the formula:

$$100(r_{E2} + r_{Z2}) / (r_{E1} + r_{E2} + r_{Z1} + r_{Z2})$$

between 49.0% and 60.0% E2- and Z2-isomers is found.

**Assay**—

**Diluent**—Prepare a mixture of methanol and water (1:1).

**Mobile phase**—[NOTE—Use chloroform, methanol, and water that have been filtered and degassed.] Mix 6 g of chloroform with 59 g of methanol, then add 900 g of water. Store in a sealed container, and do not stir or sparge the *Mobile phase* during use.

**Standard preparation**—Transfer an accurately weighed quantity of about 38 mg of USP Iopromide RS<sub>1</sub> to a 20-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume, and mix.

**Related compound B standard solution**—Transfer about 1.9 mg of USP Iopromide Related Compound B RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume, and mix.

**Assay preparation**—Transfer about 38 mg of Iopromide, accurately weighed, to a 20-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is about 1.2 mL per minute. The temperature is maintained at a constant temperature of about 20°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative reten-

tion times for iopromide *E1*-isomer, iopromide *E2*-isomer, iopromide *Z1*-isomer, and iopromide *Z2*-isomer are about 0.70, 0.75, 0.85, and 1.0, respectively; the resolution,  $R$ , between iopromide isomers *Z1* and *Z2* is not less than 2.0; and the relative standard deviation for replicate injections for total iopromide area is not more than 2.0%. Chromatograph the *Related compound B standard solution*, and measure the area of the peak responses: the relative retention times for the iopromide related compound B *Y1*- and *Y2*-isomers are about 0.28 and 0.31, respectively; and the signal-to-noise ratio for the iopromide related compound B *Y2*-isomer is not less than 20.

Determine which peaks in the chromatograms correspond to the *E*-isomers as follows. Transfer a portion of the *Standard preparation* to a vial, seal with a crimp-top, and heat to 121° for 15 minutes. Inject the cooled solution. Compare the chromatogram obtained with that of the unheated *Standard preparation*, and note the retention times of the two *E*-isomer peaks, which increase in size after heating.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation*, the *Related compound B standard solution*, and the *Assay preparation* into the chromatograph, and measure the responses for the major peaks. Allow the *Mobile phase* to flow for not less than 60 minutes between each injection to prevent interference from late-eluting amine peaks. Calculate the quantity of  $C_{18}H_{24}I_3N_3O_8$  in the portion of iopromide taken by the formula:

$$C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Iopromide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the sums of the peak responses for iopromide *E1*-isomer, iopromide *E2*-isomer, iopromide *Z1*-isomer, and iopromide *Z2*-isomer in the chromatograms obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Iopromide Injection

» Iopromide Injection is a sterile solution of iopromide in Water for Injection. It contains not less than 94.0 percent and not more than 105.0 percent of the labeled amount of iopromide ( $C_{18}H_{24}I_3N_3O_8$ ). It may contain small amounts of suitable buffers and of Edetate Calcium Disodium as a stabilizer. It contains no anti-microbial agents.

**Packaging and storage**—Preserve in single-dose glass Containers for Injections as described under *Injections* (1), and protect from light. Store at controlled room temperature.

**Labeling**—Label Injection to state that it is not to be used if it contains particulate matter and that after use any unused portion remaining in the container is to be discarded. It is labeled also to state that it is not for intrathecal use.

### USP Reference standards (11)—

USP Endotoxin RS

USP Iopromide RS

USP Iopromide Related Compound A RS

USP Iopromide Related Compound B RS

5-(Acetylamino)-*N,N'*-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-*N*-methyl-1,3-benzenedicarboxamide.

### Identification—

**A:** Evaporate 3 mL of Injection to dryness, and heat the residue so obtained in a crucible in a hood: violet vapors are evolved.

**B:** The  $R_f$  value of the principal spot in the chromatogram obtained from the *Test solution*, developed with the *Basic eluant*, in the test for *Ordinary impurities* corresponds to that obtained from the *Standard solution* similarly tested.

**Bacterial endotoxins** (85)—It contains not more than 1.25 USP Endotoxin Units per mL of Injection.

**pH** (791): between 6.5 and 8.0.

**Free iodine**—Transfer a volume of Injection, equivalent to 2 g of iopromide, to a 50-mL centrifuge tube. Dilute with water to 24 mL. Add 2 mL of toluene and 2 mL of diluted sulfuric acid solution, and shake: the toluene layer shows no red color.

**Limit of free iodide**—Transfer 10.0 mL of Injection and 50 mL of water to a 150-mL titration vessel, and titrate with 0.001 N silver nitrate VS using a silver or platinum electrode in combination with a reference electrode, determining the endpoint potentiometrically. Each mL of 0.001 N silver nitrate is equivalent to 126.9  $\mu$ g of I. The limit is 80  $\mu$ g of iodide per g of iopromide, based on the labeled content of iopromide.

**Limit of free aromatic amine**—Proceed as directed in the test for *Limit of free aromatic amine* under *Iopromide*, except to prepare the *Test solution* as follows. Transfer an accurately measured volume of Injection, equivalent to about 500 mg of iopromide, to a 25-mL volumetric flask, dilute with water to 20 mL, and mix. Calculate the percentage of free aromatic amine based on the labeled amount of iopromide in the Injection taken by the formula:

$$10(W_S / CV)(A_U / A_S)$$

in which  $W_S$  is the quantity, in mg, of USP Iopromide Related Compound A RS taken to prepare the *Standard solution*;  $C$  is the labeled concentration, in mg per mL, of iopromide in the Injection used to prepare the *Test solution*;  $V$  is the volume, in mL, of Injection to prepare the *Test solution*; and  $A_U$  and  $A_S$  are the absorbances of the *Test solution* and the *Standard solution*, respectively: not more than 0.2% is found.

**Limit of *N*-acetyl compound** (iopromide related compound B)—Using the chromatogram of the *Assay preparation* obtained in the *Assay*, calculate the percentage of *N*-acetyl compound in the iopromide in the Injection taken by the formula:

$$(W_B / C)[(A_{Y1} + A_{Y2}) / (R_{Y1} + R_{Y2})]$$

in which  $W_B$  is the quantity, in mg, of USP Iopromide Related Compound B RS taken to prepare the *Related compound B standard solution*;  $C$  is the concentration, in mg of iopromide per mL, in the *Assay preparation* based on the labeled amount and the extent of dilution;  $A_{Y1}$  and  $A_{Y2}$  are the peak responses for iopromide related compound B *Y1*- and *Y2*-isomers, respectively, from the *Assay preparation*; and  $R_{Y1}$  and  $R_{Y2}$  are the peak responses for iopromide related compound B *Y1*- and *Y2*-isomers, respectively, from the *Related compound B standard solution*: not more than 1.5% is found.

**Isomer distribution**—Using the chromatogram of the *Assay preparation* obtained in the *Assay*, calculate the percentage of iopromide isomers in the iopromide in the Injection taken by the formula:

$$100(r_i) / (r_{E1} + r_{E2} + r_{Z1} + r_{Z2})$$

in which  $r_i$  is the peak response of each individual iopromide isomer; and  $r_{E1}$ ,  $r_{E2}$ ,  $r_{Z1}$ , and  $r_{Z2}$  are the peak responses for the iopromide *E1*-, *E2*-, *Z1*-, and *Z2*-isomers, respectively, from the *Assay preparation*: between 8.0% and 12.0% of the *E1*-isomer, between 9.0% and 14.0% of the *E2*-isomer, between 32.0% and 40.0% of the *Z1*-isomer, and between 38.0% and 46.0% of the *Z2*-isomer are found.

**Other requirements**—It meets the requirements under *Injections* (1), and meets the requirements for *Ordinary impurities* and *Heavy metals* under *Iopromide*.

**Assay**—

*Diluent, Mobile phase, Standard preparation, Related compound B standard solution, and Chromatographic system*—Proceed as directed in the *Assay* under *Iopromide*.

*Assay preparation*—Dilute an accurately measured volume of Injection, quantitatively and stepwise, with *Diluent* to obtain a solution having a final nominal concentration of 1.9 mg of iopromide per mL.

*Procedure*—Proceed as directed in the *Assay* under *Iopromide*. Calculate the quantity, in mg, of iopromide ( $C_{18}H_{24}I_3N_3O_8$ ) in each mL of the Injection taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Iopromide RS in the *Standard preparation*; *L* is the labeled quantity, in mg, of iopromide in each mL of Injection; *D* is the concentration, in mg per mL, of iopromide in the *Assay preparation*, based on the volume of Injection taken and the extent of dilution; and the other factors are as defined therein.

## Iothalamate Meglumine Injection

$C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$  809.13

Benzoic acid, 3-(acetamino)-2,4,6-triiodo-5-[(methylamino)carbonyl]-, compd. with 1-deoxy-1-(methylamino)-D-glucitol (1:1).

1-Deoxy-1-(methylamino)-D-glucitol 5-acetamido-2,4,6-triiodo-*N*-methylisophthalamate (salt) [13087-53-1].

» Iothalamate Meglumine Injection is a sterile solution of Iothalamic Acid in Water for Injection, prepared with the aid of Meglumine. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of iothalamate meglumine ( $C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$ ). It may contain small amounts of suitable buffers and of Edetate Calcium Disodium or Edetate Disodium as a stabilizer. Iothalamate Meglumine Injection intended for intravascular use contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass, protected from light.

**Labeling**—Label containers of Injection intended for intravascular injection to direct the user to discard any unused portion remaining in the container. Label containers of Injection intended for other than intravascular injection to show that the contents are not intended for intravascular injection.

**USP Reference standards** (11)—

USP 5-Amino-2,4,6-triiodo-*N*-methylisophthalamic Acid RS  
 $C_9H_7I_3N_2O_3$  571.88

USP Endotoxin RS

USP Iothalamic Acid RS

**Identification**—Dilute 3 mL of Injection with water to 100 mL, add an excess of 3 N hydrochloric acid, and filter. Wash the precipitated iothalamic acid on the filter with four 10-mL portions of water, and dry at 105° for 4 hours: the dried iothalamic acid responds to the following tests.

**A:** The IR absorption spectrum of a 0.5% potassium bromide dispersion of the dried acid exhibits maxima only at the same wavelengths as that of a similar preparation of USP Iothalamic Acid RS.

**B:** Heat about 500 mg of the dried acid in a suitable crucible: violet vapors are evolved.

**Bacterial endotoxins** (85)—It contains not more than 0.9 USP Endotoxin Unit per mL.

**pH** (791): between 6.5 and 7.7.

**Free aromatic amine**—Dilute a suitable volume of Injection with water to yield a solution containing 100 mg of iothalamate meglumine per mL. Proceed as directed in the test for *Free aromatic amine* under *Iothalamic Acid*, beginning with "Pipet 5 mL of this solution into a 50-mL volumetric flask."

**Iodine and iodide**—Dilute a volume of Injection, equivalent to 2 g of iothalamate meglumine, with 20 mL of water in a 50-mL beaker, add 5 mL of 2 N sulfuric acid, stir, and filter into a glass-stoppered, 50-mL cylinder. Proceed as directed for *Procedure* in the test for *Iodine and iodide* under *Iothalamic Acid*, beginning with "To the filtrate add 5 mL of toluene."

**Heavy metals** (231)—In a 50-mL color-comparison tube, mix a volume of Injection, equivalent to 1.0 g of iothalamate meglumine, with 5 mL of 1 N sodium hydroxide, dilute with water to 40 mL, and mix. Using this as the *Test preparation*, proceed as directed in the test for *Heavy metals* under *Diatrizoate Meglumine*: the limit is 0.002%.

**Meglumine content**—Proceed as directed in the test for *Meglumine content* under *Diatrizoate Meglumine Injection*. The meglumine content is not less than 22.9% and not more than 25.3% of the labeled amount of iothalamate meglumine.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Pipet a volume of Injection, equivalent to about 4 g of iothalamate meglumine, into a 250-mL volumetric flask, dilute with water to volume, and mix. Pipet 25 mL of this solution into a glass-stoppered, 125-mL conical flask, add 12 mL of 5 N sodium hydroxide and 1 g of powdered zinc, connect the flask to a reflux condenser, and reflux for 30 minutes. Cool to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the filter and the flask thoroughly, adding the rinsings to the filtrate. Add 40 mL of 2 N sulfuric acid, and titrate immediately with 0.05 N silver nitrate VS, determining the endpoint potentiometrically, using silver-calomel electrodes and an agar-potassium nitrate salt bridge. Each mL of 0.05 N silver nitrate is equivalent to 13.49 mg of  $C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$ .

## Iothalamate Meglumine and Iothalamate Sodium Injection

» Iothalamate Meglumine and Iothalamate Sodium Injection is a sterile solution of Iothalamic Acid in Water for Injection, prepared with the aid of Meglumine and Sodium Hydroxide. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amounts of iothalamate meglumine ( $C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$ ) and iothalamate sodium ( $C_{11}H_8I_3N_2NaO_4$ ). It may con-

tain small amounts of suitable buffers and of Edetate Calcium Disodium or Edetate Disodium as a stabilizer. Iothalamate Meglumine and Iothalamate Sodium Injection intended for intravascular use contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass, protected from light.

**Labeling**—Label containers of Injection intended for intravascular injection to direct the user to discard any unused portion remaining in the container. Label containers of Injection intended for other than intravascular injection to show that the contents are not intended for intravascular injection.

**USP Reference standards** (11)—

USP 5-Amino-2,4,6-triiodo-*N*-methylisophthamic Acid RS  
 $C_9H_7I_3N_2O_3$  571.88

USP Endotoxin RS

USP Iothalamic Acid RS

**Identification**—Dilute 3 mL of Injection with water to 100 mL, add an excess of 3 N hydrochloric acid, mix, and filter. Wash the precipitate of iothalamic acid so obtained with four 10-mL portions of water, and dry at 105° for 4 hours: the dried iothalamic acid so obtained responds to the following tests.

**A:** The IR absorption spectrum of a potassium bromide dispersion of it exhibits maxima only at the same wavelengths as that of a similar preparation of USP Iothalamic Acid RS.

**B:** Heat about 500 mg in a suitable crucible: violet vapors are evolved.

**Bacterial endotoxins** (85)—It contains not more than 3.35 USP Endotoxin Units per mL.

**pH** (791): between 6.5 and 7.7.

**Free aromatic amine**—Dilute a suitable volume of Injection with water to yield a solution containing 100 mg of the total of iothalamate meglumine and iothalamate sodium per mL. Pipet 5 mL of this solution into a 50-mL volumetric flask, and add 10 mL of water. Proceed as directed in the test for *Free aromatic amine* under *Iothalamic Acid*, beginning with "In another flask place 15 mL of water. The absorbance of the solution from the Injection is not greater than that of the Standard solution (0.05%)."

**Iodine and iodide**—Dilute a volume of Injection, equivalent to 2 g of the total of iothalamate meglumine and iothalamate sodium, with 20 mL of water in a 50-mL beaker, and proceed as directed for *Procedure* in the test for *Iodine* under *Iothalamic Acid*, beginning with "add 5 mL of 2 N sulfuric acid." The limit of *Iodine and Iodide* is 0.02% of iodide.

**Heavy metals** (231)—In a 50-mL color-comparison tube, mix a volume of Injection, equivalent to 1.0 g of the total of iothalamate meglumine and iothalamate sodium, with 5 mL of 1 N sodium hydroxide, dilute with water to 40 mL, and mix. Using this as the *Test preparation*, proceed as directed for *Heavy metals* under *Diatrizoate Meglumine*: the limit is 0.002%.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay for iothalamate meglumine**—Pipet 5 mL of Injection into a 10-mL volumetric flask, add water to volume, and mix. Determine the angular rotation (see *Optical Rotation* (781)) of the diluted Injection, using a 10-cm cell and a suitable polarimeter. Calculate the quantity, in mg per mL,

of iothalamate meglumine in the Injection taken by the formula:

$$2000\alpha / 6.01$$

in which  $\alpha$  is the observed angular rotation, in degrees, corrected for the blank; and the factor 6.01 is the specific rotation, in degrees, of iothalamate meglumine.

**Assay for iothalamate sodium**—Transfer an accurately measured volume of Injection, equivalent to about 4 g of iothalamate meglumine and iothalamate sodium, to a 250-mL volumetric flask, dilute with water to volume, and mix. Pipet 25 mL of this solution into a glass-stoppered, 125-mL conical flask, add 12 mL of 5 N sodium hydroxide and 1 g of powdered zinc, connect the flask to a reflux condenser, and reflux the mixture for 30 minutes. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the flask and the filter thoroughly, adding the rinsings to the filtrate. Add 40 mL of 2 N sulfuric acid, and titrate immediately with 0.05 N silver nitrate VS, determining the end-point potentiometrically, using silver-calomel electrodes and an agar-potassium nitrate salt bridge. Calculate the volume, in mL, consumed by the iothalamate meglumine in the portion of solution taken, using the value found in the *Assay for iothalamate meglumine*. Each mL of 0.05 N silver nitrate is equivalent to 13.49 mg of  $C_{11}H_9I_3N_2O_4 \cdot C_7H_7NO_5$ . Subtract this volume from the total volume of 0.05 N silver nitrate consumed. Use the resulting volume to calculate the amount, in mg per mL, of iothalamate sodium in the Injection. Each mL of 0.05 N silver nitrate is equivalent to 10.60 mg of  $C_{11}H_8I_3N_2NaO_4$ .

## Iothalamate Sodium Injection

$C_{11}H_8I_3N_2NaO_4$  635.90

Benzoic acid, 3-(acetamino)-2,4,6-triiodo-5-[(methylamino)carbonyl]-, monosodium salt.

Monosodium 5-acetamido-2,4,6-triiodo-*N*-methylisophthalamate [1225-20-3].

» Iothalamate Sodium Injection is a sterile solution of Iothalamic Acid in Water for Injection prepared with the aid of Sodium Hydroxide. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of iothalamate sodium ( $C_{11}H_8I_3N_2NaO_4$ ). It may contain small amounts of suitable buffers and of Edetate Calcium Disodium or Edetate Disodium as a stabilizer. Iothalamate Sodium Injection intended for intravascular use contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass, protected from light.

**Labeling**—Label containers of the Injection intended for intravascular injection to direct the user to discard any unused portion remaining in the container. Label containers of the Injection intended for other than intravascular injection to show that the contents are not intended for intravascular injection.

**USP Reference standards** (11)—

USP 5-Amino-2,4,6-triiodo-*N*-methylisophthamic Acid RS  
 $C_9H_7I_3N_2O_3$  571.88

USP Endotoxin RS

USP Iothalamic Acid RS

**Identification—**

**A:** Dilute 3 mL of Injection with water to 100 mL, add an excess of 3 N hydrochloric acid, and filter. Wash the precipitated iothalamate acid with four 10-mL portions of water, and dry at 105° for 4 hours: the dried iothalamate acid responds to *Identification* tests *A* and *B* under *Iothalamate Meglumine Injection*.

**B:** It responds to the flame test for *Sodium* (191).

**Bacterial endotoxins** (85)—It contains not more than 3.35 USP Endotoxin Units per mL.

**pH** (791): between 6.5 and 7.7.

**Free aromatic amine**—Dilute a suitable volume of Injection with water to yield a solution containing 100 mg of iothalamate sodium per mL. Proceed as directed in the test for *Free aromatic amine* under *Iothalamic Acid*, beginning with "Pipet 5 mL of this solution into a 50-mL volumetric flask."

**Iodine and iodide**—Dilute a volume of Injection, equivalent to about 2 g of iothalamate sodium, with 20 mL of water in a 50-mL beaker, add 5 mL of 2 N sulfuric acid, stir, and filter into a glass-stoppered, 50-mL cylinder. Proceed as directed for *Procedure* in the test for *Iodine and iodide* under *Iothalamic Acid*, beginning with "To the filtrate add 5 mL of toluene."

**Heavy metals** (231)—In a 50-mL color-comparison tube, mix a volume of Injection, equivalent to 1.0 g of iothalamate sodium, with 5 mL of 1 N sodium hydroxide, dilute with water to 40 mL, and mix. Using this as the *Test preparation*, proceed as directed in the test for *Heavy metals* under *Diatrizoate Meglumine*: the limit is 0.002%.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Proceed with Injection as directed in the *Assay* under *Iothalamate Meglumine Injection*. Each mL of 30.05 N silver nitrate is equivalent to 10.60 mg of  $C_{11}H_9I_3N_2NaO_4$ .

---

**Iothalamic Acid**

---

$C_{11}H_9I_3N_2O_4$  613.91

Benzoic acid, 3-(acetylamino)-2,4,6-triiodo-5-[(methylamino)carbonyl]-.

5-Acetamido-2,4,6-triiodo-*N*-methylisophthamic acid  
 [2276-90-6].

» Iothalamic Acid contains not less than 98.0 percent and not more than 102.0 percent of  $C_{11}H_9I_3N_2O_4$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** (11)—

USP 5-Amino-2,4,6-triiodo-*N*-methylisophthamic Acid RS  
 $C_9H_7I_3N_2O_3$  571.88

USP Iothalamic Acid RS

**Identification—**

**A:** *Infrared Absorption* (197K).

**B:** Heat about 500 mg in a suitable crucible: violet vapors are evolved.

**Water, Method I** (921): not more than 1.0%.

**Residue on ignition** (281): not more than 0.1%.

**Free aromatic amine**—Dissolve 10.0 g of Iothalamic Acid in a minimal amount of 1 N sodium hydroxide in a 150-mL beaker, add 75 mL of water, and adjust with 1 N sulfuric acid to a pH of  $7 \pm 0.1$ . Transfer the solution to a 100-mL cylinder, dilute with water to 100 mL, and mix. Pipet 5 mL of this solution into a 50-mL volumetric flask, and add 10 mL of water. In another flask place 15 mL of water to provide a blank, and to a third flask add 12.5 mL of water and 2.5 mL of a Standard solution prepared as follows. Dissolve 25.0 mg of USP 5-Amino-2,4,6-triiodo-*N*-methylisophthamic Acid RS, accurately weighed, in a mixture of 0.5 mL of 1 N sodium hydroxide and 2.5 mL of water in a 250-mL beaker, swirling to effect solution, then add 225 mL of water, mix, adjust with 1 N sulfuric acid to a pH of  $7 \pm 0.1$ , transfer to a 250-mL volumetric flask, add water to volume, and mix. Place the three flasks containing the solutions from the substance under test, the Standard solution, and the blank, respectively, in an ice bath. [NOTE—In conducting the following steps, keep the flasks in the ice bath and in the dark as much as possible, until all of the reagents have been added. Chill all reagents and the diluting water to about 5° prior to addition.] Treat each flask as follows. Add 5 mL of freshly prepared sodium nitrite solution (1 in 200), immediately add 10 mL of 1 N hydrochloric acid, and swirl gently to mix. [NOTE—Disregard any precipitate that may be formed at this point.] Allow to stand for 2 minutes, accurately timed. Add 10 mL of ammonium sulfamate solution (1 in 50), and shake frequently during 5 minutes. Five minutes after the addition of the ammonium sulfamate solution, add 3 drops of a 1 in 10 solution of 1-naphthol in alcohol. Mix, and allow to stand for 1 minute. Add 3.5 mL of a pH 10 buffer (made by dissolving 67.5 g of ammonium chloride in 300 mL of water, adding 570 mL of ammonium hydroxide, and diluting with water to 1 L). Mix, remove from the ice bath, and immediately dilute, with water that has been chilled to 5°, to volume. Within 20 minutes of diluting the contents of all three flasks to 50 mL, concomitantly determine the absorbances of the test solution and the Standard solution in 1-cm cells at the wavelength of maximum absorbance at about 485 nm, with a suitable spectrophotometer, versus the prepared blank. The absorbance of the solution from the Iothalamic Acid is not greater than that of the Standard solution (0.05%).

**Iodine and iodide—**

**Test solution**—To 10.0 g in a 50-mL beaker add 16 mL of 1 N sodium hydroxide, and stir until solution is complete. Dilute with water to about 35 mL, and adjust the solution to a pH of between 7.0 and 7.5 with 0.1 N sodium hydroxide or 0.1 N hydrochloric acid. Dilute with water to 50 mL.

**Procedure**—Dilute 10 mL of *Test solution* with 20 mL of water in a 50-mL beaker, add 5 mL of 2 N sulfuric acid, stir, and filter into a glass-stoppered, 50-mL cylinder. To the filtrate add 5 mL of toluene, and shake: the toluene layer shows no red color. Add 1 mL of sodium nitrite solution (1 in 50), and shake: any red color in the toluene layer is not darker than that obtained when a mixture of 2 mL of potassium iodide solution (1 in 4000) and 22 mL of water is substituted for the solution under test (0.02% of iodide).

**Heavy metals** (231)—To a 50-mL color-comparison tube transfer 5.0 mL of solution prepared as directed for *Test solution* in the test for *Iodine and iodide*, add 5 mL of 1 N sodium hydroxide, dilute with water to 40 mL, and mix. Using this as the *Test preparation*, proceed as directed in the test for *Heavy metals* under *Diatrizoate Meglumine*: the limit is 0.002%.

**Assay**—Transfer about 400 mg of Iothalamic Acid, accurately weighed, to a glass-stoppered, 125-mL conical flask, add 12 mL of 5 N sodium hydroxide, 20 mL of water, and 1 g of powdered zinc, connect the flask to a reflux condenser, and reflux for 30 minutes. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the flask and the filter thoroughly, adding the rinsings to the filtrate. Add 40 mL of 2 N sulfuric acid, and titrate immediately with 0.05 N silver nitrate VS, determining the endpoint potentiometrically, using silver-calomel electrodes and an agar-potassium nitrate salt bridge. Each mL of 0.05 N silver nitrate is equivalent to 10.23 mg of  $C_{11}H_9I_3N_2O_4$ .

## Ioversol

$C_{18}H_{24}I_3N_3O_9$  807.11

1,3-Benzenedicarboxamide, *N,N'*-bis(2,3-dihydroxypropyl)-5-[(hydroxyacetyl)(2-hydroxyethyl)amino]-2,4,6-triiodo-*N,N'*-Bis(2,3-dihydroxypropyl)-5-*N*-(2-hydroxyethyl)glycol-amido]-2,4,6-triiodoisophthalamide. [87771-40-2].

» Ioversol contains not less than 97.0 percent and not more than 101.0 percent of  $C_{18}H_{24}I_3N_3O_9$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

### USP Reference standards (11)—

USP Ioversol RS

USP Ioversol Related Compound A RS

USP Ioversol Related Compound B RS

### Identification—

**A:** Infrared Absorption (197K).

**B:** Heat about 500 mg in a crucible: violet vapors are evolved.

**Water**, Method I (921): not more than 5%.

**Residue on ignition** (281): not more than 0.1%.

### Related compounds—

**Mobile phase**—Prepare a degassed mixture of water and acetonitrile (99.5:0.5).

**Standard solution**—Dissolve accurately weighed quantities of USP Ioversol Related Compound A RS and USP Ioversol Related Compound B RS in water to obtain a solution having known concentrations of about 1.0 µg per mL of USP Ioversol Related Compound A RS and 5.0 µg per mL of USP Ioversol Related Compound B RS.

**Test solution**—Transfer about 100 mg of Ioversol, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm stainless steel column containing packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at 35 ± 0.5°. The system is capable of operating at a column pressure of up to 3000 psi. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between Ioversol related compound A and Ioversol re-

lated compound B is not less than 2.0; and the relative standard deviation for replicate injections is not more than 5%.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each Ioversol related compound in the portion of Ioversol taken by the formula:

$$100(C/W)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Ioversol Related Compound A RS or USP Ioversol Related Compound B RS in the *Standard solution*; *W* is the concentration, in mg per mL, of Ioversol in the *Test solution*; *r<sub>U</sub>* is the peak response obtained from the *Test solution*; and *r<sub>S</sub>* is the average peak response from the *Standard solution*. Not more than 0.10% of Ioversol related compound A and not more than 0.50% of Ioversol related compound B are found.

**Iodine and iodide**—Dissolve 2.0 g of Ioversol in water in a 50-mL glass-stoppered cylinder, and dilute with water to 15 mL. To this solution add 5 mL each of diluted sulfuric acid and toluene. Shake vigorously, and allow the layers to separate: the toluene layer shows no red color. Add 1 mL of sodium nitrite solution (1 in 50), and shake: any red color in the toluene layer is not darker than that obtained from a mixture of 2 mL of potassium iodide solution (1 in 4000) and 13 mL of water, similarly treated (0.02% of iodide).

**Heavy metals**, Method I (231): 0.002%.

**Standard solution**—Into a 50-mL color-comparison tube, pipet 2 mL of *Standard Lead Solution* (20 µg of lead), and dilute with water to 10 mL.

**Test solution**—Dissolve 1 g in 10 mL of water in a 50-mL color-comparison tube.

**Procedure**—For each of the tubes containing the *Standard solution* and the *Test solution*, adjust with 1 N acetic acid or 6 N ammonium hydroxide to a pH of 3.0 to 4.0 using short-range pH indicator paper as external indicator, dilute with water to 40 mL, and mix. Add 1.2 mL of thioacetamide-glycerin base TS and 2 mL of pH 3.5 Acetate Buffer, allow to stand for 5 minutes, and view downward over a white surface: the color of the solution from the *Test solution* is not darker than that of the solution from the *Standard solution*, treated in the same manner. The limit is 20 µg per g.

**Assay**—Transfer about 500 mg of Ioversol, accurately weighed, to a glass-stoppered 125-mL conical flask, add 12 mL of 5 N sodium hydroxide, 20 mL of water, and 1 g of powdered zinc, connect the flask to a reflux condenser, and reflux for 30 minutes. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the flask and filter thoroughly, adding the rinsings to the filtrate. Add 40 mL of 2 N sulfuric acid, and titrate immediately with 0.05 N silver nitrate VS, determining the endpoint potentiometrically, using a silver-silver chloride double junction reference electrode and a silver billet electrode. Each mL of 0.05 N silver nitrate is equivalent to 13.45 mg of  $C_{18}H_{24}I_3N_3O_9$ .

## Ioversol Injection

» Ioversol Injection is a sterile solution of Ioversol in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amounts of Ioversol ( $C_{18}H_{24}I_3N_3O_9$ ) and iodine (I). It may contain small amounts of

suitable buffers and Edetate Calcium Disodium as a stabilizer. Ioversol Injection intended for intravascular use contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass, protected from light.

**Labeling**—Label containers of Injection intended for intravascular injection to direct the user to discard any unused portion remaining in the container.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Ioversol RS

USP Ioversol Related Compound A RS

USP Ioversol Related Compound B RS

**Identification**—

**A:** The IR absorption spectrum of the test specimen, a zinc sulfide cell having a thickness of 0.01 to 0.02 mm being used, exhibits maxima only at the same wavelength as that of a similar preparation of USP Ioversol RS.

**B:** Heat about 1 mL in a crucible: violet vapors are evolved.

**Bacterial endotoxins** (85)—It contains not more than 1.4 USP Endotoxin Units per mL of Injection.

**pH** (791): between 6.0 and 7.4.

**Heavy metals, Method I** (231)—

**Standard solution**—Into a 50-mL color-comparison tube pipet 2 mL of *Standard Lead Solution* (20 µg of Pb), and dilute with water to 5 mL.

**Test solution**—Into a 50-mL color-comparison tube, pipet a volume of Injection, equivalent to 1 g of Ioversol, and dilute with water to 5 mL.

**Procedure**—For each of the tubes containing the *Standard solution* and the *Test solution*, adjust with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 3.0 and 4.0, using short-range pH indicator paper as external indicator. Add 5.0 mL of ferrous sulfate solution (1 in 1000), dilute with water to 40 mL, and mix. Add 1.2 mL of thioacetamide-glycerin base TS and 2 mL of pH 3.5 Acetate Buffer, allow to stand for 5 minutes, and view downward over a white surface: the color of the solution from the *Test solution* is not darker than that of the solution from the *Standard solution*, treated in the same manner. The limit is 20 µg per g.

**Other requirements**—It meets the requirements under *Injections* (1).

**Related compounds**—

**Mobile phase and Chromatographic system**—Proceed as directed in the test for *Related compounds* under *Ioversol*.

**Standard solution**—Dissolve accurately weighed quantities of USP Ioversol Related Compound A RS and USP Ioversol Related Compound B RS in water to obtain a solution having known concentrations of 1.5 and 15 µg per mL, respectively.

**Test solution**—Dilute an accurately measured volume of Injection with water to obtain a solution containing 1 mg of Ioversol per mL.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each Ioversol related compound in the volume of Injection taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Ioversol Related Compound A RS or USP Ioversol Related Compound B RS in the *Standard solution*;  $C_U$  is the concentration, in mg per mL, of Ioversol in the *Assay preparation*;  $r_U$

is the peak response obtained from the *Test solution*; and  $r_S$  is the average peak response obtained from the *Standard solution*. Not more than 0.15% of Ioversol related compound A and not more than 1.5% of Ioversol related compound B are found.

**Assay**—Transfer an accurately measured volume of Injection, equivalent to about 0.5 g of Ioversol, to a glass-stoppered, 125-mL conical flask, add 12 mL of 5 N sodium hydroxide, 20 mL of water, and 1 g of powdered zinc, connect the flask to a reflux condenser, and reflux for 30 minutes. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the flask and filter thoroughly, adding the rinsings to the filtrate. Add 40 mL of 2 N sulfuric acid, and titrate immediately with 0.05 N silver nitrate VS, determining the endpoint potentiometrically, using a silver-silver chloride double junction reference electrode and a silver billet electrode. Each mL of 0.05 N silver nitrate is equivalent to 13.45 mg of  $C_{18}H_{24}I_3N_3O_9$ .

## Ioxaglate Meglumine and Ioxaglate Sodium Injection

» Ioxaglate Meglumine and Ioxaglate Sodium Injection is a sterile solution of Ioxaglic Acid in Water for Injection, prepared with the aid of Meglumine and Sodium Hydroxide. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amounts of Ioxaglate meglumine ( $C_{24}H_{21}I_6N_5O_8 \cdot C_7H_{17}NO_5$ ) and iodine (I). It may contain small amounts of Edetate Calcium Disodium as a stabilizer. Ioxaglate Meglumine and Ioxaglate Sodium Injection intended for intravascular use contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass, protected from light.

**Labeling**—Label containers of Injection intended for intravascular injection to direct the user to discard any unused portion remaining in the container. Label containers of Injection intended for other than intravascular injection to indicate that the contents are not intended for intravascular injection.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Ioxaglic Acid RS

**Identification**—

**A:** It responds to *Identification test A* under *Ioxaglic Acid*, a solution of 1.7 mL of Injection in 100 mL of water being used as the test solution.

**B:** Evaporate a volume of Injection, equivalent to about 500 mg of Ioxaglate meglumine and Ioxaglate sodium, to dryness, and heat the residue so obtained in a crucible: violet vapors are evolved.

**pH** (791): between 6.0 and 7.6.

**Heavy metals**—

**Test solution**—Transfer a volume of Injection, equivalent to a total of 1.0 g of Ioxaglate meglumine and Ioxaglate sodium, to a 50-mL color-comparison tube, and dilute with water to 5 mL.

**Standard solution**—Transfer 2.0 mL of *Standard Lead Solution* (20 µg of Pb) (see *Heavy Metals* (231)) to a 50-mL color-comparison tube, and dilute with water to 5 mL.

**Procedure**—Add 1.0 mL of ferrous sulfate solution (1 in 1000) to the *Test solution* and the *Standard solution*, adjust the solutions with 1 N acetic acid to a pH between 3 and 4, add 10 mL of hydrogen sulfide TS, mix, allow to stand for 5 minutes, and view downward over a white surface: the color of the solution from the *Test solution* is not darker than that of the solution from the *Standard solution* (0.002%).

#### Free iodine and iodide—

**Test solution**—Transfer a volume of Injection, equivalent to 2 g of the total of ioxaglate meglumine and ioxaglate sodium, to a 50-mL centrifuge tube, add 25 mL of water and 15 mL of 2 N sulfuric acid, and mix thoroughly. Centrifuge for 15 minutes, and decant the supernatant layer into a glass-stoppered 50-mL graduated cylinder. Repeat the sulfuric acid washing and centrifugation once more, adding the supernatant layer into the 50-mL graduated cylinder.

**Procedure**—Proceed as directed for *Procedure* in the test for *Free iodine and iodide* under *Ioxaglic Acid* (0.02% of iodide).

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay for ioxaglate meglumine**—Determine the angular rotation (see *Optical Rotation* (781)) of the Injection, using a 10-cm cell and a suitable polarimeter. Calculate the percentage of ioxaglate meglumine in the Injection taken by the formula:

$$100a / 3.32$$

in which *a* is the observed angular rotation, in degrees, corrected for a water blank; and 3.32 is the specific rotation, in degrees, of ioxaglate meglumine.

**Assay for iodine**—Transfer an accurately measured volume of Injection, equivalent to about 5 g (total) of ioxaglate meglumine and ioxaglate sodium, to a 250-mL volumetric flask, dilute with water to volume, and mix. Pipet 25 mL of this solution into a 125-mL conical flask, add 12 mL of 5 N sodium hydroxide and 1 g of powdered zinc, connect the flask to a reflux condenser, and reflux for 30 minutes. Proceed as directed in the *Assay for iodine* under *Ioxaglic Acid*. Each mL of 0.05 N silver nitrate is equivalent to 6.345 mg of iodine (I).

## Ioxaglic Acid

$C_{24}H_{21}I_6N_5O_8$  1268.88

Benzoic acid, 3-[[[3-(acetylmethylamino)-2,4,6-triiodo-5-[(methylamino)carbonyl]benzoyl]amino]acetyl]amino]-5-[[[(2-hydroxyethyl)amino]carbonyl]-2,4,6-triiodo-

*N*-(2-Hydroxyethyl)-2,4,6-triiodo-5[[2-[2,4,6-triiodo-3-(*N*-methylacetamido)-5-(methylcarbamoyl)benz-amido]acetamido]isophtalamic acid [59017-64-0].

» Ioxaglic Acid contains not less than 98.5 percent and not more than 101.5 percent of  $C_{24}H_{21}I_6N_5O_8$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

#### USP Reference standards (11)—

USP Ioxaglic Acid RS

#### Identification—

**A: Thin-Layer Chromatographic Identification Test** (201)—

**Test solution**—Dissolve 50 mg in 5 mL of methanol.

**Application volume:** 5  $\mu$ L.

**Developing solvent system:** butyl alcohol, water, and acetic acid (50:25:11).

**Procedure**—Proceed as directed in the chapter. The *R<sub>F</sub>* values of the two spots obtained from the *Test solution* correspond to those obtained from the *Standard solution*.

**B:** Heat about 500 mg in a crucible: violet vapors are evolved.

**Water, Method I** (921): not more than 5%.

**Residue on ignition** (281): not more than 0.1%, the residue being moistened with 2 mL of 35% sulfuric acid and ignited at 600°.

#### Heavy metals—

**Test solution**—Dissolve 2 g of Ioxaglic Acid in 16 mL of 0.1 N sodium hydroxide in a glass-stoppered 25-mL graduated cylinder, dilute with water to 20 mL, and mix. Transfer 15 mL of this solution to a 50-mL color-comparison tube.

**Standard solution**—Transfer 2.0 mL of *Standard Lead Solution* (20  $\mu$ g of Pb) (see *Heavy Metals* (231)) to a 50-mL color-comparison tube, add 5 mL of the *Test solution* and 15 mL of water, and mix.

**Procedure**—Adjust the *Test solution* and the *Standard solution* with 1 N acetic acid to a pH of between 3 and 4. Add 1 mL of a solution of sodium sulfide containing 1.16 mg per mL, mix, allow to stand for 5 minutes, and view downward over a white surface: the color of the solution from the *Test solution* is not darker than that of the solution from the *Standard solution* (0.002%).

#### Free iodine and iodide—

**Test solution**—Dissolve 2 g of Ioxaglic Acid in 20 mL of 0.1 N sodium hydroxide in a 50-mL centrifuge tube. Add 15 mL of 2 N sulfuric acid, mix on a vortex mixer, centrifuge for 15 minutes, and decant the supernatant layer into a glass-stoppered 100-mL graduated cylinder. Repeat the sulfuric acid washing and centrifugation twice more, decanting each supernatant layer into the 100-mL graduated cylinder.

**Procedure**—Add 5 mL of toluene, shake vigorously, and allow the layers to separate: the toluene layer shows no red color. Add 1 mL of sodium nitrite solution (1 in 50), shake, and allow the layers to separate: any red color in the toluene layer is not darker than that obtained when a mixture of 2.0 mL of potassium iodide solution (1 in 4000), 25 mL of water, and 15 mL of 2 N sulfuric acid is substituted for the *Test solution* (0.02% of iodide).

**Assay**—Transfer about 500 mg of Ioxaglic Acid, accurately weighed, to a glass-stoppered 125-mL conical flask, and add 12 mL of 5 N sodium hydroxide, 20 mL of water, and 1 g of powdered zinc. Connect the flask to a reflux condenser, and reflux for 30 minutes. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the flask and the filter thoroughly, adding the rinsing to the filtrate. Add 40 mL of 2 N sulfuric acid, and titrate immediately with 0.05 N silver nitrate VS, determining the end-point potentiometrically, using silver-calomel electrodes and an agar-potassium nitrate salt bridge. Each mL of 0.05 N silver nitrate is equivalent to 10.57 mg of  $C_{24}H_{21}I_6N_5O_8$ .

## Ioxilan

» Ioxilan contains not less than 98.0 percent and not more than 102.0 percent of  $C_{18}H_{24}I_3N_3O_8$ , calculated on the anhydrous and methanol-free basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

### USP Reference standards (11)—

USP Endotoxin RS

USP Ioxilan RS

USP Ioxilan Related Compound A RS

5-Amino-2,4,6-triiodo-3 N-(2-hydroxyethyl)carbamoyl benzoic acid.

$C_{10}H_9I_3N_2O_4$  601.90

### Identification—

**A:** Infrared Absorption (197K).

**B:** UV Absorption (197U)—

Solution: 10 µg per mL.

Medium: water.

**Bacterial endotoxins** (85)—It contains not more than 0.2 USP Endotoxin Unit per 50 mg of iodine.

**Heavy metals**, Method I (231): 0.002%.

**pH** (791): between 5.0 and 7.5, in a solution (1 in 10).

[NOTE—Heat gently, if necessary, to dissolve. Cool to room temperature before proceeding.]

**Water**, Method I (921): not more than 4.0%.

**Free iodine**—Transfer 2 g to a stoppered flask, add 12 mL of water, and swirl to dissolve. [NOTE—Heat gently, if necessary, to dissolve. Cool to room temperature before proceeding.] Add 2.5 mL of 2 N sulfuric acid and 4 mL of toluene, stopper the flask, and shake for 1 minute. Allow the layers to separate: the toluene layer shows no red color. Reserve the contents of the flask for use as the test solution in the test for *Free iodide*.

**Free iodide**—Prepare a solution of potassium iodide in water containing 1000 µg of iodide per mL. Quantitatively dilute portions of this solution with water to obtain standard solutions having concentrations of 100, 50, 25, and 10 µg of iodide per mL. Transfer 2 mL of each standard solution to separate stoppered flasks, and add 12 mL of water to each flask. Add 14 mL of water to an additional flask to serve as the blank. Add 2.5 mL of 2 N sulfuric acid and 4 mL of toluene to the flasks containing the standard solutions and the blank, stopper the flasks, and shake for 1 minute. To the test solution obtained in the test for *Free iodine*, each of the standard solutions, and the blank, add 0.5 mL of sodium nitrite solution (2 in 100), stopper the flasks, and shake vigorously for 1 minute. Allow the layers to separate, transfer the toluene layers to separate centrifuge tubes, and centrifuge for 1 minute. Concomitantly determine the absorbances of the test solution and the standard solutions against the blank. From a linear regression equation calculated from the concentrations and absorbances of the iodide standard solutions, determine the content of iodide in the Ioxilan: the limit is 30 µg of iodide per g of Ioxilan.

**Free aromatic amine**—[NOTE—Protect the Standard solution, the test solution, and the blank from light throughout the test.]

**pH 10 Buffer**—To 33.7 g of ammonium chloride add 285 mL of ammonium hydroxide, dilute with water to 500 mL, and mix.

**Procedure**—Transfer 20 mg of USP Ioxilan Related Compound A RS, accurately weighed, to a 200-mL volumetric flask, dissolve in a small volume of hot water, cool, dilute with water to volume, and mix. Transfer 2.5 mL of this solution to a 50-mL volumetric flask, add 12 mL of water, and mix. Transfer 0.5 g of Ioxilan to a second 50-mL volumetric flask, add 12 mL of water, and shake to dissolve. [NOTE—Heat gently, if necessary, to dissolve. Cool to room temperature before proceeding.] To a third 50-mL volumetric flask, add 12 mL of water to serve as the blank, and place the flasks containing the Standard solution, the test solution, and the blank in an ice bath. [NOTE—In conducting the following steps, keep the flasks in the ice bath as much as possible until all of the reagents have been added.] Treat each of the flasks as follows. Add 5 mL of sodium nitrite solution (0.5 in 100), and shake. [Caution—Considerable pressure is produced with the addition of each reagent.]

Add 10 mL of 1 N hydrochloric acid, swirl, and allow to stand for 2 minutes. Add 3 drops of a 1 in 10 solution of  $\alpha$ -naphthol in alcohol, swirl, and allow to stand for 2 minutes. Add 3.5 mL of pH 10 Buffer, swirl, and allow to stand out of the ice bath for 2 minutes. Degass all solutions in a water bath at 25° for 10 minutes, dilute with water to 50 mL, and mix. Within 15 minutes of this final dilution, concomitantly determine the absorbances of the test solution and the Standard solution at the wavelength of maximum absorbance at about 485 nm, with a suitable spectrophotometer, against the blank. The absorbance of the test solution is not greater than that of the Standard solution (0.05%).

### Residual methanol—

**Standard stock solution**—Transfer 200 mg of methanol to a tared 200-mL volumetric flask containing 20 mL of water, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask containing 20 mL of water, dilute with water to volume, and mix.

**Internal standard solution**—Transfer 200 mg of dehydrated alcohol to a tared 200-mL volumetric flask containing 20 mL of water, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Standard solutions A, B, C, and D**—Transfer 0.5, 1.0, 2.0, and 4.0 mL of Standard stock solution to separate 10-mL volumetric flasks, each containing 2 mL of water. Add 1.0 mL of Internal standard solution to each flask, dilute with water to volume, and mix to obtain Standard solutions A, B, C, and D having concentrations of 0.5, 1.0, 2.0, and 4.0 mg of methanol per L, respectively.

**Test solution**—Transfer about 1 g of Ioxilan to a tared 10-mL ampul, and add water to the ampul to a final weight of 10.45 g, taking care to avoid leaving water in the neck of the ampul. Seal the ampul, and immerse it in a water bath at 90° until the Ioxilan is dissolved. Mix, and allow to cool to room temperature. Mix again, open the ampul, and dilute the contents with a volume of water suitable to obtain a methanol concentration within the range of the standard curve (between 0.5 and 4 mg per L), allowing for the addition of 1.0 mL of Internal standard solution.

**Chromatographic system** (see System Suitability under Chromatography (621))—The gas chromatograph is equipped with a flame-ionization detector and a 10-m  $\times$  0.53-mm fused silica capillary column coated with support S2. The column temperature is programmed to increase from 45° to 80° at a rate of 5° per minute. The injection port temperature is maintained at 180°, and the detector temperature is maintained at 200°. Helium is used as the carrier gas at a flow rate of about 30 mL per minute. Chromatograph Standard solution D, and record the peak responses as directed for Procedure: the resolution, *R*, between the methanol and alcohol peaks is not less than 10; the tailing factor for the methanol peak is not more than 3.0;

and the relative standard deviation for replicate injections is not more than 5.0%.

**Procedure**—Separately inject equal volumes (about 1  $\mu$ L) of each *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the peak responses. From a linear regression equation calculated from the ratios of the peak responses of methanol to those of alcohol for each of the *Standard solutions* versus the methanol concentrations, in mg per L, determine the methanol content in the *Test solution*: not more than 2.0% is found.

#### Limit of serinol impurity—

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile and water (91:9). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard solution**—Transfer about 60 mg of USP Ioxilan RS to a 10-mL volumetric flask, add 1 mL of water, and heat at not more than 80° to dissolve. Cool to room temperature, dilute with acetonitrile to volume, and mix.

**Test solution**—Using about 60 mg of Ioxilan, proceed as directed for *Standard solution*.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 245-nm detector and a 25-cm  $\times$  4.6-mm stainless steel column that contains 5- $\mu$ m packing L18. The flow rate is about 2 mL per minute, and the column temperature is maintained at 30°. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the retention time of the serinol peak is about 0.9 relative to that of the larger of the Ioxilan peaks; the resolution, *R*, between the larger of the Ioxilan peaks and the serinol peak is not less than 1.0; and the relative standard deviation of the response of the serinol peak for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Test solution* and the *Standard solution* into the chromatograph, and allow the chromatogram to run for about 35 minutes. Measure the areas of the peak responses, and determine the percentage of serinol in the portion of Ioxilan taken: not more than 0.5% is found.

#### Chromatographic purity—

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile and water (87:13). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard solution**—Transfer about 60 mg of USP Ioxilan RS to a 10-mL volumetric flask, and add 1 mL of water. [NOTE—Heat gently, if necessary, to dissolve. Cool to room temperature before proceeding.] Dilute with acetonitrile to volume, and mix.

**Test solution**—Using about 60 mg of Ioxilan, proceed as directed for *Standard solution*.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 245-nm detector and a 25-cm  $\times$  4.6-mm stainless steel column that contains 5- $\mu$ m packing L8. The column is maintained at 30°, and the flow rate is about 1 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between the two largest impurity peaks eluting immediately after the second Ioxilan isomer peak is not less than 0.3.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure the areas of the peak responses. Determine the percentage of each impurity (excluding the serinol impurity, which has a retention time of 0.9 relative to the larger Ioxilan isomer) in the portion of Ioxilan taken: not more than 0.5% of any individual impurity is found; and the total of all impurities is not more than 1.5%.

**Assay**—Transfer about 500 mg of Ioxilan, accurately weighed, to a 100-mL round-bottom flask. Add 1 g of powdered zinc and 40 mL of 1.25 N sodium hydroxide, connect

the flask to a reflux condenser that is cooled with water at 5° to 10°, add a few glass boiling beads, and gently reflux the mixture for 1 hour. Allow the flask to cool to room temperature, and rinse the condenser with 10 to 20 mL of water. Disconnect the flask from the condenser, add 5 mL of glacial acetic acid, mix, and allow the mixture to cool. Pass through general purpose fast-flowing filter paper mixture. Rinse the flask and the filter with 1 N acetic acid, and add the rinsings to the filtrate. Add 5 mL of tetrabromophenolphthalein ethyl ester TS, and titrate with 0.1 N silver nitrate VS, with continuous stirring, until the precipitate turns green. Each mL of 0.1 N silver nitrate is equivalent to 26.37 mg of  $C_{18}H_{24}I_3N_3O_8$ .

## Ioxilan Injection

» Ioxilan Injection is a sterile solution of Ioxilan in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of Ioxilan ( $C_{18}H_{24}I_3N_3O_8$ ) as organically bound iodine. It may contain small amounts of suitable buffers and of Edetate Calcium Disodium as a stabilizer. Ioxilan Injection contains no antimicrobial agents.

**Packaging and storage**—Preserve injection in single-dose containers of Type I glass, protected from light.

**Labeling**—Label containers of the Injection to direct the user to discard any unused portion. The label states that it is not to be used if it is discolored or contains a precipitate and states also that it is not for intrathecal use.

#### USP Reference standards <11>—

USP Endotoxin RS

USP Ioxilan RS

#### Identification—

**A:** Evaporate a volume of Injection, equivalent to about 500 mg of Ioxilan, to dryness. Char the residue so obtained in a suitable crucible: violet vapors are evolved (*presence of iodine*).

**B:** The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those of the major peaks in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.2 USP Endotoxin Unit per 50 mg of iodine.

**Heavy metals, Method II** <231>: not more than 0.002%.

**pH** <791>: between 6.0 and 7.5.

**Free iodine**—Transfer an accurately measured volume of Injection, equivalent to about 1 g of Ioxilan, to a tared 25-mL volumetric flask, add 13 mL of water, and swirl to dissolve. Add 2.5 mL of 2 N sulfuric acid and 4 mL of toluene. Stopper the flask, and shake vigorously for 1 minute. Allow layers to separate: the toluene layer shows no red color. Reserve the contents of the flask for use as the test solution in the test for *Free iodide*.

**Free iodide**—Proceed as directed in the test for *Free iodide* under *Ioxilan*. The limit is 200  $\mu$ g of iodide per mL.

#### Residual methanol—

**Standard stock solution, Internal standard solution, Standard solutions A, B, C, D, and Chromatographic system**—Proceed as directed in the test for *Residual methanol* under *Ioxilan*.

**Test solution**—Transfer an accurately measured volume of Injection, equivalent to about 1 g of Ioxilan, to a 10-mL volumetric flask. Add 1.0 mL of *Internal standard solution*, dilute with water to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the test for *Residual methanol* under *Ioxilan*: not more than 0.005% is found.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile and water (87:13). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation A**—Transfer about 60 mg of USP Ioxilan RS, to a 10-mL volumetric flask, and add 1 mL of water. [NOTE—Heat gently, if necessary, to effect dissolution. Cool to room temperature before proceeding.] Dilute with acetonitrile to volume, and mix.

**Standard preparation B**—Prepare a 1 in 10 dilution of *Standard preparation A* in *Mobile phase*.

**Assay preparation A**—Transfer an accurately measured volume of *Injection*, equivalent to about 60 mg of Ioxilan, to a 10-mL volumetric flask, add 1 mL of water, and swirl to mix. Dilute with acetonitrile to volume, and mix.

**Assay preparation B**—Prepare a 1 in 10 dilution of *Assay preparation A* in *Mobile phase*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 245-nm detector and a 25-cm × 4.6-mm stainless steel column that contains packing L8. The column is maintained at 30°, and the flow rate is about 1 mL per minute. Chromatograph *Standard preparation A*, and record the peak responses as directed under *Procedure*: the resolution, *R*, between the two largest impurity peaks eluting immediately after the second Ioxilan isomer peak is not less than 0.3. Chromatograph *Standard preparation B*, and record the peak responses as directed under *Procedure*: the resolution, *R*, between the two Ioxilan isomer peaks is not less than 2.2, the column efficiency, based on the larger Ioxilan isomer peak, is not less than 4000 theoretical plates, and the relative standard deviation of the sums of the responses of the two Ioxilan isomer peaks from replicate injections is not less than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of *Assay preparation A*, *Assay preparation B*, *Standard preparation A*, and *Standard preparation B* into the chromatograph, record the chromatograms, and measure the areas of the responses for the major peaks. Record the integrated results, summing the areas of the two Ioxilan peaks. From the chromatogram of *Assay preparation A* in comparison to that of *Standard preparation B*, determine the quantity of Ioxilan in the *Injection* taken. Determine the percentage of impurities (excluding the serinol impurity with a relative retention time of 0.9 relative to the larger Ioxilan isomer peak) by area percent, using the chromatogram of *Assay preparation A*. Not more than 0.5% of any individual impurity is found, and the total of all impurities is not more than 1.5%. [NOTE—The impurities eluting on the tail of the second Ioxilan isomer peak should be integrated by skimming the peaks.]

## Ipecac

» Ipecac consists of the dried rhizome and roots of *Cephaelis acuminata* Karsten, or of *Cephaelis ipecacuanha* (Brotero) A. Richard (Fam. Rubiaceae).

Ipecac yields not less than 2.0 percent of the total ether-soluble alkaloids of Ipecac. Its content of emetine (C<sub>29</sub>H<sub>40</sub>N<sub>2</sub>O<sub>4</sub>) and cephaeline (C<sub>28</sub>H<sub>38</sub>N<sub>2</sub>O<sub>4</sub>) together is not less than 90.0 percent of the amount of the total ether-soluble alkaloids. The content of cephaeline varies from an

amount equal to, to an amount not more than 2.5 times, the content of emetine.

**USP Reference standards** (11)—

USP Emetine Hydrochloride RS

**Botanic characteristics**—A mixture of segments of the roots and rhizomes. The root segments are mostly curved and flexuous, occasionally branched, up to 15 cm in length and usually from 3 to 6.5 mm in diameter, but may be up to 9 mm in diameter, grayish, grayish brown, or reddish brown, the reddish brown type often having light-colored abrasions, transverse ridges about 0.5 to 1.0 mm wide that extend about halfway around the circumference of the root and fade at their tapering extremities into the general surface, with from 1 to 6 of these ridges per cm, and annulations sometimes seen at irregular intervals. The rhizomes are cylindrical, about 2 mm thick, finely longitudinally wrinkled, with a few elliptical scars. The odor is distinctive; the dust is sternutatory.

**Histology**—At the center of the root is a well-defined primary xylem but no pith. Surrounding this is a dense wood of secondary xylem crossed by medullary rays. These elements are all lignified. External to the wood is a narrow band of secondary phloem and a wide parenchymatous phelloderm surrounded by a narrow layer of cork a few cells thick. The secondary xylem consists of narrow, bordered-pitted tracheidal vessels and tracheids in combination with xylem parenchyma. The latter have simple pits and contain starch grains. Starch is present also in the medullary rays. The phloem occurs as small groups of sieve tissue embedded in parenchyma. The wide phelloderm consists of round-celled cellulose parenchyma filled with starch grains and a few idioblasts, each of which contains a bundle of acicular raphides of calcium oxalate crystals about 30 to 80 µm long. The starch grains are rarely single but usually occur as 2 to 4 and sometimes 8 in a clump. Individual grains measure up to 22 µm in diameter.

The rhizome differs from the root in having a ring of xylem around a large pith. The pericycle contains characteristic sclerenchymatous cells. Spiral vessels are found in the protoxylem. The pith is composed of pitted parenchyma, which is somewhat lignified.

**Overground stems**—The proportion of overground stems does not exceed 5%.

**Foreign organic matter** (561)—The proportion of foreign organic matter does not exceed 2.0%.

**Assay for total ether-soluble alkaloids**—[NOTE—It is important that the ether used in this assay shall have been shown by test to be free from peroxides within 24 hours prior to use.] The alkaloids may be extracted by either of the methods given in the following two paragraphs.

I—To 10 g of finely powdered Ipecac, in a suitable container, add 100 mL of ether, accurately measured at 25°, insert the stopper in the container tightly, shake the mixture thoroughly, and allow it to stand for 5 minutes. Then add 10 mL of 6 N ammonium hydroxide, close again tightly, shake it for 1 hour in a mechanical shaker or intermittently during 2 hours, and allow to stand overnight at a temperature not exceeding 25°. Again shake the mixture intermittently during 30 minutes, and allow the drug to settle at 25°. Transfer to a separator a 50.0-mL aliquot of the clear, supernatant, representing 5 g of Ipecac.

II—Place 5 g of the finely powdered Ipecac in a continuous-extraction thimble. Add enough ether to cover the powder, and allow to stand for 10 minutes with occasional stirring. Add 3 mL of ammonium hydroxide, mix, and allow to stand overnight. Cover the drug with a pledget of cotton, pack well, and extract with ether for 5 hours. Transfer the ether extract to a separator.

Extract the alkaloids from the ether with 2 N sulfuric acid, using at first 15 mL, or more, if necessary, to ensure an acid reaction, then successive 10-mL portions until extraction is complete, and filtering all extracts through the same filter

into a second separator. To the combined acid solutions add about an equal volume of ether, render the mixture distinctly alkaline with 6 N ammonium hydroxide (at least pH 10, by test paper), and extract with successive portions of ether until the last extract shows not more than a slight turbidity when treated as follows: Evaporate 1 mL of the last extraction, dissolve the residue in 0.5 mL of 0.5 N hydrochloric acid, and add 1 drop of mercuric iodide TS.

Filter each portion of the ether extract into a flask or beaker, and carefully evaporate the combined ether extracts on a steam bath almost to dryness. Add 5 mL of ether and 10.0 mL of 0.1 N sulfuric acid VS, and heat on a steam bath to dissolve the alkaloids and to remove all the ether. Cool, add 15 mL of water, then add methyl red TS, and titrate the excess acid with 0.1 N sodium hydroxide VS. Each mL of 0.1 N sulfuric acid is equivalent to 24.0 mg of the total ether-soluble alkaloids of ipecac, calculated as emetine ( $C_{29}H_{40}N_2O_4$ ).

#### Assay for emetine and cephaeline—

**Standard preparation**—Accurately weigh a suitable quantity of USP Emetine Hydrochloride RS, and dissolve in 0.5 N sulfuric acid. Dilute quantitatively and stepwise with the same dilute sulfuric acid to obtain a solution having a known concentration equivalent to about 50 µg of emetine per mL.

**Assay preparation**—Prepare a *Test Sample* as directed in *Methods of Analysis* under *Articles of Botanical Origin* (561). Transfer to a 150-mL beaker about 200 mg, accurately weighed, of the fine powder. Add 2 mL of dimethyl sulfoxide, mix with a flattened stirring rod to assure complete wetting of the powder, and allow to stand for about 30 minutes. Add 2 mL of water and about 1 g of sodium bicarbonate, and mix.

**Phosphate buffer**—Prepare approximately 0.5 M solutions of monobasic potassium phosphate (containing 5.1 g per 75 mL) and dibasic potassium phosphate (containing 2.2 g per 25 mL). Mix 3 volumes of 0.5 M monobasic potassium phosphate with 1 volume of 0.5 M dibasic potassium phosphate, and adjust by the addition of one or the other of the solutions to a pH of  $6.0 \pm 0.05$ . Dissolve 7.5 g of potassium chloride in 100 mL of the resulting solution.

**Citric acid buffer**—Prepare approximately 0.5 M solutions of sodium citrate (containing 6.5 g per 50 mL) and citric acid (containing 4.8 g per 50 mL). Mix equal volumes of these solutions, and adjust by addition of one or the other of the solutions to a pH of  $4.0 \pm 0.05$ .

**Chromatographic columns**—For each column, pack a pledget of fine glass wool in the base of a chromatographic tube (25- × 200-mm test tube to which is fused a 5-cm length of 7-mm tubing) with the aid of a tamping rod having a disk with a diameter about 1 mm less than that of the tube.

Prepare *Column I* as follows. To the *Assay preparation* add 6 g of purified siliceous earth, mix, transfer the mixture to the column, scrub the beaker with about 1 g of the purified siliceous earth, transfer this to the top of the column, and tamp. Prepare *Column II* using 3 g of the purified siliceous earth and 2 mL of *Phosphate buffer*; prepare *Column III* using 2 mL of *Citric acid buffer* and 3 g of the purified siliceous earth; and prepare *Column IV* using 2 mL of sodium hydroxide solution (1 in 50) and 3 g of the purified siliceous earth. Pack a pledget of glass wool on the top of each column.

**Procedure**—[NOTE—Use water-saturated solvents throughout this procedure. Rinse the tips of the chromatographic columns before discarding them.] Mount *Columns I* and *II* so that the effluent from *Column I* flows onto *Column II*. Pass three 50-mL portions of ether through the columns, and discard *Column I* and the eluate. Mount *Column III* below *Column II* and pass three 50-mL portions of a mixture of 1 volume of ether and 3 volumes of chloroform through the columns. Discard *Column II* and the eluate. Wash *Column III* with 25 mL of the ether-chloroform mixture, followed by 25 mL of a mixture of equal volumes of ether and isooctane,

and discard the washings. Wash *Column IV* with 20 mL of a 1 in 50 solution of triethylamine in the ether-isooctane mixture, and discard the washing. Mount *Column IV* below *Column III*, and place as a receiver under *Column IV* a 125-mL separator containing 15 mL of 4 N sulfuric acid. Pass through the columns 10 mL of a 1 in 5 solution of triethylamine in the ether-isooctane mixture, followed by three 10-mL portions of a 1 in 50 solution of triethylamine in the ether-isooctane mixture. Discard *Column III*, and pass through *Column IV* 20 mL of the 1 in 50 solution of triethylamine in the ether-isooctane mixture. Shake the separator, allow the phases to separate, and transfer the aqueous extract to a 50-mL volumetric flask. Extract with two additional 10-mL portions of 0.5 N sulfuric acid, combining the extracts in the volumetric flask. Add 0.5 N sulfuric acid to volume, and mix (*emetine solution*).

Elute *Column IV* with 75 mL of chloroform, collecting the eluate in a 250-mL separator containing 150 mL of ether. Discard *Column IV*. Extract with one 20-mL and then with two 10-mL portions of 0.5 N sulfuric acid, collecting the extracts in a 50-mL volumetric flask. Rinse the stem of the separator, add the acid to volume, and mix (*cephaeline solution*).

Concomitantly determine the absorbances of the *emetine solution*, the *cephaeline solution*, and the *Standard preparation* in 1-cm cells at the wavelength of maximum absorbance at about 283 nm and at 350 nm, with a suitable spectrophotometer, using 0.5 N sulfuric acid as the blank.

Calculate the quantity, in mg, of emetine in the portion of Ipecac taken by the formula:

$$0.05C(A_{283} - A_{350})_U / (A_{283} - A_{350})_S$$

in which C is the concentration, in µg per mL, of emetine in the *Standard preparation*; and the parenthetical expressions are the differences in the absorbances of the solution of emetine from the *Assay preparation* (U) and the *Standard preparation* (S), respectively, at the wavelengths indicated by the subscripts.

Calculate the quantity, in mg, of cephaeline in the portion of Ipecac taken by the formula:

$$0.971(0.05C)(A_{283} - A_{350})_U / (A_{283} - A_{350})_S$$

in which 0.971 is the ratio of the molecular weight of cephaeline to that of emetine; C is as defined above; and the parenthetical expressions are the differences in the absorbances of the solution of cephaeline from the *Assay preparation* (U) and the *Standard preparation* (S), respectively, at the wavelengths indicated by the subscripts.

### Powdered Ipecac

» Powdered Ipecac is Ipecac reduced to a fine or a very fine powder and adjusted to a potency of not less than 1.9 percent and not more than 2.1 percent of the total ether-soluble alkaloids of ipecac, by the addition of exhausted marc of ipecac or of other suitable inert diluent or by the addition of powdered ipecac of either a lower or a higher potency.

The content of emetine ( $C_{29}H_{40}N_2O_4$ ) and cephaeline ( $C_{28}H_{38}N_2O_4$ ) together is not less than 90.0 percent of the total amount of the ether-soluble alkaloids. The content of cephaeline varies from an amount equal to, to an amount not more than 2.5 times, the content of emetine.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Emetine Hydrochloride RS

**Botanic characteristics**—Thin-walled, fairly small cork cells, the starch grains rarely simple and usually 2- to 8-compound, the single grains up to 22  $\mu\text{m}$  in diameter; raphides of calcium oxalate 30 to 80  $\mu\text{m}$  in length; tracheids and tracheidal vessels found in groups having very numerous, small, bordered pits; parenchyma of phelloderm filled with starch or acicular crystals of calcium oxalate, having cells thin-walled, oval with intercellular spaces; parenchyma of the xylem composed of small rectangular and longitudinally elongated cells with moderately thick walls and scattered bordered or simple pits; rhizome parenchyma cells larger than root parenchyma cells, with slightly thicker walls and lignified with fairly numerous simple pits; sclereids from the rhizome large, rectangular, with uneven walls and large, conspicuous pits.

**Assay for total ether-soluble alkaloids**—Proceed with Powdered Ipecac as directed in the *Assay for total ether-soluble alkaloids* under *Ipecac*.

**Assay for emetine and cephaeline—**

*Standard preparation, Phosphate buffer, Citric acid buffer, and Chromatographic columns*—Prepare as directed in the *Assay for emetine and cephaeline* under *Ipecac*.

*Assay preparation*—Transfer to a 150-mL beaker about 200 mg, accurately weighed, of Powdered Ipecac. Add 2 mL of dimethyl sulfoxide, mix with a flattened stirring rod to ensure complete wetting of the powder, and allow to stand for about 30 minutes. Add 2 mL of water and about 1 g of sodium bicarbonate, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for emetine and cephaeline* under *Ipecac*. Calculate the quantity, in mg, of emetine in the portion of Powdered Ipecac taken by the formula:

$$0.05C(A_{283} - A_{350})_U / (A_{283} - A_{350})_S$$

in which the parenthetical expressions are the differences in the absorbances of the solution of emetine from the *Assay preparation* (*U*) and the *Standard preparation* (*S*), respectively, at the wavelengths indicated by the subscripts; and *C* is as defined for *Procedure* in the *Assay for emetine and cephaeline* under *Ipecac*. Calculate the quantity, in mg, of cephaeline in the portion of Powdered Ipecac taken by the formula:

$$0.971(0.05C)(A_{283} - A_{350})_U / (A_{283} - A_{350})_S$$

in which 0.971 is the ratio of the molecular weight of cephaeline to that of emetine; the parenthetical expressions are the differences in the absorbances of the solution of cephaeline from the *Assay preparation* (*U*) and the *Standard preparation* (*S*), respectively, at the wavelengths indicated by the subscripts; and *C* is as defined above.

## Ipecac Oral Solution

» Ipecac Oral Solution yields, from each 100 mL, not less than 123 mg and not more than 157 mg of the total ether-soluble alkaloids of ipecac.

The content of emetine ( $\text{C}_{29}\text{H}_{40}\text{N}_2\text{O}_4$ ) and cephaeline ( $\text{C}_{28}\text{H}_{38}\text{N}_2\text{O}_4$ ) together is not less than 90.0 percent of the amount of the total ether-soluble alkaloids. The content of cephaeline varies from an amount equal to, to an amount not more than 2.5 times, the content of emetine.

Powdered Ipecac . . . . .	70 g
Glycerin . . . . .	100 mL
Syrup, a sufficient quantity, to make	1000 mL

Exhaust the powdered Ipecac by percolation, using a mixture of 3 volumes of alcohol and 1 volume of water as the menstruum, macerating for 72 hours, and percolating slowly. Reduce the entire percolate to a volume of 70 mL by evaporation at a temperature not exceeding 60° and preferably in vacuum, and add 140 mL of water. Allow the mixture to stand overnight, filter, and wash the residue on the filter with water. Evaporate the filtrate and washings to 40 mL, and to this add 2.5 mL of hydrochloric acid and 20 mL of alcohol, mix, and filter. Wash the filter with a mixture of 30 volumes of alcohol, 3.5 volumes of hydrochloric acid, and 66.5 volumes of water, using a volume sufficient to produce 70 mL of the filtrate. Add 100 mL of Glycerin and enough Syrup to make the product measure 1000 mL, and mix.

**Packaging and storage**—Preserve in tight containers, preferably at a temperature not exceeding 25°. Containers intended for sale to the public without prescription contain not more than 30 mL of Oral Solution.

**USP Reference standards** (11)—

USP Emetine Hydrochloride RS

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Escherichia coli*.

**Alcohol content** (611): between 1.0% and 2.5% of  $\text{C}_2\text{H}_5\text{OH}$ .

**Assay for total ether-soluble alkaloids**—[NOTE—It is important that the ether used in this assay shall have been shown by test to be free from peroxides within 24 hours prior to use.] Transfer about 50 mL, accurately measured, of Oral Solution to a liquid-liquid automatic extractor, add water, if necessary, to reduce the viscosity, render the liquid distinctly alkaline with ammonium hydroxide, and extract with ether for at least 4 hours or until the extraction is complete. Use a water bath to boil the ether. Frequently disconnect the extractor from the condenser, and agitate the lower layer by raising and lowering the center tube or by other suitable manipulation. At the conclusion of the extraction period, transfer the ether extract to a separator, and rinse the extraction flask with 2 or more small volumes of ether, adding the rinsings to the separator. Complete the assay as directed in the *Assay for total ether-soluble alkaloids* under *Ipecac*, beginning with "Extract the alkaloids from the ether."

**Assay for emetine and cephaeline—**

*Standard preparation, Phosphate buffer, and Citric acid buffer*—Prepare as directed in the *Assay for emetine and cephaeline* under *Ipecac*.

*Assay preparation*—Pipet 10 mL of water into a 25-mL volumetric flask. With the aid of a 20-mL pipet, add Oral Solution to volume, taking care to prevent contact of the Oral Solution with the neck of the flask above the graduation line. Insert the stopper, and mix.

*Chromatographic columns*—Pack a pledget of fine glass wool in the base of a chromatographic tube (25-mm  $\times$  200-mm test tube to which is fused a 5-cm length of 7-mm tubing) with the aid of a tamping rod having a disk with a diameter about 1 mm less than that of the tube.

To prepare *Column I*, transfer 4.0 mL of the *Assay preparation* to a 150-mL beaker, add about 1 g of sodium bicarbonate, and mix. Then proceed as directed for *Chromatographic columns* in the *Assay for emetine and cephaeline* under *Ipecac*, beginning with "add 6 g of purified siliceous earth," and prepare *Columns II, III, and IV* as directed therein.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for emetine and cephaeline* under *Ipecac*.

Calculate the quantity, in mg, of emetine in each 100 mL of Oral Solution taken by the formula:

$$2.08C(A_{283} - A_{350})_U / (A_{283} - A_{350})_S$$

in which the parenthetic expressions are the differences in the absorbances of the solution of emetine from the *Assay preparation* (*U*) and the *Standard preparation* (*S*), respectively, at the wavelengths indicated by the subscripts, and *C* is as defined in the *Procedure*.

Calculate the quantity, in mg, of cephaeline in each 100 mL of Oral Solution taken by the formula:

$$0.971(2.08C)(A_{283} - A_{350})_U / (A_{283} - A_{350})_S$$

in which 0.971 is the ratio of the molecular weight of cephaeline to that of emetine, the parenthetic expressions are the differences in the absorbances of the solution of cephaeline from the *Assay preparation* (*U*) and the *Standard preparation* (*S*), respectively, at the wavelengths indicated by the subscripts, and *C* is as defined in the *Procedure*.

## Ipodate Sodium

$C_{12}H_{12}I_3N_2NaO_2$  619.94

Benzenepropanoic acid, 3-[[(dimethylamino)methylene]amino]-2,4,6-triiodo-, sodium salt.

Sodium 3-[[[(dimethylamino)methylene]amino]-2,4,6-triiodohydrocinnamate [1221-56-3].

» Ipodate Sodium contains not less than 97.5 percent and not more than 102.5 percent of  $C_{12}H_{12}I_3N_2NaO_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Ipodate Sodium RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 10 µg per mL.

*Medium:* methanol.

Absorptivities at 235 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** Heat about 500 mg in a porcelain crucible over a free flame: violet vapors of iodine are evolved.

**D:** It responds to the flame test for *Sodium* (191).

**Loss on drying** (731)—Dry it in vacuum at 60° for 3 hours: it loses not more than 0.5% of its weight.

**Iodide or iodine**—Dissolve about 200 mg in 10 mL of 6 N acetic acid, add 2 mL of 1 N sulfuric acid and 15 mL of chloroform, and shake vigorously. Allow the layers to separate: the chloroform layer shows not more than a faint violet color. Add 1 mL of 0.1 N potassium iodate, shake vigorously, and allow the layers to separate: the chloroform layer shows at most a slight trace of violet color.

**Heavy metals, Method II** (231): 0.003%.

**Assay**—Transfer about 300 mg of Ipodate Sodium, accurately weighed, to a 250-mL flask, add 30 mL of 1.25 N sodium hydroxide and 0.5 g of powdered zinc, and reflux the mixture for 60 minutes. Cool, wash the condenser with 20 mL of water, and filter the mixture. Wash the flask and the filter with small portions of water, adding the washings to the filtrate. Add to the filtrate 5 mL of glacial acetic acid and 3 mL of a mixture of 2 drops of nitric acid in 5 mL of water, then add 3 drops of eosin Y TS, and titrate with 0.05 N silver nitrate VS until the entire mixture changes to a permanent pink color. Each mL of 0.05 N silver nitrate is equivalent to 10.33 mg of  $C_{12}H_{12}I_3N_2NaO_2$ .

## Ipodate Sodium Capsules

» Ipodate Sodium Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{12}H_{12}I_3N_2NaO_2$ .

**Packaging and storage**—Preserve in tight containers.

**Identification**—

**A:** Transfer a portion of the contents of Capsules, equivalent to about 2 g of ipodate sodium, to a 250-mL separator, add 100 mL of water and 50 mL of solvent hexane, and shake. Transfer the aqueous layer to a beaker, add 5 mL of 3 N hydrochloric acid, and mix. Filter (retain the filtrate), and wash the precipitate with several portions of water. Dry the precipitate in vacuum at 60° for 4 hours. A 1 in 100,000 solution of the residue so obtained, in a 1 in 100 mixture of 2 N hydrochloric acid in methanol, exhibits an UV absorbance maximum at  $242 \pm 2$  nm.

**B:** The residue obtained in *Identification* test A responds to *Identification* test C under *Ipodate Sodium*.

**C:** The filtrate obtained in *Identification* test A responds to the flame test for *Sodium* (191).

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—Place a number of Capsules, equivalent to about 5 g of ipodate sodium, in a 400-mL beaker, add 200 mL of 1 N sodium hydroxide and 50 mL of solvent hexane, and stir by mechanical means until the capsules have completely disintegrated. Transfer the mixture to a 500-mL separator, wash the beaker with a total of 25 mL of 1 N sodium hydroxide in divided portions, and add the washings to the separator. Allow the layers to separate, and transfer the aqueous layer to a 500-mL volumetric flask. Wash the solvent hexane layer with two 50-mL portions of 1 N sodium hydroxide, add the washings to the volumetric flask, dilute with 1 N sodium hydroxide to volume, and mix. Pipet 25 mL of the solution, which may be milky in appearance, into a 250-mL conical flask, add 500 mg of powdered zinc, and proceed as directed in the *Assay* under *Ipodate Sodium*, beginning with "and reflux the mixture for 60 minutes."

## Ipratropium Bromide

$C_{20}H_{30}BrNO_3 \cdot H_2O$  430.38

8-Azoniabicyclo[3.2.1]octane-3-(3-hydroxy-1-oxo-2-phenylpropoxy)-8-methyl-8-(1-methylethyl)-, bromide, monohydrate(*endo, syn*)-, (±)-  
(8*r*)-3 $\alpha$ -Hydroxy-8-isopropyl-1 $\alpha$ H,5 $\alpha$ H-tropanium bromide (±)-tropate monohydrate [66985-17-9].

» Ipratropium Bromide contains not less than 98.0 percent and not more than 102.0 percent of  $C_{20}H_{30}BrNO_3 \cdot H_2O$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers, and store at room temperature.

### USP Reference standards (11)—

USP Ipratropium Bromide RS

USP Ipratropium Bromide Related Compound A RS  
(1*R*,3*r*,5*S*,8*r*)-3-Hydroxy-8-methyl-8-(1-methylethyl)-8-azoniabicyclo[3.2.1]octane, bromide.

$C_{11}H_{22}BrNO$  264.20

USP Ipratropium Bromide Related Compound B RS  
(1*R*,3*r*,5*S*,8*s*)-3-[[[(2*RS*)-3-Hydroxy-2-phenylpropanoyl]oxy]-8-methyl-8-(1-methylethyl)-8-azoniabicyclo[3.2.1]octane, bromide.

$C_{20}H_{30}BrNO_3$  412.36

USP Ipratropium Bromide Related Compound C RS  
(2*RS*)-3-Hydroxy-2-phenylpropanoic acid.

$C_9H_{10}O_3$  166.17

### Identification—

**A:** Infrared Absorption (197M).

**B:** A solution (1 in 100) meets the requirements of the test for Bromide (191).

**C:** The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

**pH** (791): between 5.0 and 7.0, in a solution (1 in 10).

**Water**, Method I (921): between 3.9% and 4.4%.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals**, Method II (231): 0.001%.

### Limit of ipratropium related compound A—

**Adsorbent**—Use a suitable high-performance thin-layer chromatographic silica gel mixture.

**Test solution**—Dissolve about 100 mg of Ipratropium Bromide, accurately weighed, in 5 mL of methanol.

**Stock standard solution**—Dissolve an accurately weighed quantity of USP Ipratropium Bromide Related Compound A RS in methanol and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.05 mg per mL.

**Standard solutions**—In separate flasks, dilute 0.5, 1.0, and 2.0 mL of the Stock standard solution with methanol to 5 mL

to obtain a set of standard solutions having known concentrations of approximately 0.005, 0.01, and 0.02 mg of ipratropium bromide per mL. These solutions correspond to 0.025% (Standard solution C), 0.05% (Standard solution B), and 0.1% (Standard solution A), respectively, relative to the Test solution.

**Application volume:** 1  $\mu$ L.

**Developing solvent system**—Prepare a mixture of methylene chloride, dehydrated alcohol, water, and formic acid (18:18:3:1).

**Procedure**—Proceed as directed for Thin-Layer Chromatography under Chromatography (621). Develop the plate for about 15 minutes, then remove from the tank and dry at 60° for 15 minutes. Spray the plate with the Dragendorff's TS, and allow to dry briefly. Spray the plate with sodium nitrite solution (5 in 100), and immediately cover with a glass plate. The  $R_f$  for ipratropium bromide related compound A and ipratropium bromide are about 0.15 and 0.36, respectively. Any spot in the chromatogram obtained from the Test solution, except for the principal spot, is not more intense than the spot in the chromatogram obtained from Standard solution A (0.1%).

### Related compounds—

**Phosphate solution, Buffer, Mobile phase, and Chromatographic system**—Proceed as directed in the Assay.

**System suitability solution**—Dissolve suitable quantities of USP Ipratropium Bromide RS and USP Ipratropium Bromide Related Compound B RS in Mobile phase to obtain a solution containing about 0.03 mg per mL and 0.01 mg per mL, respectively.

**Standard solution**—Dissolve an accurately weighed quantity of USP Ipratropium Bromide RS in Mobile phase and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.03 mg per mL.

**Test solution**—Transfer about 250 mg of Ipratropium Bromide, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

**Chromatographic system** (see Chromatography (621))—Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are listed in the accompanying table; the resolution,  $R$ , between ipratropium and ipratropium related compound B is not less than 4; the tailing factor of the ipratropium peak is not more than 2.5; and the relative standard deviation for replicate injections is not more than 5%.

**Procedure**—Separately inject equal volumes (about 5  $\mu$ L) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of related compounds in the portion of Ipratropium Bromide taken by the formula:

$$100(1/F)(C_s / C_T)(r_i / r_s)$$

in which  $F$  is the relative response factor of the related compound relative to ipratropium bromide;  $C_s$  is the concentration, in mg per mL, of USP Ipratropium Bromide RS in the Standard solution;  $C_T$  is the concentration, in mg per mL, of Ipratropium Bromide in the Test solution;  $r_i$  is the individual peak response of the individual related compound; and  $r_s$  is the peak response of ipratropium in the Standard solution. See the accompanying table for relative retention times, relative response factors, and acceptance criteria.

Related Compound	Relative Retention Time	Relative Response Factor	Limit (%)
Ipratropium related compound C <sup>1</sup>	0.7	3.8	0.10
Ipratropium bromide	1.0	1.0	—
Ipratropium related compound B [(8 <i>s</i> )-ipratropium bromide] <sup>2</sup>	1.3	1.0	0.10
<i>N</i> -isopropylnoratropinium bromide <sup>3</sup>	2.3	1.0	0.10
Apo-ipratropium bromide <sup>4</sup>	5.1	2.0	0.10
Any individual unknown impurity	—	—	0.10
Total impurities	—	—	0.25

<sup>1</sup>(2*RS*)-3-Hydroxy-2-phenylpropanoic acid.

<sup>2</sup>(1*R*,3*r*,5*S*,8*s*)-3-[[[(2*RS*)-3-Hydroxy-2-phenylpropanoyl]oxy]-8-methyl-8-(1-methylethyl)-8-azoniabicyclo[3.2.1]octane, bromide.

<sup>3</sup>(1*R*,3*r*,5*S*)-8-(1-Methylethyl)-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-3-hydroxy-2-phenylpropanoate.

<sup>4</sup>(1*R*,3*r*,5*S*,8*r*)-8-Methyl-8-(1-methylethyl)-3-[(2-phenylpropenyl)oxy]-8-azoniabicyclo[3.2.1]octane.

### Assay—

**Phosphate solution**—Transfer 8.9 g of dibasic sodium phosphate dihydrate to a 100-mL volumetric flask. Dissolve in and dilute with water to volume, and mix.

**Buffer**—Transfer 14.3 g of monobasic sodium phosphate dihydrate and 2.0 g of tetrapropylammonium chloride to a 1-L volumetric flask, dissolve in and dilute with water to volume, and mix. Adjust with *Phosphate solution* to a pH of 5.5 ± 0.2. Pass through a nylon membrane filter having a porosity of 0.45 μm or finer.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer* and methanol (87:13). [NOTE—Do not use the *Mobile phase* after 36 hours.] Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Dissolve suitable quantities of USP Ipratropium Bromide RS and USP Ipratropium Related Compound C RS in *Mobile phase* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL and 0.1 mg per mL, respectively.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ipratropium Bromide RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL.

**Assay preparation**—Transfer about 50 mg of Ipratropium Bromide, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and 3.9-mm × 15-cm column that contains 4-μm packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 30°. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for ipratropium related compound C and 1.0 for ipratropium bromide; the resolution, *R*<sub>s</sub>, between ipratropium related compound C and ipratropium is not less than 4; the tailing factor of the ipratropium peak is not more than 2.5; and the relative standard deviation for replicate injections is not more than 1%.

**Procedure**—Separately inject equal volumes (about 5 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in percent, of C<sub>20</sub>H<sub>30</sub>BrNO<sub>3</sub> · H<sub>2</sub>O in the portion of Ipratropium Bromide taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which *C*<sub>S</sub> is the concentration, in mg per mL, of USP Ipratropium Bromide RS in the *Standard preparation*; *C*<sub>T</sub> is the concentration, in mg per mL, of Ipratropium Bromide in the *Assay preparation*; and *r*<sub>U</sub> and *r*<sub>S</sub> are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Irbesartan

C<sub>25</sub>H<sub>28</sub>N<sub>6</sub>O 428.53

1,3-Diazaspiro[4.4]non-1-en-4-one, 2-butyl-3-[[2'-(1*H*-tetrazol-5-yl)[1,1'-biphenyl]-4-yl]methyl]-. 2-Butyl-3-[*p*-(*o*-1*H*-tetrazol-5-ylphenyl)benzyl]-1,3-diazaspiro[4.4]non-1-en-4-one [138402-11-6].

» Irbesartan contains not less than 98.0 percent and not more than 102.0 percent of C<sub>25</sub>H<sub>28</sub>N<sub>6</sub>O, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers, and store at a temperature below 30°.

### USP Reference standards (11)—

USP Irbesartan RS

USP Irbesartan Related Compound A RS

1-Pentanoylamino-cyclopentanecarboxylic acid [2'-(1*H*-tetrazol-5-yl)-biphenyl-4-ylmethyl]-amide.

C<sub>25</sub>H<sub>30</sub>N<sub>6</sub>O<sub>2</sub> 446.54

### Identification—

**A: Infrared Absorption** (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Water, Method I** (921): not more than 0.5%.

**Heavy metals, Method II** (231): 0.002%

### Limit of azide—

**Mobile phase**—Prepare a filtered and degassed 0.1 N sodium hydroxide solution (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Transfer about 25 mg of sodium azide, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 250 μL of this solution into a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains about 0.312 μg of sodium azide per mL.

**Test solution**—Transfer about 100 mg of Irbesartan, accurately weighed, to a 5-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a conductimetric detector [NOTE—A suitable background suppression unit may be used.] and a 4.0-mm × 25-cm column that contains packing L31. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution*, and record the peak

responses as directed for *Procedure*: the signal-to-noise ratio for the azide peak is not less than 10.

**Procedure**—Separately inject equal volumes (about 200  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas for azide. Calculate the amount of azide, in ppm, in the portion of Irbesartan taken by the formula:

$$1000(C_S / C_T)(42.02/65.01)(r_U / r_S)$$

in which  $C_S$  is the concentration, in  $\mu$ g per mL, of sodium azide in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of Irbesartan in the *Test solution*;  $r_U$  is the peak area for azide obtained from the *Test solution*; and  $r_S$  is the peak area for azide obtained from the *Standard solution*: not more than 10 ppm of azide is found.

#### Related compounds—

**pH 3.2 Phosphate buffer and Mobile phase**—Proceed as directed in the *Assay*.

**Standard solution**—Prepare as directed for the *System suitability solution* in the *Assay*.

**Test solution**—Dissolve an accurately weighed quantity of Irbesartan in methanol to obtain a solution having a known concentration of about 1 mg per mL.

**Chromatographic system** (see *Chromatography* <621>)—Proceed as directed in the *Assay*. Chromatograph the *Standard solution* and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the area for the irbesartan related compound A peak. Calculate the percentage of irbesartan related compound A in the portion of Irbesartan taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Irbesartan Related Compound A RS in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of Irbesartan in the *Test solution*;  $r_U$  is the peak response for irbesartan related compound A obtained from the *Test solution*; and  $r_S$  is the peak response for irbesartan related compound A obtained from the *Standard solution*.

Calculate the percentage of other impurities in the portion of Irbesartan taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Irbesartan RS in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of Irbesartan in the *Test solution*; and  $r_U$  and  $r_S$  are the peak responses for each of the other impurities and USP Irbesartan RS obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.2% of irbesartan related compound A is found; not more than 0.1% of any other impurity is found; and not more than 0.5% of total impurities is found.

#### Assay—

**pH 3.2 Phosphate buffer**—Mix 5.5 mL of phosphoric acid with about 950 mL of water, and adjust pH to 3.2 with triethylamine.

**Mobile phase**—Prepare a filtered and degassed mixture of pH 3.2 phosphate buffer and acetonitrile (67:33). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability solution**—Dissolve accurately weighed quantities of USP Irbesartan RS and USP Irbesartan Related Compound A RS in methanol to obtain a solution having a

known concentration of about 0.05 mg per mL of each USP Reference Standard.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Irbesartan RS in methanol to obtain a solution having a known concentration of about 0.5 mg per mL.

**Assay preparation**—Transfer about 50 mg of Irbesartan, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.0-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 for irbesartan related compound A and 1.0 for irbesartan; the resolution,  $R$ , between irbesartan and irbesartan related compound A is not less than 2.0. Chromatograph the *Standard preparation*, and record the peak response as directed for *Procedure*: the standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in mg, of  $C_{25}H_{28}N_6O$  in the portion of Irbesartan taken by the formula:

$$100C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Irbesartan RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Irbesartan Tablets

» Irbesartan Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of irbesartan ( $C_{25}H_{28}N_6O$ ).

**Packaging and storage**—Preserve in well-closed containers.

#### USP Reference standards <11>—

USP Irbesartan RS

USP Irbesartan Related Compound A RS

1-Pentanoylamino-cyclopentanecarboxylic acid [2'-(1H-tetrazol-5-yl)-byphenyl-4-ylmethyl]-amide.

$C_{25}H_{30}N_6O_2$  446.54

#### Identification—

**A: Infrared Absorption** <197K>—

**Test specimen:** Transfer 1 Tablet into a suitable vial. Add 10 mL of methanol, and sonicate for 10 minutes. Pass the solution through a glass microfiber membrane filter having a 0.45- $\mu$ m or finer porosity, and evaporate to dryness, using a stream of nitrogen. Mix approximately 1 mg of the residue with approximately 250 mg of potassium bromide, and mix well to obtain a homogenous mixture. The IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a potassium bromide dispersion of a similar preparation using USP Irbesartan RS.

**B:** The relative retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** <711>—

*Medium:* 0.1 N hydrochloric acid; 1000 mL.

*Apparatus 2:* 50 rpm.

*Time:* 20 minutes.

*Procedure*—Determine the amount of  $C_{25}H_{28}N_6O$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 244 nm on portions of the solution under test, passed through a 0.45- $\mu$ m filter of acrylic copolymer on a nylon support,\* and suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Irbesartan RS in the same *Medium*. Calculate the amount of  $C_{25}H_{28}N_6O$  dissolved, in percentage, by the formula:

$$\frac{A_U \times C_S \times 1000 \times 100}{A_S \times L}$$

in which  $A_U$  and  $A_S$  are the absorbances obtained from the solution under test and the Standard solution, respectively;  $C_S$  is the concentration, in mg per mL, of the Standard solution; 1000 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; and  $L$  is the label claim, in mg, of irbesartan.

*Tolerances*—Not less than 80% (Q) of the labeled amount of  $C_{25}H_{28}N_6O$  is dissolved in 20 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Related compounds**—

*Buffer solution, Mobile phase, System suitability preparation, and Chromatographic system*—Proceed as directed in the Assay.

*Standard solution*—Use the *Standard preparation*, prepared as directed in the Assay.

*Test solution*—Use the *Assay preparation*.

*Procedure*—Inject a volume of about 15  $\mu$ L of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses of all the peaks: not more than 0.2% of irbesartan related compound A is found; not more than 0.2% of any individual impurity is found; and not more than 0.5% of total impurities is found.

**Assay**—

*Buffer solution*—Dilute about 5.5 mL of phosphoric acid in approximately 950 mL of water, and add triethylamine, slowly and dropwise, to adjust to a pH of 3.0. Further dilute this solution with water to a final volume of 1 L.

*Mobile phase*—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (60:40). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*System suitability preparation*—Dissolve accurately weighed quantities of USP Irbesartan RS and USP Irbesartan Related Compound A RS in methanol to obtain a solution having a known concentration of about 0.1 mg per mL of each of the USP Reference Standards.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Irbesartan RS in methanol to obtain a solution having a known concentration of about 0.15 mg per mL.

*Assay preparation*—Weigh and finely powder not fewer than 5 Tablets. Transfer an accurately weighed portion of

the powder, equivalent to about 15 mg of irbesartan, to a 100-mL volumetric flask. Add methanol up to about three-fourths of the volume of the flask. Sonicate for 15 minutes, with stirring at 5-minute intervals. Dilute with methanol to volume, and pass a portion of this solution through a glass microfiber membrane filter having a 0.45- $\mu$ m or finer porosity.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between irbesartan and irbesartan related compound A is not less than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for five replicate injections is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 15  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of irbesartan ( $C_{25}H_{28}N_6O$ ) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Irbesartan RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Irbesartan and Hydrochlorothiazide Tablets

**DEFINITION**

Irbesartan and Hydrochlorothiazide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of irbesartan ( $C_{25}H_{28}N_6O$ ) and hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ).

**IDENTIFICATION**

- A. INFRARED ABSORPTION** <197K>

**Sample solution:** Transfer the contents of 1 Tablet, previously crushed with a mortar and pestle, to a suitable vial. Add 5 mL of acetone, sonicate for 10 min, and pass through a membrane filter of 0.45- $\mu$ m pore size. Evaporate the filtrate to dryness.

- B.** The relative retention times of the major peaks from the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assay.

**ASSAY**

- PROCEDURE**

**Buffer:** Dissolve 1.36 g of monobasic potassium phosphate in 900 mL of water, add 2 mL of triethylamine, and adjust with phosphoric acid to a pH of  $3.0 \pm 0.1$ . Dilute further with water to 1 L.

**Mobile phase:** Acetonitrile, methanol, and *Buffer* (13:20:67)

**Acidified water:** Adjust with phosphoric acid (or sodium hydroxide, if necessary) to a pH of  $2.0 \pm 0.1$ .

**Extraction solution:** Methanol and *Acidified water* (7:3)

**Irbesartan standard stock solution:** Dissolve USP Irbesartan RS in a suitable volumetric flask in methanol (1/5 of the volume of the flask), and dilute with *Extraction solution* to prepare a 0.6 mg/mL solution. Sonicate for 2 min.

**Hydrochlorothiazide standard stock solution:** Dissolve USP Hydrochlorothiazide RS in methanol (1/20 of the volume of the flask), and dilute with *Extraction solution* to prepare a 0.1 mg/mL solution. Sonicate for 2 min.

\*A suitable filter is Acrodisc, manufactured by Gelman Sciences and distributed by Pall Corp. (www.pall.com).

**Irbesartan related compound A standard stock solution:** 0.1 mg/mL of USP Irbesartan Related Compound A RS in methanol. Sonicate for 2 min.

**Benzothiadiazine related compound A standard stock solution:** 0.05 mg/mL of USP Benzothiadiazine Related Compound A RS in methanol. Sonicate for 2 min.

**Standard solution:** 0.24 mg/mL of irbesartan and 0.02 mg/mL of hydrochlorothiazide from the *Irbesartan standard stock solution* and the *Hydrochlorothiazide standard stock solution* in the *Extraction solution*

**System suitability solution:** Prepare 0.05 mg/mL of USP Irbesartan RS, 0.005 mg/mL of USP Hydrochlorothiazide RS, 1.0 µg/mL of USP Irbesartan Related Compound A RS, and 3.0 µg/mL of USP Benzothiadiazine Related Compound A RS in the *Extraction solution* from the respective Standard stock solutions

**Sample stock solution:** 0.75 mg/mL of irbesartan from NLT 5 Tablets in a suitable volumetric flask. Add *Acidified water* up to 30% of the volume of the flask, and sonicate until the Tablets disintegrate. Add methanol to fill the flask up to 90% of the total volume. Sonicate for 5 min, and stir. Dilute with methanol to volume, and pass through a filter of 0.45-µm pore size.

**Sample solution:** 0.225 mg/mL of irbesartan in the *Extraction solution* from the *Sample stock solution*. [NOTE—The hydrochlorothiazide concentration may vary depending on the ratio of irbesartan to hydrochlorothiazide in the Tablet.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L10

**Flow rate:** 1.5 mL/min

**Injection volume:** 10 µL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 1.7 between irbesartan and irbesartan related compound A; NLT 1.7 between hydrochlorothiazide and benzothiadiazine related compound A, *System suitability solution*

**Relative standard deviation:** NMT 1.5% for both the irbesartan and hydrochlorothiazide peaks, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>25</sub>H<sub>28</sub>N<sub>6</sub>O and C<sub>7</sub>H<sub>8</sub>ClN<sub>3</sub>O<sub>4</sub>S<sub>2</sub> in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of irbesartan or hydrochlorothiazide from the *Sample solution*

$r_S$  = peak area of irbesartan or hydrochlorothiazide from the *Standard solution*

$C_S$  = concentration of USP Irbesartan RS or USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of irbesartan or hydrochlorothiazide in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION <711>

**Medium:** 0.1 N hydrochloric acid; 1000 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**pH 3.0 phosphate buffer:** 1.36 g/L of monobasic potassium phosphate in water. Adjust with 10% phosphoric acid to a pH of 3.0 ± 0.1. This solution is stable for 3 months.

**Mobile phase:** pH 3.0 phosphate buffer, methanol, and acetonitrile (45:35:20)

**Irbesartan standard stock solution:** Transfer 50 mg of USP Irbesartan RS to a 100-mL volumetric flask. Add 15 mL of methanol, and sonicate for 5 min. Dilute with *Medium* to volume. This solution is stable for 14 days when stored at 4°.

**Hydrochlorothiazide standard stock solution:** Transfer 20 mg of USP Hydrochlorothiazide RS to a 200-mL volumetric flask. Add 5 mL of methanol, and sonicate for 5 min. Dilute with *Medium* to volume. This solution is stable for 14 days when stored at 4°.

**Standard solution:** Prepare on day of use dilutions of the *Irbesartan standard stock solution* and *Hydrochlorothiazide standard stock solution* in *Medium* as directed in the table below:

Label Claim of Irbesartan/ Hydrochlorothiazide (mg/Tablet)	Volume of the Irbesartan standard stock solution (mL)	Volume of the Hydrochlorothiazide standard stock solution (mL)	Final Volume (mL)
75/12.5	15	12.5	100
150/12.5	30	12.5	100
300/12.5	60	12.5	100
300/25	60	25.0	100

**System suitability solution:** Transfer 10 mg of USP Irbesartan Related Compound A RS to a 100-mL volumetric flask. Add 5 mL of methanol, and sonicate to dissolve. Dilute with *Medium* to volume. Transfer 10.0 mL of this solution, 5.0 mL of the *Irbesartan standard stock solution*, and 12.5 mL of the *Hydrochlorothiazide standard stock solution* to a 100-mL volumetric flask. Dilute with *Medium* to volume.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size, discarding the first few mL.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 272 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L10

**Column temperature:** 40°

**Flow rate:** 1.4 mL/min

**Injection volume:** 25 µL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between irbesartan and irbesartan related compound A, *System suitability solution*

**Relative standard deviation:** NMT 2.0% for both the irbesartan and hydrochlorothiazide peaks, *Standard solution*

Calculate the percentage of irbesartan and hydrochlorothiazide dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response for irbesartan or hydrochlorothiazide from the *Sample solution*

$r_S$  = peak response for irbesartan or hydrochlorothiazide from the *Standard solution*

$C_S$  = concentration of irbesartan or hydrochlorothiazide in the *Standard solution*

$L$  = label claim for irbesartan or hydrochlorothiazide (mg/Tablet)

$V$  = volume of *Medium* (mL), 1000

**Tolerances:** NLT 80% (Q) of the labeled amounts of irbesartan (C<sub>25</sub>H<sub>28</sub>N<sub>6</sub>O) and hydrochlorothiazide (C<sub>7</sub>H<sub>8</sub>ClN<sub>3</sub>O<sub>4</sub>S<sub>2</sub>) are dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

## IMPURITIES

### Organic Impurities

#### • PROCEDURE

**Buffer, Mobile phase, Acidified water, Extraction solution, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the Assay.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of irbesartan related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of irbesartan related compound A from the *Sample solution*  
 $r_S$  = peak response of irbesartan from the *Standard solution*

$C_S$  = concentration of USP Irbesartan RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of irbesartan in the *Sample solution* (mg/mL)

Calculate the percentage of benzothiadiazine related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 1/F \times 100$$

$r_U$  = peak response of benzothiadiazine related compound A from the *Sample solution*

$r_S$  = peak response of hydrochlorothiazide from the *Standard solution*

$C_S$  = concentration of USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of hydrochlorothiazide in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Impurity Table 1*)

Calculate the percentage of any other individual impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each other impurity in the *Sample solution*

$r_T$  = sum of the peak responses excluding hydrochlorothiazide and benzothiadiazine related compound A from the *Sample solution*

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 1.5% (sum of all the individual unknown impurities, irbesartan related compound A, and benzothiadiazine related compound A)

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Benzothiadiazine related compound A	0.15	1.3	1.0
Hydrochlorothiazide	0.18	—	—
Irbesartan related compound A	0.86	1.0	0.3
Irbesartan	1.00	—	—
Any other individual, unidentified impurity	—	1.0	0.2

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)
  - USP Hydrochlorothiazide RS
  - USP Irbesartan RS
  - USP Irbesartan Related Compound A RS
  - 1-Pentanoylamino-cyclopentanecarboxylic acid [2'-(1H-tetrazol-5-yl)-biphenyl-4-ylmethyl]-amide.  
C<sub>25</sub>H<sub>30</sub>N<sub>6</sub>O<sub>2</sub> 446.54
  - USP Benzothiadiazine Related Compound A RS
  - 4-Amino-6-chloro-1,3-benzenedisulfonamide.  
C<sub>6</sub>H<sub>8</sub>ClN<sub>3</sub>O<sub>4</sub>S<sub>2</sub> 285.73

## Irinotecan Hydrochloride

C<sub>33</sub>H<sub>38</sub>N<sub>4</sub>O<sub>6</sub> · HCl · 3H<sub>2</sub>O

Anhydrous: 623.14

Trihydrate: 677.18

[1,4'-Bipiperidine]-1'-carboxylic acid, 4,11-diethyl-3,4,12,14-tetrahydro-4-hydroxy-3,14-dioxo-1H-pyrano[3',4':6,7]indolizino[1,2-b]quinolin-9-yl ester, monohydrochloride, trihydrate, (S)-;  
 (+)-7-Ethyl-10-hydroxycamptothecin 10-[1,4'-bipiperidine]-1'-carboxylate, monohydrochloride, trihydrate  
 [136572-09-3].

## DEFINITION

Irinotecan Hydrochloride contains NLT 98.0% and NMT 102.0% of C<sub>33</sub>H<sub>38</sub>N<sub>4</sub>O<sub>6</sub> · HCl, calculated on the anhydrous basis.

## IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to the irinotecan (S-enantiomer) peak in the *Identification solution*, as obtained in the test for *Limit of Irinotecan Hydrochloride Enantiomer*.
- **C. IDENTIFICATION TESTS—GENERAL, Chloride** (191): A 2-mg/mL solution meets the requirements of the tests.

## ASSAY

### • PROCEDURE

**Solution A:** 2.8 g/L of monobasic sodium phosphate monohydrate and 1.8 g/L of 1-octanesulfonic acid sodium salt monohydrate in water

**Mobile phase:** Acetonitrile, methanol, and *Solution A* (17:24:59)

**Diluent:** Use *Mobile phase* adjusted with diluted hydrochloric acid to a pH of 3.65 ± 0.15.

**Standard solution:** 1 mg/mL of USP Irinotecan Hydrochloride RS in *Diluent*

**Sample solution:** 1 mg/mL of Irinotecan Hydrochloride in *Diluent*

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 255 nm**Column:** 4.6-mm × 25-cm; 5-μm packing L1**Column temperature:** 40°**Flow rate:** 1.5 mL/min**Injection size:** 15 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 1.5**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of irinotecan hydrochloride ( $C_{33}H_{38}N_4O_6 \cdot HCl$ ) in the portion of Irinotecan Hydrochloride taken:

**Add the following:****Iron, Carbonyl**

Fe 55.85  
[7439-89-6].

**DEFINITION**

Carbonyl Iron is elemental iron produced by chemical decomposition of purified iron pentacarbonyl. It is a powder, composed of spherical microparticles. It contains NLT 98.0% of iron (Fe), calculated on the as-is basis.

**IDENTIFICATION**

- **A.**  
**Analysis:** Dissolve a sample in a dilute mineral acid.  
**Acceptance criteria:** Hydrogen is evolved, and the resulting solutions give a positive test for *Identification Tests—General* (191), *Iron, Ferrous Salts*.
- **B.**  
**Analysis:** View a sample under a microscope having a magnifying power of 500 or greater.  
**Acceptance criteria:** It appears as spheres built up with concentric shells. Its particle size is 45–75 µm.

**ASSAY****• PROCEDURE**

**Sample:** 200 mg

**Blank:** Proceed as directed in the *Analysis*, omitting use of the *Sample*.

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N ceric sulfate VS

**Endpoint detection:** Potentiometric

**Electrode system:** Platinum indicating electrode and a silver–silver chloride reference electrode (or an equivalent combination electrode)

**Analysis:** Transfer the *Sample* into a 300-mL Erlenmeyer flask. Add 50 mL of 2 N sulfuric acid, and close the flask with a stopper containing a Bunsen valve (made by inserting a glass tube connected to a short piece of rubber tubing with a slit on the side and a glass rod inserted in the other end and arranged so that gases can escape but air cannot enter). Heat on a steam bath to completely dissolve the *Sample*. [NOTE—The solution should be clear.] Remove the flask from the steam bath, and allow the solution to cool at room temperature with the stopper in place.

Add a stir bar and 50 mL of recently boiled and cooled water to the flask. Titrate the solution with the *Titrant* through the inflection point. Perform a blank determination.

Calculate the percentage of iron (Fe) in the *Sample* taken:

$$\text{Result} = \{(V_S - V_B) \times N \times F\} / W \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = actual *Titrant* normality (mEq/mL)

$F$  = equivalency factor, 55.85 mg/mEq

$W$  = *Sample* weight (mg)

**Acceptance criteria:** NLT 98.0% on the as-is basis

**IMPURITIES****• ACID-INSOLUBLE SUBSTANCES**

**Sample:** 1 g of Carbonyl Iron

**Analysis:** Dissolve the *Sample* in 25 mL of 2 N sulfuric acid, and heat on a steam bath until the evolution of hydrogen ceases. Filter through a tared filter crucible,

wash the residue with water until free from sulfate, dry at 105° for 1 h, cool to room temperature, and weigh.

**Acceptance criteria:** NMT 0.2%. The residue weighs NMT 2 mg.

**• ELEMENTAL IMPURITIES, Procedures (233)**

**Acceptance criteria**

**Arsenic:** NMT 3 µg/g

**Lead:** NMT 4 µg/g

**Mercury:** NMT 2 µg/g

**SPECIFIC TESTS**

- **PARTICLE SIZE DISTRIBUTION ESTIMATION BY ANALYTICAL SIEVING, Test Sieves (786):** NLT 100% passes through a 200-mesh sieve and NLT 95% passes through a 325-mesh sieve.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. ▲USP36

**Iron Dextran Injection**

» Iron Dextran Injection is a sterile, colloidal solution of ferric hydroxide in complex with partially hydrolyzed Dextran of low molecular weight, in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of iron. It may contain not more than 0.5 percent of phenol as a preservative.

**Packaging and storage—**Preserve in single-dose or multiple-dose containers, preferably of Type I or Type II glass.

**USP Reference standards (11)—**

USP Endotoxin RS

**Identification—**To 1 mL of Injection on a watch glass add 2 drops of ammonium hydroxide: no precipitate is formed. Add 2 mL of hydrochloric acid, mix, and add 2 mL of ammonium hydroxide: a brown precipitate is formed.

**Bacterial endotoxins (85)—**It contains not more than 0.50 USP Endotoxin Unit per mg of iron.

**Acute toxicity—**Select five mice each weighing between 18 and 25 g, maintained on an adequately balanced diet. Inject a dose of Injection, equivalent to 200 mg of iron per kg of body weight, into a tail vein at a rate not exceeding 0.1 mL per second. Keep the mice under observation for 48 hours after the injection. If none of the mice show outward symptoms of toxicity, the requirements of the test are met. If any of the mice die within the observation period, select four groups of ten mice each weighing between 18 and 25 g. Inject, intravenously, all mice of one group with one of the following doses of Injection: 375, 500, 750, or 1000 mg of iron per kg of body weight. Observe the mice for 7 days, and record the number of deaths in each group. If more than 16 mice die, calculate the LD<sub>50</sub> as directed under *Design and Analysis of Biological Assays* (111): the LD<sub>50</sub> is not less than 500 mg of iron per kg of body weight.

**Absorption from injection site—**Prepare a site over the semitendinosus muscle of one leg of each of two rabbits by clipping the fur and disinfecting the exposed skin. Inject each site with a dose of 0.4 mL per kg of body weight in the following manner. Place the needle in the distal end of the semitendinosus muscle at an angle such as to ensure that the full length of the needle is used, then pass it through the sartorius and vastus medialis muscles. House the rabbits separately. Seven days after the injection, sacrifice the rabbits and dissect the treated legs to examine the muscles: no heavy black deposit of unabsorbed iron compounds is observed, and the tissue is only lightly colored.

**pH** (791): between 4.5 and 7.0.

**Nonvolatile residue**—Using a “to contain” pipet, transfer 1.0 mL onto 3 to 5 g of sand spread in a shallow layer in a stainless steel dish, the dish and sand having been previously dried and weighed. Rinse the pipet, with several small portions of water, onto the sand. Evaporate on a steam bath to dryness, continue the drying in an oven at 105° for 15 hours, and weigh: the weight of the residue for Injection labeled to contain 50 mg of iron per mL is not less than 28.0% and not more than 32.0%, that for Injection labeled to contain 75 mg of iron per mL is not less than 35.0% and not more than 40.0%, and that for Injection labeled to contain 100 mg of iron per mL is not less than 37.0% and not more than 43.0%.

**Chloride content**—Using a “to contain” pipet, transfer 10.0 mL of Injection into a 150-mL beaker, rinsing the pipet into the beaker with several small portions of water. Add 50 mL of water and 2 mL of nitric acid, mix, and titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically with silver-glass electrodes. Each mL of 0.1 N silver nitrate consumed is equivalent to 3.545 mg of chloride (Cl). The chloride content of Injection labeled to contain 50 mg of iron per mL is not less than 0.48% and not more than 0.68%, and that of Injection labeled to contain either 75 mg or 100 mg of iron per mL is not less than 0.8% and not more than 1.1%.

**Limit of phenol**—Proceed as directed for *Phenol* under *Antimicrobial Agents*—**Content** (341): not more than 0.5% is found.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay for iron—

**Iron stock solution**—Transfer an accurately weighed quantity of about 350 mg of ferrous ammonium sulfate hexahydrate to a 1000-mL volumetric flask, add water to dissolve, dilute with water to volume, and mix to obtain a solution having a concentration of 50 µg of iron per mL.

**Calcium chloride solution**—Transfer 2.64 g of calcium chloride dihydrate to a 1000-mL volumetric flask, add 500 mL of water, and swirl to dissolve. Add 5.0 mL of hydrochloric acid, and dilute with water to volume.

**Standard preparations**—To separate 100-mL volumetric flasks transfer 2.0, 4.0, 6.0, 8.0, and 10.0 mL, respectively, of *Iron stock solution*. Dilute each flask with *Calcium chloride solution* to volume, and mix to obtain *Standard preparations* having known concentrations of 1.0, 2.0, 3.0, 4.0 and 5.0 µg of iron per mL.

**Assay preparation**—Using a “to contain” pipet, transfer an accurately measured volume of Injection, equivalent to about 100 mg of iron, to a 200-mL volumetric flask. Dilute with *Calcium chloride solution* to volume, and mix. Pipet 2.0 mL of this solution into a 250-mL volumetric flask, dilute with *Calcium chloride solution* to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the iron emission line of 248.3-nm with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with an iron hollow-cathode lamp and an air-acetylene flame, using the *Calcium chloride solution* as the blank. Plot the absorbance of each *Standard preparation* versus concentration, in µg per mL, of iron, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, in µg per mL, of iron in the *Assay preparation*. Calculate the quantity, in mg, of iron in each mL of the Injection taken by the formula:

$$25C/V$$

in which C is the concentration, in µg per mL, of iron in the *Assay preparation*; and V is the volume of Injection taken.

## Iron Sorbitex Injection

» Iron Sorbitex Injection is a sterile solution of a complex of iron, Sorbitol, and Citric Acid that is stabilized with the aid of Dextrin and an excess of Sorbitol. It contains not less than 94.0 percent and not more than 104.0 percent of the labeled amount of iron.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass.

**Labeling**—Label it to indicate its expiration date, which is not more than 24 months after date of manufacture.

**USP Reference standards** (11)—

USP Endotoxin RS

#### Identification—

**A:** To 1 mL of Injection add 5 mL of water and 1 mL of ammonium hydroxide: no precipitate is formed.

**B:** To 1 mL of Injection add 0.1 mL of 3 N hydrochloric acid and 0.5 mL of potassium ferrocyanide TS: a dark blue precipitate is formed.

**C:** To 1 mL of Injection in a separator add 4 mL of water and 10 mL of hydrochloric acid, and extract with three 15-mL portions of isopropyl ether. Dilute the aqueous layer with water to 25 mL, and mix. To 0.5 mL of this solution add 10 mL of water, 2 mL of 2 N sulfuric acid, and 10 mg of potassium periodate, allow to stand for 10 minutes, and then add 10 mL of 0.1 N sodium arsenite. When the solution is colorless, add 10 mL of a 1 in 250 solution of phenylhydrazine hydrochloride in 0.5 N hydrochloric acid. Allow to stand for 10 minutes, add 1 mL of potassium ferricyanide solution (1 in 20), allow to stand for 15 minutes, and then add 3 mL of hydrochloric acid: a wine-red color is produced (*presence of sorbitol*).

**D:** Dilute 1 mL of Injection with 50 mL of water, and to 4 mL of this solution add 1 mL of 6 N sulfuric acid and 0.5 mL of phosphoric acid, mix, and allow to stand for about 5 minutes or until decolorized. Add 1 mL of potassium bromide solution (1 in 10) and 1 mL of potassium permanganate solution (1 in 20). After 10 minutes, add hydrogen peroxide TS, dropwise, to discharge the pink color. Transfer the solution to a small separator, shake with 20 mL of solvent hexane, discard the water layer, and wash the hexane layer with 20 mL of water. To the washed hexane solution add 5 mL of a 1 in 25 solution of thiourea in sodium borate solution (1 in 50), and shake the mixture: the aqueous layer that separates shows a yellow color (*presence of citric acid*).

**Specific gravity** (841): between 1.17 and 1.19 at 20°.

**Viscosity—Capillary Viscometer Methods** (911): between 8 and 13 centipoises, determined at 20° with a capillary tube viscometer.

**Bacterial endotoxins** (85)—It contains not more than 10.0 USP Endotoxin Units per mL.

**pH** (791): between 7.2 and 7.9.

**Limit of ferrous iron**—Using a “to contain” pipet, transfer 10 mL of Injection to a glass-stoppered, 125-mL flask, rinsing the pipet into the flask with several small portions of water. Add 5 mL of sulfuric acid, shake vigorously until decolorization is effected, add 2 drops of orthophenanthroline TS, and immediately titrate with 0.1 N ceric sulfate VS. Each mL of 0.1 N ceric sulfate is equivalent to 5.585 mg of ferrous iron. The ferrous iron content is not more than 8.5 mg per mL of Injection.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay for iron—**

**Standard preparation**—Transfer an accurately weighed portion of ferrous ammonium sulfate, equivalent to about 100 mg of iron (Fe), to a 300-mL Kjeldahl flask, and proceed as directed under *Assay preparation*, beginning with “Add 10 mL of nitric acid,” to obtain a *Standard preparation* having a known concentration of about 2 µg of iron per mL.

**Assay preparation**—Using a “to contain” pipet, transfer an accurately measured volume of Injection, equivalent to about 100 mg of iron, to a 300-mL Kjeldahl flask, rinsing the pipet into the flask with several small portions of water. Add 10 mL of nitric acid, 10 mL of sulfuric acid, and a few glass beads, and boil the solution gently until fumes of sulfur trioxide appear. Cool, add 3 mL of nitric acid, and heat gently again until fumes of sulfur trioxide appear. Continue the addition of nitric acid, followed by gentle boiling, until the solution is clear and light yellow or green in color, and then boil for an additional 30 minutes. Cool, cautiously add 100 mL of water, and boil gently until solution is complete. Cool, transfer the solution to a 500-mL volumetric flask, rinse the Kjeldahl flask with several small portions of water, dilute with water to volume, and mix. Transfer 5.0 mL of the solution to a second 500-mL volumetric flask, add 100 mL of water and 1 g of ascorbic acid, dilute with water to volume, and mix.

**Procedure**—Transfer 5.0-mL portions of the *Standard preparation*, of the *Assay preparation*, and of water to serve as the blank to separate, clean, dry test tubes, and to each add 3.0 mL of a 1 in 1500 solution of 2,2'-bipyridine in 0.6 N glacial acetic acid, mix, and allow to stand for 15 minutes. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 510 nm, with a suitable spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mg, of iron in each mL of the Injection taken by the formula:

$$(50C / V)(A_U / A_S)$$

in which C is the concentration, in µg per mL, of the *Standard preparation*; V is the volume, in mL, of Injection taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and *Standard preparation*, respectively.

## Iron Sucrose Injection

» Iron Sucrose Injection is a sterile, colloidal solution of ferric hydroxide in complex with Sucrose in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of iron. Sodium Hydroxide may be added to adjust the pH. It contains no antimicrobial agent, chelating agent, dextran, gluconate, or other added substances.

**Packaging and storage**—Preserve in single-dose containers of Type I glass. Store at controlled room temperature. Do not freeze.

**Labeling**—Label it to state that it is for intravenous use only. Label it to indicate that when administered by intravenous infusion, the Injection must be diluted with 0.9% Sodium Chloride Injection to a concentration of 0.5 to 2.0 mg of elemental iron per mL. Label it also to state the total osmolality of the solution expressed in mOsmol per L.

**USP Reference standards (11)—**

USP Endotoxin RS

USP Sucrose RS

**Identification—**

**A: Iron**—To 2.5 mL of Injection add 17.5 mL of water and 5 mL of hydrochloric acid, mix, and heat for 5 minutes in a boiling water bath. Cool, add dropwise 13.5 N ammonium hydroxide until no further precipitation of ferric hydroxide occurs, and filter. Wash the precipitate with water to remove excess ammonium hydroxide, dissolve the precipitate in a minimum volume of 2 N hydrochloric acid, and add sufficient water to make a volume of 20 mL. To 3 mL of the solution so obtained add 1 mL of 2 N hydrochloric acid and 1 mL of potassium thiocyanate TS: the resulting solution (*Solution 1*) is red. To 1 mL of *Solution 1* add 5 mL of amyl alcohol or ethyl ether, shake, and allow to stand: the organic layer is pink. To a separate 1-mL aliquot of *Solution 1* add 2 mL of mercuric chloride TS: the red color is discharged [iron (III) salts].

**B: Sucrose**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for sucrose*.

**C: Molecular weight determination—**

**Mobile phase**—Dissolve 7.12 g of dibasic sodium phosphate dihydrate, 5.52 g of monobasic sodium phosphate, and 0.40 g of sodium azide in 2 L of water.

**System suitability solution**—Dissolve 200 mg of high molecular weight dextran and 100 mg of glucose in 20 mL of *Mobile phase*.

**Standard solutions**—Transfer about 20 mg of each polysaccharide molecular weight standard (5,000–400,000 Da), accurately weighed, to separate 5-mL volumetric flasks. Add 4 mL of *Mobile phase* to each flask, and allow each aliquot to stand at or below 25° for a minimum of 12 hours. After the agglomerate particles of each *Standard solution* have swelled to their fullest extent, gently swirl each *Standard solution* until dissolved. [NOTE—The chromatograms of freshly prepared *Standard solutions* regularly show a small, unidentified secondary peak following the main peak. Discard the *Standard solutions* if the secondary peak reaches half the height of the main peak.]

**Test solution**—Transfer 5.0 mL of Injection to a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a refractive index detector maintained at a constant temperature of 45° and two 7.8-mm × 30-cm columns set up in series that contain packing L39 with pore sizes of 1000Å and 120Å, respectively. The column temperatures are maintained at 45 ± 2° and the flow rate is about 0.5 mL per minute. Chromatograph the *System suitability solution*, and measure the peak areas as directed for *Procedure*: the resolution,  $R$ , between dextran and glucose is not less than 4.0. Chromatograph the *Standard solutions*, and measure the peak areas as directed for *Procedure*. Using a suitable program, plot the retention times of the *Standard solutions* and their molecular weights to generate a third order (cubic) calibration curve. The correlation coefficient obtained is not less than 0.98.

**Procedure**—Separately inject equal volumes (about 25 µL) of each *Standard solution*, the *System suitability solution*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the retention times and peak areas. The molecular weight of the complex is calculated from the calibration curve. The molecular weight distribution curve of the sample is sliced into fractions. Calculate the weight-average molecular weight,  $M_w$ , as follows:

$$\Sigma(A_T M_T) / \Sigma A_T$$

and the number-average molecular weight,  $M_n$ , as follows:

$$\Sigma(A_T) / \Sigma(A_T / M_T)$$

in which  $A_T$  is the area of each fraction of the sample distribution; and  $M_T$  is the corresponding mean molecular weight

of each fraction as determined from its retention time on the calibration curve. The molecular weight distribution curve obtained for the Injection conforms to the following parameters:

$$M_W = 34,000\text{--}60,000 \text{ Da,}$$

$$M_N = \text{not less than } 24,000 \text{ Da, and}$$

$$M_W / M_N = \text{not more than } 1.7.$$

**Specific gravity** (841): not less than 1.135 and not more than 1.165 at 20°.

**Bacterial endotoxins** (85): not more than 3.7 USP Endotoxin Units per mg of iron contained in the Injection.

**Alkalinity**—Transfer 5 mL of Injection to a suitable vessel, and titrate with 0.1 N hydrochloric acid VS with constant stirring to a pH of 7.4. Record the volume of 0.1 N hydrochloric acid VS consumed, and calculate the alkalinity of the Injection as the volume of acid, in mL, consumed per mL of Injection. Not less than 0.5 mL and not more than 0.8 mL of 0.1 N hydrochloric acid VS is consumed per mL of Injection.

**pH** (791): between 10.5 and 11.1 at 20°.

**Osmolarity** (785): not less than 1150 mOsmol per L and not more than 1350 mOsmol per L for the Injection. The solution for test is prepared by diluting the Injection 1 in 10.

**Absence of low-molecular weight Fe(II) and Fe(III) complexes**—In the polarograms obtained in the test for *Limit of iron (II)*, no additional peaks are found.

**Turbidity**—Transfer 0.5 g of Injection to a 150-mL beaker, add 100 mL of water, and with constant stirring adjust with 0.1 N hydrochloric acid VS to a pH of about 6.0. Remove the pH electrode from the solution. Adjust a light source such that the beam hits the beaker at a parallel angle about 2 cm below the surface of the liquid. The light must shine through to the surface, and the solution must not have any turbidity. Measurement must be carried out in as dark a room as possible. Slowly add 0.1 N hydrochloric acid VS, dropwise, until a slight but lasting turbidity develops. Record the pH of the solution as the turbidity point of the Injection: not less than 4.4 and not more than 5.3.

**Particulate matter** (788)—Prepare a solution of Injection (1 in 40) using water that has been passed through a filter having a 1.2- $\mu$ m or finer porosity: meets the requirements for *Light Obscuration Particle Count Test* for small-volume injections.

#### Limit of iron (II)—

**Supplementary electrolyte solution**—Dissolve 15.0 g of sodium acetate in 100 mL of water, and adjust with 0.1 N acetic acid to a pH of 7.0.

**Procedure**—Transfer a suitable amount of *Supplementary electrolyte solution* to a polarographic cell equipped with a mercury drop electrode. With the electrode submerged in the liquid, bubble nitrogen through the liquid for 5 minutes. Avoiding any undue exposure to air, immediately transfer a volume of Injection, accurately measured, equivalent to a concentration of about 20 to 120  $\mu$ g of elemental iron per mL, to the polarographic cell. [NOTE—The sample must be analyzed immediately upon opening the container.] Record the polarogram from 0 mV and  $-1700$  mV. The iron (III)/iron (II) peak is detected at  $-750 \pm 50$  mV and the iron (II)/iron (0) peak is detected at  $-1400 \pm 50$  mV. Measure the iron (II)/iron (III) peak responses obtained from the polarogram, and perform a blank determination. Calculate the iron (II) content, in % w/v, in the volume of Injection taken by the formula:

$$[1 - (2/R)] \times \text{Fe}$$

in which *R* is the peak response ratio of iron (II) to iron (III); and Fe is the total iron concentration, in % w/v, of the Injection. Not more than 0.4% (w/v) of iron (II) is found.

**Content of chloride**—Transfer about 12 g of Injection, accurately weighed, into a 50-mL beaker. Add 40 mL of water,

0.3 mL of 65% nitric acid, and, while stirring, titrate with 0.01 N silver nitrate VS, determining the endpoint potentiometrically with silver–glass electrodes. Calculate the chloride content, in mg, of Injection taken. Each mL of 0.01 N silver nitrate consumed is equal to 0.3545 mg of chloride (Cl). The chloride content of the Injection is not less than 0.012% and not more than 0.025%.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay for sucrose—

**Mobile phase**—Prepare a mixture of acetonitrile and water (79:21).

**Standard preparations**—Dissolve an accurately weighed quantity of USP Sucrose RS in water, and quantitatively dilute with water to obtain solutions having known concentrations of about 13, 16, 18, 21, and 23 mg of sucrose per mL.

**Assay preparation**—Transfer about 1.875 g of Injection, accurately weighed, into a 25-mL flask, add 1.25 mL of water, and mix. Add 1.25 mL of a monobasic sodium phosphate solution, prepared by dissolving 30 g in 50 mL, and mix. Allow the resulting solution to stand for 10 minutes to precipitate the colloidal ferric hydroxide. Dilute with water to volume, and mix. Centrifuge this solution at 3000 rpm for 15 minutes. Pass the resulting solution through a filter, discarding the first 2 mL of the filtrate.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a column compartment and a refractive index detector each maintained at a controlled temperature between 20° and 25° ( $\pm 2^\circ$ ) and a 4-mm  $\times$  25-cm column that contains packing L8. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparations*, and measure the peak areas as directed for *Procedure*. The correlation coefficient obtained from the linear regression of the *Standard preparations* is not less than 0.998. [NOTE—The retention time for sucrose is about 8 minutes.]

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of each *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Plot the peak area for each *Standard preparation* versus concentration, in mg per mL, of sucrose, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, in mg per mL, of sucrose in the *Assay preparation*. Calculate the quantity, in mg, of sucrose in each mL of Injection taken by the formula:

$$CDG/W$$

in which *C* is the concentration, in mg per mL, of sucrose in the *Assay preparation*; *D* is the dilution volume of the *Assay preparation*; *G* is the density, in g per mL, of Injection taken; and *W* is the weight, in g, of Injection taken. It contains not less than 260 mg and not more than 340 mg of sucrose per mL.

#### Assay for iron—

**Iron stock solution**—Transfer about 350 mg of ferrous ammonium sulfate, accurately weighed, to a 1000-mL volumetric flask, add water to dissolve, dilute with water to volume, and mix to obtain a solution having a concentration of about 50  $\mu$ g of iron per mL.

**Calcium chloride solution**—Transfer 2.64 g of calcium chloride to a 1000-mL volumetric flask, add 500 mL of water, and swirl to dissolve. Add 5.0 mL of hydrochloric acid, and dilute with water to volume.

**Standard preparations**—To separate 50-mL volumetric flasks transfer 2.0, 4.0, 6.0, 8.0, and 10.0 mL of *Iron stock solution*. Dilute each flask with *Calcium chloride solution* to volume, and mix to obtain *Standard preparations* having known concentrations of about 2.0, 4.0, 6.0, 8.0, and 10.0  $\mu$ g of iron per mL.

**Assay preparation**—Using a “to contain” pipette, transfer 2.0 mL of Injection to a 100-mL volumetric flask. Rinse the pipette several times with *Calcium chloride solution*. Add 5 mL of hydrochloric acid, and swirl until the solution turns yellow. After the solution has cooled to room temperature, dilute with *Calcium chloride solution* to volume, and mix. Pipet 2.0 mL of this solution to a 100-mL volumetric flask, dilute with *Calcium chloride solution* to volume, and mix to obtain a solution with a theoretical concentration of about 8.0 µg of iron per mL.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the iron emission line at 248.3 nm with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with an iron hollow-cathode lamp and air-acetylene flame, using *Calcium chloride solution* as a blank. Plot the absorbances for each *Standard preparation* versus concentration, in µg per mL, of iron and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, in µg per mL, of iron in the *Assay preparation*. Calculate the quantity, in mg, of iron in each mL of the Injection taken by the formula:

$$5C/V$$

in which C is the concentration, in µg per mL, of iron in the *Assay preparation*; and V is the volume of Injection taken.

## Isoetharine Hydrochloride

$C_{13}H_{21}NO_3 \cdot HCl$  275.77

1,2-Benzenediol, 4-[1-hydroxy-2-[(1-methylethyl)amino]butyl]-, hydrochloride.

3,4-Dihydroxy- $\alpha$ -[1-(isopropylamino)propyl]benzyl alcohol hydrochloride [2576-92-3].

» Isoetharine Hydrochloride contains not less than 97.0 percent and not more than 102.0 percent of  $C_{13}H_{21}NO_3 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Isoetharine Hydrochloride RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** A solution (1 in 100) responds to the tests for *Chloride* (191).

**pH** (791): between 4.0 and 5.6, in a solution (1 in 100).

**Loss on drying** (731)—Dry it at 100° for 4 hours: it loses not more than 1.0% of its weight.

**Aromatic ketones**—Its absorptivity (see *Spectrophotometry and Light-scattering* (851)) at 312 nm, determined in a solution in 0.01 N hydrochloric acid containing 2.0 mg per mL, is not more than 0.20.

**Assay**—

**Standard preparation**—Dissolve an accurately weighed quantity of USP Isoetharine Hydrochloride RS in freshly prepared sodium bisulfite solution (3 in 1000) to obtain a solution having a concentration of about 5 mg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with 0.17 N acetic acid to volume, and mix to obtain a

solution having a known concentration of about 500 µg per mL.

**Assay preparation**—Transfer about 125 mg of Isoetharine Hydrochloride, accurately weighed, to a 25-mL volumetric flask, dissolve in sodium bisulfite solution (3 in 1000), dilute with sodium bisulfite solution to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with 0.17 N acetic acid to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 278-nm detector and a 4-mm  $\times$  30-cm column that contains packing L1. The mobile phase is 0.17 N acetic acid, having a flow rate of about 2.2 mL per minute. Chromatograph five replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 3.0%.

**Procedure**—Using a microsyringe or sampling valve, chromatograph 10 µL of the *Standard preparation*, and adjust the specimen size and other operating parameters, if necessary, until satisfactory chromatography and peak responses are obtained. Chromatograph equal volumes of the *Standard preparation* and the *Assay preparation*, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of  $C_{13}H_{21}NO_3 \cdot HCl$  in the portion of Isoetharine Hydrochloride taken by the formula:

$$0.25C(h_u / h_s)$$

in which C is the concentration, in µg per mL, of USP Isoetharine Hydrochloride RS in the *Standard preparation*; and  $h_u$  and  $h_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isoetharine Inhalation Solution

» Isoetharine Inhalation Solution is a sterile solution of Isoetharine Hydrochloride in Purified Water. It may contain Sodium Chloride. It contains not less than 92.0 percent and not more than 108.0 percent of the labeled amount of isoetharine hydrochloride ( $C_{13}H_{21}NO_3 \cdot HCl$ ).

**Packaging and storage**—Preserve in small, tight containers that are well-filled or otherwise protected from oxidation. Protect from light.

**Labeling**—The label indicates that the Inhalation Solution is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

**USP Reference standards** (11)—

USP Isoetharine Hydrochloride RS

**Color and clarity**—

**Standard solution**—Transfer 2.0 mL of 0.100 N iodine VS to a 500-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Visually examine a portion of the Inhalation Solution (*Test solution*) in a suitable clear glass test tube against a white background: it is not pinkish and it contains no precipitate. If any yellow color is observed in the *Test solution*, concomitantly determine the absorbances of the *Test solution* and the *Standard solution* in 1-cm cells with a suitable spectrophotometer set at 460 nm: the absorbance of the *Test solution* does not exceed that of the *Standard solution*.

**Identification**—Dilute the Inhalation Solution with water to obtain a solution containing about 2.5 mg of isoetharine hydrochloride per mL. Apply 10-µL portions of this solution and a solution of USP Isoetharine Hydrochloride RS containing 2.5 mg per mL to a thin-layer chromatographic plate

coated with silica gel mixture. Develop the plate in a mixture consisting of *n*-butyl alcohol, water, and formic acid (70:20:10) to a height of 12 to 14 cm above the point of application. Remove the plate, and evaporate the solvents with the aid of warm, circulating air. Examine under short-wavelength UV light. Spray the plate with Folin–Ciocalteu phenol TS, and then expose to ammonia vapor until the isoetharine spots develop an intense blue color: the  $R_f$  value and color of the principal spot obtained from the solution under test correspond to those obtained from the *Standard solution*.

**Sterility** <71>: meets the requirements.

**pH** <791>: between 2.5 and 5.5.

**Assay—**

*Standard preparation*—Prepare as directed in the Assay under *Isoetharine Hydrochloride*.

*Assay preparation*—Transfer an accurately measured volume of Inhalation Solution, equivalent to about 50 mg of isoetharine hydrochloride, to a 100-mL volumetric flask, dilute with 0.17 N acetic acid solution to volume, and mix.

*Chromatographic system*—Proceed as directed in the Assay under *Isoetharine Hydrochloride*.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Isoetharine Hydrochloride*. Calculate the quantity, in mg, of  $C_{13}H_{21}NO_3 \cdot HCl$  in each mL of the Inhalation Solution taken by the formula:

$$0.1(C/V)(h_U / h_S)$$

in which  $V$  is the volume, in mL, of Inhalation Solution taken; and  $C$ ,  $h_U$ , and  $h_S$  are as defined therein.

## Isoetharine Mesylate

$C_{13}H_{21}NO_3 \cdot CH_3O_3S$  335.42  
1,2-Benzenediol, 4-[1-hydroxy-2-  
[(1-methylethyl)amino]butyl]-, methanesulfonate (salt).  
3,4-Dihydroxy- $\alpha$ -[1-(isopropylamino)propyl]benzyl alcohol  
methanesulfonate (salt) [7279-75-6].

» Isoetharine Mesylate contains not less than 97.0 percent and not more than 102.0 percent of  $C_{13}H_{21}NO_3 \cdot CH_3O_3S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Isoetharine Hydrochloride RS

**Identification—**

**A:** It responds to the *Thin-layer Chromatographic Identification Test* <201>, the test solution and the Standard solution of USP Isoetharine Hydrochloride RS being prepared at a concentration of 2.5 mg per mL in methanol, the solvent mixture being *n*-butanol, water, and formic acid (64:25:11), and the spots being located by spraying with sodium hydroxide solution (1 in 10).

**B:** Mix about 50 mg with about 200 mg of powdered sodium hydroxide, transfer the mixture to a small test tube, heat in a small flame to fusion, and continue the heating for a few minutes longer. Cool, add about 0.5 mL of water, then add a moderate excess of hydrochloric acid, and warm: starch iodate paper placed over the mouth of the test tube turns blue.

**Melting range** <741>: between 162° and 168°.

**pH** <791>: between 4.5 and 5.5, in a solution (1 in 100).

**Loss on drying** <731>—Dry it at 80° under vacuum at a pressure of not more than 5 mm of mercury for 4 hours: it loses not more than 1.0% of its weight.

**Limit of keto precursor**—Its absorptivity (see *Spectrophotometry and Light-scattering* <851>) at 312 nm, determined in a solution in 0.01 N hydrochloric acid containing 2.0 mg per mL, is not more than 0.20.

**Assay—**

*Mobile phase*—Prepare a filtered and degassed mixture of 0.1 M sodium sulfate in 0.8% acetic acid. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Standard preparation*—Transfer about 60 mg of USP Isoetharine Hydrochloride RS, accurately weighed, to a 25-mL volumetric flask, add 4.0 mL of alcohol, and mix. Add 3 drops of 1 N hydrochloric acid, dilute with water to volume, and mix.

*Assay preparation*—Transfer about 75 mg of Isoetharine Mesylate, accurately weighed, to a 25-mL volumetric flask, add 4.0 mL of alcohol, and mix. Add 3 drops of 1 N hydrochloric acid, dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L9. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 3.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of  $C_{13}H_{21}NO_3 \cdot CH_3O_3S$  in the portion of Isoetharine Mesylate taken by the formula:

$$0.025C(335.42 / 275.77)(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP Isoetharine Hydrochloride RS in the *Standard preparation*; 335.42 and 275.77 are the molecular weights of isoetharine mesylate and isoetharine hydrochloride, respectively; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isoetharine Mesylate Inhalation Aerosol

» Isoetharine Mesylate Inhalation Aerosol is a solution of Isoetharine Mesylate in Alcohol in an inert propellant base. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of isoetharine mesylate ( $C_{13}H_{21}NO_3 \cdot CH_3O_3S$ ).

**Packaging and storage**—Preserve in small, nonreactive, light-resistant, aerosol containers equipped with metered-dose valves and provided with oral inhalation actuators.

**USP Reference standards** <11>—

USP Isoetharine Hydrochloride RS

**Identification—**

**A:** Expel a quantity of Inhalation Aerosol, equivalent to about 12 mg of isoetharine mesylate, into 2 mL of methanol, dilute with methanol to 5 mL, and mix: this solution responds to *Identification test A* under *Isoetharine Inhalation Solution*.

**B:** Expel a quantity of Inhalation Aerosol, equivalent to about 12 mg of isoetharine mesylate, into a test tube, evaporate on a steam bath just to dryness, and add 50 mg of powdered sodium hydroxide. Heat in a small flame to fusion, and continue heating for a few seconds longer. Cool, add about 0.5 mL of water, then add a moderate excess of

3 N hydrochloric acid: starch iodate paper placed over the mouth of the test tube turns blue.

**Alcohol content** (611)—Weigh accurately a filled Inhalation Aerosol container, and record the weight. Invert the container, and place the outlet tip against the bottom of a 50-mL beaker containing 5 mL of water. Slowly actuate the valve 10 times. Raise the unit above the contents of the beaker, and wash the outlet with 1 mL of water. Collect the washings in the beaker. Dip the outlet stem in alcohol, shake to remove the solvent completely, air-dry the valve, and again weigh the Inhalation Aerosol container. Record the weight of the expelled specimen. Transfer the contents of the beaker, with the aid of 4 mL of water, to a glass-stoppered graduated cylinder. Determine the alcohol content of the test solution thus prepared by the gas-liquid chromatographic procedure, 2 mL of dilute isopropyl alcohol (15 in 100) being used as the internal standard. Calculate the alcohol content of the Inhalation Aerosol taken by the formula:

$$SV / W$$

in which *S* is the percentage (w/v) of alcohol in the test solution; *V* is the total volume, in mL, of the test solution; and *W* is the weight, in g, of the expelled specimen taken: between 25.9% and 35.0% (w/w) of C<sub>2</sub>H<sub>5</sub>OH is found.

**Dose uniformity over the entire contents:** meets the requirements for *Metered-Dose Inhalers* under *Aerosols*, *Nasal Sprays*, *Metered-Dose Inhalers*, and *Dry Powder Inhalers* (601).

**PROCEDURE FOR DOSE UNIFORMITY—**

*Ferro-citrate solution and Buffer solution*—Prepare as directed under *Epinephrine Assay* (391).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Isoetharine Hydrochloride RS in a freshly prepared sodium bisulfite solution (1 in 1000), and dilute quantitatively and stepwise with the same sodium bisulfite solution as necessary to obtain a solution having a known concentration of about 34 µg per mL.

*Test preparation*—Discharge the minimum recommended dose into the sampling apparatus and detach the inhaler as directed. Rinse the apparatus (filter and interior) with two 5.0-mL portions of a freshly prepared sodium bisulfite solution (1 in 500), and transfer the resulting solutions quantitatively to a 50-mL centrifuge tube. Add 10 mL of chloroform, insert the stopper, shake vigorously for 5 minutes and centrifuge. Use the clear supernatant as directed in the *Procedure*.

*Procedure*—Into three separate 25-mL volumetric flasks transfer the *Test preparation*, 10.0 mL of the *Standard preparation*, and 10.0 mL of a freshly prepared sodium bisulfite solution (1 in 1000) to provide the blank. To each flask add 0.5 mL of *Ferro-citrate solution* followed by 5 mL of *Buffer solution*. Dilute with the sodium bisulfite solution (1 in 1000) to volume, mix, and allow the color to develop for 10 minutes. Concomitantly determine the absorbances with a suitable spectrophotometer, in 5-cm cells, of the solutions from the *Test preparation* and the *Standard preparation* relative to the blank at the wavelength of maximum absorbance at about 530 nm. Calculate the quantity, in µg, of C<sub>13</sub>H<sub>21</sub>NO<sub>3</sub> · CH<sub>4</sub>O<sub>3</sub>S contained in the minimum dose taken by the formula:

$$10CN(335.42 / 275.77)(A_U / A_S)$$

in which *C* is the concentration, in µg per mL, of USP Isoetharine Hydrochloride RS in the *Standard preparation*; *N* is the number of sprays discharged to obtain the minimum recommended dose; 335.42 and 275.77 are the molecular weights of isoetharine mesylate and isoetharine hydrochloride, respectively; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively.

**Assay—**

*Mobile phase and Standard preparation*—Proceed as directed in the *Assay* under *Isoetharine Mesylate*.

*Assay preparation*—Weigh 1 Inhalation Aerosol container with contents. Invert the container, and place the outlet tip against the bottom of a 50-mL beaker containing 2.5 mL of 0.01 N hydrochloric acid. Slowly actuate the valve about 90 times (the weight of the assay specimen is approximately 5 g). Raise the unit above the contents of the beaker, and wash the outlet with a few mL of water. Collect the washings in the beaker. Dip the outlet stem in alcohol, shake to remove the solvent completely, air-dry the valve, and then again weigh the Inhalation Aerosol container. Record the weight of the expelled specimen. Transfer the contents of the beaker to a 100-mL volumetric flask with the aid of water, dilute with water to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Isoetharine Mesylate*. Calculate the percentage of C<sub>13</sub>H<sub>21</sub>NO<sub>3</sub> · CH<sub>4</sub>O<sub>3</sub>S in the portion of Inhalation Aerosol taken by the formula:

$$0.01(335.42 / 275.77)(C / W)(r_U / r_S)$$

in which *W* is the weight, in g, of Inhalation Aerosol taken; and the other terms are as defined therein.

## Isoflupredone Acetate

C<sub>23</sub>H<sub>29</sub>FO<sub>6</sub> 420.47

Pregna-1,4-diene-3,20-dione, 21-(acetyloxy)-9-fluoro-11,17-dihydroxy-, (11β)-.

9-Fluoro-11β,17,21-trihydroxypregna-1,4-diene-3,20-dione 21-acetate [338-98-7].

» Isoflupredone Acetate contains not less than 97.0 percent and not more than 103.0 percent of C<sub>23</sub>H<sub>29</sub>FO<sub>6</sub>, calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**Labeling**—Label it to indicate that it is intended for veterinary use only. Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Isoflupredone Acetate RS

USP Prednisolone Acetate RS

**Identification, Infrared Absorption** (197M).

**Assortivity—**

*Test preparation:* 25 mg in 2000 mL of alcohol.

*Procedure*—Proceed as directed under *Spectrophotometry and Light-Scattering* (851), and measure the absorbance at 240 nm: the absorptivity is between 35.0 and 38.0.

**Specific rotation** (781S): between +110° and +120°.

*Test solution:* 10 mg per mL, in dioxane.

**Bacterial endotoxins** (85)—Where the label states that Isoflupredone Acetate is sterile or that it must be subjected to further processing during the preparation of injectable dosage forms, it contains not more than 125 USP Endotoxin Units per mg of isoflupredone acetate.

**Loss on drying** (731)—Dry it at 105° for 4 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Chromatographic purity—**

**Solution A**—Prepare a mixture of water, methanol, acetonitrile, and glacial acetic acid (500:350:150:3), and degas.

**Solution B**—Prepare a mixture of acetonitrile, methanol, and water (550:500:3), and degas.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Dissolve accurately weighed quantities of USP Isoflupredone Acetate RS and USP Prednisolone Acetate RS in *Solution A* to obtain a solution having known concentrations of about 0.03 mg of each per mL. Sonicate, if necessary, to dissolve.

**Test solution**—Dissolve an accurately weighed quantity of Isoflupredone Acetate in *Solution A* to obtain a solution having a concentration of about 0.3 mg per mL. Sonicate, if necessary, to dissolve. Use this solution within 16 hours.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1 mL per minute. Protect the column from temperature fluctuations. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	100	0	equilibration
0–32.5	100	0	isocratic
32.5–47.5	100→0	0→100	linear gradient
47.5–50.5	0	100	isocratic
50.5–51.5	0→100	100→0	linear gradient
51.5–61.5	100	0	isocratic

Chromatograph the *System suitability solution*, and record the peak areas as directed for *Procedure*: the retention time for isoflupredone acetate is between 21 and 26 minutes; the relative retention times are about 1.1 for prednisolone acetate and 1.0 for isoflupredone acetate; the resolution,  $R$ , between isoflupredone acetate and prednisolone acetate is not less than 1.2; and the column efficiency determined from isoflupredone is not less than 6000 theoretical plates.

**Procedure**—Inject a volume (about 50  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for the major peaks. Calculate the percentage of each impurity in the portion of Isoflupredone Acetate taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses of all the peaks: not more than 1.0% of any individual impurity is found; and not more than 2.0% of total impurities is found, excluding those that are present in amounts less than 0.05%.

**Other requirements**—Where the label states that it is sterile, it meets the requirements for *Sterility Tests* (71) when tested as directed for *Direct Transfer Method* under *Test Procedures*.

**Assay—**

**Mobile phase**—Prepare a mixture of *n*-butyl chloride, water-saturated *n*-butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (475:475:70:35:30). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Use water-saturated chloroform.

**Internal standard solution**—Dissolve an accurately weighed quantity of fluoxymesterone in *Diluent* to obtain a solution having a known concentration of about 0.9 mg per mL.

**Standard preparation**—Dissolve about 4 mg of USP Isoflupredone Acetate RS, accurately weighed, in 8.0 mL of *Internal standard solution* and 32.0 mL of *Diluent*.

**Assay preparation**—Transfer about 4 mg of Isoflupredone Acetate, accurately weighed, to a suitable container. Dissolve in 8.0 mL of *Internal standard solution* and 32.0 mL of *Diluent*, centrifuge, and use the clear chloroform portion.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L3. The flow rate is about 0.7 mL per minute. Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure*: the relative retention times are about 1.0 for isoflupredone acetate and 1.2 for fluoxymesterone; the resolution,  $R$ , between isoflupredone acetate and fluoxymesterone is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 12  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of  $C_{23}H_{29}FO_6$  in the portion of Isoflupredone Acetate taken by the formula:

$$W_s(R_U / R_s)$$

in which  $W_s$  is the weight, in mg, of USP Isoflupredone Acetate RS taken to prepare the *Standard preparation*; and  $R_U$  and  $R_s$  are the peak area ratios of isoflupredone acetate to fluoxymesterone obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isoflupredone Acetate Injectable Suspension

» Isoflupredone Acetate Injectable Suspension contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of isoflupredone acetate ( $C_{23}H_{29}FO_6$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

**Labeling**—Label it to indicate that it is intended for veterinary use only.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Isoflupredone Acetate RS

USP Prednisolone Acetate RS

**Identification, Infrared Absorption** (197M).

**Test specimen**—Transfer about 25 mg of Injectable Suspension to a centrifuge tube, add 20 mL of water, and shake well. Centrifuge, and discard the liquid layer. Repeat this washing step with three additional 20-mL portions of water. Dry the material so obtained at 105° for 3 hours.

**Bacterial endotoxins** (85)—It contains not more than 125 USP Endotoxin Units per mg of isoflupredone acetate.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 5.0 and 7.5.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay—**

*Mobile phase, Diluent, Internal standard solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under *Isoflupredone Acetate*.

*Assay preparation*—Transfer an accurately measured volume of Injectable Suspension, equivalent to about 4 mg of isoflupredone acetate, to a suitable container. Add 8.0 mL of *Internal standard solution* and 32.0 mL of *Diluent*, and swirl to dissolve.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Isoflupredone Acetate*. Calculate the quantity, in mg, of isoflupredone acetate ( $C_{23}H_{29}FO_6$ ) in each mL of Injectable Suspension taken by the formula:

$$(W_S / V)(R_U / R_S)$$

in which *V* is the volume, in mL, of Injectable Suspension taken to prepare the *Assay preparation*; and the other terms are as defined therein.

---

**Isoflurane**

---

$C_3H_2ClF_5O$  184.49  
 Ethane, 2-chloro-2-(difluoromethoxy)-1,1,1-trifluoro-;  
 1-Chloro-2,2,2-trifluoroethyl difluoromethyl ether  
 [26675-46-7].

**DEFINITION**

Isoflurane contains NLT 99.9% of isoflurane ( $C_3H_2ClF_5O$ ).

**IDENTIFICATION**

- A.** The IR absorption spectrum of it obtained using a gas cell exhibits maxima only at the same wavelengths as that of a similar preparation of USP Isoflurane RS.

**ASSAY****PROCEDURE**

**Analysis:** Using the results from *Organic Impurities*, calculate the percentage of isoflurane ( $C_3H_2ClF_5O$ ) in the volume of Isoflurane taken by subtracting the sum of percentages for all impurities found from 100.0%.

**Acceptance criteria:** NLT 99.9%

**IMPURITIES****CHLORIDE**

**Sample solution:** Pipet 10 mL into a suitable vessel containing 60 mL of isopropyl alcohol and 4 drops of dilute nitric acid (1:1), and stir to dissolve.

**Analysis:** Titrate potentiometrically with 0.0020 N silver nitrate.

**Acceptance criteria:** NMT 2.11 mL is required (NMT 10 ppm).

**LIMIT OF FLUORIDE**

Use plasticware throughout this test.

**Buffer:** Dissolve 110 g of sodium chloride and 1 g of sodium citrate in 700 mL of water in a 2-L volumetric flask. Cautiously add 150 g of sodium hydroxide, and dissolve with shaking. Cool to room temperature, and, while stirring, cautiously add 450 mL of glacial acetic acid to the cooled solution. Cool, add 600 mL of isopropyl alcohol, dilute with water to volume, and mix: the pH of this solution is between 5.0 and 5.5. [NOTE—This solution may be used for 6 weeks if stored at room temperature.]

**Standard stock solution:** Transfer 55 mg of USP Sodium Fluoride RS, previously dried at 150° for 4 h, to a

25-mL volumetric flask. Add 5 mL of water, and mix to dissolve. Add 1.0 mL of sodium hydroxide solution (1 in 10,000), dilute with water to volume, and mix. Each mL of this solution contains 1 mg of fluoride ion. Store in a tightly closed plastic container. [NOTE—This solution may be used for 2 weeks if stored in a refrigerator.]

**Standard solutions:** Dilute portions of the *Standard stock solution* with water to obtain 100-mL volumes of stock solutions having concentrations of 2.0, 6.0, 10.0, and 20.0 µg/mL of fluoride. Transfer 25.0 mL of each of these stock solutions to separate 50-mL volumetric flasks, dilute with *Buffer* to volume, and mix to obtain *Standard solutions* having concentrations of 1.0, 3.0, 5.0, and 10.0 µg/mL of fluoride.

**Sample solution:** Shake 50.0 mL of Isoflurane with 50.0 mL of water for 5 min, and allow the liquids to separate completely. Transfer 25.0 mL of the water layer to a 50-mL volumetric flask, dilute with *Buffer* to volume, and mix.

**Analysis**

(See pH <791>.)

Concomitantly measure the potentials in mV, of the *Standard solutions* and the *Sample solution* with a pH meter capable of a minimum reproducibility of ±0.2 mV and equipped with a fluoride ion electrode and a glass-sleeved calomel reference electrode. When taking measurements, immerse the electrodes in the solution under test, which has been transferred to a 150-mL beaker containing a polytetrafluoroethylene-coated stirring bar. Allow to stir on a magnetic stirrer having an insulated top until equilibrium is attained (1–2 min), and record the potential. Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the fluoride ion electrode.

A satisfactory response is achieved if the difference in potential between the potentials obtained with the *Standard solutions* having fluoride concentrations of 1.0 and 10.0 µg/mL is in the range of 50–60 mV. Plot the logarithm of the fluoride ion concentrations, in µg/mL, of the *Standard solutions* versus potential, in mV. From the measured potential of the *Sample solution* and the standard response line determine the concentration, in µg/mL, of fluoride in the *Sample solution*.

**Acceptance criteria:** NMT 5 µg/mL [NMT 0.001% (w/v)]

**NONVOLATILE RESIDUE**

**Analysis:** Transfer 10.0 mL to a suitable weighed evaporating dish, evaporate with the aid of a current of air to dryness, and dry the residue at 50° for 2 h.

**Acceptance criteria:** The weight of the residue does not exceed 2.0 mg.

**ORGANIC IMPURITIES**

[NOTE—The *Internal standard solution* and the *Standard solution* are prepared using the same Isoflurane that is under test. If multiple lots or samples of Isoflurane are under test, one sample may be selected for the *Internal standard solution* and the *Standard solution*. An appropriate blank correction should be made when determining the percentages of impurities in the other lots or samples.]

**Internal standard solution:** 10 mg/mL of normal butyl acetate in Isoflurane

**Standard solution:** To 95 mL of Isoflurane in a 100-mL volumetric flask add 10.0 µL of USP Isoflurane Related Compound A RS, 7.0 µL of USP Isoflurane Related Compound B RS, 10.0 µL of acetone, and 250 µL of *Internal standard solution*. Dilute with Isoflurane to volume, and mix. It contains 0.01% of isoflurane related compound A, 0.007% of isoflurane related compound B, and 0.01% of acetone.

**Sample solution:** To 20.0 mL of Isoflurane add 50.0 µL of *Internal standard solution*. It contains about 0.0025% (w/v) of normal butyl acetate.

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** GC**Detector:** Flame ionization**Column:** 2.4-mm × 3.7-m nickel or stainless steel; packed with 10% phase G31 and 15% phase G18 on 60- to 80-mesh sodium hydroxide-washed support S1C**Temperatures****Detector:** 200°**Injection port:** 150°**Column:** See *Table 1*.**Table 1**

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
65	—	65	7
65	4	110	22

**Carrier gas:** Helium**Flow rate:** 25 mL/min**Injection volume:** 3 µL**System suitability****Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 1.5 for the normal butyl acetate peak**Relative standard deviation:** NMT 2.0% for the ratio of the response of the acetone peak to the response of the normal butyl acetate peak**Analysis****Samples:** *Standard solution* and *Sample solution*

Separately calculate the percentages of acetone, isoflurane related compound A, and isoflurane related compound B in the portion of Isoflurane taken:

$$\text{Result} = [R_U / (R_S - R_U)] \times P$$

 $R_U$  = peak response ratio of the relevant analyte to the internal standard from the *Sample solution* $R_S$  = peak response ratio of the relevant analyte to the internal standard from the *Standard solution* $P$  = percentage of the relevant analyte in the *Standard solution*

Calculate the percentage of any other individual impurity:

$$\text{Result} = [R_U / (R_S - R_U)] \times P$$

 $R_U$  = peak response ratio of any individual impurity to the internal standard from the *Sample solution* $R_S$  = peak response ratio of isoflurane related compound B to the internal standard from the *Standard solution* $P$  = percentage of isoflurane related compound B in the *Standard solution***Acceptance criteria:** See *Table 2*.**Table 2**

Name	Acceptance Criteria, NMT (%)
Acetone	0.01
Isoflurane related compound A	0.01
Isoflurane related compound B	0.007
Any other individual impurity	0.003

**SPECIFIC TESTS**• **REFRACTIVE INDEX** (831): 1.2990–1.3005 at 20°• **WATER DETERMINATION, Method I** (921): NMT 0.10%**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°.• **USP REFERENCE STANDARDS** (11)

USP Isoflurane RS

USP Isoflurane Related Compound A RS

1-Chloro-2,2,2-trifluoroethylchlorodifluoromethyl ether.

C<sub>3</sub>HCl<sub>2</sub>F<sub>5</sub>O 219.49

USP Isoflurane Related Compound B RS

2,2,2-Trifluoroethyldifluoromethyl ether.

C<sub>3</sub>H<sub>3</sub>F<sub>5</sub>O 150.05

USP Sodium Fluoride RS

**Isoflurophate**C<sub>6</sub>H<sub>14</sub>FO<sub>3</sub>P 184.15

Phosphorofluoridic acid, bis(1-methylethyl) ester.

Diisopropyl phosphorofluoridate [55-91-4].

» Isoflurophate contains not less than 95.0 per cent of C<sub>6</sub>H<sub>14</sub>FO<sub>3</sub>P.**Caution**—Handle Isoflurophate with exceptional care since it is very toxic. Wear full-face breathing apparatus and gloves. Open the container only in a hood.**Packaging and storage**—Preserve in glass, fuse-sealed containers, or in other suitable sealed containers, in a cool place.**Labeling**—Label it to indicate that in the handling of Isoflurophate in open containers, the eyes, nose, and mouth are to be protected with a suitable mask, and contact with the skin is to be avoided.**Identification**—**A:** Under a hood with a good draft place a few drops of Isoflurophate in a small platinum crucible, quickly add 2 mL of sulfuric acid, and immediately cover the crucible with a small, clear watch glass. Allow to stand for 10 minutes, then heat on a steam bath for 5 to 10 minutes: the side of the watch glass exposed to the mixture is visibly etched.**B:** Slowly heat under the hood the crucible and contents from Identification test A until copious white fumes are evolved. Cool, place the crucible in a beaker, and add a sufficient quantity of water nearly to cover the crucible. After a few minutes remove the crucible from the beaker with the aid of a glass rod, add 3 mL of nitric acid, and boil for a few minutes. Cool, cautiously add 6 N ammonium hydroxide with stirring until a slight odor of ammonia persists, then add 1 mL of nitric acid. Filter the liquid if not clear, warm to about 40°, and add about 10 mL of ammonium molybdate TS: a yellow precipitate, which is soluble in 6 N ammonium hydroxide, is formed.**Acidity**—**Mixed indicator**—Mix 3 volumes of a 1 in 1000 solution of bromocresol green in alcohol and 1 volume of a 1 in 500 solution of methyl red in alcohol.**0.1 N Sodium hydroxide in dehydrated alcohol**—Dissolve about 0.4 g of sodium hydroxide in 100 mL of dehydrated alcohol, and when solution is complete, standardize the alcoholic solution as follows. Pipet 25.0 mL of 0.1 N hydrochloric acid VS into a suitable container. Dilute with 50 mL

of water, add 2 drops of *Mixed indicator*, and titrate with the alcoholic sodium hydroxide solution to the first appearance of a green color. Calculate the normality. [NOTE—Store in tightly stoppered bottles.]

**Test preparation**—Prepare as directed in the Assay, except to draw 1.0 mL instead of 0.5 mL of Isoflurophate into the bulb.

**Procedure**—Carefully place the bulb containing the *Test preparation* in a 250-mL flask containing 20 mL of dehydrated alcohol. Break the bulb as directed in the *Procedure* under *Ionic fluorine*. Rinse the glass tube with 30 mL of dehydrated alcohol, and titrate immediately with 0.1 N Sodium hydroxide in dehydrated alcohol, using the *Mixed indicator*, to the appearance of the first green color. Each mL of 0.1 N Sodium hydroxide in dehydrated alcohol is equivalent to 100.8 µg of hydrogen ion (acidity). The limit is 0.01%.

#### **Ionic fluorine—**

**Sodium methoxide solution**—Dissolve 10 g of sodium methoxide in dehydrated alcohol to make 500 mL, and mix.

**Buffer solution**—Dissolve 9.55 g of monochloroacetic acid and 2 g of sodium hydroxide in water to make 100 mL. If necessary, adjust by the addition, of either reagent to obtain a solution having a pH of 3.0.

**Standard fluoride solution**—Dissolve 2.2105 g of sodium fluoride in water to make 1000.0 mL. Each mL is equivalent to 1.00 mg of fluoride ion.

**Thorium nitrate solution**—Dissolve 9 g of thorium nitrate in water to make 1000.0 mL, and mix. Standardize as directed under *Standard curve*.

**Standard curve**—Into each of four 180-mL beakers pipet 50.0 mL of *Sodium methoxide solution* and 0.25, 0.50, 1.0, and 2.0 mL, respectively, of *Standard fluoride solution*. Treat each beaker in the same manner, as follows. Add 2 drops of phenolphthalein TS, and render just acid with 6 N hydrochloric acid. Add 1.0 mL of sodium alizarinsulfonate solution (1 in 2000), and add 6 N hydrochloric acid dropwise until the pink color is discharged. Dilute with water to 100 mL, and add *Buffer solution* (approximately 4 mL) until the pH is 3.1. Titrate with *Thorium nitrate solution*, while stirring constantly and rapidly, to a permanent pink color. During the titration, maintain the solution at a pH between 2.9 and 3.1 by adding small volumes of *Buffer solution*, if necessary, but not more than a total of 10 mL. Plot the mg of fluoride ion versus the mL of *Thorium nitrate solution* consumed.

**Test preparation**—Prepare as directed in the Assay, except to draw 1.0 mL instead of 0.5 mL of Isoflurophate into the bulb.

**Procedure**—Place 50.0 mL of *Sodium methoxide solution* in a 180-mL beaker, and add 2 drops of phenolphthalein TS. Acidify, dropwise, with 6 N hydrochloric acid. Add 1.0 mL of sodium alizarinsulfonate solution (1 in 2000), then add 6 N hydrochloric acid dropwise until the pink color disappears. Add 0.5 N sodium hydroxide until a faint pink color appears, then add 0.05 N hydrochloric acid until the pink color just disappears. Add 4 mL of the *Buffer solution*. Carefully place the *Test preparation* in the beaker with the stem of the bulb inserted in a suitable length of glass tubing. Break the bulb by pressing down on the glass tubing, making sure that the bulb is beneath the surface of the liquid and that the bottom of the beaker is properly supported so that it will not break when the bulb is broken. Wash down the glass tube with water, and dilute with water to 100 mL. Titrate immediately with the *Thorium nitrate solution*. Determine the mg of ionic fluorine present in the *Test preparation* directly from the thorium nitrate standardization curve. Not more than 0.15% of ionic fluorine is found.

#### **Assay—**

**Solvent**—Use dry carbon disulfide, chromatographic grade.

**Internal standard solution**—Pipet 1.0 mL of chromatographic grade cyclohexanone into a 100-mL volumetric

flask, dilute with *Solvent* to volume, and mix. Pipet 3.0 mL of the resulting solution into a 100-mL volumetric flask, dilute with *Solvent* to volume, and mix. Each mL of the *Internal standard solution* contains 0.30 µL of cyclohexanone.

**Standard preparation**—Dissolve a suitable quantity of Isoflurophate, previously subjected to the Assay, in peanut oil, and dilute quantitatively and stepwise with peanut oil to obtain a solution having a known concentration of about 0.8 mg of isoflurophate per g of solution. Transfer about 1.2 g of this Isoflurophate solution in peanut oil, accurately weighed, to a 10-mL volumetric flask, pipet 1.0 mL of *Internal standard solution* into the flask, dilute with *Solvent* to volume, and mix.

**Assay preparation**—Tare an unsealed, thin-walled glass bulb with a thin, long stem, having a capacity of 1 to 2 mL. Under a hood, open the Isoflurophate container and place it in a firmly based container in a suitable vacuum-filtration flask. Insert the stem of the bulb under the surface of the liquid, and insert the stopper in the filtration flask. Allow about 0.5 mL of liquid to be drawn up into the bulb, and release the vacuum. Remove the bulb from the container, wipe the stem clean, fire-seal it without loss of any glass, cool, and again weigh.

Place the glass bulb in a 125-mL conical flask, add about 70 mL of *Solvent*, and break the bulb with the aid of a glass rod by pressing down on the glass tubing over the neck of the bulb. Take care to assure that the bulb is beneath the surface of the liquid in the flask and that the bottom of the flask is properly supported so that it will not break when the bulb is broken. Remove the rod, transfer the solution to a 100-mL volumetric flask, dilute with *Solvent* to volume, and mix (*Solution A*). Pipet 2.0 mL of *Solution A* into a 10-mL volumetric flask, dilute with *Solvent* to volume, and mix (*Solution B*). Pipet 1.0 mL of *Solution B* into another 10-mL volumetric flask, pipet 1.0 mL of *Internal standard solution* into the flask, dilute with *Solvent* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—Under typical conditions, the gas chromatograph is equipped with a flame-ionization detector, and contains a 1.8-m × 4-mm glass column packed with 5% phase G33 on 80- to 100-mesh support S1AB, utilizing either a glass-lined sample introduction system or on-column injection. The column is maintained isothermally at a temperature between 75° and 80°, and the injector port and detector block are maintained at 200° and 250°, respectively; dry, oxygen-free helium is used as the carrier gas at a flow rate adjusted to obtain a cyclohexanone peak about 6 minutes after sample introduction.

**Procedure**—Inject 6 µL of the *Standard preparation* into a suitable gas chromatograph, and record the chromatogram. Measure the areas under the first (cyclohexanone) and second (isoflurophate) peaks, and record the values as  $A_D$  and  $A_S$ , respectively. Calculate the factor  $F$  taken by the formula:

$$(A_D / A_S)(W_S / 10)(C / 1000)$$

in which  $W_S$  is the weight, in mg, of Isoflurophate solution in peanut oil in the *Standard preparation*, and  $C$  is the weight, in mg, of isoflurophate per g of Isoflurophate solution in peanut oil. Similarly inject 6 µL of the *Assay preparation*, and record the chromatogram. Measure the areas under the first (cyclohexanone) and second (isoflurophate) peaks, and record the values as  $a_D$  and  $a_U$ , respectively. Calculate the percentage of  $C_6H_{14}FO_3P$  in the portion of Isoflurophate taken by the formula:

$$(F(a_U / a_D)(100 / W_U)(5000)$$

in which  $W_U$  is the weight, in mg, of Isoflurophate in the *Assay preparation*; and  $F$  is the factor as determined above.

## Isoflurophate Ophthalmic Ointment

» Isoflurophate Ophthalmic Ointment contains not less than 0.0225 percent and not more than 0.0275 percent of  $C_6H_{14}FO_3P$ , in a suitable anhydrous ointment base. It is sterile.

**Packaging and storage**—Preserve in collapsible ophthalmic ointment tubes.

**Labeling**—Label it to indicate the expiration date, which is not later than 2 years after date of manufacture.

**Identification**—Place about 100 mg of Ointment in one eye of each of 3 rabbits, and examine the eyes 18 to 20 hours later: the average diameter of the pupils of the treated eyes is not less than 2 mm smaller than the average diameter of the pupils of the untreated eyes.

**Irritation**—The conjunctivas of the eyes treated as directed in the *Identification* test, as compared with those of the untreated eyes, after 1 hour, show not more than a slight reddening, which practically disappears in 4 hours.

**Sterility** (71): meets the requirements.

**Minimum fill** (755): meets the requirements.

**Water, Method I** (921)—Dissolve about 10 g, accurately weighed, in a mixture of 25 mL each of methanol and toluene. Not more than 0.03% is found.

**Metal particles**—It meets the requirements of the test for *Metal Particles in Ophthalmic Ointments* (751).

**Assay**—

*Solvent, Internal standard solution, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Isoflurophate*.

*Assay preparation*—Transfer about 3.5 g of Ophthalmic Ointment, accurately weighed, to a 50-mL centrifuge tube. Add 9 mL of *Solvent* and 1.0 mL of *Internal standard solution*, shake, and centrifuge. The bottom layer is the *Assay preparation*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Isoflurophate*.

## Isoleucine

$C_6H_{13}NO_2$   
L-Isoleucine [73-32-5].

131.17

### DEFINITION

Isoleucine contains NLT 98.5% and NMT 101.5% of L-isoleucine ( $C_6H_{13}NO_2$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

### ASSAY

#### • PROCEDURE

**Sample:** 130 mg of Isoleucine

**Blank:** Mix 3 mL of formic acid and 50 mL of glacial acetic acid.

### Titrimetric system

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid VS

**Endpoint detection:** Potentiometric

**Analysis:** Dissolve the *Sample* in 3 mL of formic acid and 50 mL of glacial acetic acid. Titrate with the *Titrant*. Perform the *Blank* determination.

Calculate the percentage of isoleucine ( $C_6H_{13}NO_2$ ) in the *Sample* taken:

$$\text{Result} = \{(V_S - V_B) \times N \times F / W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = actual normality of the *Titrant* (mEq/mL)

$F$  = equivalency factor, 131.2 mg/mEq

$W$  = *Sample* weight (mg)

**Acceptance criteria:** 98.5%–101.5% on the dried basis

### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.3%

- **CHLORIDE AND SULFATE, Chloride** (221)

**Standard solution:** 0.50 mL of 0.020 N hydrochloric acid

**Sample:** 0.73 g of Isoleucine

**Acceptance criteria:** NMT 0.05%

- **CHLORIDE AND SULFATE, Sulfate** (221)

**Standard solution:** 0.10 mL of 0.020 N sulfuric acid

**Sample:** 0.33 g of Isoleucine

**Acceptance criteria:** NMT 0.03%

- **IRON** (241): NMT 30 ppm

- **HEAVY METALS, Method I** (231): NMT 15 ppm

### RELATED COMPOUNDS

**System suitability solution:** 0.4 mg/mL each of USP L-Isoleucine RS and USP L-Valine RS in 0.1 N hydrochloric acid

**Standard solution:** 0.05 mg/mL of USP L-Isoleucine RS in 0.1 N hydrochloric acid. [NOTE—This solution has a concentration equivalent to 0.5% of that of the *Sample solution*.]

**Sample solution:** 10 mg/mL of Isoleucine in 0.1 N hydrochloric acid

### Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 5  $\mu$ L

**Developing solvent system:** Butyl alcohol, glacial acetic acid, and water (3:1:1)

**Spray reagent:** 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)

### System suitability

**Suitability requirements:** The chromatogram of the *System suitability solution* exhibits two clearly separated spots.

### Analysis

**Samples:** *System suitability solution*, *Standard solution*, and *Sample solution*

After air-drying the plate, spray with *Spray reagent*, and heat between 100° and 105° for 15 min. Examine the plate under white light.

**Acceptance criteria:** Any secondary spot of the *Sample solution* is not larger or more intense than the principal spot of the *Standard solution*.

Individual impurities: NMT 0.5%  
Total impurities: NMT 2.0%

**SPECIFIC TESTS**

- **OPTICAL ROTATION**, *Specific Rotation* (781S)  
Sample solution: 40 mg/mL in 6 N hydrochloric acid  
Acceptance criteria: +38.9° to +41.8°
- **pH** (791)  
Sample solution: 10 mg/mL of solution  
Acceptance criteria: 5.5–7.0
- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 0.3% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)  
USP L-Isoleucine RS  
USP L-Valine RS

**Isometheptene Mucate**

(C<sub>9</sub>H<sub>19</sub>N)<sub>2</sub> · C<sub>6</sub>H<sub>10</sub>O<sub>8</sub> 492.65  
Isometheptene, galactarate (2:1) (salt).  
6-Methylamino-2-methylheptene, tetrahydroxyadipic acid  
(2:1) (salt) [7492-31-1].

» Isometheptene Mucate contains not less than 99.0 percent and not more than 103.0 percent of (C<sub>9</sub>H<sub>19</sub>N)<sub>2</sub> · C<sub>6</sub>H<sub>10</sub>O<sub>8</sub>, calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Isometheptene Mucate RS

**Identification**, *Infrared Absorption* (197K).

**pH** (791): between 6.0 and 7.5, in a solution (1 in 20).

**Loss on drying** (731)—Dry it at 60° for 18 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Assay**—Transfer about 500 mg of Isometheptene Mucate, accurately weighed, to a 125-mL conical flask. Add 25 mL of water, and swirl to dissolve. Add 45.0 mL of 0.1 N bromine VS, attach a 30-mL separator to the conical flask, and evacuate the system. Stir with a magnetic stirrer for 1 hour. Equilibrate the system to atmospheric pressure. Add 5 mL of hydrochloric acid to the separator, and allow 4 mL of it to enter the conical flask. Add 10 mL of potassium iodide TS to the separator, and allow the contents to pass into the conical flask. Immediately titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Perform a blank titration (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 0.1 N sodium thiosulfate is equivalent to 12.32 mg of (C<sub>9</sub>H<sub>19</sub>N)<sub>2</sub> · C<sub>6</sub>H<sub>10</sub>O<sub>8</sub>.

**Isometheptene Mucate, Dichloralphenazone, and Acetaminophen Capsules**

» Isometheptene Mucate, Dichloralphenazone, and Acetaminophen Capsules contain not less than 85.0 percent and not more than 110.0 percent of the labeled amounts of isometheptene mucate [(C<sub>9</sub>H<sub>19</sub>N)<sub>2</sub> · C<sub>6</sub>H<sub>10</sub>O<sub>8</sub>] and dichloralphenazone (C<sub>15</sub>H<sub>18</sub>Cl<sub>6</sub>N<sub>2</sub>O<sub>5</sub>), and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Acetaminophen RS

USP Dichloralphenazone RS

USP Isometheptene Mucate RS

**Identification**—The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those of the *Standard preparation* obtained as directed in the *Assay*.

**Dissolution** (711)—

*Medium:* water; 900 mL.

*Apparatus 1:* 100 rpm.

*Time:* 60 minutes.

Determine the amounts of acetaminophen, dichloralphenazone, and isometheptene mucate dissolved using the following method.

*Mobile phase and Chromatographic system*—Proceed as directed in the *Assay*.

*Standard preparation*—Prepare a solution in water containing about 0.0011 A mg of USP Acetaminophen RS, 0.0011 A/ mg of USP Dichloralphenazone RS, and 0.0011 A/ mg of USP Isometheptene Mucate RS per mL, A being the labeled amount, in mg, of acetaminophen per Capsule, / being the ratio of the labeled amount, in mg, of dichloralphenazone to the labeled amount, in mg, of acetaminophen per Capsule, and /' being the ratio of the labeled amount, in mg, of isometheptene mucate to the labeled amount, in mg, of acetaminophen per Capsule, and filter.

*Test preparation*—Filter about 20 mL of the solution under test through a glass fiber filter, discarding the first 15 mL of the filtrate.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* except to inject 100 µL, instead of 10 µL. Calculate the quantity, in mg, of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>), dichloralphenazone (C<sub>15</sub>H<sub>18</sub>Cl<sub>6</sub>N<sub>2</sub>O<sub>5</sub>), and isometheptene mucate [(C<sub>9</sub>H<sub>19</sub>N)<sub>2</sub> · C<sub>6</sub>H<sub>10</sub>O<sub>8</sub>] dissolved by the formula:

$$900C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the responses of the corresponding analyte peaks obtained from the *Test preparation* and the *Standard preparation*, respectively.

*Tolerances*—Not less than 65% (Q) of the labeled amounts of isometheptene mucate [(C<sub>9</sub>H<sub>19</sub>N)<sub>2</sub> · C<sub>6</sub>H<sub>10</sub>O<sub>8</sub>], dichloralphenazone (C<sub>15</sub>H<sub>18</sub>Cl<sub>6</sub>N<sub>2</sub>O<sub>5</sub>), and acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>) are dissolved after 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay—**

**Mobile phase**—Prepare a mixture of 0.07 M monobasic potassium phosphate, acetonitrile, 0.007 M sodium 1-decanesulfonate, and diethylamine (750:250:25:15). Adjust with phosphoric acid to a pH of 3.5. Filter and degas before use. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Chromatographic test solution**—Empty the contents of 1 Capsule into a 100-mL volumetric flask, add about 80 mL of water, and swirl to dissolve. Dilute with water to volume, and mix. Pass a portion of this solution through a glass-fiber filter, discarding the first 5 mL of the filtrate. [NOTE—Prepare this solution and chromatograph it as directed under *Chromatographic system* before preparing the *Standard preparation* and the *Assay preparation*.]

**Standard preparation**—Prepare a solution having known concentrations of about 3.25 mg of USP Acetaminophen RS, 3.25/ mg of USP Dichloralphenazone RS, and 3.25/ mg of USP Isometheptene Mucate RS per mL, / being the ratio of the labeled amount, in mg, of dichloralphenazone to the labeled amount, in mg, of acetaminophen per Capsule, and /' being the ratio of the labeled amount, in mg, of isometheptene mucate to the labeled amount, in mg, of acetaminophen per Capsule.

**Assay preparation**—Transfer 20 Capsules, accurately counted, to a 2000-mL volumetric flask, add about 1900 mL of water, and heat on a steam bath until the Capsules disintegrate. While still warm, shake by mechanical means for 15 minutes, sonicate for 15 minutes, and allow to cool to ambient temperature. Dilute with water to volume, and mix. Pass a portion of this mixture through a glass-fiber filter, discarding the first 5 mL of the filtrate.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a variable wavelength detector and a 4.6-mm × 25-cm column that contains 5-μm packing L7. The flow rate is about 1 mL per minute. Chromatograph 10 μL of the *Chromatographic test solution*, and record the chromatogram to confirm that all three analytes are detected and recorded acceptable levels of sensitivity. The wavelength and sensitivity settings are at 280 nm and 3.0 absorbance units full-scale until the acetaminophen peak has been recorded, then at 243 nm and 0.5 absorbance units full-scale until the dichloralphenazone peak has been recorded, and then at 190 nm and 0.5 absorbance units full-scale until the isometheptene mucate peak has been recorded. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections determined from each analyte peak is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>), dichloralphenazone (C<sub>15</sub>H<sub>18</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>5</sub>), and isometheptene mucate [(C<sub>9</sub>H<sub>19</sub>N)<sub>2</sub> · C<sub>6</sub>H<sub>10</sub>O<sub>8</sub>] in the portion of Capsules taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and  $r_U$  and  $r_S$  are the responses of the corresponding analyte peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isoniazid

C<sub>6</sub>H<sub>7</sub>N<sub>3</sub>O 137.14

4-Pyridinecarboxylic acid, hydrazide.

Isonicotinic acid hydrazide [54-85-3].

» Isoniazid contains not less than 98.0 percent and not more than 102.0 percent of C<sub>6</sub>H<sub>7</sub>N<sub>3</sub>O, calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** (11)—

USP Isoniazid RS

**Identification—**

**A: Infrared Absorption** (197K).

**B:** Transfer about 50 mg of it to a 500-mL volumetric flask, add water to volume, and mix. Transfer 10.0 mL of the resulting solution to a 100-mL volumetric flask, add 2.0 mL of 0.1 N hydrochloric acid, dilute with water to volume, and mix to obtain a 1 in 100,000 solution: the UV absorption spectrum of the solution so obtained exhibits maxima and minima only at the same wavelengths as that of a similar solution of USP Isoniazid RS, concomitantly measured.

**Melting range** (741): between 170° and 173°.

**pH** (791): between 6.0 and 7.5, in a solution (1 in 10).

**Loss on drying** (731)—Dry it at 105° for 4 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Heavy metals, Method II** (231): 0.002%.

**Assay—**

**Mobile phase**—Dissolve 4.4 g of docusate sodium in 600 mL of methanol, add 400 mL of water, adjust with 2 N sulfuric acid to a pH of 2.5, and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Isoniazid RS in *Mobile phase*, and quantitatively dilute with *Mobile phase* to obtain a solution having a known concentration of about 0.32 mg per mL.

**Assay preparation**—Transfer about 16 mg of Isoniazid, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the isoniazid peak is not less than 1800 theoretical plates; the tailing factor for the isoniazid peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of  $C_6H_7N_3O$  in the portion of Isoniazid taken by the formula:

$$50C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Isoniazid RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses of isoniazid obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isoniazid Injection

» Isoniazid Injection is a sterile solution of Isoniazid in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_6H_7N_3O$ .

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

**Labeling**—Its package label states that if crystallization has occurred, the Injection should be warmed to redissolve the crystals prior to use.

**USP Reference standards** (11)—

USP Isoniazid RS

USP Endotoxin RS

**Identification**—

**A:** The retention time exhibited by isoniazid in the chromatogram of the *Assay preparation* corresponds to that of isoniazid in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**B:** A volume of Injection, equivalent to about 50 mg of isoniazid, responds to *Identification test B* under *Isoniazid*.

**Bacterial endotoxins** (85)—It contains not more than 0.3 USP Endotoxin Unit per mg of isoniazid.

**pH** (791): between 6.0 and 7.0.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Isoniazid*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of isoniazid, to a 50-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix. Transfer 8.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Isoniazid*. Calculate the quantity, in mg, of  $C_6H_7N_3O$  in each mL of the Injection taken by the formula:

$$312.5(C / V)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Isoniazid RS in the *Standard preparation*;  $V$  is the volume, in mL, of Injection taken; and  $r_U$  and  $r_S$  are the peak responses of isoniazid obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isoniazid Oral Solution

» Isoniazid Oral Solution contains, in each 100 mL, not less than 0.93 g and not more than 1.10 g of isoniazid ( $C_6H_7N_3O$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Isoniazid RS

**Identification**—A volume of Oral Solution equivalent to about 50 mg of isoniazid meets the requirements of *Identification test B* under *Isoniazid*.

**Assay**—Transfer an accurately measured volume of Oral Solution, equivalent to about 100 mg of isoniazid, to a 100-mL beaker. Add 50 mL of a mixture of 1 part of potassium bromide in 10 parts of dilute hydrochloric acid (1 in 6), and proceed as directed under *Nitrite Titration* (451), beginning with "cool to 15°." Each mL of 0.1 M sodium nitrite is equivalent to 13.71 mg of isoniazid ( $C_6H_7N_3O$ ).

## Isoniazid Tablets

» Isoniazid Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of isoniazid ( $C_6H_7N_3O$ ).

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Isoniazid RS

**Identification**—

**A:** The retention time of the isoniazid peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** Transfer a portion of finely powdered Tablets, equivalent to about 50 mg of isoniazid, to a 500-mL volumetric flask. Add water to volume, mix, and filter a portion of the mixture. Proceed as directed in *Identification test B* under *Isoniazid*, beginning with "Transfer 10.0 mL of the resulting solution to a 100-mL volumetric flask."

**Dissolution** (711)—

*Medium:* 0.01 N hydrochloric acid; 900 mL.

*Apparatus 1:* 100 rpm.

*Time:* 45 minutes.

*Procedure*—Determine the amount of  $C_6H_7N_3O$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 263 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, in comparison with a Standard solution having a known concentration of USP Isoniazid RS in the same *Medium*.

*Tolerances*—Not less than 80% (Q) of the labeled amount of  $C_6H_7N_3O$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

*Procedure for content uniformity*—Transfer 1 finely powdered Tablet to a 500-mL volumetric flask with the aid of 200 mL of water. Shake by mechanical means for 30 minutes, add water to volume, and mix. Filter, and discard the first 20 mL of the filtrate. Dilute a portion of the filtrate quantitatively and stepwise, if necessary, with a 3 in 100 mixture of 0.1 N hydrochloric acid and water to obtain a solution containing about 10 µg per mL. Dissolve an accurately weighed quantity of USP Isoniazid RS in a volume of water corresponding to that used to dissolve a similar amount of isoniazid from the Tablet, and dilute quantitatively and stepwise, if necessary, with a 3 in 100 mixture of 0.1 N hydrochloric acid and water to obtain a Standard solution having a known concentration of about 10 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorb-

ance at about 263 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of isoniazid ( $C_6H_7N_3O$ ) in the Tablet taken by the formula:

$$(TC / D)(A_U / A_S)$$

in which  $T$  is the labeled quantity, in mg, of isoniazid in the Tablet;  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Isoniazid RS in the Standard solution;  $D$  is the concentration, in  $\mu\text{g}$  per mL, of isoniazid in the solution from the Tablet, based on the labeled quantity per Tablet and the extent of dilution; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Tablet and the Standard solution, respectively.

#### Assay—

**Buffer solution**—Prepare a 0.1 M monobasic potassium phosphate solution, adjust with 10 N sodium hydroxide to a pH of 6.9, add sufficient triethanolamine to obtain a solution having a known concentration of 0.2 mM of triethanolamine, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (95:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Isoniazid RS in *Mobile phase*, and dilute quantitatively, and stepwise, if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.32 mg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to 32 mg of isoniazid, to a 100-mL volumetric flask, add 40 mL of *Mobile phase*, and sonicate for 10 minutes. Cool to room temperature, dilute with *Mobile phase* to volume, and centrifuge for 5 minutes.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , is not less than 2.35; the column efficiency is not less than 1800 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of isoniazid ( $C_6H_7N_3O$ ) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Isoniazid RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isopropamide Iodide

$C_{23}H_{33}IN_2O$  480.43

Benzenepropanaminium,  $\gamma$ -(aminocarbonyl)- $N$ -methyl- $N$ , $N$ -bis(1-methylethyl)- $\gamma$ -phenyl-, iodide.

(3-Carbamoyl-3,3-diphenylpropyl)diisopropylmethylammonium iodide [71-81-8].

» Isopropamide Iodide, dried in vacuum at 60° for 2 hours, contains not less than 98.0 percent and not more than 101.0 percent of  $C_{23}H_{33}IN_2O$ .

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

#### USP Reference standards <11>—

USP Isopropamide Iodide RS

#### Identification—

**A: Infrared Absorption** <197K>.

**B:** To 5 mL of a solution (1 in 1000) add 5 mL of sodium carbonate solution (1 in 100), 0.5 mL of bromophenol blue TS, and 10 mL of chloroform, and shake for several minutes: the chloroform layer becomes an intense blue in color.

**C:** A solution (1 in 1000) responds to the tests for *Iodide* <191>.

**Loss on drying** <731>—Dry it in vacuum at 60° for 2 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** <281>: not more than 0.5%, after ignition at  $550 \pm 25^\circ$  for 4 hours.

**Heavy metals, Method II** <231>: 0.002%.

#### Ordinary impurities <466>—

**Test solution:** methanol.

**Standard solution:** methanol.

**Eluant:** a mixture of methanol, glacial acetic acid, and water (8:1:1).

**Visualization:** 2.

**Assay**—Dissolve about 750 mg of Isopropamide Iodide, previously dried and accurately weighed, in 60 mL of glacial acetic acid, add 15 mL of mercuric acetate TS and crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 48.04 mg of  $C_{23}H_{33}IN_2O$ .

## Isopropamide Iodide Tablets

» Isopropamide Iodide Tablets contain an amount of isopropamide iodide ( $C_{23}H_{33}IN_2O$ ) equivalent to not less than 93.0 percent and not more than 107.0 percent of the labeled amount of isopropamide ( $C_{23}H_{33}N_2O$ ).

**Packaging and storage**—Preserve in well-closed containers.

#### USP Reference standards <11>—

USP Isopropamide Iodide RS

**Identification**—Triturate a portion of powdered Tablets, equivalent to about 10 mg of isopropamide, with 10 mL of water, and filter: the filtrate responds to *Identification* tests B and C under *Isopropamide Iodide*.

#### Dissolution <711>—

**Medium:** water; 500 mL.

**Apparatus 2:** 100 rpm.

**Time:** 60 minutes.

**Procedure**—Determine the amount of isopropamide ( $C_{23}H_{33}N_2O$ ) dissolved from UV absorbances at the wavelength of maximum absorbance at about 258 nm of filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Isopropamide Iodide RS in the same medium.

**Tolerances**—Not less than 70% (Q) of the labeled amount of  $C_{23}H_{33}N_2O$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Procedure for content uniformity**—Crush and transfer 1 Tablet to a 100-mL volumetric flask with the aid of about 50 mL of water, and shake by mechanical means for 30 minutes. Dilute with water to volume, mix, and filter, discarding the first 20 mL of the filtrate. Concomitantly determine the absorbances of this solution and a Standard solution of USP Isopropamide Iodide RS in the same medium having a known concentration of about 70  $\mu\text{g}$  per mL, in 5-cm cells at 280 nm and at the wavelength of maximum absorbance at about 258 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of isopropamide ( $C_{23}H_{33}N_2O$ ) in the Tablet taken by the formula:

$$(353.53 / 480.43)(TC / D)[(A_{U258} - A_{U280}) / (A_{S258} - A_{S280})]$$

in which 353.53 and 480.43 are the molecular weights of isopropamide and isopropamide iodide, respectively;  $T$  is the labeled quantity, in mg, of isopropamide in the Tablet;  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Isopropamide Iodide RS in the Standard solution;  $D$  is the concentration, in  $\mu\text{g}$  per mL, of isopropamide in the test solution, based upon the labeled quantity per Tablet and the extent of dilution; and  $A_U$  and  $A_S$  are the absorbances of the test solution and the Standard solution, respectively, at the wavelengths indicated by the subscripts.

#### Assay—

**Ion-exchange column**—Insert a small pledget of glass wool in the bottom of a 6-mm  $\times$  240-mm glass tube fitted with a stopcock, fill the tube with water, and add an aqueous slurry of a suitable anion-exchange resin, chloride form (soaked in water for not less than 24 hours prior to use), until a height of about 200 mm is reached. Wash the column with 50 mL of water, and use without delay.

**Standard preparation**—Transfer about 135 mg of USP Isopropamide Iodide RS, accurately weighed, to a 250-mL volumetric flask, and dissolve in 150 mL of water. Add 5 mL of aluminum chloride solution (1 in 10) and 2 mL of ammonium hydroxide, then dilute with water to volume, mix, and filter, discarding the first 15 mL of the filtrate. Use the subsequent filtrate as directed for *Procedure*.

**Assay preparation**—Weigh and finely powder not less than 25 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of isopropamide, to a 250-mL volumetric flask, add 150 mL of water, and shake by mechanical means for 60 minutes. Add 5 mL of aluminum chloride solution (1 in 10) and 2 mL of ammonium hydroxide, dilute with water to volume, mix, and filter, discarding the first 15 mL of the filtrate. Use the subsequent filtrate as directed for *Procedure*.

**Procedure**—Pipet 50.0 mL each of the *Standard preparation* and the *Assay preparation*, respectively, onto separate ion-exchange columns, and collect the eluates in separate 200-mL volumetric flasks. Regulate the flow of effluent so that it does not exceed 40 drops per minute, and when the liquid level reaches the top of each column, add successively two 5-mL portions and one 10-mL portion of water to each column, allowing each portion just to enter the column before adding the next portion of water. After the eluates have been collected, dilute the contents of each flask with water to volume, and mix. Concomitantly determine the absorbances of the solutions in 5-cm cells at 280 nm and at the maximum at about 258 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in

mg, of isopropamide ( $C_{23}H_{33}N_2O$ ) in the portion of Tablets taken by the formula:

$$(353.53 / 480.43)(0.25C)[(A_{U258} - A_{U280}) / (A_{S258} - A_{S280})]$$

in which 353.53 and 480.43 are the molecular weights of isopropamide and isopropamide iodide, respectively;  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Isopropamide Iodide RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively, at the wavelengths indicated by the subscripts.

## Isopropyl Alcohol

$C_3H_8O$

2-Propanol;

Isopropyl alcohol [67-63-0].

60.10

#### DEFINITION

Isopropyl Alcohol contains NLT 99.0% of isopropyl alcohol ( $C_3H_8O$ ).

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197F)

#### ASSAY

- **PROCEDURE**

**Sample:** Isopropyl Alcohol

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Thermal conductivity

**Column:** 6.4-mm (OD)  $\times$  1.8-m stainless steel packed with 10% liquid phase G20 on support S1A

**Column temperature:** 55°

**Carrier gas:** Helium

**Flow rate:** 45 mL/min

**Injection volume:** 5  $\mu\text{L}$

**Analysis**

**Sample:** *Sample*

[NOTE—The relative retention times of some of the possible components, when present, are listed in *Table 1*.]

**Table 1**

Name	Relative Retention Time
Air	0.09
Diethyl ether	0.14
Diisopropyl ether	0.17
Acetone	0.37
Isopropyl alcohol	1.00
2-Butanol	1.64
<i>n</i> -Propyl alcohol	1.86
Water	3.14

Calculate the percentage of isopropyl alcohol ( $C_3H_8O$ ) in the *Sample* taken:

$$\text{Result} = (r_U / r_T) \times 100$$

$r_U$  = peak response of isopropyl alcohol  
 $r_T$  = sum of all the peak responses

Acceptance criteria: NLT 99.0%

#### SPECIFIC TESTS

- **SPECIFIC GRAVITY** <841>: 0.783–0.787
- **REFRACTIVE INDEX** <831>: 1.376–1.378 at 20°
- **LIMIT OF NONVOLATILE RESIDUE**

Sample: 50 mL

**Analysis:** Evaporate the *Sample* in a tared porcelain dish on a steam bath to dryness, and heat at 105° for 1 h.

**Acceptance criteria:** NMT 2.5 mg (0.005%)

- **ACIDITY**

**Sample solution:** To 50 mL of Isopropyl Alcohol add 100 mL of carbon dioxide-free water.

**Analysis:** To the *Sample solution* add 2 drops of phenolphthalein TS, and titrate with 0.020 N sodium hydroxide to a pink color that persists for 30 s.

**Acceptance criteria:** NMT 0.70 mL of 0.020 N sodium hydroxide is required for neutralization.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, remote from heat.
- **USP REFERENCE STANDARDS** <11>  
USP 2-Propanol RS

### Azeotropic Isopropyl Alcohol

#### DEFINITION

Azeotropic Isopropyl Alcohol contains NLT 91.0% and NMT 93.0% of isopropyl alcohol, by volume, the remainder consisting of water.

#### IDENTIFICATION

- **A. INFRARED ABSORPTION:** The IR absorption spectrum of a thin film of it exhibits a strong broad band at 3.0  $\mu\text{m}$ ; a strong region of absorption between 3.35 and 3.5  $\mu\text{m}$ , with its highest peak at 3.36  $\mu\text{m}$ , and others at 3.41 and 3.47  $\mu\text{m}$ ; many weak peaks between 3.6 and 6.0  $\mu\text{m}$ , among the most noticeable being those at 3.68, 3.77, 3.97, 4.17, and 5.26  $\mu\text{m}$ ; a broad band at 6.2  $\mu\text{m}$ ; a strong region of absorption between 6.7 and 7.8  $\mu\text{m}$ , the most prominent features being the peaks at 6.80, 7.09, 7.25 (the highest), 7.46, and 7.63  $\mu\text{m}$ ; a strong region of absorption between 8.5 and 9.2  $\mu\text{m}$ , peaking at 8.6, 8.85, and 9.0  $\mu\text{m}$ ; and strong peaks at 10.5 and 12.3  $\mu\text{m}$ .

#### IMPURITIES

- **LIMIT OF NONVOLATILE RESIDUE**

Sample: 50 mL

**Analysis:** Evaporate the *Sample* in a tared porcelain dish on a steam bath to dryness, and heat at 105° for 1 h.

**Acceptance criteria:** The weight of the residue does not exceed 2.5 mg (0.005%).

- **VOLATILE IMPURITIES**

**System suitability solution:** USP 2-Propanol System Suitability RS

**Sample solution:** Azeotropic Isopropyl Alcohol (Neat) Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Thermal conductivity

**Column:** 0.25-mm  $\times$  60-m, coated with a 1.4- $\mu\text{m}$  film of phase G43

**Temperature**

**Injector:** 150°

**Detector:** 200°

**Column:** See *Table 1*.

**Table 1**

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
35	0	35	5
35	1	45	2
45	10	100	1

**Carrier gas:** Helium

**Linear velocity:** 35 cm/s

**Injection size:** 1  $\mu\text{L}$

**Split ratio:** 10:1

**Run time:** 30 min

**System suitability**

**Sample:** *System suitability solution*

[NOTE—Approximate relative retention times for ethyl ether, acetone, isopropyl alcohol, diisopropyl ether, 1-propanol, and 2-butanol are 0.6, 0.7, 1.0, 1.1, 1.3, and 1.5, respectively.]

**Suitability requirements**

**Resolution:** NLT 1.5 between acetone and isopropyl alcohol

**Signal-to-noise ratio:** NLT 10 for any of the following peaks: ethyl ether, acetone, isopropyl alcohol, diisopropyl ether, 1-propanol, and 2-butanol

**Tailing factor:** NMT 2.0 for the isopropyl alcohol peak

**Relative standard deviation:** NMT 2.0% for the isopropyl alcohol peak

**Analysis**

**Samples:** *Sample solution*

Calculate the ratio of isopropyl alcohol ( $\text{C}_3\text{H}_8\text{O}$ ) in the portion of Azeotropic Isopropyl Alcohol taken:

$$\text{Result} = (r_i/r_T)$$

$r_i$  = peak area for isopropyl alcohol

$r_T$  = sum of all of the peak areas excluding the peak for water

**Acceptance criteria:** NLT 0.99

#### SPECIFIC TESTS

- **SPECIFIC GRAVITY** <841>: 0.815–0.810, indicating 91.0%–93.0% of isopropyl alcohol ( $\text{C}_3\text{H}_8\text{O}$ ) by volume
- **REFRACTIVE INDEX** <831>: 1.376–1.378 at 20°
- **ACIDITY**

**Sample:** 50 mL

**Analysis:** Place the *Sample* in a suitable flask, and add 100 mL of carbon dioxide-free water. Add 2 drops of phenolphthalein TS, and titrate with 0.020 N sodium hydroxide to a pink color that persists for 30 s.

**Acceptance criteria:** NMT 0.70 mL of 0.020 N sodium hydroxide is required for neutralization.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, remote from heat.
- **USP REFERENCE STANDARDS** <11>  
USP 2-Propanol System Suitability RS  
It contains 0.1% of each of the following: ethyl ether, acetone, isopropyl alcohol, diisopropyl ether, 1-propanol, and 2-butanol.

## Isopropyl Rubbing Alcohol

» Isopropyl Rubbing Alcohol contains not less than 68.0 percent and not more than 72.0 percent of isopropyl alcohol, by volume, the remainder consisting of water, with or without suitable stabilizers, perfume oils, and color additives certified by the FDA for use in drugs.

**Packaging and storage**—Preserve in tight containers, remote from heat.

**Labeling**—Label it to indicate that it is flammable.

**Specific gravity** (841): between 0.872 and 0.883 at 20°.

**Acidity**—Transfer 50 mL to a suitable flask, and add about 75 mL of carbon dioxide-free water. Titrate potentiometrically to a pH of 8.5: not more than 1.0 mL of 0.020 N sodium hydroxide is required for neutralization.

**Limit of nonvolatile residue**—Evaporate 50 mL to dryness in a tared porcelain dish on a steam bath, and dry at 105° for 1 hour: the weight of the residue does not exceed 5 mg (0.01%).

**Assay**—Transfer 50.0 mL of Isopropyl Rubbing Alcohol to a 250-mL distilling flask, and add 100 mL of water. Arrange the flask for distillation, distil, and collect 95 mL of distillate in a 100-mL volumetric flask. Dilute to volume with water, mix, and determine the specific gravity of the distillate at 25° (see *Specific Gravity* (841)). The specific gravity is between 0.955 and 0.950, corresponding to between 68.0% and 72.0% of isopropyl alcohol in the specimen taken.

## Isoproterenol Hydrochloride

$C_{11}H_{17}NO_3 \cdot HCl$  247.72

1,2-Benzenediol, 4-[1-hydroxy-2-

[(1-methylethyl)amino]ethyl]-, hydrochloride.

3,4-Dihydroxy- $\alpha$ -[(isopropylamino)methyl]benzyl alcohol hydrochloride [51-30-9].

» Isoproterenol Hydrochloride contains not less than 97.0 percent and not more than 101.5 percent of  $C_{11}H_{17}NO_3 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Isoproterenol Hydrochloride RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 50  $\mu$ g per mL.

*Medium:* water.

**Melting range** (741): between 165° and 170°.

**Loss on drying** (731)—Dry about 1 g, accurately weighed, in vacuum over phosphorus pentoxide for 4 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Sulfate** (221)—A 0.10-g portion shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid (0.2%).

**Limit of isoproterenone**—Its absorptivity (see *Spectrophotometry and Light-scattering* (851)) at 310 nm, determined in a solution containing 2 mg per mL, is not more than 0.2.

**Chloride content**—Dissolve about 500 mg, accurately weighed, in 5 mL of water. Add 5 mL of glacial acetic acid and 40 mL of methanol. Add eosin Y TS, and titrate with 0.1 N silver nitrate VS. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl. Between 13.9% and 14.6% of Cl is found, calculated on the dried basis.

**Assay**—

**Standard preparation**—Dissolve an accurately weighed quantity of USP Isoproterenol Hydrochloride RS in freshly prepared sodium bisulfite solution (3 in 1000) to obtain a solution having a concentration of about 2.5 mg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with 0.17 N acetic acid to volume, and mix to obtain a solution having a known concentration of about 250  $\mu$ g per mL.

**Assay preparation**—Transfer about 125 mg of Isoproterenol Hydrochloride, accurately weighed, to a 25-mL volumetric flask, dissolve in sodium bisulfite solution (3 in 1000), dilute with sodium bisulfite solution to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with 0.17 N acetic acid to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 278-nm detector and a 30-cm  $\times$  4-mm stainless steel column that contains packing L1. The mobile phase is 0.17 N acetic acid having a flow rate of about 1.5 mL per minute. Chromatograph five replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 3.0%.

**Procedure**—Using a microsyringe or sampling valve, chromatograph 10  $\mu$ L of the *Standard preparation*, and adjust the specimen size and other operating parameters, if necessary, until satisfactory chromatography and peak responses are obtained. Chromatograph equal volumes of the *Standard preparation* and the *Assay preparation*, and measure the peak responses. Calculate the quantity, in mg, of  $C_{11}H_{17}NO_3 \cdot HCl$  in the portion of Isoproterenol Hydrochloride taken by the formula:

$$0.5C(h_U / h_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Isoproterenol Hydrochloride RS in the *Standard preparation*; and  $h_U$  and  $h_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isoproterenol Inhalation Solution

» Isoproterenol Inhalation Solution is a sterile solution of Isoproterenol Hydrochloride in Purified Water. It may contain Sodium Chloride. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of isoproterenol hydrochloride ( $C_{11}H_{17}NO_3 \cdot HCl$ ).

**Packaging and storage**—Preserve in small, tight containers that are well-filled or otherwise protected from oxidation. Protect from light.

**Labeling**—Label it to indicate that the Inhalation Solution is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

**USP Reference standards** (11)—  
USP Isoproterenol Hydrochloride RS**Color and clarity**—

**Standard solution**—Transfer 2.0 mL of 0.100 N iodine VS to a 500-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Visually examine a portion of the Inhalation Solution (*Test solution*) in a suitable clear glass test tube against a white background: it is not pinkish and it contains no precipitate. If any yellow color is observed in the *Test solution*, concomitantly determine the absorbances of the *Test solution* and the *Standard solution* in 1-cm cells with a suitable spectrophotometer set at 460 nm: the absorbance of the *Test solution* does not exceed that of the *Standard solution*.

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* obtained as directed in the *Assay*.

**Sterility** (71): meets the requirements.

**pH** (791): between 2.5 and 5.5.

**Assay**—

**Standard preparation**—Prepare as directed in the *Assay* under *Isoproterenol Hydrochloride*.

**Assay preparation**—Transfer an accurately measured volume of Inhalation Solution, equivalent to about 25 mg of isoproterenol hydrochloride, to a 100-mL volumetric flask, dilute with 0.17 N acetic acid solution to volume, and mix.

**Chromatographic system**—Proceed as directed in the *Assay* under *Isoproterenol Hydrochloride*.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Isoproterenol Hydrochloride*. Calculate the quantity, in mg, of  $C_{11}H_{17}NO_3 \cdot HCl$  in each mL of the Inhalation Solution taken by the formula:

$$0.1(C/V)(h_u / h_s)$$

in which *V* is the volume, in mL, of Inhalation Solution taken; and *C*, *h<sub>u</sub>*, and *h<sub>s</sub>* are as defined therein.

**Isoproterenol Hydrochloride Inhalation Aerosol**

» Isoproterenol Hydrochloride Inhalation Aerosol is a solution of Isoproterenol Hydrochloride in Alcohol in an inert propellant base. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of isoproterenol hydrochloride ( $C_{11}H_{17}NO_3 \cdot HCl$ ).

**Packaging and storage**—Preserve in small, nonreactive, light-resistant aerosol containers equipped with metered-dose valves and provided with oral inhalation actuators.

**USP Reference standards** (11)—  
USP Isoproterenol Hydrochloride RS**Identification**—

**A:** Place 10 mL of water in a small beaker, and deliver 10 sprays from the Inhalation Aerosol under the surface of the water, actuating the valve by pressing the stem tip against the bottom of the beaker. Filter, place 5 mL of the filtrate in a test tube, and retain the remainder of the solution for *Identification test B*. Add 1 drop of 0.2 N sulfuric acid and 0.5 mL of 0.1 N iodine, allow to stand for 5 minutes, and add 1 mL of 0.1 N sodium thiosulfate: a salmon-pink color is produced.

**B:** Dilute the remainder of the filtrate obtained in *Identification test A* with an equal volume of water. Add a few

drops of 6 N ammonium hydroxide, filter, acidify the filtrate with nitric acid, and divide into two equal portions. To each portion add a few drops of silver nitrate TS: white precipitates are formed. To one portion add a slight excess of nitric acid: the white precipitate remains. To the other portion add a slight excess of 6 N ammonium hydroxide, and shake: the precipitate dissolves.

**Alcohol content** (611)—Weigh accurately a filled Inhalation Aerosol container, and record the weight. Place the container in a dry ice-alcohol bath, and cool for 60 minutes. Remove the container from the bath, and carefully remove the valve with wire cutters, taking precautions to save all pieces of the valve and cap. With the aid of three 5-mL portions of water, transfer the contents of the container to a beaker previously chilled in the bath. Dry the rinsed empty container and all of its parts in an oven at 105° for 2 hours, cool, and weigh. Calculate the weight of the container contents. Add a few boiling chips to the beaker, and carefully stir to help evaporate the propellant. After the bulk of the propellant has evaporated, transfer the contents of the beaker, with the aid of several mL of water, to a glass-stoppered graduated cylinder, measure the volume, and determine the alcohol content of the *Test solution* thus prepared by the gas-liquid chromatographic procedure, methyl ethyl ketone being used as the internal standard. Calculate the alcohol content of the Inhalation Aerosol taken by the formula:

$$SV / W$$

in which *S* is the percentage of alcohol (w/v) in the *Test solution*; *V* is the volume, in mL, of the *Test solution*; and *W* is the weight, in g, of the container contents: between 28.5% and 38.5% (w/w) of  $C_2H_5OH$  is found.

**Dose uniformity over the entire contents:** meets the requirements for *Metered-Dose Inhalers* under *Aerosols*, *Nasal Sprays*, *Metered-Dose Inhalers*, and *Dry Powder Inhalers* (601).

**PROCEDURE FOR DOSE UNIFORMITY**—

**Ferro-citrate solution and Buffer solution**—Prepare as directed under *Epinephrine Assay* (391).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Isoproterenol Hydrochloride RS in a freshly prepared sodium bisulfite solution (1 in 500), and dilute quantitatively and stepwise with the same sodium bisulfite solution as necessary to obtain a solution having a known concentration of about 6 µg per mL.

**Test preparation**—Discharge the minimum recommended dose into the sampling apparatus and detach the inhaler as directed. Rinse the apparatus (filter and interior) with four 5.0-mL portions of a freshly prepared sodium bisulfite solution (1 in 500), and transfer the resulting solutions quantitatively to a 50-mL centrifuge tube. Add 10 mL of chloroform, insert the stopper, shake vigorously for 1 minute, and centrifuge. Use the clear supernatant as directed for *Procedure*.

**Procedure**—Into three separate flasks, transfer the *Test preparation*, 20.0 mL of the *Standard preparation*, and 20.0 mL of water to provide the blank. To each flask add 100 µL of *Ferro-citrate solution* followed by 1.0 mL of *Buffer solution*, and mix. Concomitantly determine the absorbances with a suitable spectrophotometer, in 5-cm cells, of the solutions from the *Test preparation* and the *Standard preparation*, at the wavelength of maximum absorbance at about 530 nm, against the blank. Calculate the quantity, in µg, of  $C_{11}H_{17}NO_3 \cdot HCl$  contained in the minimum dose taken by the formula:

$$20CN (A_u / A_s)$$

in which *C* is the concentration, in µg per mL, of USP Isoproterenol Hydrochloride RS in the *Standard preparation*; *N* is the number of sprays discharged to obtain the minimum dose; and *A<sub>u</sub>* and *A<sub>s</sub>* are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively.

**Assay—**

*Ferro-citrate Solution, Buffer Solution, and Standard preparation*—Prepare as directed under *Unit spray content*.

*Assay preparation*—Fit the Inhalation Aerosol container with its inhalation actuator, and prime the unit by firing it 10 times. Remove the actuator, and accurately weigh the container with its remaining contents. Invert the container, place the valve stem tip against the bottom of a 100-mL beaker containing 20 mL of chloroform, and deliver under the surface of the chloroform a number of sprays equivalent to about 500 µg of isoproterenol hydrochloride. Raise the unit above the contents of the beaker, and wash the valve stem with about 2 mL of chloroform. Collect the washings in the beaker. Allow the valve stem to dry, and again accurately weigh the Inhalation Aerosol container with its remaining contents. Record the weight of the expelled specimen. Transfer the contents of the beaker to a centrifuge tube with the aid of two 3-mL portions of chloroform, add 10.0 mL of freshly prepared sodium bisulfite solution (1 in 500), and shake vigorously for 1 minute. Centrifuge, and use the clear supernatant as directed for *Procedure*.

*Procedure*—Into three separate test tubes, pipet 5 mL each of the *Assay preparation*, *Standard preparation*, and water to provide the blank, respectively. To each tube add 100 µL of *Ferro-citrate Solution*, followed by 1.0 mL of *Buffer Solution*, and mix. Determine the absorbances of the *Assay preparation* and the *Standard preparation* at the wavelength of maximum absorbance at about 530 nm, against the blank. Calculate the percentage (w/w) of  $C_{11}H_{17}NO_3 \cdot HCl$  in the portion of Inhalation Aerosol taken by the formula:

$$0.001(C/W)(A_U/A_S)$$

in which *C* is the concentration, in µg per mL, of USP Isoproterenol Hydrochloride RS in the *Standard preparation*; *W* is the weight, in g, of Inhalation Aerosol taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Isoproterenol Hydrochloride Injection

» Isoproterenol Hydrochloride Injection is a sterile solution of Isoproterenol Hydrochloride in Water for Injection. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of isoproterenol hydrochloride ( $C_{11}H_{17}NO_3 \cdot HCl$ ).

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass, protected from light. Store at controlled room temperature.

**Labeling**—Label it to indicate that the Injection is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Isoproterenol Hydrochloride RS

**Color and clarity**—Using the Injection as the *Test solution*, proceed as directed for *Color and clarity* under *Isoproterenol Inhalation Solution*.

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 1250.0 USP Endotoxin Units per mg of isoproterenol hydrochloride.

**pH** (791): between 2.5 and 4.5.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay—**

*Mobile phase*—Dissolve 1.76 g of sodium 1-heptanesulfonate in 800 mL of water. Add 200 mL of methanol, and adjust with 1 M phosphoric acid to a pH of  $3.0 \pm 0.1$ . Pass the solution through a membrane filter having a 1-µm or finer porosity.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Isoproterenol Hydrochloride RS in freshly prepared sodium bisulfite solution (1 in 1000) to obtain a solution having a known concentration of about 20 µg per mL.

*Resolution solution*—Prepare a solution of epinephrine bitartrate in freshly prepared *Mobile phase* containing 1.0% of sodium bisulfite, having a concentration of about 200 µg per mL. Mix 2.0 mL of this solution and 18.0 mL of the *Standard preparation*.

*Assay preparation*—Quantitatively dilute an accurately measured volume of Injection with freshly prepared sodium bisulfite solution (1 in 1000) to obtain a solution having a concentration of about 20 µg per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%. Chromatograph the *Resolution solution*: the relative retention times are about 0.55 for epinephrine and 1.0 for isoproterenol; the resolution, *R*, for epinephrine and isoproterenol is not less than 3.5; and the tailing factors for the epinephrine and isoproterenol peaks are not more than 2.5.

*Procedure*—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation*, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of isoproterenol hydrochloride ( $C_{11}H_{17}NO_3 \cdot HCl$ ) in each mL of the Injection taken by the formula:

$$C(L/D)(r_U/r_S)$$

in which *C* is the concentration, in µg per mL, of USP Isoproterenol Hydrochloride RS in the *Standard preparation*; *L* is the labeled quantity, in µg per mL, of isoproterenol hydrochloride in the Injection; *D* is the concentration, in µg per mL, of isoproterenol hydrochloride in the *Assay preparation*, on the basis of the labeled quantity in each mL and the extent of dilution; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isoproterenol Hydrochloride Tablets

» Isoproterenol Hydrochloride Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of  $C_{11}H_{17}NO_3 \cdot HCl$ .

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Isoproterenol Hydrochloride RS

**Identification**—Powder a number of Tablets, equivalent to about 50 mg of isoproterenol hydrochloride, digest with 15 mL of hot dehydrated alcohol for 20 minutes, cool, filter, and evaporate the filtrate on a steam bath to dryness: the residue responds to the *Identification* tests under *Isoproterenol Hydrochloride*.

**Dissolution** <711>—

*Medium*: water; 900 mL.

*Apparatus 2*: 50 rpm.

*Time*: 45 minutes.

*Procedure*—Determine the amount of  $C_{11}H_{17}NO_3 \cdot HCl$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 279 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Isoproterenol Hydrochloride RS in the same medium.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{11}H_{17}NO_3 \cdot HCl$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

*Procedure for content uniformity*—Crush 1 Tablet, and transfer it with the aid of 25 mL of water to a 50-mL volumetric flask. Shake gently until no more dissolves, add water to volume, and mix. Filter through a dry filter into a dry flask, rejecting the first 20 mL of the filtrate. Transfer a portion of the filtrate, equivalent to about 2.5 mg of isoproterenol hydrochloride and accurately measured, to a 50-mL volumetric flask, dilute with water to volume, and mix. Dissolve an accurately weighed quantity of USP Isoproterenol Hydrochloride RS in water, and dilute quantitatively and stepwise with water to obtain a Standard solution having a known concentration of about 50 µg per mL. Concomitantly and without delay, determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 279 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of  $C_{11}H_{17}NO_3 \cdot HCl$  in the Tablet taken by the formula:

$$2.5(C/V)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Isoproterenol Hydrochloride RS in the Standard solution; V is the volume, in mL, of the filtrate taken; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Tablet and the Standard solution, respectively.

**Assay**—

*Mobile phase*—Adjust 0.1 M sodium sulfate with phosphoric acid to a pH of 3.0. Mix 90 parts of this solution with 10 parts of methanol.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Isoproterenol Hydrochloride RS in 0.1 N sulfuric acid, and dilute quantitatively and stepwise with the same solvent to obtain a solution having a known concentration of about 0.1 mg per mL.

*Assay preparation*—Weigh and finely powder not less than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 10 mg of isoproterenol hydrochloride, and transfer with the aid of 50 mL of 0.1 N sulfuric acid to a 100-mL volumetric flask. Shake gently until no more dissolves, dilute with the same solvent to volume, and mix. Filter through a dry filter into a dry flask, rejecting the first 20 mL of the filtrate.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph three replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into

the chromatograph by means of a suitable microsyringe or sampling valve, record the chromatograms, and measure the responses for the major peaks. The retention time is about 3.5 minutes for isoproterenol. Calculate the quantity, in mg, of  $C_{11}H_{17}NO_3 \cdot HCl$  in the portion of Tablets taken by the formula:

$$100C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Isoproterenol Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isoproterenol Hydrochloride and Phenylephrine Bitartrate Inhalation Aerosol

» Isoproterenol Hydrochloride and Phenylephrine Bitartrate Inhalation Aerosol is a suspension of microfine Isoproterenol Hydrochloride and Phenylephrine Bitartrate in suitable propellants in a pressurized container. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of isoproterenol hydrochloride ( $C_{11}H_{17}NO_3 \cdot HCl$ ) and phenylephrine bitartrate ( $C_9H_{13}NO_2 \cdot C_4H_6O_6$ ).

**Packaging and storage**—Preserve in small, nonreactive, light-resistant aerosol containers equipped with metered-dose valves and provided with oral inhalation actuators.

**USP Reference standards** <11>—

USP Isoproterenol Hydrochloride RS  
USP Phenylephrine Hydrochloride RS

**Identification**—

**A:** Place 10 mL of water in a small beaker, and deliver 20 sprays from the Aerosol under the surface of the water, actuating the valve by pressing the tip against the bottom of the beaker. To 5 mL of the solution add 1 drop of dilute sulfuric acid (1 in 200), add 0.5 mL of 0.1 N iodine, allow to stand for 5 minutes, and add 1 mL of 0.1 N sodium thiosulfate: a red-brown color is produced.

**B:** To the balance of the solution obtained in *Identification* test A add 3 mL of *Mercuric sulfate solution*, prepared as directed in the test for *Dose uniformity over the entire contents*. Heat on a steam bath for 5 minutes, cool, and add 3 mL of sodium nitrite solution (1 in 80): a deep red color is produced.

**Dose uniformity over the entire contents:** meets the requirements for *Metered-Dose Inhalers* under *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* <601>.

**PROCEDURE FOR DOSE UNIFORMITY**—

*Ferro-citrate solution and Buffer solution*—Prepare as directed under *Epinephrine Assay* <391>.

*Mercuric sulfate solution*—While stirring a mixture of 15 g of yellow mercuric oxide and 80 mL of water, slowly add 20 mL of sulfuric acid, and stir until completely dissolved.

*Isoproterenol hydrochloride standard preparation*—Dissolve an accurately weighed quantity of USP Isoproterenol Hydrochloride RS in dilute sulfuric acid (1 in 1000), and dilute quantitatively and stepwise with the same dilute sulfuric acid as necessary to obtain a solution having a known concentration of about 8 µg per mL.

*Phenylephrine hydrochloride standard preparation*—Dissolve an accurately weighed quantity of USP Phenylephrine Hydrochloride RS in dilute sulfuric acid (1 in 1000), and dilute quantitatively and stepwise with the same dilute sulfuric

acid as necessary to obtain a solution having a known concentration of about 12 µg per mL.

**Test preparation for isoproterenol hydrochloride**—Discharge the minimum recommended dose into the sampling apparatus, and detach the inhaler as directed. Rinse the apparatus (filter and interior) with four 5.0-mL portions of dilute sulfuric acid (1 in 1000), and transfer the resulting solutions quantitatively to a 50-mL centrifuge tube. Add 10 mL of chloroform, insert the stopper, shake vigorously for 1 minute, and centrifuge for 20 minutes. Use the clear supernatant as directed in the *Procedure for isoproterenol hydrochloride*.

**Test preparation for phenylephrine bitartrate**—Proceed as directed for *Test preparation for isoproterenol hydrochloride* and use the clear supernatant as directed in the *Procedure for phenylephrine bitartrate*.

**Procedure for isoproterenol hydrochloride**—Into three separate flasks transfer the *Test preparation for isoproterenol hydrochloride*, 20.0 mL of the *Isoproterenol hydrochloride standard preparation*, and 20.0 mL of dilute sulfuric acid (1 in 1000) to provide the blank. To each flask add 100 µL of *Ferro-citrate solution* and 1.0 mL of *Buffer solution*, and mix. Concomitantly determine the absorbances of the *Test preparation* and the *Standard preparation* against the blank at the wavelength of maximum absorbance at about 530 nm, in 5-cm cells, with a suitable spectrophotometer. Calculate the quantity, in µg, of  $C_{11}H_{17}NO_3 \cdot HCl$  contained in the minimum dose taken by the formula:

$$20CN(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Isoproterenol Hydrochloride RS in the *Isoproterenol hydrochloride standard preparation*; N is the number of sprays discharged to obtain the minimum dose; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively.

**Procedure for phenylephrine bitartrate**—Into three separate flasks transfer the *Test preparation for phenylephrine bitartrate*, 20.0 mL of the *Phenylephrine hydrochloride standard preparation*, and 20.0 mL of dilute sulfuric acid (1 in 1000) to provide the blank. To each flask add 3.0 mL of *Mercuric sulfate solution*, and mix. Immerse in a water bath maintained between 35° and 40° for 10 minutes, remove, and allow to stand at room temperature for 30 minutes. Add 0.25 mL of a sodium nitrite solution (1 in 80), mix, and allow to stand, with occasional swirling, for 30 minutes. Concomitantly determine the absorbances of the *Test preparation* and the *Standard preparation* against the blank at the wavelength of maximum absorbance at about 495 nm, in 5-cm cells, with a suitable spectrophotometer. Calculate the quantity, in µg, of  $C_9H_{13}NO_2 \cdot C_4H_6O_6$  in the minimum dose taken by the formula:

$$(317.30 / 203.67)(20CN)(A_U / A_S)$$

in which 317.30 and 203.67 are the molecular weights of phenylephrine bitartrate and phenylephrine hydrochloride, respectively; C is the concentration, in µg per mL, of USP Phenylephrine Hydrochloride RS in the *Phenylephrine hydrochloride standard preparation*; N is the number of sprays discharged to obtain the minimum dose; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively.

**Particle size**—Prime the valve of the Aerosol by alternately shaking and firing it several times through its oral inhalation actuator, and then actuate one measured spray onto a clean, dry microscope slide held 5 cm from the end of the actuator, perpendicular to the direction of spray. Carefully rinse the slide with about 2 mL of carbon tetrachloride, and allow to dry. Examine the slide under a microscope, equipped with a calibrated ocular micrometer, using 450× magnification. Focus on the particles of 25 fields of view near the center of the sample pattern, and note the size of

the great majority of individual particles: they are less than 5 µm in diameter. Record the size of all individual crystalline particles (not agglomerates) more than 10 µm in length measured along the longest axis: not more than 10 such particles are observed.

#### Assay—

**Ferro-citrate solution, Buffer solution, and Mercuric sulfate solution**—Prepare as directed in the test for *Dose uniformity over the entire contents*.

**Isoproterenol hydrochloride standard preparation**—Transfer about 50 mg of USP Isoproterenol Hydrochloride RS, accurately weighed, to a 100-mL volumetric flask, add dilute sulfuric acid (1 in 1000) to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, add dilute sulfuric acid (1 in 1000) to volume, and mix. The concentration of USP Isoproterenol Hydrochloride RS in the *Isoproterenol hydrochloride standard preparation* is about 100 µg per mL.

**Phenylephrine hydrochloride standard preparation**—Transfer about 50 mg of USP Phenylephrine Hydrochloride RS, accurately weighed, to a 100-mL volumetric flask, add dilute sulfuric acid (1 in 1000) to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, add dilute sulfuric acid (1 in 1000) to volume, and mix. The concentration of USP Phenylephrine Hydrochloride RS in the *Phenylephrine hydrochloride standard preparation* is about 100 µg per mL.

**Assay preparation**—[NOTE—Valve actuation during sampling is to be performed in a manner that will deliver freely the spray into the solvent in the bottom of the sampling beaker, but with minimal lateral pressure on the valve stem to avoid possible side-of-stem leakage. Any devices and techniques designed to accomplish these objectives may be used (e.g., actuating the valve by pressing the tip into an indentation in the bottom of the beaker or using a special adapter to spray at right angles to the valve held at the bottom of the beaker).] Place 20 mL of chloroform in a suitable 100-mL beaker. Prime the valve of the Aerosol by alternately shaking and firing it 10 times through its oral inhalation actuator. Accurately weigh the Aerosol, shake it, and immediately deliver a single spray under the surface of the chloroform. Raise the Aerosol above the surface of the chloroform, and shake it gently preparatory to delivering another spray similarly under the surface of the chloroform. Deliver a total of 6 sprays in this manner. Rinse the valve stem and ferrule with about 2 mL of chloroform, collecting the rinsing with the sample in the beaker. Allow the Aerosol to dry, weigh it, and determine the total weight of the 6 sprays. Transfer the solution to a centrifuge tube with the aid of two 3-mL portions of chloroform, and add 10.0 mL of dilute sulfuric acid (1 in 1000). Insert the stopper, shake vigorously for 1 minute, centrifuge for 20 minutes, and use the clear supernatant.

**Procedure for isoproterenol hydrochloride**—Transfer 3.0 mL each of the *Isoproterenol hydrochloride standard preparation* and the *Assay preparation* to separate test tubes. To each tube add 0.10 mL of *Ferro-citrate solution* and 1.0 mL of *Buffer solution*, and mix. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 530 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of isoproterenol hydrochloride ( $C_{11}H_{17}NO_3 \cdot HCl$ ) in each mL of the Aerosol taken by the formula:

$$(0.01Cd / W)(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Isoproterenol Hydrochloride RS in the *Isoproterenol hydrochloride standard preparation*; d is the density, in g per mL, of Aerosol taken; W is the weight, in g, of the sample taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Isoproterenol hydrochloride standard preparation*, respectively. [The density, d, is determined as follows. Weigh a known volume (v) of the Aerosol in a suitable 5-mL gas-tight syringe equipped with a linear valve.

Calibrate the volume of the syringe by filling to the 5-mL mark with dichlorotetrafluoroethane withdrawn from a plastic-coated glass vial sealed with a neoprene multiple-dose rubber stopper and an aluminum seal, using 1.456 g per mL as the density of the calibrating liquid. Maintain the dichlorotetrafluoroethane, the Aerosol sample, and the syringe (protected from becoming wet) at 25° in a water bath. Obtain the sample, equivalent to the same volume as that obtained during the sampling procedure, from the Aerosol by means of a sampling device consisting of a replaceable rubber septum engaged in the plate threads at one end of a threaded fitting, the opposite end of which contains a sharpened tube capable of puncturing the aerosol container, and a rubber gasket around the tube to prevent leakage of the container contents after puncture.\* Calculate the density taken by the formula:

$$w/v$$

in which *w* is the weight of the volume, *v*, of Aerosol taken.]

**Procedure for phenylephrine bitartrate**—Transfer 5.0 mL each of the *Phenylephrine hydrochloride standard preparation*, the *Assay preparation*, and a blank consisting of dilute sulfuric acid (1 in 1000), to separate test tubes. To each tube add 3.0 mL of *Mercuric sulfate solution*, and mix. Immerse in a water bath maintained between 35° and 40° for 10 minutes, remove, and allow to stand at room temperature for 30 minutes. Add 0.25 mL of sodium nitrite solution (1 in 80), mix, and allow to stand, with occasional swirling, for 30 minutes. Concomitantly determine the absorbances of the solutions against the blank in 1-cm cells at the wavelength of maximum absorbance at about 495 nm, with a suitable spectrophotometer. Calculate the quantity, in mg, of phenylephrine bitartrate ( $C_9H_{13}NO_2 \cdot C_4H_6O_6$ ) in each mL of the Aerosol taken by the formula:

$$(317.30 / 203.67)(0.01Cd / W)(A_U / A_S)$$

in which 317.30 and 203.67 are the molecular weights of phenylephrine bitartrate and phenylephrine hydrochloride, respectively; *C* is the concentration, in µg per mL, of USP Phenylephrine Hydrochloride RS in the *Phenylephrine hydrochloride standard preparation*; *d* is the density, in g per mL, of Aerosol taken; *W* is the weight, in g, of the sample taken; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solutions from the *Assay preparation* and the *Phenylephrine hydrochloride standard preparation*, respectively.

## Isoproterenol Sulfate

( $C_{11}H_{17}NO_3$ )<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub> · 2H<sub>2</sub>O 556.62

1,2-Benzenediol, 4-[1-hydroxy-2-[(1-methylethyl)amino]ethyl]-, sulfate (2:1) (salt), dihydrate.

3,4-Dihydroxy-α-[(isopropylamino)methyl]benzyl alcohol sulfate (2:1) (salt) dihydrate [6700-39-6].

Anhydrous 520.60 [299-95-6].

» Isoproterenol Sulfate contains not less than 97.0 percent and not more than 103.0 percent of ( $C_{11}H_{17}NO_3$ )<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub>, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Isoproterenol Hydrochloride RS

\* A suitable sampling system is available from Alltech Associates, 2051 Waukegan Rd., Deerfield, IL 60015.

## Identification—

**A: Ultraviolet Absorption** (197U)—

**Solution:** 50 µg per mL.

**Medium:** 0.1 N hydrochloric acid.

**B:** To a solution of 10 mg in 5 mL of water add 1 drop of ferric chloride TS: an intense green color is produced, and it becomes olive-green on standing.

**C:** To a solution of 10 mg in 1 mL of water add 1 drop of phosphotungstic acid TS: a white precipitate is formed immediately and it becomes brown on standing (*distinction from epinephrine, which forms no precipitate*).

**D:** Dilute 1.0 mL of a solution (1 in 1000) with water to 10 mL, add 0.1 mL of dilute hydrochloric acid (1 in 120), then add 1.0 mL of 0.10 N iodine. Allow to stand for 5 minutes, and add 2.0 mL of 0.10 N sodium thiosulfate: a salmon pink color is produced (*distinction from norepinephrine, which, at the same pH, about 3, produces no color or at most only a slight pink color*).

**E:** It responds to the tests for *Sulfate* (191).

**Water, Method I** (921): not more than 7.0%.

**Residue on ignition** (281): not more than 0.2%.

**Chloride** (221)—A 0.10-g portion shows no more chloride than corresponds to 0.20 mL of 0.020 N hydrochloric acid (0.14%).

**Limit of isoproterenone**—It meets the requirements of the test for *Isoproterenone* under *Isoproterenol Hydrochloride*.

## Assay—

**Standard preparation**—Prepare as directed in the *Assay under Isoproterenol Hydrochloride*.

**Assay preparation**—Transfer about 125 mg of Isoproterenol Sulfate, accurately weighed, to a 25-mL volumetric flask, dissolve in sodium bisulfite solution (3 in 1000), dilute with sodium bisulfite solution to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with 0.17 N acetic acid to volume, and mix.

**Chromatographic system**—Proceed as directed for *Procedure* in the *Assay under Isoproterenol Hydrochloride*. Calculate the quantity, in mg, of ( $C_{11}H_{17}NO_3$ )<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub> in the portion of Isoproterenol Sulfate taken by the formula:

$$(260.30 / 247.72)(0.5C)(h_U / h_S)$$

in which 260.30 is one-half of the molecular weight of anhydrous isoproterenol sulfate, 247.72 is the molecular weight of isoproterenol hydrochloride; and *C*, *h<sub>U</sub>*, and *h<sub>S</sub>* are as defined therein.

## Isoproterenol Sulfate Inhalation Aerosol

» Isoproterenol Sulfate Inhalation Aerosol is a suspension of microfine Isoproterenol Sulfate in fluorochlorohydrocarbon propellants in a pressurized container. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of isoproterenol sulfate [( $C_{11}H_{17}NO_3$ )<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub>].

**Packaging and storage**—Preserve in small, nonreactive, light-resistant aerosol containers equipped with metered-dose valves and provided with oral inhalation actuators.

**USP Reference standards** (11)—  
USP Isoproterenol Hydrochloride RS

## Identification—

**A:** Place 10 mL of water in a small beaker, and deliver 10 sprays from the Aerosol under the surface of the water, ac-

tuating the valve by pressing the tip against the bottom of the beaker. Filter, and to 5 mL of the filtrate add 1 drop of dilute hydrochloric acid (1 in 120). Add 0.50 mL of 0.10 N iodine, allow to stand for 5 minutes, and add 1.0 mL of 0.10 N sodium thiosulfate: a red-brown color is produced.

**B:** A portion of the filtrate obtained in *Identification* test A responds to the tests for *Sulfate* (191).

**Microbial enumeration tests (61) and Tests for specified microorganisms (62)**—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Dose uniformity over the entire contents:** meets the requirements for *Metered-Dose Inhalers* under *Aerosols*, *Nasal Sprays*, *Metered-Dose Inhalers*, and *Dry Powder Inhalers* (601).

#### PROCEDURE FOR DOSE UNIFORMITY—

*Ferro-citrate solution and Buffer solution*—Prepare as directed under *Epinephrine Assay* (391).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Isoproterenol Hydrochloride RS in a freshly prepared sodium bisulfite solution (1 in 500), and dilute quantitatively and stepwise with the same sodium bisulfite solution as necessary to obtain a solution having a known concentration of about 4 µg per mL.

*Test preparation*—Discharge the minimum recommended dose into the sampling apparatus and detach the inhaler as directed. Rinse the apparatus (filter and interior) with four 5.0-mL portions of a freshly prepared sodium bisulfite solution (1 in 500), and transfer the resulting solutions quantitatively to a 50-mL centrifuge tube. Add 10 mL of chloroform, insert the stopper, shake vigorously for 1 minute, and centrifuge for 5 minutes. Use the clear supernatant as directed in the *Procedure*.

*Procedure*—Into three separate flasks transfer the *Test preparation*, 20.0 mL of the *Standard preparation*, and 20.0 mL of water to provide the blank. To each flask add 100 µL of *Ferro-citrate solution* and 1.0 mL of *Buffer solution*, and mix. Concomitantly determine the absorbances with a suitable spectrophotometer, in 5-cm cells, of the solutions from the *Test preparation* and the *Standard preparation* at the wavelength of maximum absorbance at about 530 nm, against the blank. Calculate the quantity, in µg, of  $(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4$  contained in the minimum dose taken by the formula:

$$(260.30 / 247.72)(20CN)(A_U / A_S)$$

in which 260.30 is one-half of the molecular weight of isoproterenol sulfate (anhydrous), and 247.72 is the molecular weight of isoproterenol hydrochloride; C is the concentration, in µg per mL, of USP Isoproterenol Hydrochloride RS in the *Standard preparation*; N is the number of sprays discharged to obtain the minimum recommended dose; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

**Particle size**—Prime the valve of the Aerosol by alternately shaking and firing it several times through its oral inhalation actuator, and then actuate one measured spray onto a clean, dry microscope slide held 5 cm from the end of the actuator, perpendicular to the direction of the spray. Carefully rinse the slide with about 2 mL of carbon tetrachloride, and allow to dry. Examine the slide under a microscope, equipped with a calibrated ocular micrometer, using 450 × magnification. Focus on the particles of 25 fields of view near the center of the test specimen pattern, and note the size of the great majority of individual particles: they are less than 5 µm in diameter. Record the number and size of all individual crystalline particles (not agglomerates) more than 10 µm in length measured along the longest axis: not more than 10 such particles are observed.

#### Assay—

*Ferro-citrate solution and Buffer solution*—Prepare as directed under *Epinephrine Assay* (391).

*Standard preparation*—Transfer about 50 mg of USP Isoproterenol Hydrochloride RS, accurately weighed, to a 100-mL volumetric flask, add a freshly prepared solution of sodium bisulfite (1 in 500) to volume, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, dilute with the sodium bisulfite solution to volume, and mix. The concentration of USP Isoproterenol Hydrochloride RS in the *Standard preparation* is about 50 µg per mL.

*Assay preparation*—[NOTE—A suitable sampling beaker is one having a small indentation formed in its inside bottom surface having dimensions adequate to accept the aerosol valve stem during actuation, thereby preventing particle entrapment and side-of-stem leakage during the sample delivery.] Place 20 mL of chloroform in a suitable 100-mL beaker. Prime the valve of the Aerosol by alternately shaking and firing it 10 times through its oral inhalation actuator. Accurately weigh the Aerosol, shake it, and immediately deliver a single spray under the surface of the chloroform, actuating the valve by pressing the tip into the indentation in the bottom of the beaker. Raise the Aerosol above the surface of the chloroform, and shake it gently preparatory to delivering another spray similarly under the surface of the chloroform. Deliver a total of 5 sprays in this manner. Rinse the valve stem and ferrule with about 2 mL of chloroform, collecting the rinsing with the sample in the beaker. Allow the Aerosol to dry, weigh it, and determine the total weight of the 5 sprays. Transfer the solution to a centrifuge tube with the aid of two 3-mL portions of chloroform, and add 10.0 mL of freshly prepared sodium bisulfite solution (1 in 500). Insert the stopper, shake vigorously for 1 minute, centrifuge for 5 minutes, and use the clear supernatant as directed in the *Procedure*.

*Procedure*—Transfer 5.0 mL each of the *Standard preparation* and the *Assay preparation* to separate test tubes. To each tube add 100 µL of *Ferro-citrate solution* and 1.0 mL of *Buffer solution*, and mix. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 530 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of  $(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4$  in each mL of the Aerosol taken by the formula:

$$(260.30 / 247.72)(0.01Cd / W)(A_U / A_S)$$

in which 260.30 is one-half of the molecular weight of isoproterenol sulfate (anhydrous); 247.72 is the molecular weight of isoproterenol hydrochloride; C is the concentration, in µg per mL, of USP Isoproterenol Hydrochloride RS in the *Standard preparation*; d is the density, in g per mL, of the Aerosol; W is the weight, in g, of the portion of Inhalation Aerosol taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively. [The density, d, is determined as follows. Weigh a known volume (v) of the Inhalation Aerosol in a suitable, gas-tight, 5-mL syringe equipped with a linear valve. Calibrate the volume of the syringe by filling to the 5-mL mark with dichlorotetrafluoroethane withdrawn from a plastic-coated glass vial sealed with a neoprene multiple-dose rubber stopper and an aluminum seal, using 1.456 g per mL as the density of the calibrating liquid. Maintain the dichlorotetrafluoroethane, the Aerosol assay specimen, and the syringe (protected from becoming wet) in a water bath at 25°. Obtain the specimen equivalent to the same volume as that obtained during the sampling procedure, from the Aerosol by means of a sampling device consisting of a replaceable rubber septum engaged in the plate threads at one end of a threaded fitting, the opposite end of which contains a sharpened tube capable of puncturing the aerosol container, and a rubber gasket around the tube to prevent leakage of the container contents after puncture.\* Record the weight of the volume (v) of the Aerosol as w, and calculate the density by the formula  $w/v$ .]

\*A suitable sampling system is available from Alltech Associates, 2051 Waukegan Rd., Deerfield, IL 60015.

## Isoproterenol Sulfate Inhalation Solution

» Isoproterenol Sulfate Inhalation Solution is a sterile solution of Isoproterenol Sulfate in Purified Water. It may contain Sodium Chloride. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of isoproterenol sulfate  $[(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4]$ .

**Packaging and storage**—Store in small, tight containers that are well-filled or otherwise protected from oxidation. Protect from light.

**Labeling**—Label it to indicate that the Inhalation Solution is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

**USP Reference standards** (11)—  
USP Isoproterenol Hydrochloride RS

**Color and clarity**—Using the Inhalation Solution as the *Test solution*, proceed as directed for *Color and clarity* under *Isoproterenol Inhalation Solution*.

**Identification**—It meets the requirements for *Identification* tests *C*, *D*, and *E* under *Isoproterenol Sulfate*.

**Sterility** (71): meets the requirements.

**Assay**—

*Standard preparation*—Prepare as directed in the *Assay* under *Isoproterenol Hydrochloride*.

*Assay preparation*—Transfer an accurately measured volume of Inhalation Solution, equivalent to about 25 mg of isoproterenol sulfate, to a 100-mL volumetric flask, add 50.0 mL of 0.30 N acetic acid, dilute with water to volume, and mix.

*Chromatographic system*—Proceed as directed in the *Assay* under *Isoproterenol Hydrochloride*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Isoproterenol Hydrochloride*. Calculate the quantity, in mg, of  $(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4$  in each mL of the Inhalation Solution taken by the formula:

$$(260.30/247.72)(0.1)(C/V)(h_u / h_s)$$

in which 260.30 is one-half of the molecular weight of anhydrous isoproterenol sulfate; 247.72 is the molecular weight of isoproterenol hydrochloride; *V* is the volume, in mL, of Inhalation Solution taken; and *C*, *h<sub>u</sub>*, and *h<sub>s</sub>* are as defined therein.

## Isosorbide Concentrate

$C_6H_{10}O_4$  146.14  
D-Glucitol, 1,4:3,6-dianhydro-  
1,4:3,6-Dianhydro-D-glucitol [652-67-5].

» Isosorbide Concentrate is an aqueous solution containing, in each 100 g, not less than 70.0 g and not more than 80.0 g of  $C_6H_{10}O_4$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—The label states that this article is not intended for direct administration to humans or animals.

**USP Reference standards** (11)—  
USP Isosorbide RS

**Identification**—[NOTE—Isosorbide is hygroscopic. Take precautions to protect isolated isosorbide crystals from atmospheric moisture.]

**A:** Dry a portion of it in an evaporating dish over phosphorus pentoxide at 70° and at a pressure of 50 mm of mercury for 48 hours, changing the phosphorus pentoxide after 24 hours. Scratch the bottom of the dish with a glass rod or seed with a crystal of isosorbide, if necessary, to initiate crystallization: the crystals so obtained melt between 60° and 63° when tested by the procedure for *Class I* substances (see *Melting Range or Temperature* (741)).

**B:** The IR absorption spectrum of a potassium bromide dispersion of the crystals obtained as directed in *Identification* test *A* exhibits maxima and minima only at the same wavelengths as that of a similar preparation of USP Isosorbide RS.

**Specific rotation** (781S): between +44.5° and +47.0°.

*Test solution:* 80 mg of isosorbide per mL, in water.

**Water**, *Method I* (921): between 24.0% and 26.0%.

**Residue on ignition** (281): not more than 0.01%.

**Heavy metals**, *Method II* (231): not more than 5 ppm, calculated on the anhydrous basis.

**Periodate consumption**—Dilute about 15 g, accurately weighed, with 25 mL of water, and add 50.0 mL of a solution prepared by dissolving 5.4 g of periodic acid in 100 mL of water and adding 1900 mL of glacial acetic acid. Allow to stand for 1 hour. Add 20 mL of potassium iodide TS, and titrate with 0.1 N sodium thiosulfate VS to the disappearance of the brown color. Add 3 mL of starch TS, and complete the titration. Perform a blank determination, and note the difference in volumes required. If the volume required for the specimen is less than 0.8 of that required for the blank, repeat the procedure with a smaller specimen. The difference in volume corresponds to not more than 0.20 mL of 0.1 N sodium thiosulfate for each g of Concentrate taken.

**Acid value**—Dilute about 15 g, accurately weighed, with 50 mL of water, and titrate with 0.02 N potassium hydroxide VS to a phenolphthalein endpoint. Perform a blank determination, and make any necessary correction. Calculate the acid value taken by the formula:

$$56.11(AN / W)$$

in which *A* is the number of mL of potassium hydroxide VS consumed; *N* is its normality; and *W* is the weight, in g, of Concentrate taken. The limit is 0.5, calculated on the anhydrous basis.

**Methyl ethyl ketone**—

*Internal standard solution*—Prepare a solution in water containing about 1 mg per mL of methyl isobutyl ketone.

*Standard preparation*—Prepare a solution in water containing an accurately known concentration of methyl ethyl ketone equivalent to about 1 mg per mL. Pipet 5 mL of this solution into a 100-mL volumetric flask, add 5.0 mL of *Internal standard solution*, add water to volume, and mix.

*Test preparation*—Pipet 5 mL of *Internal standard solution* into a 100-mL volumetric flask, add Concentrate to volume, and mix.

*Support*—Place about 90 g of unsilanized support S1A in a crystallizing dish, and cover it with chloroform. Stir the mixture thoroughly, and carefully remove the supernatant chloroform with an aspirator. Spread the moist support on a clean surface, and allow it to air-dry. Place the dried support in the crystallizing dish, and cover it with 0.5 N alcoholic potassium hydroxide TS. Allow it to stand for one-half hour with occasional stirring. Carefully pour off the supernatant

alcoholic potassium hydroxide solution, and wash the moist support with water until the washing is neutral to phenolphthalein indicator. Spread the moist support on a clean surface, and allow it to air-dry.

**Chromatographic system**—The gas chromatograph is equipped with a flame-ionization detector and a 0.6-m × 2-mm column packed with 25% liquid phase G16 on unsilanized acid- and base-washed *Support* which has been washed with chloroform, and conditioned as directed (see *Chromatography* (621)). The column is maintained at 70°, and nitrogen is used as the carrier gas at a flow rate of about 30 mL per minute. In a suitable chromatogram, the relative standard deviation of five replicate injections is not more than 3.0%, and the resolution is not less than 2.0.

**Procedure**—Inject about 3 µL of the *Standard preparation* into the gas chromatograph, record the chromatogram, and measure the peak response of each component. [NOTE—Clean the syringe after each injection with pentane. Do not use acetone.] Similarly inject about 3 µL of the *Test preparation*, record the chromatogram, and measure the peak response of each component. Calculate the quantity, in mg, of methyl ethyl ketone in each mL of the Concentrate taken by the formula:

$$(1 / 0.95)C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of methyl ethyl ketone in the *Standard preparation*, and  $R_U$  and  $R_S$  are the ratios of the response of the methyl ethyl ketone to the response of the internal standard obtained from the *Test preparation* and the *Standard preparation*, respectively. The limit is 0.05 mg per mL.

#### Assay—

**Internal standard solution**—Dissolve a suitable quantity of triethylene glycol in water to obtain a solution containing about 15 mg per mL.

**Standard solution**—Prepare a solution of USP Isosorbide RS in water containing an accurately known concentration equivalent to about 25 mg of  $C_6H_{10}O_4$  per mL.

**Standard preparations**—Pipet 2-, 3-, 4-, and 5-mL quantities of *Standard solution* into separate 50-mL volumetric flasks, add 5.0 mL of *Internal standard solution* to each, add water to volume, and mix.

**Assay preparation**—Transfer about 200 mg of Concentrate, accurately weighed, to a 100-mL volumetric flask, add 10.0 mL of *Internal standard solution*, add water to volume, and mix.

**Chromatographic system**—The gas chromatograph is equipped with a flame-ionization detector and a 3-mm × 0.6-m glass column packed with support S9. The column is maintained at 230°, and nitrogen is used as the carrier gas. The retention time of the isosorbide peak is about 1.5, relative to that of triethylene glycol.

**System suitability and standard curve**—Inject 1-µL portions of each *Standard preparation*, and record each peak response. Plot the ratio of the peak response of isosorbide to that of triethylene glycol versus the concentration, in mg per mL, of isosorbide in the respective *Standard preparation*. The analytical system is suitable for conducting the assay if the correlation coefficient for the Standard curve is greater than 0.980, the resolution,  $R$ , is not less than 1.5, and neither tailing factor exceeds 2.0.

**Procedure**—Inject a 1-µL portion of the *Assay preparation*, record the peak responses for the two major peaks, calculate the ratio of the peak responses, and determine the concentration, C, in mg per mL, of isosorbide in the *Assay preparation* by reference to the *Standard curve*. Calculate the quan-

tity, in mg, of  $C_6H_{10}O_4$  in the Concentrate taken by the formula:

$$100C.$$

## Isosorbide Oral Solution

» Isosorbide Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of isosorbide ( $C_6H_{10}O_4$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Isosorbide RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatograms of the *Standard preparations*, as obtained in the *Assay*.

**Uniformity of dosage units** (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 3.2 and 3.8.

#### Assay—

**Internal standard solution, Standard solution, Standard preparations, Chromatographic system, and System suitability and standard curve**—Proceed as directed in the *Assay* under *Isosorbide Concentrate*.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 450 mg of isosorbide, to a 250-mL volumetric flask, add 25.0 mL of *Internal standard solution*, then add water to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Isosorbide Concentrate*. Calculate the quantity, in mg, of isosorbide ( $C_6H_{10}O_4$ ) in each mL of the Oral Solution taken by the formula:

$$250(C/V)$$

in which C is the concentration, in mg per mL, of isosorbide in the *Assay preparation* found by reference to the *Standard curve*; and V is the volume, in mL, of Oral Solution taken.

## Diluted Isosorbide Dinitrate

$C_6H_8N_2O_8$  236.14

D-Glucitol, 1,4:3,6-dianhydro-, dinitrate.

1,4:3,6-Dianhydro-D-glucitol dinitrate [87-33-2].

» Diluted Isosorbide Dinitrate is a dry mixture of isosorbide dinitrate ( $C_6H_8N_2O_8$ ) with Lactose, Mannitol, or suitable inert excipients to permit safe handling. It may contain up to 1.0 percent of a suitable stabilizer, such as Ammonium Phos-

phate. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_6H_8N_2O_8$ . It usually contains approximately 25 percent of isosorbide dinitrate.

**Caution**—Exercise proper precautions in handling undiluted isosorbide dinitrate, which is a powerful explosive and can be exploded by percussion or excessive heat. Only exceedingly small amounts should be isolated.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Diluted Isosorbide Dinitrate RS

**Identification**—Transfer to a medium-porosity, sintered-glass filtering crucible a quantity of it, equivalent to about 50 mg of isosorbide dinitrate, and pass three 5-mL portions of acetone through it. Evaporate the combined extracts at a temperature not exceeding 35°, with the aid of a gentle current of air, and dry the residue in vacuum over calcium chloride at room temperature for 16 hours: the IR absorption spectrum of a 1 in 40 solution of the residue so obtained, in chloroform, determined in a 0.1-mm cell, exhibits maxima only at the same wavelengths as that of a similar preparation from the residue obtained from USP Diluted Isosorbide Dinitrate RS.

**Loss on drying** (731)—Dry it in vacuum over calcium chloride at room temperature for 16 hours: it loses not more than 1.0% of its weight.

**Heavy metals, Method II** (231): 0.001%.

**Assay**—

**Buffer solution**—Dissolve 15.4 g of ammonium acetate in water, add 11.5 mL of glacial acetic acid, dilute with water to 1000 mL, and mix to obtain a solution having a pH of about 4.7.

**Mobile phase**—Mix 350 mL of water, 100 mL of *Buffer solution*, and 550 mL of methanol. Cool to room temperature, dilute with water to 1000 mL, mix, degas, and filter. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Transfer a quantity of diluted nitroglycerin to a suitable volumetric flask, add about 60% of the flask volume of methanol, sonicate for 5 minutes, and shake for 30 minutes. Dilute with methanol to volume to obtain a solution having a concentration of about 3 mg of nitroglycerin per mL, and mix. Allow any undissolved material to settle, filter, and store the filtrate in an airtight container.

**Standard preparation**—Transfer about 125 mg of recently mixed USP Diluted Isosorbide Dinitrate RS, accurately weighed, to a 50-mL volumetric flask, add about 30 mL of *Mobile phase*, shake for 30 minutes, dilute with *Mobile phase* to volume, and mix. Pipet 10 mL of the resulting solution into a 25-mL volumetric flask, and add 4.0 mL of *Internal standard solution* and 4 mL of dilute *Buffer solution* (1 in 10). Cool to room temperature, dilute with *Mobile phase* to volume, and mix to obtain a solution having a known concentration of about 0.25 mg of isosorbide dinitrate per mL, based on the quantity of USP Diluted Isosorbide Dinitrate RS weighed and the labeled content of isosorbide dinitrate. Pass a portion of this solution through a 0.45- $\mu$ m filter.

**Assay preparation**—Transfer an accurately weighed quantity of recently mixed Diluted Isosorbide Dinitrate, equivalent to about 30 mg of isosorbide dinitrate, to a 50-mL volumetric flask. Proceed as directed for *Standard preparation*, beginning with “add about 30 mL of *Mobile phase*.”

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as di-

rected for *Procedure*: the resolution,  $R$ , between isosorbide dinitrate and nitroglycerin is not less than 2.0; and the relative standard deviation for replicate injections determined from the peak response ratios is not more than 2%. [NOTE—The relative retention times are about 0.75 for isosorbide dinitrate and 1.0 for nitroglycerin. The relative retention times for isosorbide mononitrates, if present, are about 0.38.]

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_6H_8N_2O_8$  in the portion of Diluted Isosorbide Dinitrate taken by the formula:

$$125C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of isosorbide dinitrate from USP Diluted Isosorbide Dinitrate RS taken for the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isosorbide Dinitrate Extended-Release Capsules

» Isosorbide Dinitrate Extended-Release Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_6H_8N_2O_8$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Diluted Isosorbide Dinitrate RS

**Identification**—The finely powdered contents of the Capsules respond to the *Identification* test under *Isosorbide Dinitrate Tablets*. If separation of interferences is required, transfer a quantity of the finely powdered contents of the Capsules, equivalent to about 20 mg of isosorbide dinitrate, to a glass-stoppered centrifuge tube, add 10 mL of sodium hydroxide solution (1 in 250), shake to wet the powder, add 15 mL of solvent hexane, and shake again. Centrifuge the mixture, and transfer the upper phase to a beaker. Place in a freezer, at a temperature of about  $-14^\circ$ , the beaker and a short-stem funnel fitted with a cotton plug that previously has been chloroform-washed and dried. After 30 minutes, filter the solution while still in the freezer. Evaporate the solvent, and dry the residue in vacuum over calcium chloride for 16 hours: the IR absorption spectrum of the residue so obtained, dissolved in 0.4 mL of chloroform and determined with the use of matched 0.1-mm cells, shows all of the significant absorption bands present in the spectrum obtained for a similar preparation from the residue obtained from USP Diluted Isosorbide Dinitrate RS. The major peaks are at about 1650  $cm^{-1}$ , 1284  $cm^{-1}$  and 1275  $cm^{-1}$  (a doublet), 1106  $cm^{-1}$ , and 844  $cm^{-1}$ .

**Dissolution** (711)—Proceed as directed for *Method B* in *Delayed-Release Dosage Forms* in *Procedure, Apparatus 1 and Apparatus 2*, except to operate the apparatus in the acid medium for 1 hour instead of 2 hours and to use *Acceptance Table 2* in *Extended-Release Dosage Forms* in *Interpretation*.

*Apparatus 2*: 50 rpm.

*Times*: 2, 4, and 8 hours.

Determine the amount of  $C_6H_8N_2O_8$  dissolved employing the following method.

**Mobile phase**—Prepare a filtered and degassed mixture of 0.05 M monobasic potassium phosphate and acetonitrile

(52:48). Make adjustments, if necessary (see *System Suitability* under *Chromatography* <621>).

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 224-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph a Standard solution of USP Diluted Isosorbide Dinitrate RS in the same medium, and record the chromatograms as directed for *Procedure*: the tailing factor is not more than 2.5; and the relative standard deviation is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of a filtered portion of the solution under test, and record the chromatograms. Determine the amount of C<sub>6</sub>H<sub>8</sub>N<sub>2</sub>O<sub>8</sub> dissolved in comparison with a Standard solution of USP Diluted Isosorbide Dinitrate RS in the same medium and similarly chromatographed.

**Tolerances**—The percentages of the labeled amount of C<sub>6</sub>H<sub>8</sub>N<sub>2</sub>O<sub>8</sub> dissolved at the times specified conform to *Acceptance Table 2*. [NOTE—The test times given are cumulative, beginning with the 1 hour in the acid medium.]

Time (hours)	Amount dissolved
2	between 10% and 30%
4	between 40% and 75%
8	not less than 75%

**Uniformity of dosage units** <905>: meet the requirements.

#### Assay—

**Buffer solution, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system**—Prepare as directed in the Assay under *Diluted Isosorbide Dinitrate*.

**Assay preparation**—Weigh and finely powder the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 12.5 mg of isosorbide dinitrate, to a dry, 50-mL volumetric flask, add about 30 mL of *Mobile phase*, and shake the mixture by hand immediately, to prevent clumping. If clumping persists, disperse with the aid of sonication, or break the aggregates with a stirring rod, or warm on a steam bath while keeping the flask stoppered, or allow the flask to stand until the clumps dissipate. [NOTE—If clumping still continues, discard the mixture, and instead disperse an accurately weighed test portion in 15 mL of a 1 in 10 dilution of *Buffer solution* in water by heating on a steam bath for 1 hour with frequent shaking, then add 15 mL of methanol.] Shake for 30 minutes. Add 8.0 mL of *Internal standard solution*, cool to room temperature, add 8 mL of a 1 in 10 dilution of *Buffer solution* in water, dilute with *Mobile phase* to volume, and mix. Pass a portion through a microporous membrane filter.

**Procedure**—Proceed as directed for *Procedure* in the Assay under *Diluted Isosorbide Dinitrate*. Calculate the quantity, in mg, of C<sub>6</sub>H<sub>8</sub>N<sub>2</sub>O<sub>8</sub> in the portion of Capsules taken by the formula:

$$50C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of isosorbide dinitrate from the USP Diluted Isosorbide Dinitrate RS taken for the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isosorbide Dinitrate Tablets

» Isosorbide Dinitrate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>6</sub>H<sub>8</sub>N<sub>2</sub>O<sub>8</sub>.

**Packaging and storage**—Preserve in well-closed containers.

#### USP Reference standards <11>—

USP Diluted Isosorbide Dinitrate RS

**Identification**—Transfer a suitable quantity of finely powdered Tablets to a glass-stoppered centrifuge tube. Add 10 mL of sodium hydroxide solution (1 in 250), shake to wet the powder, then add 15 mL of solvent hexane, and again shake. Centrifuge the mixture, and transfer the upper phase to a beaker. Evaporate the solvent, and dry the residue in vacuum over anhydrous calcium chloride at room temperature for 16 hours: the IR absorption spectrum of a suitable solution in chloroform of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation from the residue obtained from USP Diluted Isosorbide Dinitrate RS.

#### Dissolution <711>—

*Medium*: water; 1000 mL.

*Apparatus 2*: 75 rpm.

*Time*: 45 minutes.

**Mobile phase**—Prepare a suitable filtered and degassed mixture of pH 3.0, 0.1 M ammonium sulfate and methanol (50:50). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>), using sulfuric acid for any necessary pH adjustment.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 5-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph replicate injections of the Standard solution, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%, and the tailing factor is not more than 1.5.

**Procedure**—Separately inject equal volumes (about 20 µL) of the Standard solution and a filtered aliquot of the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of C<sub>6</sub>H<sub>8</sub>N<sub>2</sub>O<sub>8</sub> dissolved in comparison with a Standard solution having a known concentration of USP Diluted Isosorbide Dinitrate RS, similarly prepared and chromatographed.

**Tolerances**—Not less than 70% (Q) of the labeled amount of C<sub>6</sub>H<sub>8</sub>N<sub>2</sub>O<sub>8</sub> is dissolved in 45 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

#### Assay—

**Buffer solution, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system**—Prepare as directed in the Assay under *Diluted Isosorbide Dinitrate*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 12.5 mg of isosorbide dinitrate, to a dry, 50-mL volumetric flask, add about 30 mL of *Mobile phase*, and shake the mixture by hand immediately, to prevent clumping. If clumping persists, disperse with the aid of sonication, or break the aggregates with a stirring rod. Shake for 30 minutes. Add 8.0 mL of *Internal standard solution*, cool to room temperature, add 8 mL of a 1 in 10 dilution of *Buffer solution* in water, dilute with *Mobile phase* to volume, and mix. Pass a portion through a disposable ion-exchange filter.

**Procedure**—Proceed as directed for *Procedure* in the Assay under *Diluted Isosorbide Dinitrate*. Calculate the quantity, in

mg, of  $C_6H_8N_2O_8$  in the portion of Tablets taken by the formula:

$$50C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of isosorbide dinitrate from the USP Diluted Isosorbide Dinitrate RS taken for the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isosorbide Dinitrate Chewable Tablets

» Isosorbide Dinitrate Chewable Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_6H_8N_2O_8$ .

**Packaging and storage**—Preserve in well-closed containers.

### USP Reference standards <11>—

USP Diluted Isosorbide Dinitrate RS

**Identification**—Chewable Tablets respond to the *Identification* test under *Isosorbide Dinitrate Tablets*. Where separation of interferences is required, use the technique given under the *Identification* test for *Isosorbide Dinitrate Extended-release Capsules*.

**Uniformity of dosage units** <905>: meet the requirements.

### Assay—

*Buffer solution*, *Mobile phase*, *Internal standard solution*, *Standard preparation*, and *Chromatographic system*—Prepare as directed in the *Assay* under *Diluted Isosorbide Dinitrate*.

*Assay preparation*—Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 12.5 mg of isosorbide dinitrate, to a dry, 50-mL volumetric flask, add about 30 mL of *Mobile phase*, and shake the mixture by hand immediately, to prevent clumping. If clumping persists, disperse with the aid of sonication, or break the aggregates with a stirring rod, or warm on a steam bath while keeping the flask stoppered, or allow the flask to stand until the clumps dissipate. [NOTE—If clumping still continues, discard the mixture, and instead disperse an accurately weighed test portion in 15 mL of a 1 in 10 dilution of *Buffer solution* in water by heating on a steam bath for 1 hour with frequent shaking, then add 15 mL of methanol.] Shake for 30 minutes. Add 8.0 mL of *Internal standard solution*, cool to room temperature, add 8 mL of a 1 in 10 dilution of *Buffer solution* in water, dilute with *Mobile phase* to volume, and mix. Pass a portion through a microporous membrane filter.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Diluted Isosorbide Dinitrate*. Calculate the quantity, in mg, of  $C_6H_8N_2O_8$  in the portion of Chewable Tablets taken by the formula:

$$50C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of isosorbide dinitrate from the USP Diluted Isosorbide Dinitrate RS taken for the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isosorbide Dinitrate Extended-Release Tablets

» Isosorbide Dinitrate Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_6H_8N_2O_8$ .

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

### USP Reference standards <11>—

USP Diluted Isosorbide Dinitrate RS

**Identification**—Tablets respond to the *Identification* test under *Isosorbide Dinitrate Tablets*. Where separation of interferences is required, use the technique given under the *Identification* test for *Isosorbide Dinitrate Extended-Release Capsules*.

### Dissolution <711>—

TEST 1—

*Medium*: water; 500 mL.

*Apparatus 2*: 50 rpm.

*Times*: 1, 2, 4, and 6 hours.

Determine the amount of  $C_6H_8N_2O_8$  dissolved, using the following method.

*pH 3.0 Buffer solution*—Add 6.6 g of ammonium sulfate, accurately weighed, to 500 mL of water. Adjust with 1 N sulfuric acid to a pH of 3.0.

*Mobile phase*—Prepare a filtered and degassed mixture of methanol and *pH 3.0 Buffer solution* (50:50). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a UV wavelength detector and a 5-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph a Standard solution of USP Diluted Isosorbide Dinitrate RS in the same *Medium*, and record the chromatograms as directed for *Procedure*: the tailing factor is not more than 2.5; and the relative standard deviation is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of a filtered portion of the solution under test, and record the chromatograms. Determine the amount of  $C_6H_8N_2O_8$  dissolved in comparison with a Standard solution of USP Diluted Isosorbide Dinitrate RS in the same *Medium*, similarly chromatographed.

*Tolerances*—The percentages of the labeled amount of  $C_6H_8N_2O_8$  dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 15% and 30%
2	between 50% and 70%
4	between 65% and 85%
6	not less than 75%

TEST 2—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

*Medium*: pH 1.2 simulated gastric fluid (without pepsin) for the first hour, 900 mL; pH 7.5 simulated intestinal fluid (without enzymes) for the subsequent hours, 900 mL.

*Apparatus 2*: 50 rpm, with helix sinkers.

*Times*: 1, 3, 6, and 12 hours.

Determine the amount of isosorbide dinitrate ( $C_6H_9NO_6$ ) dissolved by employing the following method.

*Buffer solution and Mobile phase*—Prepare as directed in the Assay under *Diluted Isosorbide Dinitrate*.

*Standard solution*—Prepare two solutions, one in each *Medium*. Dissolve an accurately weighed quantity of USP Diluted Isosorbide Dinitrate RS in *Medium*, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration of about 40 µg per mL.

*Test solution*—Pass 5 mL of the solution under test through a suitable 10-µm filter. Replace the *Medium* withdrawn at the 3- and 6-hour timepoints.

*Chromatographic system* (see *Chromatography* (621))—Proceed as directed in the Assay under *Diluted Isosorbide Dinitrate*. Chromatograph the *Standard solution*, and record the chromatogram as directed for *Procedure*: the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the cumulative percentage of isosorbide dinitrate dissolved at each collection point, corrected for the quantities removed at previous collection points (not applicable for the first hour), as follows:

$$C_U = r_U \times \frac{C_S}{r_S}$$

Percentage released at first hour (see *Formula 1*).  
Percentage released at third hour (see *Formula 2*).  
Percentage released at sixth hour (see *Formula 3*).  
Percentage released at twelfth hour (see *Formula 4*).  
in which  $r_U$  and  $r_S$  are the peak responses for the *Test solution* and the *Standard solution*, respectively;  $C_U$  is the sample concentration, in µg per mL, at the indicated collection time point;  $C_S$  is the concentration, in µg per mL, of the *Standard solution*; 900 is the volume, in mL, of *Medium*; 1000 is the conversion factor from µg to mg; 100 is the conversion factor to percentage;  $LC$  is the Tablet label claim, in mg; and 5 is the volume, in mL, of sample withdrawn and of the *Medium* replaced.

*Tolerances*—The percentages of the labeled amount of  $C_6H_8N_2O_8$  dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 5% and 25%
3	between 30% and 50%
6	between 50% and 80%
12	not less than 75%

**Uniformity of dosage units** (905): meet the requirements.

**Assay—**

*Buffer solution, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system*—Prepare as directed in the Assay under *Diluted Isosorbide Dinitrate*.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 12.5 mg of isosorbide dinitrate, to a dry, 50-mL volumetric flask, add about 30 mL of *Mobile phase*, and shake the mixture by hand immediately to prevent clumping. If clumping persists, disperse with the aid of sonication, or break the aggregates with a stirring rod, or warm on a steam bath while keeping the flask stoppered, or allow the flask to stand until the clumps dissipate. [NOTE—If clumping still continues, discard the mixture, and instead disperse an accurately weighed test portion in 15 mL of a 1 in 10 dilution of *Buffer solution* in water by heating on a steam bath for 1 hour with frequent shaking, then add 15 mL of methanol.] Shake for 30 minutes. Add 8.0 mL of *Internal standard solution*, cool to room temperature, add 8 mL of a 1 in 10 dilution of *Buffer solution* in water, dilute with *Mobile phase* to volume, and mix. Pass a portion through a microporous membrane filter.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Diluted Isosorbide Dinitrate*. Calculate the quantity, in mg, of  $C_6H_8N_2O_8$  in the portion of Tablets taken by the formula:

$$50C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of isosorbide dinitrate from the USP Diluted Isosorbide Dinitrate RS taken for the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

$$\% \text{released} = C_1 \times \frac{900 \times 100}{1000 \times LC}$$

Formula 1

$$\% \text{released} = \left[ C_3 \times \frac{900 \times 100}{1000 \times LC} \right] + \% \text{released at 1st hour}$$

Formula 2

$$\% \text{released} = \frac{900 \times 100}{1000 \times LC} \times \left[ C_6 + \left( \frac{5 \times C_3}{900} \right) \right] + \% \text{released at 1st hour}$$

Formula 3

$$\% \text{released} = \frac{900 \times 100}{1000 \times LC} \times \left[ C_{12} + \left( \frac{5}{900} \times (C_3 + C_6) \right) \right] + \% \text{released at 1st hour}$$

Formula 4

## Isosorbide Dinitrate Sublingual Tablets

» Isosorbide Dinitrate Sublingual Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_6H_8N_2O_8$ .

**Packaging and storage**—Preserve in well-closed containers.

### USP Reference standards (11)—

USP Diluted Isosorbide Dinitrate RS

**Identification**—Tablets respond to the *Identification* test under *Isosorbide Dinitrate Tablets*.

**Disintegration** (701): 2 minutes, determined as directed for *Sublingual Tablets*.

**Dissolution**, *Procedure for a Pooled Sample* (711)—

*Medium*: water; 900 mL.

*Apparatus 2*: 50 rpm.

*Time*: 20 minutes.

*Mobile phase*—Prepare a suitable degassed and filtered mixture of pH 3.0, 0.1 M ammonium sulfate and methanol (50:50).

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 5-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed under *Procedure*: the tailing factor is not more than 1.5, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and a filtered aliquot of the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of  $C_6H_8N_2O_8$  dissolved in comparison with a *Standard solution* having a known concentration of USP Diluted Isosorbide Dinitrate RS, similarly prepared and chromatographed.

*Tolerances*—Not less than 80% (Q) of the labeled amount of  $C_6H_8N_2O_8$  is dissolved in 20 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Assay—

*Buffer solution*, *Mobile phase*, *Internal standard solution*, *Standard preparation*, and *Chromatographic system*—Prepare as directed in the Assay under *Diluted Isosorbide Dinitrate*.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 12.5 mg of isosorbide dinitrate, to a 50-mL volumetric flask, add about 30 mL of *Mobile phase*, and shake for 30 minutes. Add 8.0 mL of *Internal standard solution*, cool to room temperature, add 8 mL of a 1 in 10 dilution of *Buffer solution* in water, dilute with *Mobile phase* to volume, and mix. Pass a portion through a 0.45- $\mu$ m filter.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Diluted Isosorbide Dinitrate*. Calculate the quantity, in mg, of  $C_6H_8N_2O_8$  in the portion of Tablets taken by the formula:

$$50C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of isosorbide dinitrate from the USP Diluted Isosorbide Dinitrate RS taken for the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diluted Isosorbide Mononitrate

$C_6H_9NO_6$  191.14

D-Glucitol, 1,4:3,6-dianhydro-, 5-nitrate.

1,4:3,6-Dianhydro-D-glucitol 5-nitrate [16051-77-7].

» Diluted Isosorbide Mononitrate is a dry mixture of isosorbide mononitrate ( $C_6H_9NO_6$ ) with lactose or other suitable excipients to permit safe han-

dling. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of isosorbide mononitrate ( $C_6H_9NO_6$ ).

**Caution**—Exercise proper precautions in handling undiluted isosorbide mononitrate, which is a powerful explosive and can be exploded by percussion or excessive heat. Only exceedingly small amounts should be isolated.

**Packaging and storage**—Preserve in tight containers. Store at a temperature between 20° and 30°.

**USP Reference standards** (11)—

USP Isosorbide RS

[NOTE—The following Reference Standards are dry mixtures of an active component and suitable excipients to permit safe handling. For quantitative applications, calculate the concentration of the active component based on the content stated on the label.]

USP Diluted Isosorbide Dinitrate RS

USP Diluted Isosorbide Mononitrate RS

USP Diluted Isosorbide Mononitrate Related Compound A RS

1,4:3,5-Dianhydro-D-glucitol 2-nitrate.

$C_6H_9NO_6$  191.14

**Identification**—

**A:** Shake a quantity of it, equivalent to about 25 mg of isosorbide mononitrate, with 10 mL of acetone for 5 minutes. Filter, evaporate to dryness at a temperature below 40°, and dry the residue in a vacuum over phosphorus pentoxide for 16 hours: the IR absorption spectrum of a potassium bromide dispersion prepared from the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation from the residue obtained from USP Diluted Isosorbide Mononitrate RS.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Heavy metals, Method I** (231): not more than 10 µg per g.

**Related compounds**—

TEST 1—

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture.

**Standard solution 1**—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.0125 mg of isosorbide per mL.

**Standard solution 2**—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.025 mg of isosorbide per mL.

**Standard solution 3**—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.05 mg of isosorbide per mL.

**Test solution**—Transfer a portion of Diluted Isosorbide Mononitrate, equivalent to about 200 mg of isosorbide mononitrate, accurately weighed, to a suitable container, add 20.0 mL of absolute alcohol, sonicate for 10 minutes, and then centrifuge. Use the supernatant.

**Application volume:** 20 µL.

**Developing solvent system:** a mixture of absolute alcohol and toluene (8:2).

**Procedure**—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). After developing, dry the plate with warm air for about 10 minutes, dip the plate in a solution prepared by dissolving 1.25 g of potassium permanganate and 10.0 g of sodium hydroxide in 500 mL

of water (prepared fresh for each plate), and heat at 105° for 5 minutes. Any spot in the chromatogram obtained from the *Test solution* and corresponding to the  $R_f$  value of the spots obtained from the *Standard solutions* is not more intense than the spot in the chromatogram obtained from *Standard solution 3*: not more than 0.5% of any individual impurity is found. If the spot in the chromatogram obtained from the *Test solution* is nearly as intense as the spot obtained from *Standard solution 3*, further dilute the *Test solution* with absolute alcohol (1:1), repeat the test, and compare the intensity of the isosorbide spot in the diluted *Test solution* with the intensity of the spots obtained from the *Standard solutions*, correcting the percentage level for the additional dilution of the *Test solution*.

TEST 2—

**Mobile phase, Resolution solution, and Chromatographic system**—Proceed as directed in the *Assay*.

**Isosorbide mononitrate related compound A standard solution**—Prepare as directed for *Isosorbide mononitrate related compound A standard preparation* in the *Assay*.

**Isosorbide dinitrate standard stock solution**—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Dinitrate RS in methanol, sonicate and warm if necessary, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.125 mg of isosorbide dinitrate per mL.

**Standard solution**—Transfer a quantity of USP Diluted Isosorbide Mononitrate RS, accurately weighed, to a suitable volumetric flask. Dissolve in water, quantitatively add a volume of *Isosorbide mononitrate related compound A standard solution* and a volume of *Isosorbide dinitrate standard stock solution*, and dilute with water to volume to obtain a solution having a known concentration of about 2.0 mg of isosorbide mononitrate per mL, 0.005 mg of isosorbide mononitrate related compound A per mL, and 0.005 mg of isosorbide dinitrate per mL. Filter a portion of the solution, discarding the first few mL of the filtrate.

**Test solution**—Use the *Assay preparation*, prepared as directed in the *Assay*.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of isosorbide mononitrate related compound A and isosorbide dinitrate relative to the amount of isosorbide mononitrate in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$100(CV/W)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of isosorbide mononitrate related compound A or isosorbide dinitrate, as appropriate, in the *Standard solution*;  $V$  is the volume, in mL, of the *Test solution*;  $W$  is the amount, in mg, of isosorbide mononitrate in the portion of Diluted Isosorbide Mononitrate used to prepare the *Test solution*, based on the label claim; and  $r_U$  and  $r_S$  are the peak areas of the corresponding components obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.25% of isosorbide mononitrate related compound A is found; and not more than 0.25% of isosorbide dinitrate is found. Calculate the percentage of each other impurity (other than isosorbide mononitrate related compound A or isosorbide dinitrate) in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$100(r_i / r_S)$$

in which  $r_i$  is the peak area for each other impurity obtained from the *Test solution*; and  $r_S$  is the sum of the areas of all the peaks: not more than 0.5% of total impurities is found, including isosorbide mononitrate related compound A and isosorbide dinitrate; and not more than 0.5% of total impu-

rities is found, the results for *Test 1* and *Test 2* being considered.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of water and methanol (95:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Transfer an accurately weighed quantity of USP Diluted Isosorbide Mononitrate RS to a suitable volumetric flask, dissolve in water, add a volume of methanol equivalent to 4% of the flask volume, and dilute with water to volume to obtain a solution having a known concentration of about 2.0 mg of isosorbide mononitrate per mL.

**Isosorbide mononitrate related compound A standard preparation**—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Mononitrate Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 1.0 mg of isosorbide mononitrate related compound A per mL. Quantitatively dilute a portion of this solution with water to obtain a solution having a known concentration of about 0.05 mg per mL.

**Resolution solution**—Transfer 10.0 mL of *Isosorbide mononitrate related compound A standard preparation*, 1.0 mL of the *Standard preparation*, and 4.0 mL of methanol to a 100-mL volumetric flask, and dilute with water to volume. Filter a portion of the solution, discarding the first few mL of the filtrate.

**Assay preparation**—Transfer an accurately weighed amount of Diluted Isosorbide Mononitrate, equivalent to 100 mg of isosorbide mononitrate, to a 50-mL volumetric flask, dissolve in about 25 mL of water, add 2 mL of methanol, dilute with water to volume, and mix. Filter a portion of the solution, discarding the first few mL of the filtrate.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4-mm × 12.5-cm column that contains packing L1. The flow rate is about 1.5 mL per minute, increasing to 3.0 mL per minute at about 8.5 minutes to ensure that the isosorbide mononitrate peak has completely eluted. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 for isosorbide mononitrate related compound A, 1.0 for isosorbide mononitrate, and 4.1 for isosorbide dinitrate; and the resolution, *R*, between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the isosorbide mononitrate peaks. Calculate the quantity, in mg, of isosorbide mononitrate (C<sub>6</sub>H<sub>9</sub>NO<sub>6</sub>) in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$CV(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of isosorbide mononitrate in the *Standard preparation*; *V* is the volume, in mL, of the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isosorbide Mononitrate Tablets

» Isosorbide Mononitrate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of isosorbide mononitrate (C<sub>6</sub>H<sub>9</sub>NO<sub>6</sub>).

**Packaging and storage**—Preserve in tight containers. Store at a temperature between 20° and 30°.

#### USP Reference standards <11>—

USP Isosorbide RS

[NOTE—The following Reference Standards are dry mixtures of an active component and suitable excipients to permit safe handling. For quantitative applications, calculate the concentration of the active component based on the content stated on the label.]

USP Diluted Isosorbide Dinitrate RS

USP Diluted Isosorbide Mononitrate RS

USP Diluted Isosorbide Mononitrate Related Compound A RS  
1,4:3,5-Dianhydro-D-glucitol 2-nitrate.

C<sub>6</sub>H<sub>9</sub>NO<sub>6</sub> 191.14

#### Identification—

**A: Thin-Layer Chromatographic Identification Test** <201>—

**Test solution**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 120 mg of isosorbide mononitrate, to a suitable container, add 50.0 mL of absolute alcohol, sonicate for 10 minutes, and then centrifuge. Quantitatively dilute the supernatant (10 in 50) with absolute alcohol.

**Standard solution**: a solution of USP Diluted Isosorbide Mononitrate RS in absolute alcohol containing 0.5 mg of isosorbide mononitrate per mL.

**Application volume**: 20 µL.

**Developing solvent system**: a mixture of chloroform and methanol (95:5).

**Spray reagent**—Dissolve 1 g of soluble starch in 100 mL of boiling water. Cool, add 0.5 g of potassium iodide, and mix to dissolve.

**Procedure**—Examine the plate under short-wavelength UV light, marking any observed spots. Visualize nitrates on the plate by spraying with *Spray reagent* and illuminating with short-wavelength UV light for about 10 minutes. Isosorbide mononitrate and other nitrates appear as a violet spot on a white to light violet background.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Dissolution <711>—

**Medium**: water; 900 mL, deaerated.

**Apparatus 2**: 50 rpm.

**Time**: 15 minutes.

Determine the amount of C<sub>6</sub>H<sub>9</sub>NO<sub>6</sub> dissolved by employing the following method.

**Mobile phase**—Proceed as directed in the *Assay*.

**Standard solution**—Transfer 20 mg, accurately weighed, of USP Diluted Isosorbide Mononitrate RS to a 200-mL volumetric flask, dilute with *Medium* to volume, and mix well. Transfer 20.0 mL of this solution to a 100-mL volumetric flask, dilute with *Medium* to volume, and mix well.

**Test solution**—Pass a portion of the solution under test through a suitable filter having a porosity of 0.45 µm, discarding the first few mL.

**Chromatographic system** (see *Chromatography* <621>)—Proceed as directed in the *Assay*. Chromatograph the *Standard solution*, and record the peak responses as directed for

**Procedure:** the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Proceed as directed in the *Assay*. Calculate the percentage of  $C_6H_9NO_6$  dissolved by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times LC}$$

in which  $r_U$  and  $r_S$  are the peak responses for the *Test solution* and the *Standard solution*, respectively;  $C_S$  is the concentration, in mg per mL, of the *Standard solution*; 900 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; and  $LC$  is the Tablet label claim, in mg.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_6H_9NO_6$  is dissolved in 15 minutes.

**Uniformity of dosage units** (905): meet the requirements for *Content Uniformity*.

#### Related compounds—

##### TEST 1—

**Adsorbent, Standard solution 1, Standard solution 2, Standard solution 3, Application volume, and Developing solvent system**—Prepare as directed in *Related compounds, Test 1* under *Diluted Isosorbide Mononitrate*.

**Test solution**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of isosorbide mononitrate, to a suitable container, add 20.0 mL of absolute alcohol, sonicate for 10 minutes, and then centrifuge. Use the supernatant.

**Procedure**—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). After developing, dry the plate with warm air for about 10 minutes, dip the plate in a solution prepared by dissolving 1.25 g of potassium permanganate and 10.0 g of sodium hydroxide in 500 mL of water (prepared fresh for each plate), and heat at 105° for 5 minutes. Any spot in the chromatogram obtained from the *Test solution* and corresponding to the  $R_f$  value of the spots obtained from the *Standard solutions* is not more intense than the spot in the chromatogram obtained from *Standard solution 3*: not more than 1.0% of any individual impurity is found. If the spot in the chromatogram obtained from the *Test solution* is nearly as intense as the spot obtained from *Standard solution 3*, further dilute the *Test solution* (1:1) with absolute alcohol, repeat the test, and compare the intensity of the isosorbide spot in the diluted *Test solution* with the intensity of the spots obtained from the *Standard solutions*, correcting the percentage level for the additional dilution of the *Test solution*.

##### TEST 2—

**Mobile phase and Resolution solution**—Proceed as directed in the *Assay*.

**Isosorbide mononitrate related compound A standard stock solution**—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Mononitrate Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg of isosorbide mononitrate related compound A per mL.

**Isosorbide dinitrate standard stock solution**—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Dinitrate RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg of isosorbide dinitrate per mL.

**Standard solution**—Transfer a quantity of USP Diluted Isosorbide Mononitrate RS, accurately weighed, to a suitable volumetric flask. Dissolve in water, quantitatively add a volume of *Isosorbide mononitrate related compound A standard stock solution* and a volume of *Isosorbide dinitrate standard*

*stock solution*, and dilute with water to volume to obtain a solution having a known concentration of about 0.1 mg of isosorbide mononitrate per mL, 0.0005 mg of isosorbide mononitrate related compound A per mL, and 0.0005 mg of isosorbide dinitrate per mL. Filter a portion of the solution, discarding the first few mL of the filtrate.

**Test solution**—Use the *Assay preparation*, prepared as directed in the *Assay*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 1.5. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 10% for the isosorbide mononitrate related compound A and isosorbide dinitrate peaks.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Compare the peak areas of the corresponding impurity obtained from the *Test solution* and the *Standard solution*, respectively. The average peak area of the impurity in the *Test solution* is less than or equal to the average peak area of the corresponding peak in the *Standard solution*: not more than 0.5% of isosorbide mononitrate related compound A is found; and not more than 0.5% of isosorbide dinitrate is found.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of water and methanol (7:3). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Resolution solution**—Prepare a solution of USP Diluted Isosorbide Mononitrate RS and USP Diluted Isosorbide Mononitrate Related Compound A RS having a concentration of 0.0005 mg of each of isosorbide mononitrate and isosorbide mononitrate related compound A per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Mononitrate RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.1 mg of isosorbide mononitrate per mL. Pass a portion of this solution through a filter having a 0.45- $\mu$ m or finer porosity, and use the filtrate.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of isosorbide mononitrate, to a 200-mL volumetric flask, add 100 mL of water, and sonicate for about 10 minutes. Dilute with water to volume, and mix. Pass a portion of this solution through a filter having a 0.45- $\mu$ m or finer porosity, and use the filtrate.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of isosorbide mononitrate ( $C_6H_9NO_6$ ) in the portion of Tablets taken by the formula:

$$200C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of isosorbide mononitrate in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isosorbide Mononitrate Extended-Release Tablets

» Isosorbide Mononitrate Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of isosorbide mononitrate ( $C_6H_9NO_6$ ).

**Packaging and storage**—Preserve in tight containers. Store at a temperature between 20° and 30°.

**Labeling**—When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.

### USP Reference standards (11)—

USP Isosorbide RS

[NOTE—The following Reference Standards are dry mixtures of an active component and suitable excipients to permit safe handling. For quantitative applications, calculate the concentration of the active component based on the content stated on the label.]

USP Diluted Isosorbide Dinitrate RS

USP Diluted Isosorbide Mononitrate RS

USP Diluted Isosorbide Mononitrate Related Compound A RS

1,4:3,5-Dianhydro-D-glucitol 2-nitrate.

$C_6H_9NO_6$  191.14

### Identification—

**A:** *Thin-Layer Chromatographic Identification Test* (201)—Proceed as directed for *Identification test A* under *Isosorbide Mononitrate Tablets*.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Dissolution (711)—

TEST 1—

*Medium:* water; 900 mL.

*Apparatus 2:* 50 rpm. The Tablets are placed in a metal helix, prepared by winding 10 inches of a 0.8-mm stainless steel wire around a 9/32-inch shaft and pulling the coils to form a helix 1 inch long.

*Times:* 1, 2, 4, 8, and 12 hours.

Determine the amount of  $C_6H_9NO_6$  dissolved by employing the following method.

*Mobile phase*—Prepare a filtered and degassed mixture of water and methanol (7:3). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard solution*—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Mononitrate RS in *Medium*, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration of about  $LC/1000$  where  $LC$  is the Tablet label claim in mg.

*Test solution*—Use portions of the solution under test passed through a 0.45- $\mu$ m nylon filter, discarding the first 4 to 6 mL of the filtrate.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph

the *Standard solution*, and record the chromatogram as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Determine the amount, in mg, of isosorbide mononitrate dissolved at each interval by the formula:

$$\frac{r_U \times C_S \times V}{r_S}$$

in which  $r_U$  and  $r_S$  are the peak responses for the *Test solution* and the *Standard solution*, respectively;  $C_S$  is the concentration, in mg per mL, of the *Standard solution*; and  $V$  is the volume, in mL, of *Medium* in the vessel at each time point.

Calculate the amount, in mg, of isosorbide mononitrate removed by sampling at the previous time points by the formula:

$$\sum AD \times \frac{V_S}{V}$$

in which  $AD$  is the amount, in mg, of isosorbide mononitrate dissolved at each time point;  $V_S$  is the volume, in mL, of the sample taken; and  $V$  is the volume, in mL, of *Medium* in the vessel at each time point.

Calculate the percentage of isosorbide mononitrate dissolved at each time point by the formula:

$$\frac{(AD + AR) \times 100}{LC}$$

in which  $AD$  is the amount, in mg, of isosorbide mononitrate dissolved at a given time point;  $AR$  is the amount, in mg, of isosorbide mononitrate removed at the previous time point; 100 is the conversion factor to percentage; and  $LC$  is the Tablet label claim, in mg.

*Tolerances*—The percentages of the labeled amount of  $C_6H_9NO_6$  dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 15% and 35%
2	between 28% and 48%
4	between 43% and 68%
8	between 65% and 90%
12	not less than 80%

TEST 2—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

*Medium:* Simulated gastric fluid (without enzymes); 500 mL.

*Apparatus 2:* 50 rpm.

*Times:* 1, 2, 6, and 12 hours.

Determine the amount of  $C_6H_9NO_6$  dissolved by employing the following method.

*Mobile phase*—Prepare a filtered and degassed mixture of water and methanol (3:2). Make adjustments if necessary (see *System suitability* under *Chromatography* (621)).

*Standard stock solution*—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Mononitrate RS in *Medium*, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration of about 1.2 mg of isosorbide mononitrate per mL.

*Working standard solution*—Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of 60  $\mu$ g per mL for Tablets labeled to contain 30 mg and a final

concentration of 120 µg per mL for Tablets labeled to contain 60 mg.

**Test solution**—Use portions of the solution under test passed through a suitable 0.45-µm filter.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains 10-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Working standard solution*, and record the chromatogram as directed for *Procedure*: the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the appropriate *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the concentration ( $C_i$ ), in mg per mL, of isosorbide mononitrate removed at each time point  $i$  by the formula:

$$C_i = \frac{r_{U(i)}}{r_S} \times C_S$$

in which  $r_{U(i)}$  is the peak response for the *Test solution* at time point  $i$ ;  $r_S$  is the peak response for the *Working standard solution*; and  $C_S$  is the concentration, in mg per mL, of the *Working standard solution*. Calculate the total amount, in percentage, of drug release at each time point  $i$  by the formula:

$$\{C_i \times [V_0 - ((i - 1)V_i)] + (\sum_{j=1}^{i-1} C_j V_j)\} \times \frac{100}{LC}$$

in which  $C_i$  is the concentration, in mg per mL, of drug removed at time point  $i$ ;  $V_0$  is the initial volume, in mL, of *Medium*;  $V_i$  is the volume, in mL, of sample removed at each sampling time;  $C_j$  is the concentration, in mg per mL, of drug released at time  $j$ ; 100 is the conversion factor to percentage; and  $LC$  is the Tablet label claim, in mg.

**Tolerances**—The percentages of the labeled amount of  $C_6H_9NO_6$  dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 25% and 45%
2	between 35% and 60%
6	between 72% and 90%
12	not less than 80%

**TEST 3**—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3*.

**Medium:** Simulated gastric fluid (without enzymes); 500 mL.

**Apparatus 2:** 50 rpm.

**Times:** 1, 2, 6, and 12 hours.

Determine the amount of  $C_6H_9NO_6$  dissolved by employing the following method.

**Buffer solution**—Transfer 15.4 g of ammonium acetate and 11.5 mL of acetic acid to a 1-L volumetric flask containing about 500 mL of water. Adjust with acetic acid to a pH of 4.7. Dilute with water to volume.

**Standard stock solution**—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Mononitrate RS in *Medium*, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration of about 0.12 mg of isosorbide mononitrate per mL.

**Working standard solution**—For Tablets labeled to contain 60 mg, use the *Standard stock solution* with no further dilution. For Tablets labeled to contain 30 mg, transfer 25.0 mL

of the *Standard stock solution* to a 50-mL volumetric flask. Dilute with *Medium* to volume.

**Test solution**—Use portions of the solution under test passed through a suitable 0.45-µm filter.

**Mobile phase**—Prepare a filtered and degassed mixture of water, methanol, and *Buffer solution* (6:3:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Working standard solution*, and record the chromatogram as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 100 µL) of the appropriate *Working standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the concentration ( $C_i$ ), in mg per mL, of isosorbide mononitrate removed at each time point  $i$  by the formula:

$$C_i = \frac{r_{U(i)}}{r_S} \times C_S$$

in which  $r_{U(i)}$  is the peak response for the *Test solution* at time point  $i$ ;  $r_S$  is the peak response for the *Working standard solution*; and  $C_S$  is the concentration, in mg per mL, of the *Working standard solution*. Calculate the total amount, in percentage, of drug release at each time point  $i$  by the formula:

$$\{C_i \times [V_0 - ((i - 1)V_i)] + (\sum_{j=1}^{i-1} C_j V_j)\} \times \frac{100}{LC}$$

in which  $C_i$  is the concentration, in mg per mL, of drug removed at time point  $i$ ;  $V_0$  is the initial volume, in mL, of *Medium*;  $V_i$  is the volume, in mL, of sample removed at each sampling time;  $C_j$  is the concentration, in mg per mL, of drug released at time  $j$ ; 100 is the conversion factor to percentage; and  $LC$  is the Tablet label claim, in mg.

**Tolerances**—The percentages of the labeled amount of isosorbide mononitrate dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 20% and 40%
2	between 30% and 50%
6	between 70% and 90%
12	not less than 85%

**Uniformity of dosage units** <905>: meet the requirements for *Content Uniformity*. Proceed as directed in the *Assay*, except to use 1 Tablet instead of the portion of powdered Tablets used in the *Assay preparation*.

#### Related compounds—

**TEST 1—**

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture.

**Standard solution 1**—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.0125 mg of isosorbide per mL.

**Standard solution 2**—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.025 mg of isosorbide per mL.

**Standard solution 3**—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if nec-

essary, with acetonitrile to obtain a solution having a known concentration of about 0.05 mg of isosorbide per mL.

**Test solution**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of isosorbide mononitrate, to a suitable flask containing 20.0 mL of acetonitrile. Sonicate for 10 minutes and then centrifuge. Use the supernatant.

**Application volume:** 20  $\mu$ L.

**Developing solvent system:** a mixture of toluene, ethyl acetate, and isopropyl alcohol (53:32:15).

**Procedure**—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). After developing, dry the plate with warm air for about 10 minutes, dip the plate in a solution prepared by dissolving 1.25 g of potassium permanganate and 10.0 g of sodium hydroxide in 500 mL of water (prepared fresh for each plate), and heat at 105° for 5 minutes. Any spot in the chromatogram obtained from the *Test solution* and corresponding to the  $R_f$  value of the spots obtained from the *Standard solutions* is not more intense than the spot in the chromatogram obtained from *Standard solution* 3: not more than 1% of any individual impurity is found. [NOTE—The  $R_f$  values of isosorbide and isosorbide mononitrate are about 0.2 and 0.6, respectively.] If the spot in the chromatogram obtained from the *Test solution* is nearly as intense as the spot obtained from *Standard solution* 3, further dilute the *Test solution* with acetonitrile (1:1), repeat the test, and compare the intensity of the isosorbide spot in the diluted *Test solution* with the intensity of the spots obtained from the *Standard solutions*, correcting the percentage level for the additional dilution of the *Test solution*.

#### TEST 2—

**Mobile phase**—Prepare a filtered and degassed mixture of water and methanol (75:25). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Isosorbide mononitrate related compound A standard stock solution**—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Mononitrate Related Compound A RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.3 mg of isosorbide mononitrate related compound A per mL.

**Isosorbide dinitrate standard stock solution**—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Dinitrate RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.15 mg of isosorbide dinitrate per mL.

**Standard stock solution**—Transfer 2.0 mL of *Isosorbide mononitrate related compound A standard stock solution* and 4.0 mL of *Isosorbide dinitrate standard stock solution* to a 100-mL volumetric flask. Dilute with water to volume, and mix.

**Resolution solution**—Transfer a quantity of USP Diluted Isosorbide Mononitrate RS, equivalent to about 24 mg of isosorbide mononitrate, to a 100-mL volumetric flask, add 10.0 mL of *Standard stock solution*, add 20 mL of methanol, and dilute with water to volume.

**Standard solution**—Transfer 10.0 mL of *Standard stock solution* and 20 mL of methanol to a 100-mL volumetric flask. Dilute with water to volume, and mix.

**Test solution**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 60 mg of isosorbide mononitrate, to a 50-mL volumetric flask, add 40 mL of methanol, and sonicate for about 30 minutes with cooling. Warm to ambient temperature, dilute with methanol to volume, and mix. Centrifuge at about 3000 rpm for 10 minutes. Quantitatively dilute the supernatant with water (10 in 50). Pass a portion of this solution through a filter having a 0.45- $\mu$ m or finer porosity, and use the filtrate.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 1.0. [NOTE—The relative retention times are about 0.9 for isosorbide mononitrate related compound A, 1.0 for isosorbide mononitrate, and 5.6 for isosorbide dinitrate.] Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 10% for the isosorbide mononitrate related compound A and isosorbide dinitrate peaks.

**Procedure**—Separately inject equal volumes (about 100  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of isosorbide mononitrate related compound A and isosorbide dinitrate in the portion of Tablets taken by the formula:

$$25(C/W)(r_u / r_s)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of the appropriate Standard, USP Diluted Isosorbide Mononitrate Related Compound A RS or USP Diluted Isosorbide Dinitrate RS, in the *Standard solution*;  $W$  is the weight, in mg, of isosorbide mononitrate in the sample used to prepare the *Test solution*; and  $r_u$  and  $r_s$  are the peak areas of the corresponding component obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.25% of isosorbide mononitrate related compound A is found, and not more than 0.25% of isosorbide dinitrate is found. Calculate the percentage of each other impurity (other than isosorbide mononitrate related compound A or isosorbide dinitrate) in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak area for each other impurity obtained from the *Test solution*; and  $r_s$  is the sum of the areas of all the peaks: not more than 0.25% of total other impurities is found, and not more than 0.5% of total impurities is found, including isosorbide mononitrate related compound A and isosorbide dinitrate.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of water and methanol (8:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Isosorbide mononitrate related compound A standard preparation**—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Mononitrate Related Compound A RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.15 mg of isosorbide mononitrate related compound A per mL.

**Resolution solution**—Transfer a quantity of USP Diluted Isosorbide Mononitrate RS, accurately weighed and equivalent to about 30 mg of isosorbide mononitrate, to a 250-mL volumetric flask. Dissolve in water, add 10.0 mL of *Isosorbide mononitrate related compound A standard preparation*, add 50 mL of methanol, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a concentration of about 0.12 mg of isosorbide mononitrate per mL and about 0.006 mg of isosorbide mononitrate related compound A per mL.

**Standard preparation**—Transfer a quantity of USP Diluted Isosorbide Mononitrate RS, accurately weighed, to a suitable volumetric flask. Dissolve in water, add a portion of methanol equivalent to about 20% of the flask volume, and dilute with water to volume to obtain a solution having a known

concentration of about 0.12 mg of isosorbide mononitrate per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 60 mg of isosorbide mononitrate, to a 100-mL volumetric flask, add 50 mL of methanol, and sonicate for about 30 minutes with cooling. Warm to ambient temperature, dilute with methanol to volume, and mix. Centrifuge at about 3000 rpm for 10 minutes. Quantitatively dilute the supernatant with water (10 in 50). Pass a portion of this solution through a filter having a 0.45- $\mu$ m or finer porosity, and use the filtrate.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4-mm  $\times$  12.5-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5, and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of isosorbide mononitrate ( $C_6H_9NO_6$ ) in the portion of Tablets taken by the formula:

$$500C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of isosorbide mononitrate in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isotretinoin

$C_{20}H_{28}O_2$  300.44

Retinoic acid, 13-*cis*-.

3,7-Dimethyl-9-(2,6,6-trimethyl-1-cyclohexen-1-yl)-2-*cis*-4-*trans*-6-*trans*-8-*trans*-nonatetraenoic acid [4759-48-2].

» Isotretinoin contains not less than 98.0 percent and not more than 102.0 percent of  $C_{20}H_{28}O_2$ , calculated on the dried basis.

**Caution**—Isotretinoin is teratogenic. Avoid inhalation and skin contact.

**Packaging and storage**—Preserve in tight containers, under an atmosphere of an inert gas, protected from light.

**USP Reference standards** <11>—

USP Isotretinoin RS

USP Tretinoin RS

**NOTE**—Avoid exposure to strong light, and use low-actinic glassware in the performance of the following procedures.

### Identification—

**A: Infrared Absorption** <197M>.

**B: Ultraviolet Absorption** <197U>—

**Solution:** 4  $\mu$ g per mL.

**Medium:** acidified isopropyl alcohol (prepared by diluting 1 mL of 0.01 N hydrochloric acid with isopropyl alcohol to 1000 mL). Absorptivities at 354 nm do not differ by more than 3.0%.

**Loss on drying** <731>—Dry it in vacuum at room temperature for 16 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** <281>: not more than 0.1%.

**Heavy metals, Method II** <231>: 0.002%.

### Limit of tretinoin—

**Mobile phase**—Prepare a suitable filtered and degassed mixture of isooctane, isopropyl alcohol, and glacial acetic acid (99.65:0.25:0.1).

**Standard stock solution**—Dissolve an accurately weighed quantity of USP Tretinoin RS in a minimum quantity of methylene chloride, add an amount of isooctane to obtain a solution having a known concentration of about 250  $\mu$ g per mL, and mix.

**Standard solution**—Pipet 1 mL of *Standard stock solution* into a 100-mL volumetric flask, add isooctane to volume, and mix.

**Test solution**—Transfer about 25 mg of Isotretinoin, accurately weighed, to a 100-mL volumetric flask, dissolve in a minimum quantity of methylene chloride, add isooctane to volume, and mix.

**System suitability stock solution**—Dissolve a quantity of USP Isotretinoin RS in a minimum amount of methylene chloride, add an amount of isooctane to obtain an isotretinoin concentration of about 250  $\mu$ g per mL, and mix.

**System suitability solution**—Pipet 1 mL of *Standard stock solution* into a 100-mL volumetric flask, add *System suitability stock solution* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 352-nm detector and a 4.0-mm  $\times$  25-cm column containing 5- $\mu$ m packing L3. The flow rate is about 1 mL per minute. Chromatograph about 20  $\mu$ L of the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times for isotretinoin and tretinoin are about 0.84 and 1.00, respectively; the resolution,  $R$ , between isotretinoin and tretinoin is not less than 2.0; and the relative standard deviation determined from the tretinoin peak response in replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of tretinoin by the formula:

$$10(C / W)(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP Tretinoin RS in the *Standard solution*;  $W$  is the weight, in mg, of Isotretinoin taken; and  $r_U$  and  $r_S$  are the tretinoin peak responses obtained from the *Test solution* and the *Standard solution*, respectively. The content of tretinoin is not more than 1.0%.

**Assay**—Dissolve about 240 mg of Isotretinoin, accurately weighed, in 50 mL of dimethylformamide, add 3 drops of a solution of thymol blue in dimethylformamide (1 in 100), and titrate with 0.1 N sodium methoxide VS to a greenish endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium methoxide is equivalent to 30.04 mg of  $C_{20}H_{28}O_2$ .

## Isotretinoin Capsules

» Isotretinoin Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of isotretinoin ( $C_{20}H_{28}O_2$ ).

**Caution**—Isotretinoin is teratogenic. Avoid inhalation and skin contact.

**Packaging and storage**—Preserve in tight containers, protected from light. Store at controlled room temperature, in a dry place.

**Labeling**—When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.

### USP Reference standards (11)—

USP Isotretinoin RS

USP Tretinoin RS

**NOTE**—Avoid exposure to strong light, and use low-actinic glassware in the performance of the following procedures.

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—[**Caution**—Carry out all the tests under subdued light and use low-actinic glassware.]

TEST 1—

*Medium*—

STAGE 1: simulated gastric fluid with pepsin, prepared freshly and purged with nitrogen.

STAGE 2: 0.13 N sodium hydroxide, prepared by transferring 5 g of sodium hydroxide to a 1-L volumetric flask and dissolving in and diluting with water to volume. Prepare fresh, and purge with nitrogen.

**Apparatus** (see *Disintegration* (701))—No disks; the apparatus is adjusted so that the bottom of the basket-rack assembly descends to  $1.0 \pm 0.1$  cm from the inside bottom surface of the vessel on the downward stroke; the 10-mesh stainless steel cloth in the basket-rack assembly is replaced with a 40-mesh stainless steel cloth; a 10-mesh stainless-steel cloth is fitted to the top of the basket-rack assembly.

**Time:** 60 minutes.

**Standard solution**—Transfer about 10 mg of USP Isotretinoin RS, accurately weighed, to a 200-mL low-actinic volumetric flask; add 25.0 mL of *Stage 1 Medium* and about 150 mL of *Stage 2 Medium*; sonicate until completely dissolved (about 20 minutes); and dilute with *Stage 2 Medium* to volume. Pass 20 mL of this solution through a suitable filter, discarding the first 5 mL. Dilute 5.0 mL of the filtrate with *Stage 2 Medium* to 50 mL.

**Sample solution**—Perform a dissolution test on each of 6 Capsules: place 1 Capsule in one of the tubes in each of six basket-rack assemblies. Place each basket in a 1-L beaker containing 100 mL of *Stage 1 Medium* in a bath having a temperature of  $37.0 \pm 0.5^\circ$ . Allow to stand for 30 minutes. Carefully add 800 mL of *Stage 2 Medium* to each beaker. With the disintegration apparatus operating, connect each basket-rack assembly to the drive rod in a timed sequence. After 60 minutes, withdraw 20 mL of *Medium* (*Stage 1* and *Stage 2*), immediately pass the solution through a suitable 0.45- $\mu$ m filter, discard the first 5 mL, and collect the solution in argon-charged, low-actinic glassware. Dilute, if necessary, using low-actinic glassware, with *Stage 2 Medium*, to obtain a theoretical concentration of about 0.0055 mg per mL of isotretinoin, assuming complete dissolution, based on the label claim.

**Capsule shell correction**—Empty the contents of 3 Capsules. Wash the Capsule shells in several 20-mL aliquots of chloroform. Allow the Capsule shells to air dry. Place the Capsule shells in a 1-L flask containing 100 mL of *Stage*

*1 Medium* and 800 mL of *Stage 2 Medium*. Allow the flask to stand for about 1 hour in a bath having a temperature of  $37.0 \pm 0.5^\circ$ , stirring occasionally. Filter, and dilute as described for *Sample solution*.

**Procedure**—Determine the amount of  $C_{20}H_{28}O_2$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 343 nm, in portions of the *Sample solution* in comparison with the *Standard solution*, correcting for the Capsule shell absorbance, and using *Medium* (*Stage 1* and *Stage 2*) as the blank. Calculate the percentage of  $C_{20}H_{28}O_2$  dissolved by the formula:

$$\frac{(A_U - A_{CS}) \times C_S \times D_U \times 100}{A_S \times LC}$$

in which  $A_U$ ,  $A_{CS}$ , and  $A_S$  are the absorbances obtained from the *Sample solution*, the *Capsule shell correction*, and the *Standard solution*, respectively;  $C_S$  is the concentration, in mg per mL, of the *Standard solution*;  $D_U$  is the dilution factor of the *Sample solution*; 100 is the conversion factor to percentage; and  $LC$  is the Capsule label claim, in mg.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{20}H_{28}O_2$  is dissolved in 60 minutes.

TEST 2—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

**Medium:** 0.05 M phosphate buffer, pH 7.8, containing 0.5% w/v solid *N,N*-dimethyldodecylamine *N*-oxide; 900 mL.

**Apparatus 1:** 20-mesh basket; 100 rpm.

**Time:** 90 minutes.

**Buffer solution**—Transfer 3.4 g of monobasic potassium phosphate to a 1-L volumetric flask, dissolve in and dilute with water to volume, and adjust with phosphoric acid to a pH of  $2.10 \pm 0.05$ .

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and *Buffer solution* (81:19). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Transfer about 44 mg, accurately weighed, of USP Isotretinoin RS to a 100-mL low-actinic volumetric flask. Add 15 mL of 1-propanol, and sonicate for about 15 minutes. Add 50 mL of *Medium*, and sonicate for 10 minutes. Fill with *Medium* to volume. Transfer 5.0 mL to a 100-mL low-actinic volumetric flask, and dilute with *Medium* to volume. Dilute this solution with *Medium* to obtain a final concentration of about  $L/1000$  mg/mL, where  $L$  is the Capsule label claim, in mg.

**Test solution**—Pass a portion of the solution under test through a suitable 0.45- $\mu$ m filter.

**Chromatographic system**—The liquid chromatograph is equipped with a 358-nm detector and a 4.6-mm  $\times$  5-cm column containing 5- $\mu$ m packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0; the column efficiency is not less than 1000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of isotretinoin dissolved by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times L}$$

in which  $r_U$  and  $r_S$  are the peak responses for the *Test solution* and the *Standard solution*, respectively;  $C_S$  is the concen-

tration, in mg per mL, of the *Standard solution*; 900 is the volume, in mL, of *Medium*; 100 is the percentage conversion factor; and *L* is the Capsule label claim, in mg.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{20}H_{28}O_2$  is dissolved in 90 minutes.

**TEST 3**—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3*.

**Medium:** borate buffer, pH 8.0, containing 0.5% cetrimide and 50 mg per L of pancreatin (Prepared by dissolving 12.37 g of boric acid and 14.91 g of potassium chloride in water and diluting with water to 1 L. To 250 mL of this solution, add 19.5 mL of 0.2 M sodium hydroxide solution, and dilute with water to 1 L. Adjust with 0.2 M sodium hydroxide to a pH of  $8.00 \pm 0.05$ , if necessary. Add 5 g of cetrimide, and mix until dissolved. Just before starting the test, dissolve a quantity of pancreatin to obtain a final concentration of 50 mg per L.); 900 mL.

**Apparatus 2:** 75 rpm, with sinkers.

**Time:** 90 minutes.

**Standard solution**—Transfer about 45 mg, accurately weighed, of USP Isotretinoin RS to a 100-mL volumetric flask. Add 60 mL of 0.1 N sodium hydroxide, and sonicate until dissolved. Dilute with 0.1 N sodium hydroxide to volume. Dilute this solution with *Medium* to obtain a final concentration of about  $L/1000$  mg/mL, where *L* is the Capsule label claim, in mg.

**Test solution**—Pass a portion of the solution under test through a suitable 0.45- $\mu$ m filter.

**Mobile phase**—Prepare a filtered and degassed mixture of 0.5% acetic acid in methanol and 0.5% acetic acid in water (71:29). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Chromatographic system**—The liquid chromatograph is equipped with a 353-nm detector and a 4.6-mm  $\times$  25-cm column containing 10- $\mu$ m packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0; the column efficiency is not less than 1800 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of isotretinoin dissolved by the formula:

$$\frac{r_t \times C_s \times 900 \times 100}{r_s \times L}$$

in  $r_t$  and  $r_s$  are the peak responses for the *Test solution* and the *Standard solution*, respectively;  $C_s$  is the concentration, in mg per mL, of the *Standard solution*; 900 is the volume, in mL, of *Medium*; 100 is the percentage conversion factor; and *L* is the Capsule label claim, in mg.

**Tolerances**—Not less than 70% (Q) of the labeled amount of  $C_{20}H_{28}O_2$  is dissolved in 90 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Chromatographic purity—

**Methylene chloride reagent**—Transfer 50 g of sodium bicarbonate to 1000 mL of methylene chloride, shake, and allow to stand overnight. At the time of use, filter suitable portions of this solution, and add 10 mg of butylated hydroxytoluene per mL.

**Mobile phase**—Prepare a filtered and degassed mixture of hexanes, ethyl acetate, and glacial acetic acid (970:30:0.1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Dissolve accurately weighed quantities of USP Isotretinoin RS and USP Tretinoin RS in *Methylene chloride reagent* to obtain a solution having known concentrations of about 1 mg of each Reference Standard per mL. Transfer 1.0 mL of this solution, and dilute quantitatively with hexanes to 100.0 mL to obtain a solution having known concentrations of about 0.01 mg of each Reference Standard per mL.

**Standard solution**—Dissolve an accurately weighed quantity of USP Tretinoin RS in *Methylene chloride reagent* to obtain a solution having a known concentration of about 0.5 mg per mL. Dilute an accurately measured volume of this solution quantitatively, and stepwise if necessary, with hexanes to obtain a solution having a known concentration of about 1  $\mu$ g per mL.

**Test solution**—Weigh a number of Capsules, equivalent to about 200 mg of isotretinoin. With a sharp blade, carefully open the Capsules, without loss of material, and transfer the contents by pipetting 5 mL of *Methylene chloride reagent* over each Capsule and rinsing with hexanes. Collect the washings in a 500-mL volumetric flask, dilute with hexanes to volume, and mix. Transfer 50.0 mL of this solution to a 200-mL volumetric flask, dilute with hexanes to volume, and mix to obtain a solution having a concentration of about 0.1 mg of isotretinoin per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 365-nm detector and a 4.6-mm  $\times$  25-cm column containing packing L3. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution* [NOTE—The injection volume is about 20  $\mu$ L.], and record the peak responses as directed for *Procedure*: the relative retention times for isotretinoin and tretinoin are about 0.75 and 1.00, respectively; the resolution, *R*, between isotretinoin and tretinoin is not less than 3.0; the tailing factor for the isotretinoin peak is not greater than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, and allow the *Test solution* to elute for not less than two times the retention time of isotretinoin. Record the chromatograms, and measure the peak responses: the peak response for any impurity is not more than that of the tretinoin response obtained from the *Standard solution* (1.0%); and the sum of all the peak responses, excluding that of isotretinoin, obtained from the *Test solution*, is not more than 1.5 times the tretinoin response obtained from the *Standard solution* (1.5%).

**Assay**—[NOTE—Protect the *System suitability solution*, the *Standard preparation*, the *Assay stock preparation*, and the *Assay preparation* from direct light.]

**Diluent**—Heat 0.1 N sodium hydroxide to about 60° to 70°. Cool it to room temperature and purge with helium or nitrogen. Store it in a plastic container.

**Solvent A**—Prepare a solution of 0.5% acetic acid in methanol.

**Solvent B**—Prepare a solution of 0.5% acetic acid in water.

**Mobile phase**—Prepare a mixture of *Solvent A* and *Solvent B* (71:29). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Dissolve suitable quantities of USP Isotretinoin RS and USP Tretinoin RS in *Diluent* to obtain a solution having known concentrations of about 0.04 mg per mL of isotretinoin and 0.02 mg per mL of tretinoin.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Isotretinoin RS in *Diluent*, and dilute with *Diluent*, stepwise if necessary, to obtain a solution having a known concentration of about 0.04 mg per mL.

**Assay stock preparation**—Transfer not fewer than 10 Capsules to a suitable volumetric flask. Add *Diluent* to the volumetric flask to fill about 50% of the volume, sonicate for

1 hour with occasional shaking to disperse all the contents, and make up the volume with *Diluent* to obtain a solution having a known concentration of about 0.4 mg per mL of isotretinoin.

**Assay preparation**—Transfer 5 mL of the *Assay stock preparation* to a 50-mL volumetric flask, and dilute with *Diluent* to volume. Pass the solution through a suitable 0.45- $\mu$ m or finer porosity membrane filter.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 353-nm detector and a 4.6-mm  $\times$  25-cm column containing packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak areas as directed for *Procedure*: the relative retention times for isotretinoin and tretinoin are about 1.0 and 1.3, respectively; the resolution, *R*, between isotretinoin and tretinoin is not less than 2.0; the tailing factor for the isotretinoin peak is not greater than 2.0; and the column efficiency determined from the isotretinoin peak is not less than 2000. Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of isotretinoin ( $C_{20}H_{28}O_2$ ) in each of the Capsules taken by the formula:

$$10(CV/N)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of isotretinoin in the *Standard preparation*; *V* is the volume, in mL, of the volumetric flask used to prepare the *Assay stock preparation*; *N* is the number of Capsules taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the isotretinoin peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isoxsuprine Hydrochloride

$C_{18}H_{23}NO_3 \cdot HCl$  337.84

Benzenemethanol, 4-hydroxy- $\alpha$ -[1-[(1-methyl-2-phenoxyethyl)amino]ethyl]-, hydrochloride, stereoisomer.

*p*-Hydroxy- $\alpha$ -[1-[(1-methyl-2-phenoxyethyl)amino]ethyl]benzyl alcohol hydrochloride.  
( $\pm$ )-( $\alpha R^*$ )-*p*-Hydroxy- $\alpha$ -[(1*S*\*)-1-[(1*S*\*)-1-methyl-2-phenoxyethyl]amino]ethyl]benzyl alcohol hydrochloride [579-56-6; 34331-89-0].

» Isoxsuprine Hydrochloride contains not less than 97.0 percent and not more than 103.0 percent of  $C_{18}H_{23}NO_3 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Isoxsuprine Hydrochloride RS

### Identification—

**A: Infrared Absorption** <197K>.

**B: Ultraviolet Absorption** <197U>—

*Solution:* 50  $\mu$ g per mL.

*Medium:* water.

**C:** To 1 mL of a solution (1 in 100), obtained by heating as necessary, add 3 mL of a 1 in 15 solution of sodium nitrite in 2 N sulfuric acid. Add ammonium hydroxide dropwise: a yellow precipitate is formed and it dissolves upon the addition of sodium hydroxide solution (1 in 5).

**D:** To 1 mL of a solution (1 in 100) add 1 mL of phosphomolybdic acid solution (1 in 100): a pale yellow to white precipitate is formed.

**pH** <791>: between 4.5 and 6.0, in a solution (1 in 100).

**Loss on drying** <731>—Dry it at 105° for 1 hour: it loses not more than 0.5% of its weight.

**Residue on ignition** <281>: not more than 0.2%.

**Heavy metals, Method II** <231>: 0.002%.

**Related compounds**—To 10 mg, accurately weighed in a suitable vial, add 1 mL of *N*-trimethylsilylimidazole, and heat at 65° for 10 minutes. Add 5 mL of isooctane, wash with one 3-mL portion of water, and allow the layers to separate. Inject a 2- $\mu$ L portion of the isooctane solution into a gas chromatograph equipped with a 0.3-cm  $\times$  2.0-m glass column packed with packing S1A containing 3% liquid phase G2 and a flame-ionization detector. The column temperature is maintained at 215°, and the injection port and detector are maintained at 250°. The carrier gas is nitrogen, flowing at the rate of 25 mL per minute. Adjust the instrument to provide full-scale response for the major component. Inject a second 2- $\mu$ L portion of the isooctane solution with the attenuator adjusted to an 8-fold increase in sensitivity, and record the chromatogram from 0.5 to 1.5 relative to the retention time of the major peak. Measure the area of all minor peaks, and correct for differences in sensitivity settings. Calculate the percentage of related compounds present taken by the formula:

$$100A / B$$

in which *A* is the sum of the corrected area peaks for all minor peaks, and *B* is the sum of the corrected area peaks for the major and minor peaks. Not more than 2.0% is found.

**Assay**—Transfer about 50 mg of Isoxsuprine Hydrochloride, accurately weighed, to a 1000-mL volumetric flask, add water to volume, and mix. Concomitantly determine the absorbances of this solution and of a Standard solution of USP Isoxsuprine Hydrochloride RS in the same medium having a known concentration of about 50  $\mu$ g per mL in 1-cm cells at the wavelengths of maximum absorbance at about 269 and 300 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of  $C_{18}H_{23}NO_3 \cdot HCl$  in the Isoxsuprine Hydrochloride taken by the formula:

$$C(A_{U269} - A_{U300}) / (A_{S269} - A_{S300})$$

in which *C* is the concentration, in  $\mu$ g per mL, of USP Isoxsuprine Hydrochloride RS in the Standard solution; and the parenthetical expressions are the differences in the absorbances of the two solutions at the wavelengths indicated by the subscripts, for the assay solution (*U*) and the Standard solution (*S*), respectively.

## Isoxsuprine Hydrochloride Injection

» Isoxsuprine Hydrochloride Injection is a sterile solution of Isoxsuprine Hydrochloride in Water

for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_{18}H_{23}NO_3 \cdot HCl$ .

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Isoxsuprine Hydrochloride RS

**Identification**—To a 60-mL separator transfer 10 mL of pH 9.0 buffer (prepared by mixing equal volumes of 0.1 M monobasic potassium phosphate and 0.1 N sodium hydroxide and, using a pH meter, adjusting to a pH of 9.0 by adding, as necessary, more of either solution) add 1 mL of Injection, and mix. Add 2 mL of chloroform, shake vigorously for 1 minute, filter the chloroform extract through a pledget of cotton, and mix the filtrate with 500 mg of potassium bromide. Evaporate the chloroform, carefully removing the last trace of solvent in a small vacuum flask: the IR absorption spectrum of a potassium bromide dispersion of the isoxsuprine so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Isoxsuprine Hydrochloride RS that has been treated in the same manner.

**Bacterial endotoxins** (85)—It contains not more than 35.70 USP Endotoxin Units per mg of isoxsuprine hydrochloride.

**pH** (791): between 4.9 and 6.0.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*pH 4.0 Citrate buffer*—Mix equal volumes of 0.5 M citric acid and 0.5 M sodium citrate, and adjust, by the addition of either solution as necessary, the pH of the solution to  $4.0 \pm 0.2$ .

*Mixed solvent*—Shake 40 mL of ether, 160 mL of iso-octane, and 10 mL of water in a separator, remove and discard the water phase, and pass the solvent phase through a large pledget of cotton to remove excess water.

*Standard preparation*—Transfer about 40 mg of USP Isoxsuprine Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask, add 2 N sulfuric acid to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with 2 N sulfuric acid to volume, and mix. The concentration of USP Isoxsuprine Hydrochloride RS in the *Standard preparation* is about 80  $\mu$ g per mL.

*Chromatographic column*—Proceed as directed under *Column Partition Chromatography* (see *Chromatography* (621)), packing a chromatographic tube with two segments of packing material. The lower segment is a mixture of 2 g of *Solid Support* and 1 mL of *pH 4.0 Citrate buffer*, and the upper segment is a mixture prepared as directed under *Assay preparation*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 4 mg of isoxsuprine hydrochloride, to a 100-mL beaker, add 1 mL of dimethyl sulfoxide, and allow to stand for about 10 minutes, with occasional swirling. Add 1 mL of *pH 4.0 Citrate buffer* and 3 g of *Solid Support*, mix as directed under *Chromatographic column*, and transfer to the column. Pass 75 mL of *Mixed solvent* through the column, and discard the eluate. Elute the column with a solution prepared by mixing 0.2 mL of bis(2-ethylhexyl)phosphoric acid with 75 mL of *Mixed solvent*, and collect the eluate in a 125-mL separator. Extract the eluate with two 20-mL portions of 2 N sulfuric acid. Transfer the extracts to a 50-mL volumetric flask, dilute with 2 N sulfuric acid to volume, and mix.

*Procedure*—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* in 1-cm cells at the wavelength of maximum absorbance at about 275 nm, with a suitable spectrophotometer, using a column

blank, prepared with *Mixed solvent*, to set the instrument. Calculate the quantity, in mg, of  $C_{18}H_{23}NO_3 \cdot HCl$  in the portion of Injection taken by the formula:

$$0.05C(A_U / A_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Isoxsuprine Hydrochloride RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Isoxsuprine Hydrochloride Tablets

» Isoxsuprine Hydrochloride Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of  $C_{18}H_{23}NO_3 \cdot HCl$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Isoxsuprine Hydrochloride RS

**Identification**—Transfer a portion of finely powdered Tablets, equivalent to about 10 mg of isoxsuprine hydrochloride, to a 60-mL beaker, add about 20 mL of water, mix, and filter. Transfer the clear filtrate to a 60-mL separator, add 10 mL of pH 9.0 alkaline borate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), and shake vigorously to mix. Extract with 2 mL of chloroform, filter the extract through a pledget of cotton, and mix the filtrate with 500 mg of potassium bromide. Evaporate the chloroform, carefully removing the last trace of solvent in a small vacuum flask: the IR absorption spectrum of a potassium bromide dispersion of the isoxsuprine so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Isoxsuprine Hydrochloride RS that has been treated in the same manner.

**Dissolution** (711)—

*Medium*: water; 900 mL.

*Apparatus 1*: 100 rpm.

*Time*: 45 minutes.

*Procedure*—Determine the amount of  $C_{18}H_{23}NO_3 \cdot HCl$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 269 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Isoxsuprine Hydrochloride RS in the same medium.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{18}H_{23}NO_3 \cdot HCl$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

*Buffer solution*—Transfer about 1.32 g of anhydrous dibasic ammonium phosphate to a 1-liter volumetric flask, add about 950 mL of water, and mix. Adjust with phosphoric acid to a pH of 7.5, dilute with water to volume, and mix.

*Mobile phase*—Prepare a filtered and degassed mixture of methanol and *Buffer solution* (2:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Isoxsuprine Hydrochloride RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.4 mg per mL.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of isoxsuprine hy-

drochloride, to a 50-mL volumetric flask, and add about 25 mL of *Mobile phase*. Shake by mechanical means for 30 minutes, sonicate for ten minutes to dissolve, dilute with *Mobile phase* to volume, mix, and filter.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 274-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 1800 theoretical plates, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>18</sub>H<sub>23</sub>NO<sub>3</sub> · HCl in the portion of Tablets taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Isosuprine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isradipine

C<sub>19</sub>H<sub>21</sub>N<sub>3</sub>O<sub>5</sub> 371.39

3,5-Pyridinedicarboxylic acid, 4-(4-benzofurazanyl)-1,4-dihydro-2,6-dimethyl-, methyl 1-methylethyl ester, (±)-. Isopropyl methyl (±)-4-(4-benzofurazanyl)-1,4-dihydro-2,6-dimethyl-3,5-pyridinedicarboxylate [75695-93-1].

» Isradipine contains not less than 98.0 percent and not more than 102.0 percent of C<sub>19</sub>H<sub>21</sub>N<sub>3</sub>O<sub>5</sub>, calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

### USP Reference standards <11>—

USP Isradipine RS

USP Isradipine Related Compound A RS

Isopropyl methyl 4-(4-benzofurazanyl)-2,6-dimethyl-3,5-pyridinedicarboxylate.

C<sub>19</sub>H<sub>19</sub>N<sub>3</sub>O<sub>5</sub> 369.38

**Identification, Infrared Absorption** <197K>.

**Melting range** <741>: between 166° and 170°.

**Loss on drying** <731>—Dry it at 105° for 4 hours: it loses not more than 0.2% of its weight.

**Residue on ignition** <281>: not more than 0.1%.

**Heavy metals, Method II** <231>: 0.002%.

**Chromatographic purity**—[NOTE—Use low-actinic glassware throughout this procedure, and otherwise protect the test specimen, the Reference Standard, and all solutions containing them from unnecessary exposure to light.]

*Mobile phase*—Prepare as directed in the *Assay*.

*Standard solution*—Dissolve an accurately weighed quantity of USP Isradipine RS in *Mobile phase*, with the aid of

sonication if necessary, and dilute quantitatively and stepwise with *Mobile phase* to obtain a solution having a known concentration of about 6 µg per mL. [NOTE—If necessary, use 1 mL of methanol per 20 mL of *Mobile phase* to dissolve the Reference Standard prior to diluting with *Mobile phase*.]

*Resolution solution*—Use the *Standard preparation* prepared as directed in the *Assay*.

*Test solution*—Transfer about 50 mg of Isradipine, accurately weighed, to a 25-mL volumetric flask, and add 5.0 mL of methanol to dissolve, using sonication if necessary. Dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 10-cm column that contains packing L1. The flow rate is about 1.7 mL per minute. Chromatograph replicate injections of the *Resolution solution*, and record the peak responses as directed under *Procedure*: the resolution,  $R$ , between isradipine and isradipine related compound A is not less than 1.5, and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, and allow the *Test solution* to elute for not less than three times the retention time of isradipine. Record the chromatograms, and measure the responses for all of the peaks: the sum of the peak responses, other than that of isradipine, in the chromatogram of the *Test solution* is not more than four times the isradipine response obtained from the *Standard solution* (1.2%), the response of the largest peak, other than that of isradipine, in the chromatogram of the *Test solution* is not more than 1.6 times greater than the isradipine response obtained from the *Standard solution* (0.5%), and no other peak response, other than that of isradipine, is greater than the isradipine response obtained from the *Standard solution* (0.3%).

**Assay**—[NOTE—Use low-actinic glassware throughout this procedure, and otherwise protect the test specimen, the Reference Standard, and all solutions containing them, from unnecessary exposure to light.]

*Mobile phase*—Prepare a filtered and degassed mixture of water, methanol, and tetrahydrofuran (50:40:10). Make adjustments, if necessary (see *System Suitability* under *Chromatography* <621>).

*Standard preparation*—Dissolve, with the aid of sonication, if necessary, accurately weighed quantities of USP Isradipine RS and USP Isradipine Related Compound A RS in *Mobile phase*, and dilute quantitatively, and stepwise, if necessary, with *Mobile phase* to obtain a solution having known concentrations of 0.2 mg and 10 µg of USP Isradipine RS and USP Isradipine Related Compound A RS, respectively, per mL. [NOTE—If necessary, 1 mL of methanol per 20 mL of *Mobile phase* may be added to dissolve the Reference Standards.]

*Assay preparation*—Transfer about 20 mg of Isradipine, accurately weighed, to a 100-mL volumetric flask. Add sufficient methanol to dissolve, using sonication, if necessary. Dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 326-nm detector and a 4.6-mm × 10-cm column that contains packing L1. The flow rate is about 1.7 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between isradipine and isradipine related compound A is not less than 1.5, and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of  $C_{19}H_{21}N_3O_5$  in the portion of Isradipine taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Isradipine RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the isradipine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Isradipine Capsules

» Isradipine Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of isradipine ( $C_{19}H_{21}N_3O_5$ ).

**Packaging and storage**—Store in a tight container at controlled room temperature. Protect from light.

### USP Reference standards (11)—

USP Isradipine RS

USP Isradipine Related Compound A RS

Isopropyl methyl 4-(4-benzofurazanyl)-2,6-dimethyl-3,5-pyridinedicarboxylate.

$C_{19}H_{19}N_3O_5$  369.38

### Identification—

**A:** *Ultraviolet Absorption* (197U)—

*Medium:* methanol.

*Solution*—Transfer the contents of 1 Capsule into a suitable volumetric flask, dissolve the contents in the *Medium* by mechanical shaking for 15 minutes, and dilute with *Medium* to obtain a solution containing 25 µg of isradipine per mL.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Dissolution (711)—

*Medium:* 0.1% aqueous solution of lauryl dimethyl amine oxide (prepared by transferring 500 mL of deaerated water into the dissolution vessel, adding 1.65 mL of 30% lauryl dimethyl amine oxide, and mixing); 500 mL.

*Apparatus 2:* 50 rpm.

*Time:* 45 minutes.

*Procedure*—Determine the amount of  $C_{19}H_{21}N_3O_5$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 328 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Isradipine RS in the same *Medium*.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{19}H_{21}N_3O_5$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

NOTE—Isradipine is light sensitive. Throughout the following procedures, protect test or assay specimens, the Reference Standards, and solutions containing them from unnecessary exposure to light. Use low-actinic glassware, unless otherwise directed.

### Chromatographic purity—

*Mobile phase, Resolution solution, and Chromatographic system*—Proceed as directed in the test for *Chromatographic purity* under *Isradipine*.

*Standard solution*—Dissolve an accurately weighed quantity of USP Isradipine RS in *Mobile phase*, with the aid of sonication if necessary, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1 µg per mL.

[NOTE—If necessary, use 1 mL of methanol per 20 mL of *Mobile phase* to dissolve the Reference Standard prior to diluting with *Mobile phase*.]

*Test solution*—Use the *Assay preparation*.

*Procedure*—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for all the peaks: the sum of all peak responses, other than that of isradipine, from the *Test solution* is not more than four times the isradipine response obtained from the *Standard solution* (2.0%); and no single peak response is greater than that of the isradipine peak response obtained from the *Standard solution* (0.5%).

### Assay—

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Isradipine*.

*Assay preparation*—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and mix the combined contents. Transfer an accurately weighed quantity, equivalent to about 25 mg of isradipine, to a 100-mL volumetric flask. Add 5.0 mL of methanol and 5.0 mL of *Mobile phase*, and sonicate at room temperature for 15 minutes. Shake for 15 minutes in a mechanical shaker. Dilute with *Mobile phase* to volume, mix, and filter, discarding the first 5 mL of the filtrate.

*Procedure*—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of isradipine ( $C_{19}H_{21}N_3O_5$ ) in the portion of Capsules taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Isradipine RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the isradipine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Add the following:

## ▲Isradipine Oral Suspension

### DEFINITION

Isradipine Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of isradipine ( $C_{19}H_{21}N_3O_5$ ).

Prepare Isradipine Oral Suspension 1 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Isradipine capsules <sup>a</sup> or powder <sup>b</sup>	100 mg
Glycerin, USP	3 mL
Syrup, NF, a sufficient quantity to make	100 mL

<sup>a</sup> DynaCirc 5-mg capsules, Sandoz Pharmaceuticals, East Hanover, NJ.

<sup>b</sup> Isradipine powder, Sandoz, East Hanover, NJ.

Calculate the required quantity of each ingredient for the total amount to be prepared. If using capsules, empty the required number in a suitable mortar, or use *Isradipine* powder. Add sufficient *Glycerin* to wet the powder, and triturate to a fine paste. Add the *Syrup* in small portions. Add increasing volumes of the *Syrup* to make an isradipine liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Syrup* to bring to final volume, and mix well.

**ASSAY****• PROCEDURE**

**Mobile phase:** Methanol, tetrahydrofuran, and water (42:20:38). Filter, and degas.

**Diluent:** Prepare a solution of methanol and 95% ethanol (50:50).

**Standard stock solution:** 1.0 mg/mL of USP Isradipine RS in *Diluent*

**Standard solution:** Prepare 0.1 mg/mL of isradipine from *Standard stock solution* and *Diluent*, and pass through a filter of 0.22-μm pore size.

**Sample solution:** Shake thoroughly by hand each bottle of Oral Suspension. Prepare 0.1 mg/mL of isradipine from Oral Suspension and *Diluent*, and pass through a filter of 0.22-μm pore size.

**Chromatographic system**

(See *Chromatography* ⟨621⟩, *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Flow rate:** 1.0 mL/min

**Injection volume:** 10 μL

**System suitability**

**Sample:** *Standard solution*

[NOTE—The retention time for isradipine is about 6.1 min.]

**Suitability requirements**

**Relative standard deviation:** NMT 2.0% for replicate injections

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of isradipine (C<sub>19</sub>H<sub>21</sub>N<sub>3</sub>O<sub>5</sub>) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of isradipine in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of isradipine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**SPECIFIC TESTS**

**• pH** ⟨791⟩: 5.5–6.5

**ADDITIONAL REQUIREMENTS**

**• PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled cold temperature.

**• LABELING:** Label it to indicate that it is to be well-shaken before use, and to state the *Beyond-Use Date*.

**• BEYOND-USE DATE:** NMT 30 days after the date on which it was compounded, when stored at controlled cold temperature

**• USP REFERENCE STANDARDS** ⟨11⟩

USP Isradipine RS<sub>▲USP36</sub>

**Itraconazole**

C<sub>35</sub>H<sub>38</sub>Cl<sub>2</sub>N<sub>8</sub>O<sub>4</sub> 705.63

3*H*-1,2,4-Triazol-3-one, 4-[4-[4-[2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]-1-piperazinyl]phenyl]-2,4-dihydro-2-(1-methylpropyl)-; (±)-1-*sec*-Butyl-4-[*p*-[4-[*p*-[[2*R*\*,4*S*\*)-2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]-1-piperazinyl]phenyl]-Δ<sup>2</sup>-1,2,4-triazolin-5-one [84625-61-6].

**DEFINITION**

Itraconazole contains NLT 98.5% and NMT 101.5% of C<sub>35</sub>H<sub>38</sub>Cl<sub>2</sub>N<sub>8</sub>O<sub>4</sub>, calculated on the dried basis.

**IDENTIFICATION**

**• A. INFRARED ABSORPTION** ⟨197K⟩

**ASSAY****• PROCEDURE**

**Diluent:** Methyl ethyl ketone and glacial acetic acid (7:1)

**Sample solution:** 0.3 g of Itraconazole in 70 mL of *Diluent*

**Analysis:** Titrate with 0.1 M perchloric acid, determining the endpoint potentiometrically at the second inflection point. Each mL of 0.1 M perchloric acid is equivalent to 35.3 mg of itraconazole (C<sub>35</sub>H<sub>38</sub>Cl<sub>2</sub>N<sub>8</sub>O<sub>4</sub>).

**Acceptance criteria:** 98.5%–101.5% on the dried basis

**IMPURITIES**

**• RESIDUE ON IGNITION** ⟨281⟩: NMT 0.1%, determined on 1.0 g

**• ORGANIC IMPURITIES**

**Solution A:** 0.08 M tetrabutylammonium hydrogen sulfate

**Solution B:** Acetonitrile

**Diluent:** Dilute 4.0 mL of hydrochloric acid with methanol to 1 L.

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	80	20
2	80	20
22	50	50
27	50	50

**System suitability solution:** 10 mg/mL of USP

Itraconazole System Suitability Mixture RS in *Diluent*

**Standard solution:** 1.0 μg/mL of USP Itraconazole RS in *Diluent*

**Sample solution:** 10 mg/mL of Itraconazole in *Diluent*

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 10-cm; 3-μm packing L1

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection size: 10 μL

System suitability

Sample: System suitability solution

Suitability requirements

System suitability solution: NLT 1.5 peak-to-valley ratio  
Calculate the peak-to-valley ratio, *p/v*, using the following:

$$p/v = H_p/H_v$$

*H<sub>p</sub>* = height above the baseline of the peak due to the *n*-butyl isomer impurity  
*H<sub>v</sub>* = height above the baseline of the lowest point of the curve separating this peak from the itraconazole peak

Analysis

Samples: Diluent, Standard solution, and Sample solution  
Calculate the percentage of each impurity in the portion of Itraconazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

*r<sub>U</sub>* = peak response of each impurity from the Sample solution  
*r<sub>S</sub>* = peak response of itraconazole from the Standard solution  
*C<sub>S</sub>* = concentration of the Standard solution (mg/mL)  
*C<sub>U</sub>* = concentration of the Sample solution (mg/mL)  
Acceptance criteria: See Table 2.

Table 2

<sup>f</sup> 4-[4-[4-[(2*RS*,4*SR*)-2-[(1*H*-1,2,4-Triazol-1-yl)methyl]-2-(2,4-dichlorophenyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-sec-butyl-2*H*-1,2,4-triazol-3(4*H*)-one.

<sup>g</sup> 4-[4-[4-[(2*RS*,4*SR*)-2-[(1*H*-1,2,4-Triazol-1-yl)methyl]-2-(2,4-dichlorophenyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-butyl-2*H*-1,2,4-triazol-3(4*H*)-one.

<sup>h</sup> 4-[4-[4-[(2*RS*,4*SR*)-2-[(1*H*-1,2,4-Triazol-1-yl)methyl]-2-(2,4-dichlorophenyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-[(2*RS*,4*SR*)-2-[(1*H*-1,2,4-triazol-1-yl)methyl]-2-(2,4-dichlorophenyl)-1,3-dioxolan-4-yl]methyl]-2*H*-1,2,4-triazol-3(4*H*)-one.

SPECIFIC TESTS

• OPTICAL ROTATION, Angular Rotation <781A>

Sample: 100 mg/mL in methylene chloride

Acceptance criteria: −0.10° to +0.10° at 20°

• LOSS ON DRYING <731>

Sample: Dry 1 g at 105° for 4 h: it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in tight, light-resistant containers, and store at room temperature.

• USP REFERENCE STANDARDS <11>

USP Itraconazole RS

USP Itraconazole System Suitability Mixture RS

USP Itraconazole System Suitability Mixture RS contains itraconazole and 6 other minor components

(4-triazolyl isomer, propyl analog, isopropyl analog, epimer, *n*-butyl isomer, and didioxolanyl analog).

Ivermectin

C<sub>48</sub>H<sub>74</sub>O<sub>14</sub> (Component H<sub>2</sub>B<sub>1a</sub>) 875.09

C<sub>47</sub>H<sub>72</sub>O<sub>14</sub> (Component H<sub>2</sub>B<sub>1b</sub>) 861.07

Component H<sub>2</sub>B<sub>1a</sub>:

Avermectin A<sub>1a</sub>, 5-O-demethyl-22,23-dihydro-

(2*aE*,4*E*,8*E*)-(5′,5′,6′,6′,7′,5′,11*R*,13*R*,15*S*,17*aR*,20*R*,20*aR*,20*bS*)-6′-(*S*)-sec-Butyl-3′,4′,5′,6′,7′,10′,11′,14′,15′,17*a*,20′,20*a*,20*b*-tetradecahydro-20′,20*b*-dihydroxy[11′,15′-methano-2*H*,13*H*,17*H*-furo[4,3,2-*pq*][2,6]benzodioxacyclooctadecin-13,2′-[2*H*]pyran]-7-yl 2,6-dideoxy-4-O-(2,6-dideoxy-3-O-methyl-

$\alpha$ -L-arabino-hexopyranosyl)-3-O-methyl- $\alpha$ -L-arabino-hexopyranoside [70161-11-4].

Component H<sub>2</sub>B<sub>1b</sub>:

Avermectin A<sub>1a</sub>, 5-O-demethyl-25-de(1-methylpropyl)-22,23-dihydro-25-(1-methylethyl)-.

(2aE,4E,8E)-(5'S,6S,6'R,7S,11R,13R,15S,17aR,20R,20aR,20bS)-3',4',5',6',7,10,11-oxospiro[11,15-methano-2H,13H,17H-furo[4,3,2-pq][2,6]benzodioxacyclooctadecin-13,2'[2H]pyran]-7-yl 2,6-dideoxy-4-O-(2,6-dideoxy-3-O-methyl- $\alpha$ -L-arabino-hexopyranosyl)-3-O-methyl- $\alpha$ -L-arabino-hexopyranoside [70209-81-3].

» Ivermectin is a mixture of avermectin A<sub>1a</sub>, 5-O-demethyl-22,23-dihydro-(component H<sub>2</sub>B<sub>1a</sub>), and avermectin A<sub>1a</sub>, 5-O-demethyl-25-de(1-methylpropyl)-22,23-dihydro-25-(1-methylethyl)-(component H<sub>2</sub>B<sub>1b</sub>). It contains not less than 95.0 percent and not more than 102.0 percent for the sum of component H<sub>2</sub>B<sub>1a</sub> plus component H<sub>2</sub>B<sub>1b</sub>, calculated on the anhydrous and alcohol- and formamide-free basis; and the ratio (calculated by area percentage) of component H<sub>2</sub>B<sub>1a</sub>/(H<sub>2</sub>B<sub>1a</sub> + H<sub>2</sub>B<sub>1b</sub>) is not less than 90.0 percent. It may contain small amounts of suitable antioxidant and chelating agents.

**Packaging and storage**—Preserve in tight containers. Store between 2° and 8°. Where the use of an antioxidant is allowed, store at 25°, excursions permitted between 15° and 30°.

**Labeling**—If it is intended for veterinary use only, it is so labeled. Label it to state the name(s) and amount(s) of any added substance(s). Label it also to state that it is for manufacturing, processing, or repackaging.

**USP Reference standards** (11)—

USP Ivermectin RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** The retention times of the component H<sub>2</sub>B<sub>1a</sub> peak and the component H<sub>2</sub>B<sub>1b</sub> peak in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Specific rotation** (781S): between -17° and -20° measured at 20°, calculated on the water-, alcohol-, and formamide-free basis.

*Test solution*: 25 mg per mL, in methanol.

**Water**, *Method I* (921): not more than 1.0%.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals**, *Method II* (231): 0.002%.

**Limit of alcohol and formamide**—

*Internal standard solution*—Dilute 0.5 mL of isopropyl alcohol with water to 100 mL, and mix.

*Standard solution 1*—Transfer 2.0 mL of dehydrated alcohol to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Standard solution 2*—Transfer 1.0 mL of formamide to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Standard solution 3*—Transfer 5.0 mL of *Standard solution 1* and 5.0 mL of *Standard solution 2* to a 50-mL volumetric flask, dilute with water to volume, and mix to obtain a solution having concentrations of formamide and alcohol of 0.001 and 0.002 mL per mL, respectively. Transfer 2.0 mL of this solution to a 15-mL centrifuge tube, add 2.0 mL of *m*-xylene, insert the stopper, mix, and centrifuge. Remove the upper *m*-xylene layer, and extract it with 2.0 mL of water. Discard the upper layer, combine the two retained lower aqueous layers, add 1.0 mL of *Internal standard solution*, and

mix. Each mL of this solution contains about 0.0008 mL of alcohol and 0.0004 mL of formamide.

*Standard solution 4*—Transfer 10.0 mL of *Standard solution 1* and 10.0 mL of *Standard solution 2* to a 50-mL volumetric flask, dilute with water to volume, and mix to obtain a solution having concentrations of alcohol and formamide of 0.004 and 0.002 mL per mL, respectively. Transfer 2.0 mL of this solution to a 15-mL centrifuge tube, add 2.0 mL of *m*-xylene, insert the stopper, mix, and centrifuge. Remove the upper *m*-xylene layer, and extract it with 2.0 mL of water. Discard the upper layer, combine the two retained lower aqueous layers, add 1.0 mL of *Internal standard solution*, and mix. Each mL of this solution contains about 0.0016 mL of alcohol and 0.0008 mL of formamide.

*Test solution*—Transfer 120 mg of Ivermectin, accurately weighed, to a 15-mL centrifuge tube, and dissolve in 2.0 mL of *m*-xylene, heating in a water bath at 45 ± 5°, if necessary. Add 2.0 mL of water, mix, and centrifuge. Transfer the *m*-xylene layer to a 15-mL centrifuge tube, and extract with 2.0 mL of water. Discard the upper *m*-xylene layer, combine the two retained lower aqueous layers, add 1.0 mL of *Internal standard solution*, and mix.

*Chromatographic system* (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m fused-silica analytical column coated with a 3-μm G43 stationary phase. The carrier gas is helium, with a 10:1 split ratio and a linear velocity of about 35 cm per second. The chromatograph is programmed as follows. The column temperature is maintained at about 40° for 5 minutes after injection, then increased at a rate of 20° per minute to 180° and maintained at 180° for 2 minutes. The injection port temperature is maintained at about 220°, and the detector temperature is maintained at about 280°.

*Procedure*—Separately inject equal volumes (about 2 μL) of *Standard solution 3*, *Standard solution 4*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for alcohol, formamide, and isopropyl alcohol. Plot the ratios of the peak responses for alcohol and isopropyl alcohol and for formamide and isopropyl alcohol versus concentrations, in mL per mL, of alcohol and formamide, respectively, obtained from *Standard solution 3* and *Standard solution 4*. From the graphs so obtained, and using the ratios of the peak responses for alcohol and isopropyl alcohol and for formamide and isopropyl alcohol obtained from the chromatogram of the *Test solution*, determine the concentrations, *C*, of alcohol and formamide in the *Test solution*. [NOTE—In the event that the peak responses of the *Test solution* are significantly outside the ranges of peak responses obtained from *Standard solution 3* and *Standard solution 4*, prepare additional *Standard solutions*, and chromatograph them to obtain peak responses bracketing those obtained with the *Test solution*.] Calculate the percentages of alcohol and formamide in the portion of Ivermectin taken by the formula:

$$500,000CD/W$$

in which *C* is the concentration of alcohol or formamide, as appropriate, in mL per mL, in the *Test solution*; *D* is the density of alcohol (0.79) or formamide (1.13); and *W* is the weight, in mg, of Ivermectin taken: not more than 5.0% of alcohol and 3.0% of formamide are found.

**Related compounds**—

*Mobile phase and Chromatographic system*—Proceed as directed in the *Assay*.

*Standard solution*—Proceed as directed for *Standard preparation* in the *Assay*.

*Test solution*—Use the *Assay preparation*.

*Procedure*—Separately inject equal volumes (about 50 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatogram of the *Test solution* for a period of time equivalent to twice the retention time of the main peak in the chromatogram obtained from the

*Standard solution*, and measure the peak areas. Calculate the percentage of each impurity by the formula:

$$100r_i / (r_s - r_b)$$

in which  $r_i$  is the peak area for each individual impurity in the *Test solution* chromatogram;  $r_s$  is the sum of all peaks in the *Test solution* chromatogram; and  $r_b$  is the total area of all peaks in a blank chromatogram: not more than 2.5% is found for the sum of all peaks with a relative retention time of about 1.3 to 1.4 (corresponding to  $H_4B_{1a}$  isomers and  $\Delta^{2,3}H_2B_{1a}$ ); not more than 1% is found for the peak with a relative retention time of about 0.7 (corresponding to 8a-oxo- $H_2B_{1a}$ ); not more than 0.7% is found for the peak with a relative retention time of about 0.5 (corresponding to avermectin  $B_{1a}$ ); not more than 0.5% is found for any other individual impurity peak; not more than 1% is found for the sum of all unidentified peaks; and not more than 4% is found for the sum of all the peaks, apart from the two main peaks ( $H_2B_{1a}$  and  $H_2B_{1b}$ ). Disregard any peak that is calculated to be less than 0.05%.

#### Assay—

*Mobile phase*—Prepare a mixture of acetonitrile, methanol, and water (53:27.5:19.5), and degas. Make adjustments if necessary (see *System Suitability under Chromatography* <621>). Increasing the proportion of water increases the elution times and allows better separation of impurities.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Ivermectin RS in methanol to obtain a solution having a known concentration of about 0.4 mg per mL.

*Assay preparation*—Transfer about 40 mg of Ivermectin, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Sonicate, if necessary.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.75 for component  $H_2B_{1b}$  and 1.0 for component  $H_2B_{1a}$ ; the resolution,  $R$ , between component  $H_2B_{1b}$  and component  $H_2B_{1a}$  is not less than 3.0; the column efficiency determined from the component  $H_2B_{1a}$  peak is not less than 2000 theoretical plates; the tailing factor for component  $H_2B_{1a}$  peak is not more than 2.5; and the relative standard deviation for six replicate injections is not more than 1.0% determined from the component  $H_2B_{1a}$  peak.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas for component  $H_2B_{1a}$  and component  $H_2B_{1b}$ . Calculate the quantity, in mg, of component  $H_2B_{1a}$  ( $C_{48}H_{74}O_{14}$ ) and component  $H_2B_{1b}$  ( $C_{47}H_{72}O_{14}$ ) in the portion of Ivermectin taken by the formula:

$$DC(r_U / r_S)$$

in which  $D$  is the dilution factor, in mL, used to prepare the *Assay preparation*;  $C$  is the concentration, in mg per mL, of component  $H_2B_{1a}$  or component  $H_2B_{1b}$  in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak areas for component  $H_2B_{1a}$  or component  $H_2B_{1b}$  obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ivermectin Injection

» Ivermectin Injection is a sterile solution of Ivermectin in a suitable vehicle. It contains not

less than 95.0 percent and not more than 105.0 percent of the labeled amount of ivermectin, calculated as the sum of component  $H_2B_{1a}$  ( $C_{48}H_{74}O_{14}$ ) plus component  $H_2B_{1b}$  ( $C_{47}H_{72}O_{14}$ ). The ratio of the contents,  $H_2B_{1a} / (H_2B_{1a} + H_2B_{1b})$ , is not less than 90.0 percent.

**Packaging and storage**—Preserve in single-dose or in multi-dose containers, preferably of Type I glass or plastic. Store at a temperature of not more than 30°.

**Labeling**—Label it to indicate that it is for veterinary use only.

#### USP Reference standards <11>—

USP Endotoxin RS

USP Ivermectin RS

#### Identification—

**A: Thin-Layer Chromatographic Identification Test** <201>—

*Test solution*—Dissolve a volume of the Injection in methanol, dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution containing 0.5 mg per mL of ivermectin, and filter.

*Injection volume*: 2  $\mu$ L.

*Developing solvent system*: unsaturated chamber, consisting of a freshly prepared and equilibrated mixture of methylene chloride, methanol, and ammonium hydroxide (90:9:1).

*Procedure*—Remove the plate, allow to air dry, and examine under short- and long-wavelength UV light: the retardation factor,  $R_f$ , of the principal spot obtained from the *Test solution* corresponds to that obtained from the *Standard solution*.

**B:** The retention times of the two principal component peaks of ivermectin in the chromatogram of the *Assay preparation* corresponds to that of the two principal component peaks of ivermectin in the chromatogram of the *Standard preparation*, obtained as directed in the Assay.

**Bacterial endotoxins** <85>—It contains not more than 0.016 USP Endotoxin Unit per  $\mu$ g of ivermectin.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

#### Chromatographic purity—

*Mobile phase and Chromatographic system*—Proceed as directed in the Assay.

*Standard solution*—Dissolve an accurately weighed quantity of USP Ivermectin RS in methanol and dilute quantitatively, and stepwise if necessary, with methanol to obtain a 0.004 mg per mL solution.

*Test solution*—Dissolve a volume of the Injection in methanol and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution containing 0.4 mg of ivermectin per mL of solution, based on the label claim.

*Procedure*—Inject equal volumes (about 20  $\mu$ L) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Injection taken by the formula:

$$100(C_S / C_T)(r_i / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of ivermectin in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of ivermectin in the *Test solution*;  $r_i$  is the peak response for each individual peak obtained from the *Test solution*; and  $r_S$  is the ivermectin peak response obtained from the *Standard solution*. Not more than 2.7% of the peak with a relative retention time of about 1.3 to 1.5 to that of the principal peak is found; not more than 1.0% of any other impurity is found; and not more than 6.0% of total impurities is found. Disregard any peak below 0.05%.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile, methanol, and water (106:55:39). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ivermectin RS in methanol and dilute quantitatively, and stepwise if necessary, with methanol to obtain a 0.4 mg per mL solution.

**Assay preparation**—Dilute a volume of Injection in methanol and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution containing 0.4 mg of ivermectin per mL of solution, based on the label claim.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with 245-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the first peak (component  $H_2B_{1b}$ ) and the second peak (component  $H_2B_{1a}$ ) is not less than 3.0; and the relative standard deviation for replicate injections is not more than 2.0%, determined from the component  $H_2B_{1a}$  peak.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the component  $H_2B_{1a}$  plus component  $H_2B_{1b}$ . Calculate the percentage of label claim of ivermectin ( $H_2B_{1a} + H_2B_{1b}$ ) in the portion of Injection taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Ivermectin RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of ivermectin in the *Assay preparation*;  $r_U$  is the total peak response of  $H_2B_{1a}$  plus  $H_2B_{1b}$  peaks obtained from the *Assay preparation*; and  $r_S$  is the total peak response of  $H_2B_{1a}$  plus  $H_2B_{1b}$  peaks obtained from the *Standard preparation*. Calculate the ratio of the contents, in percent, of  $H_2B_{1a} / (H_2B_{1a} + H_2B_{1b})$  in the portion of Injection taken by the formula:

$$100(r_1 / r_U)$$

in which  $r_1$  is the peak response of  $H_2B_{1a}$  obtained from the *Assay preparation*; and  $r_U$  is as defined above.

## Ivermectin Paste

### DEFINITION

Ivermectin Paste contains NLT 90.0% and NMT 110.0% of the labeled amount of Ivermectin, calculated as the sum of component  $H_2B_{1a}$  ( $C_{48}H_{74}O_{14}$ ) and component  $H_2B_{1b}$  ( $C_{47}H_{72}O_{14}$ ). The ratio of the contents,  $H_2B_{1a} / (H_2B_{1a} + H_2B_{1b})$ , is NLT 90.0%.

### IDENTIFICATION

#### • A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

**Sample solution:** 0.5 mg/mL of ivermectin dispersed in methanol from a quantity of Paste. Sonicate if necessary until completely dispersed.

**Application volume:** 2 μL

**Developing solvent system:** Methylene chloride, methanol, and ammonium hydroxide (90:9:1)

**Analysis:** Develop the chromatogram in an unsaturated chamber. Remove the plate, allow to air dry, and examine under short- and long-wavelength UV light.

**Acceptance criteria:** Meets the requirements

- **B.** The retention times of the two principal component peaks of ivermectin from the *Sample solution* correspond to those of the two principal component peaks of ivermectin from the *Standard solution*, as obtained in the Assay.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Acetonitrile, methanol, and water (106:55:39)

**Standard solution:** 0.4 mg/mL of USP Ivermectin RS in methanol

**Sample solution:** Disperse a quantity of Paste in methanol, using sonication if necessary, to obtain a solution containing 0.4 mg/mL of ivermectin.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 245 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 20 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 3.0 between the first peak (component  $H_2B_{1b}$ ) and the second peak (component  $H_2B_{1a}$ )

**Relative standard deviation:** NMT 2.0%, determined from the component  $H_2B_{1a}$  peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ivermectin, component  $H_2B_{1a}$  ( $C_{48}H_{74}O_{14}$ ) and component  $H_2B_{1b}$  ( $C_{47}H_{72}O_{14}$ ), in the portion of Paste taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = sum of the peak responses for component  $H_2B_{1a}$  and component  $H_2B_{1b}$  from the *Sample solution*

$r_S$  = sum of the peak responses for component  $H_2B_{1a}$  and component  $H_2B_{1b}$  from the *Standard solution*

$C_S$  = concentration of USP Ivermectin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of ivermectin in the *Sample solution* (mg/mL)

Calculate the ratio of the contents, in percentage, of the components,  $H_2B_{1a} / (H_2B_{1a} + H_2B_{1b})$ , in the portion of Paste taken:

$$\text{Result} = (r_U / r_T) \times 100$$

$r_U$  = peak response of  $H_2B_{1a}$  from the *Sample solution*

$r_T$  = sum of the peak responses for component  $H_2B_{1a}$  and component  $H_2B_{1b}$  from the *Sample solution*

**Acceptance criteria:** 90.0%–110.0% of the labeled amount of ivermectin, calculated as the sum of component  $H_2B_{1a}$  ( $C_{48}H_{74}O_{14}$ ) and component  $H_2B_{1b}$  ( $C_{47}H_{72}O_{14}$ ). The ratio of the contents,  $H_2B_{1a} / (H_2B_{1a} + H_2B_{1b})$ , is NLT 90.0%.

### IMPURITIES

#### • ORGANIC IMPURITIES

**Mobile phase, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the Assay.

**Standard solution:** 0.004 mg/mL of USP Ivermectin RS in methanol

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of each impurity in the portion of Paste taken, disregarding any peak below 0.05%:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response for each impurity from the *Sample solution*  
 $r_S$  = peak response of the principal peak from the *Standard solution*  
 $C_S$  = concentration of the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of ivermectin in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 3.0% of any peak with a relative retention time of 1.3–1.5, relative to that of the principal peak

**Any other impurity:** NMT 1.0%

**Total impurities:** NMT 6.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at a temperature not higher than 30°.
- **LABELING:** Label it to indicate that it is for oral veterinary use only.
- **USP REFERENCE STANDARDS** <11>  
USP Ivermectin RS

**Ivermectin Tablets**

» Ivermectin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Ivermectin components  $\text{H}_2\text{B}_{1a}$  ( $\text{C}_{48}\text{H}_{74}\text{O}_{14}$ ) plus  $\text{H}_2\text{B}_{1b}$  ( $\text{C}_{47}\text{H}_{72}\text{O}_{14}$ ). They may contain a suitable antioxidant.

**Packaging and storage**—Preserve in well-closed containers, and store at a temperature below 30°.

**USP Reference standards** <11>—

USP Ivermectin RS

USP 3-*tert*-Butyl-4-hydroxyanisole RS

**Identification**—The retention times of the  $\text{H}_2\text{B}_{1a}$  and  $\text{H}_2\text{B}_{1b}$  peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** <711>—

**Medium:** 0.01 M phosphate buffer, pH 7, with 0.5% of sodium dodecyl sulfate (prepared by dissolving 50 g of sodium dodecyl sulfate in approximately 9 L of water, adding 100 mL of 1 M monobasic sodium phosphate monohydrate, adjusting with sodium hydroxide to a pH of 7, and diluting with water to 10 L); 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 45 minutes.

Determine the amount of  $\text{C}_{48}\text{H}_{74}\text{O}_{14}$  (component  $\text{H}_2\text{B}_{1a}$ ) plus  $\text{C}_{47}\text{H}_{72}\text{O}_{14}$  (component  $\text{H}_2\text{B}_{1b}$ ) dissolved by employing the following method.

**Mobile phase**—Prepare a degassed solution of acetonitrile, methanol, and water (53:35:12).

**Standard stock solution**—Prepare a 0.13 mg per mL solution of USP Ivermectin RS in *Medium*.

**Standard solution**—Using the accompanying table, dilute the *Standard stock solution* with *Medium* to volume, and mix.

Tablet Strength (mg per Tablet)	Required Dilution Ratio	Volume of Standard stock solution (mL)	Volumetric Flask Size (mL)
3.0	1 in 40	5.0	200
6.0	1 in 20	5.0	100

**Test solution**—Pass a portion of the solution under test through a suitable filter, and use the filtrate.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 245-nm detector and a 4.6-mm  $\times$  10-cm column that contains 5- $\mu\text{m}$  packing L1. The flow rate is about 1.2 mL per minute. The column temperature is maintained at 30°. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.81 for  $\text{H}_2\text{B}_{1b}$  and 1.0 for  $\text{H}_2\text{B}_{1a}$ ; the resolution,  $R$ , between the  $\text{H}_2\text{B}_{1a}$  and  $\text{H}_2\text{B}_{1b}$  peaks is not less than 1.5; the capacity factor,  $k'$ , for the  $\text{H}_2\text{B}_{1a}$  peak is not less than 4; the column efficiency determined from both the  $\text{H}_2\text{B}_{1a}$  and  $\text{H}_2\text{B}_{1b}$  peaks is not less than 1500 theoretical plates; the tailing factor for the  $\text{H}_2\text{B}_{1a}$  peak is not more than 2; and the relative standard deviation for replicate injections for the  $\text{H}_2\text{B}_{1a}$  peak is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 100  $\mu\text{L}$ ) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the combined quantities, in percentage, of  $\text{H}_2\text{B}_{1a}$  plus  $\text{H}_2\text{B}_{1b}$  dissolved based on the peak responses obtained from the *Test solution* and the *Standard solution* by the formula:

$$[100(A_U)(W_S)(P)(D_U)]/[A_S(D_S)L]$$

in which  $A_U$  is the total peak area of  $\text{H}_2\text{B}_{1a}$  plus  $\text{H}_2\text{B}_{1b}$  obtained from the *Test solution*;  $W_S$  is the weight, in mg, of the USP Ivermectin RS taken to prepare the *Standard stock solution*;  $P$  is the purity of the USP Ivermectin RS (percent [w/w]  $\text{H}_2\text{B}_{1a}$  plus percent [w/w]  $\text{H}_2\text{B}_{1b}$ ), expressed as a decimal;  $D_U$  is the *Test solution* dilution factor;  $A_S$  is the total peak area of  $\text{H}_2\text{B}_{1a}$  plus  $\text{H}_2\text{B}_{1b}$  obtained from the *Standard solution*;  $D_S$  is the *Standard solution* dilution factor; and  $L$  is the label claim of ivermectin, in mg per Tablet.

**Tolerances**—Not less than 80% ( $Q$ ) of the labeled amount of  $\text{C}_{48}\text{H}_{74}\text{O}_{14}$  ( $\text{H}_2\text{B}_{1a}$ ) plus  $\text{C}_{47}\text{H}_{72}\text{O}_{14}$  ( $\text{H}_2\text{B}_{1b}$ ) is dissolved in 45 minutes.

**Uniformity of dosage units** <905>: meet the requirements for *Content uniformity*.

PROCEDURE FOR CONTENT UNIFORMITY—

**Mobile phase**—Prepare as directed in the *Assay*.

**Standard solution A**—Use the *Standard preparation* from the *Assay*.

**Standard solution B**—Dissolve an accurately weighed quantity of USP Ivermectin RS in methanol to obtain a solution containing 0.125 mg per mL.

**Stock sensitivity solution (1%)**—Use the *Stock sensitivity solution* (1%) from the *Assay*.

**Sensitivity solution (0.2%)**—Use the *Sensitivity solution* (0.2%) from the *Assay*.

**Test solution**—Transfer 1 Tablet into each of ten 25-mL volumetric flasks. Add 5.0 mL of water, and sonicate for 10 minutes. Add approximately 15 mL of methanol, sonicate for 5 minutes, and mix. Allow the solution to cool to room temperature. Dilute with methanol to volume, and mix. Pass a portion of each solution through a 1.0- to 1.2- $\mu\text{m}$  chemically resistant filter prior to analysis.

**Chromatographic system** (see *Chromatography* <621>)—Proceed as directed in the *Assay*.

**Procedure**—Separately inject equal volumes (about 10  $\mu\text{L}$ ) of *Standard solution A* (for the 6 mg per Tablet dose) or *Standard solution B* (for the 3 mg per Tablet dose), the *Sensi-*

tivity solution (0.2%), and the Test solution into the chromatograph, record the chromatograms, and measure the responses of the ivermectin peaks. Calculate the quantity as a percentage of the label claim of ivermectin per Tablet taken by the formula:

$$[100(A_U)(W_S)(P)(D_U)]/[(A_S)(D_S)L]$$

in which  $A_U$  is the peak area of  $H_2B_{1a}$  plus the peak area of  $H_2B_{1b}$  obtained from the Test solution;  $W_S$  is the weight, in mg, of the USP Ivermectin RS taken to prepare Standard solution A or Standard solution B;  $P$  is the purity of USP Ivermectin RS (percent [w/w]  $H_2B_{1a}$  plus percent [w/w]  $H_2B_{1b}$ ), expressed as a decimal;  $D_U$  is the Test solution dilution factor;  $A_S$  is the peak area of  $H_2B_{1a}$  plus the peak area of  $H_2B_{1b}$  obtained from Standard solution A or Standard solution B;  $D_S$  is the Standard solution A or Standard solution B dilution factor; and  $L$  is the label claim of ivermectin, in mg per Tablet.

#### Limit of 8a-oxo- $H_2B_{1a}$ —

**Mobile phase**—Proceed as directed in the Assay.

**BHA Working Standard solution**—Dissolve an accurately weighed quantity of USP 3-*tert*-Butyl-4-hydroxyanisole RS in methanol, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.96  $\mu$ g per mL.

**Test solution**—Use the Assay preparation.

**Chromatographic system** (see Chromatography (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L1. The column temperature is maintained at 30°. The flow rate is about 1.2 mL per minute. Chromatograph the BHA Working Standard solution and the Test solution, and record the peak responses as directed for Procedure: the relative retention times at 280 nm are about 0.24 for BHA, 0.77 for 8a-oxo- $H_2B_{1a}$ , and 1.0 for  $H_2B_{1a}$ .

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the BHA Working Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of 8a-oxo- $H_2B_{1a}$  as a percentage of the label claim of ivermectin in the portion of Tablets taken by the formula:

$$[100(A_D)(W_S)(P)(D_U)(C_F)]/[(A_S)(D_S)(N)(L)(F)]$$

in which  $A_D$  is the peak area of 8a-oxo- $H_2B_{1a}$  obtained from the Test solution;  $W_S$  is the weight of USP 3-*tert*-Butyl-4-hydroxyanisole RS, in mg, taken to prepare the BHA Working Standard solution;  $P$  is the purity of USP 3-*tert*-Butyl-4-hydroxyanisole RS, expressed as a decimal;  $D_U$  is the Test solution dilution factor;  $C_F$  is the correction factor (equal to 0.98) used to convert mg of 8a-oxo- $H_2B_{1a}$  to mg of ivermectin;  $A_S$  is the peak area of BHA obtained from the BHA Working Standard solution;  $D_S$  is the BHA Working Standard solution dilution factor;  $N$  is the number of Tablets taken to prepare the Test solution;  $L$  is the label claim of ivermectin, in mg per Tablet; and  $F$  is the relative response factor (equal to 1.0): not more than 2.0% of 8a-oxo- $H_2B_{1a}$  is found. The correction factor,  $C_F$ , (equal to 0.98) is calculated by the following formula:

$$[0.90 (\text{molecular weight of } H_2B_{1a}) + 0.10 (\text{molecular weight of } H_2B_{1b})]/(\text{molecular weight of 8a-oxo-}H_2B_{1a}) = 873.10/889.10 = 0.98]$$

#### Assay—

**Mobile phase**—Prepare a mixture of acetonitrile, methanol, and water (53:35:12). Make adjustments if necessary (see System Suitability under Chromatography (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ivermectin RS in methanol to obtain a solution containing 0.25 mg per mL.

**Stock sensitivity solution (1%)**—Quantitatively prepare a 1 in 100 dilution of the Standard solution in methanol.

**Sensitivity solution (0.2%)**—Quantitatively prepare a 1 in 5 dilution of the Stock sensitivity solution (1%) in methanol.

**Assay preparation**—Transfer the appropriate number of Tablets into a 250-mL volumetric flask according to the accompanying table:

Tablet Strength (mg per Tablet)	Number of Tablets
3.0	20
6.0	10

Add approximately 25 mL of water, and sonicate for 10 minutes. Add methanol to fill the flask three-quarters full, sonicate for 5 minutes or until the Tablets are completely disintegrated, and shake until mixed well. Allow the solution to cool to room temperature. Dilute with methanol to volume, add a magnetic stirrer, and mix until no lumps are present in the solution. Pass a portion of this solution through a 1.0- to 1.2- $\mu$ m chemically resistant filter prior to injection.

**Chromatographic system** (see Chromatography (621))—The liquid chromatograph is equipped with a 245-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 1.2 mL per minute. The column temperature is maintained at 30°. Chromatograph the Sensitivity solution (0.2%) and the Standard preparation at 245-nm detection, and record the peak responses as directed for Procedure: the signal-to-noise ratio for the ivermectin peak obtained from the Sensitivity solution (0.2%) is not less than 10; obtained from the Standard preparation, the relative retention times are about 0.82 and 1.0 for components  $H_2B_{1b}$  and  $H_2B_{1a}$ , respectively; the capacity factor,  $k'$ , for the component  $H_2B_{1b}$  is not less than 3; the column efficiency for component  $H_2B_{1a}$  is not less than 1500 theoretical plates; the tailing factor for component  $H_2B_{1a}$  is not more than 2; and the relative standard deviation for the area response for total ivermectin ( $H_2B_{1a}$  plus  $H_2B_{1b}$ ) for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak areas for component  $H_2B_{1a}$  plus component  $H_2B_{1b}$ . Calculate the percentage of component  $H_2B_{1a}$  ( $C_{48}H_{74}O_{14}$ ) plus component  $H_2B_{1b}$  ( $C_{47}H_{72}O_{14}$ ) as a percentage of the label claim of ivermectin per Tablet taken by the formula:

$$[100(A_U)(W_S)(P)(D_U)]/[(A_S)(D_S)(N)(L)]$$

in which  $A_U$  is the total peak response of  $H_2B_{1a}$  plus  $H_2B_{1b}$  obtained from the Assay preparation;  $W_S$  is the weight of the USP Ivermectin RS, in mg, taken to prepare the Standard preparation;  $P$  is the purity of the USP Ivermectin RS (percent [w/w]  $H_2B_{1a}$  plus percent [w/w]  $H_2B_{1b}$ ), expressed as a decimal;  $D_U$  is the sample dilution factor;  $A_S$  is the total peak area of  $H_2B_{1a}$  plus  $H_2B_{1b}$  obtained from the Standard preparation;  $D_S$  is the Standard dilution factor;  $N$  is the number of Tablets taken to prepare the Assay preparation; and  $L$  is the label claim of ivermectin, in mg per Tablet.

### Ivermectin Topical Solution

» Ivermectin Topical Solution is a topical solution in a suitable vehicle. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of Ivermectin, calculated as the sum of component  $H_2B_{1a}$  ( $C_{48}H_{74}O_{14}$ ) plus component  $H_2B_{1b}$  ( $C_{47}H_{72}O_{14}$ ). The ratio of the

contents,  $H_2B_{1a} / (H_2B_{1a} + H_2B_{1b})$ , is not less than 90.0 percent.

**Packaging and storage**—Preserve in well-closed containers. Store at a temperature not more than 30°.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Ivermectin RS

**Identification**—

**A:** *Thin-Layer Chromatographic Identification Test* (201)—

*Test solution*—Dissolve a volume of Topical Solution in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution containing 0.5 mg per mL of ivermectin, and filter.

*Injection volume:* 2  $\mu$ L.

*Developing solvent system:* unsaturated chamber, freshly prepared and equilibrated mixture of methylene chloride, methanol, and ammonium hydroxide (90:9:1).

*Procedure*—Remove the plate, allow to air dry, and examine under short- and long-wavelength UV light: the retardation factor,  $R_f$ , of the principal spot obtained from the *Test solution* corresponds to that obtained from the *Standard solution*.

**B:** The retention times of the two principal component peaks of ivermectin in the chromatogram of the *Assay preparation* corresponds to that of the two principal component peaks of ivermectin in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay*.

**Chromatographic purity**—

*Mobile phase and Chromatographic system*—Proceed as directed in the *Assay*.

*Standard solution*—Dissolve an accurately weighed quantity of USP Ivermectin RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a 0.004 mg per mL solution.

*Test solution*—Dissolve a quantity of Topical Solution in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution containing 0.4 mg of ivermectin per mL of solution, based on the label claim.

*Procedure*—Inject equal volumes (about 20  $\mu$ L) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Topical Solution taken by the formula:

$$100(C_S / C_T) (r_i / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of ivermectin in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of ivermectin in the *Test solution*;  $r_i$  is the peak response for each impurity from the *Test solution*; and  $r_S$  is the ivermectin peak response obtained from *Standard solution*. Not more than 2.7% of the peak with a relative retention time of about 1.3 to 1.5 to that of the principal peak is found; not more than 1.0% of any other impurity is found; and not more than 6.0% of total impurities is found. Disregard any peak below 0.05%.

**Assay**—

*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile, methanol, and water (106:55:39). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Ivermectin RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.4 mg per mL.

*Assay preparation*—Dilute a volume of Topical Solution, quantitatively, and stepwise if necessary, with methanol to

obtain a solution containing 0.4 mg of ivermectin per mL of solution, based on the label claim.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 245-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the first peak (component  $H_2B_{1b}$ ) and the second peak (component  $H_2B_{1a}$ ) is not less than 3.0; and the relative standard deviation for replicate injections is not more than 2.0%, determined from the  $H_2B_{1a}$  peak.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the component  $H_2B_{1a}$  plus component  $H_2B_{1b}$ . Calculate the percentage of label claim of ivermectin ( $H_2B_{1a} + H_2B_{1b}$ ) in the portion of Topical Solution taken by the formula:

$$100(C_S / C_U) (r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Ivermectin RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of ivermectin in the *Assay preparation*;  $r_U$  is the total peak response of  $H_2B_{1a}$  plus  $H_2B_{1b}$  peaks obtained from the *Assay preparation*; and  $r_S$  is the total peak response of  $H_2B_{1a}$  plus  $H_2B_{1b}$  peaks obtained from the *Standard preparation*. Calculate the ratio of the contents, in percent, of  $H_2B_{1a} / (H_2B_{1a} + H_2B_{1b})$  in the portion of Topical Solution taken by the formula:

$$100(r_1 / r_U)$$

in which  $r_1$  is the peak response of  $H_2B_{1a}$  obtained from the *Assay preparation*; and  $r_U$  is as described above.

## Ivermectin and Clorsulon Injection

» Ivermectin and Clorsulon Injection is a sterile solution of Ivermectin and Clorsulon in a suitable vehicle. It contains not less than 95.0 percent and not more than 110.0 percent of the labeled amount of ivermectin [component  $B_{1a}$  ( $C_{48}H_{74}O_{14}$ ) plus component  $B_{1b}$  ( $C_{47}H_{72}O_{14}$ )] and not less than 95.0 percent and not more than 105.0 percent of the labeled amount of clorsulon ( $C_8H_8Cl_3N_3O_4S_2$ ).

**Packaging and storage**—Preserve in single-dose or multi-dose containers, preferably of Type I glass or plastic. Store at a temperature not higher than 30°.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Clorsulon RS

USP Endotoxin RS

USP Ivermectin RS

**Identification**—

**A:** *Thin-Layer Chromatographic Identification Test* (201)—

*Test solution:* about 0.5 mg of ivermectin and 5 mg of clorsulon per mL in methanol.

*Application volume:* 2  $\mu$ L.

*Developing solvent system:* a mixture of methylene chloride, methanol, and ammonium hydroxide (90:9:1).

**B:** The retention times of the two major peaks in the chromatogram of the *Assay preparation* correspond to those

in the chromatogram of the *Standard preparation*, as obtained in the *Assay for ivermectin*. The retention time of the major clorsulon peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for clorsulon*.

[NOTE—The two major ivermectin components are not separated by this method.]

**Bacterial endotoxins** (85)—It contains not more than 2.3 USP Endotoxin Units per mg of combined ivermectin and clorsulon.

**Sterility** (71): meets the requirements.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay for ivermectin—

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile, methanol, and water (530:350:70). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). Increasing the proportion of water increases the resolution.

**Standard preparation**—Prepare a solution of USP Ivermectin RS in methanol having a known concentration of about 0.3 mg per mL.

**Assay preparation**—Transfer an accurately measured portion of Injection, equivalent to about 30 mg of ivermectin, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure* [NOTE—The relative retention times are about 0.8 for component B<sub>1b</sub> and 1.0 for component B<sub>1a</sub>]; the resolution, *R*, between component B<sub>1b</sub> and component B<sub>1a</sub> is not less than 2.0; the column efficiency determined from the component B<sub>1a</sub> peak is not less than 2000 theoretical plates; and the relative standard deviation for replicate injections determined for the component B<sub>1a</sub> peak is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of ivermectin component B<sub>1a</sub> (C<sub>48</sub>H<sub>74</sub>O<sub>14</sub>) plus ivermectin component B<sub>1b</sub> (C<sub>47</sub>H<sub>72</sub>O<sub>14</sub>) in the portion of Injection taken by the formula:

$$CP(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Ivermectin RS in the *Standard preparation*; *P* is the designated percentage of the sum of component B<sub>1a</sub> plus component B<sub>1b</sub> in USP Ivermectin RS; and *r<sub>U</sub>* and *r<sub>S</sub>* are the sums of the peak area responses for ivermectin component B<sub>1a</sub> plus ivermectin component B<sub>1b</sub> obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for clorsulon—

**Mobile phase**—Prepare a filtered and degassed mixture of chloroform, methanol, and water (900:100:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Prepare a solution of USP Clorsulon RS in methanol having a known concentration of about 2.4 mg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with chloroform to volume, and mix.

**Assay preparation**—Transfer an accurately measured portion of Injection, equivalent to about 240 mg of clorsulon, to a 100-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with chloroform to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L3. The flow rate is about 0.8 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure* [NOTE—The relative retention times are about 0.6 for ivermectin (the major components of ivermectin co-elute) and 1.0 for clorsulon]; the column efficiency determined from the clorsulon peak is not less than 4000 theoretical plates; the tailing factor for the clorsulon peak is not more than 2.0; and the relative standard deviation for replicate injections determined for the clorsulon peak is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of clorsulon (C<sub>8</sub>H<sub>8</sub>Cl<sub>3</sub>N<sub>3</sub>O<sub>4</sub>S<sub>2</sub>) in the portion of Injection taken by the formula:

$$1000C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Clorsulon RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the clorsulon peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ivermectin and Pyrantel Pamoate Tablets

» Ivermectin and Pyrantel Pamoate Tablets contain not less than 90.0 percent and not more than 115.0 percent of the labeled amount of ivermectin components H<sub>2</sub>B<sub>1a</sub> (C<sub>48</sub>H<sub>74</sub>O<sub>14</sub>) plus H<sub>2</sub>B<sub>1b</sub> (C<sub>47</sub>H<sub>72</sub>O<sub>14</sub>) and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of pyrantel pamoate (C<sub>34</sub>H<sub>30</sub>N<sub>2</sub>O<sub>6</sub>S).

**Packaging and storage**—Preserve in tight containers, protected from light, at a temperature not exceeding 30°, and avoid freezing.

**Labeling**—Label Tablets to indicate that they are intended for veterinary use only. Tablets that can be chewed are so labeled.

#### USP Reference standards (11)—

USP Ivermectin RS

USP Pyrantel Pamoate RS

**Identification**—The retention times of the two major ivermectin peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay for ivermectin*. The retention time of the pyrantel peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay for pyrantel pamoate*.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined molds and yeasts count does not exceed 100 cfu per g. Tablets meet the requirements of the test for absence of *Escherichia coli*.

**Uniformity of dosage units** (905): The requirements for dosage uniformity are met if the amount of ivermectin and pyrantel pamoate in each of the 10 dosage units as determined from the Content Uniformity method lies within the range of 75.0% to 125.0% of the label claim, and the RSD is less than or equal to 7%.

If not more than 3 units are outside the range of 75.0% to 125.0% of label claim, and no unit is outside the range of 75.0% to 135.0% of label claim, or if the RSD is greater than 7%, or if both conditions prevail, test 20 additional units. The requirements are met if not more than 3 units of the 30 are outside the range of 75.0% to 125.0% of label claim, and no unit is outside the range of 75.0% to 135.0% of label claim and the RSD of the 30 dosage units does not exceed 9%.

**pH** (791): between 4 and 6, in a solution prepared as follows. Grind about 15 g of Tablets in a blender. Transfer 10 g of the coarse powder thus obtained to a blender jar, add 250 mL of water, previously adjusted to a pH of 7.0 with 0.01 N sodium hydroxide or 0.01 N hydrochloric acid, and blend for about 5 minutes. Allow to settle, and filter a portion of the supernatant. Determine the pH of the filtrate.

#### Assay for ivermectin—

**Mobile phase**—Prepare a mixture of acetonitrile, methanol, 0.05 M monobasic sodium phosphate, and water (1130:670:200:5), adjust with phosphoric acid to a pH of 3.0, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Prepare a mixture of methanol and water (95:5).

**Alumina column**—Add about 30 mL of water to about 500 g of neutral alumina, and shake for about 2 hours on a reciprocating shaker. Add about 4 g of the resulting suspension to a 10-mm × 10-cm chromatographic tube fitted with a stopcock, tapping the sides of the column to facilitate settling of the alumina to a height of between 5 and 6 cm. Prepare a separate column for each solution to be tested.

**Standard stock solution**—Prepare a solution of USP Ivermectin RS in methanol having a known concentration of about 0.28 mg of USP Ivermectin RS per mL. Transfer 4.0 mL of this solution and 5.0 mL of water to a 100-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a second 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. This solution contains about 0.56 µg of USP Ivermectin RS per mL.

**Standard preparation**—Transfer 15.0 mL of the *Standard stock solution* to a 50-mL centrifuge tube, add 4.0 mL of water, and mix on a vortex mixer. Extract this solution with 10 mL of hexanes by shaking for about 10 minutes. Centrifuge, and discard the hexanes layer. Repeat the extraction with 5 mL of hexanes by shaking for 5 minutes. Centrifuge, and discard the hexanes layer. Add the aqueous layer to the *Alumina column*, and allow to elute. Discard the first 2 mL of eluant, and collect the next 5 mL of eluant in a stoppered tube.

**Assay stock solution**—Grind an accurately weighed Tablet until it is completely broken up and free from lumps and transfer to a screw-capped, wide-mouth, amber bottle of appropriate volume. Add an accurately measured volume of *Diluent* to the bottle to obtain the estimated concentration of ivermectin of about 0.55 µg per mL. Cap the bottle, and mix on a vortex mixer for about 1 minute. Ultrasonicate for 15 minutes then mechanically shake for an additional 30 minutes. Centrifuge a portion of the suspension thus obtained for about 5 minutes.

**Assay preparation**—Transfer 15.0 mL of the *Assay stock solution* to a 50-mL centrifuge tube, add 4.0 mL of water, and mix on a vortex mixer. Proceed as directed under *Standard preparation*, beginning with "Extract this solution." The solution thus obtained is the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 245-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.2 mL per minute. The column temperature is maintained at about 30°. Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure*: the relative retention times are about

0.8 for component H<sub>2</sub>B<sub>1b</sub> and 1.0 for component H<sub>2</sub>B<sub>1a</sub>; the resolution, *R*, between the component H<sub>2</sub>B<sub>1b</sub> peak and the component H<sub>2</sub>B<sub>1a</sub> peak is not less than 2.5; the column efficiency determined from the component H<sub>2</sub>B<sub>1a</sub> peak is not less than 2000 theoretical plates; the tailing factor at 5.0% of peak height for the H<sub>2</sub>B<sub>1a</sub> peak is not more than 2.2; and the relative standard deviation for replicate injections determined from the sum of the component H<sub>2</sub>B<sub>1b</sub> peaks and the component H<sub>2</sub>B<sub>1a</sub> peak is not more than 2.0%. [NOTE—After the column has been used, if the system suitability requirements are not met, regenerate the column as follows. Wash the column with 50 mL of water, slowly increasing the flow rate to 1 mL per minute. Make at least seven 100-µL injections of a dimethyl sulfoxide and water solution (1:1) at 5-minute intervals using water as a mobile phase. Purge the column with 100 mL of methanol, 200 mL of methylene chloride, and again with 100 mL of methanol, slowly increasing the flow rate to 1 mL per minute after each solvent changeover. Finally, purge the column with *Mobile phase*, increasing the flow rate to that used for the analysis.]

**Procedure**—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of label claim of ivermectin [component H<sub>2</sub>B<sub>1a</sub> (C<sub>48</sub>H<sub>74</sub>O<sub>14</sub>) plus component H<sub>2</sub>B<sub>1b</sub> (C<sub>47</sub>H<sub>72</sub>O<sub>14</sub>)] in the Tablet taken by the formula:

$$100(P(C_S/C_U))(r_U/r_S)$$

in which *C<sub>S</sub>* is the concentration, in µg per mL, of USP Ivermectin RS in the *Standard stock solution*; *C<sub>U</sub>* is the nominal concentration, in µg per mL, of ivermectin in the *Assay stock solution*; *P* is the purity of the USP Ivermectin RS [percent (w/w) H<sub>2</sub>B<sub>1a</sub> plus percent (w/w) H<sub>2</sub>B<sub>1b</sub>], expressed as a decimal; and *r<sub>U</sub>* and *r<sub>S</sub>* are the sums of the peak areas for component H<sub>2</sub>B<sub>1a</sub> and component H<sub>2</sub>B<sub>1b</sub> obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for pyrantel pamoate**—[NOTE—Use amber glassware in preparing solutions of pyrantel pamoate, and otherwise protect the solutions from unnecessary exposure to bright light. Complete the *Assay for pyrantel pamoate* without prolonged interruption.]

**Extraction solvent**—Prepare a mixture of tetrahydrofuran and trifluoroacetic acid (94:6).

**Mobile phase**—Prepare a degassed mixture of acetonitrile, water, acetic acid, and triethylamine (940:25: 25:10). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). [NOTE—Increasing the amount of acetonitrile in the *Mobile phase* increases retention times.]

**Standard preparation**—Prepare a solution of USP Pyrantel Pamoate RS in *Extraction solvent* having a known concentration of about 1.7 mg per mL. Transfer 4.0 mL of this solution to a 25-mL volumetric flask, dilute with tetrahydrofuran to volume, and mix. This solution contains about 0.27 mg of USP Pyrantel Pamoate RS per mL. [NOTE—Stable for 72 hours if stored at room temperature in a dark area.]

**Assay preparation**—Grind an accurately weighed Tablet until it is completely broken up and free from lumps and transfer to a 300-mL stock bottle, add 50.0 mL of *Extraction solvent*, mix, sonicate for about 15 minutes, and shake by mechanical means for about 1 hour. Allow to settle, and decant the supernatant into a second 300-mL bottle. Add a second 50-mL portion of *Extraction solvent* to the stock bottle, and shake by mechanical means for about 1 hour. Transfer the contents of the second 300-mL bottle to the stock bottle. Rinse the second bottle with 50.0 mL of *Extraction solvent*, and transfer this rinsing to the stock bottle. Sonicate the stock bottle for about 10 minutes, and centrifuge a portion of the liquid. Transfer an accurately meas-

ured volume of the clear supernatant, equivalent to about 6.5 mg of pyrantel pamoate, to a 25-mL volumetric flask, dilute with tetrahydrofuran to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 313-nm detector and a 4.6-mm × 25-cm column that contains packing L3. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure*: the column efficiency determined from the pyrantel peak is not less than 8000 theoretical plates; the tailing factor is not more than 1.3; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the per-

centage of label claim of pyrantel pamoate ( $C_{34}H_{30}N_2O_6S$ ) in the Tablet taken by the formula:

$$100 (C_s/C_u)(r_u / r_s)$$

in which  $C_s$  is the concentration, in mg per mL, of USP Pyrantel Pamoate RS in the *Standard preparation*;  $C_u$  is the nominal concentration of pyrantel pamoate in the *Assay preparation*; and  $r_u$  and  $r_s$  are the pyrantel peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively. [NOTE—Where the test for *Uniformity of dosage units* has been performed using the *Assay for pyrantel pamoate* procedure as a test for *Content uniformity*, use the average of these determinations as the *Assay for pyrantel pamoate* value.]

# Combined Index to USP 36 and NF 31, Volumes 1–3

## Capsules

Acebutolol hydrochloride, 2289  
 Acetaminophen, 2293  
 Containing at least three of the following—  
 acetaminophen and (salts of)  
 chlorpheniramine, dextromethorphan,  
 and phenylpropanolamine, 2300  
 Containing at least three of the following—  
 acetaminophen and (salts of)  
 chlorpheniramine, dextromethorphan,  
 and pseudoephedrine, 2305  
 Acetaminophen and codeine phosphate,  
 2315  
 Acitretin, 2337  
 Acyclovir, 2339  
 Altretamine, 2388  
 Aluminum hydroxide gel, dried, 2408  
 Amantadine hydrochloride, 2429  
 Aminobenzoate potassium, 2442  
 Amoxicillin, 2479  
 Ampicillin, 2491  
 Anagrelide, 2501  
 Arginine, 1335  
 Aspirin, 2535  
 Aspirin, caffeine, and dihydrocodeine  
 bitartrate, 2544  
 Aspirin delayed-release, 2536  
 Azithromycin, 2575  
 Balsalazide disodium, 2597  
 Benzonatate, 2625  
 Beta carotene, 2634  
 Bromocriptine mesylate, 2691  
 Butalbital, acetaminophen, and caffeine,  
 2717  
 Butalbital, aspirin, and caffeine, 2720  
 Butalbital, aspirin, caffeine, and codeine  
 phosphate, 2722  
 Calcifediol, 2735  
 C 14, urea, 2803  
 Castor oil, 2832  
 Cat's claw, 1381  
 Cefaclor, 2836  
 Cefadroxil, 2840  
 Cefdinir, 2850  
 Cephalixin, 2903  
 Cephadrine, 2912  
 Chloral hydrate, 2924  
 Chloramphenicol, 2926  
 Chlordiazepoxide hydrochloride, 2938  
 Chlordiazepoxide hydrochloride and  
 clidinium bromide, 2939  
 Chlorpheniramine maleate extended-  
 release, 2957  
 Chlorpheniramine maleate and  
 phenylpropanolamine hydrochloride  
 extended-release, 2960  
 Chlorpheniramine maleate and  
 pseudoephedrine hydrochloride  
 extended-release, 2962  
 Cinoxacin, 2992  
 Clindamycin hydrochloride, 3029  
 Clofazimine, 3047  
 Clofibrate, 3048  
 Clomipramine hydrochloride, 3051  
 Cloxacillin sodium, 3078  
 Cod liver oil, 1404  
*Cryptocodinium cohnii* oil, 1410  
 Curcuminoids, 1414  
 Cyanocobalamin Co 57, 3082  
 Cyanocobalamin Co 58, 3083  
 Cycloserine, 3127  
 Cyclosporine, 3128  
 Danazol, 3140  
 Dantrolene sodium, 3142  
 Demeclocycline hydrochloride, 3154  
 Dextroamphetamine sulfate, 3197  
 Diazepam, 3209  
 Diazepam extended-release, 3209  
 Diazoxide, 3212  
 Dicloxacillin sodium, 3225  
 Dicyclomine hydrochloride, 3226  
 Didanosine delayed-release, 3229  
 Digitalis, 3244  
 Dihydrotachysterol, 3254  
 Diltiazem hydrochloride extended-release,  
 3259  
 Diphenhydramine hydrochloride, 3276  
 Diphenhydramine and pseudoephedrine,  
 3277  
 Disopyramide phosphate, 3287  
 Disopyramide phosphate extended-release,  
 3287  
 Divalproex sodium delayed-release, 3290  
 Docusate calcium, 3306  
 Docusate potassium, 3307  
 Docusate sodium, 3309  
 Doxepin hydrochloride, 3330  
 Doxycycline, 3334  
 Doxycycline hyclate, 3338  
 Doxycycline hyclate delayed-release, 3339  
 Dronabinol, 3347  
 Duloxetine delayed-release, 3355  
 Efavirenz, 3375  
 Ephedrine sulfate, 3415  
 Ergocalciferol, 3428  
 Ergoloid mesylates, 3432  
 Erythromycin delayed-release, 3444  
 Erythromycin estolate, 3450  
 Esomeprazole magnesium delayed-release,  
 3466  
 Ethchlorvynol, 3501  
 Ethosuximide, 3508  
 Etodolac, 3517  
 Etoposide, 3524  
 Fenofibrate, 3545  
 Fenoprofen calcium, 3553  
 Ferrous gluconate, 3563  
 Fexofenadine hydrochloride, 3574  
 Fish oil containing omega-3 acids, 1447  
 Fish oil containing omega-3 acids, delayed-  
 release, 1450  
 Flucytosine, 3598  
 Fluoxetine, 3633  
 Fluoxetine delayed-release, 3634  
 Flurazepam hydrochloride, 3647  
 Flutamide, 3652  
 Fluvastatin, 3662  
 Gabapentin, 3691  
 Gemfibrozil, 3719  
 Ginger, 1473  
 Ginkgo, 1481  
 Ginseng, American, 1322

Griseofulvin, 3777  
 Guaifenesin, 3780  
 Guaifenesin and pseudoephedrine  
 hydrochloride, 3783  
 Guaifenesin, pseudoephedrine  
 hydrochloride, and dextromethorphan  
 hydrobromide, 3784  
 Hydrochlorothiazide, 3822  
 Hydroxyurea, 3861  
 Hydroxyzine pamoate, 3865  
 Indomethacin, 3903  
 Indomethacin extended-release, 3904  
 Sodium iodide I 123, 3929  
 Sodium iodide I 131, 3933  
 Iodate sodium, 3965  
 Isometheptene mucate,  
 dichloralphenazone, and acetaminophen,  
 3986  
 Isosorbide dinitrate extended-release, 4001  
 Isotretinoin, 4013  
 Isradipine, 4018  
 Kanamycin sulfate, 4033  
 Ketoprofen extended-release, 4038  
 Lansoprazole delayed-release, 4067  
 Levodopa, 4096  
 Lincomycin hydrochloride, 4118  
 Alpha lipoic acid, 1518  
 Lithium carbonate, 4130  
 Loperamide hydrochloride, 4135  
 Loracarbef, 4141  
 Loxapine, 4165  
 Magnesium oxide, 4186  
 Meclofenamate sodium, 4215  
 Mefenamic acid, 4219  
 Mesalamine extended-release, 4255  
 Methacycline hydrochloride, 4279  
 Methoxsalen, 4303  
 Methsuximide, 4308  
 Methyltestosterone, 4335  
 Metronidazole, 4353  
 Metyrosine, 4358  
 Mexiletine hydrochloride, 4360  
 Milk thistle, 1542  
 Minerals, 1545  
 Minocycline hydrochloride, 4375  
 Morphine sulfate extended-release, 4408  
 Mycophenolate mofetil, 4422  
 Nafcillin sodium, 4434  
 Nifedipine, 4507  
 Nitrofurantoin, 4516  
 Nizatidine, 4528  
 Nortriptyline hydrochloride, 4546  
 Oil- and water-soluble vitamins with  
 minerals, 1710  
 Olanzapine and fluoxetine, 4564  
 Oleovitamin A and D, 4569  
 Omega-3 ethyl esters, 4574  
 Omeprazole delayed-release, 4577  
 Orlistat, 4598  
 Oseltamivir phosphate, 4605  
 Oxacillin sodium, 4607  
 Oxazepam, 4623  
 Oxycodone and acetaminophen, 4644  
 Oxytetracycline hydrochloride, 4659  
 Oxytetracycline and nystatin, 4657  
 Pancrelipase, 4676  
 Pancrelipase delayed-release, 4677  
 Paromomycin sulfate, 4694  
 Penicillamine, 4705  
 Phendimetrazine tartrate, 4755

**Capsules** (*continued*)

- Phenoxybenzamine hydrochloride, 4765  
 Phensuximide, 4767  
 Phentermine hydrochloride, 4768  
 Phenylpropanolamine hydrochloride, 4779  
 Phenylpropanolamine hydrochloride extended-release, 4780  
 Phenytoin sodium, extended, 4787  
 Phenytoin sodium, prompt, 4789  
 Piroxicam, 4818  
 Potassium chloride extended-release, 4838  
 Potassium perchlorate, 4855  
 Prazosin hydrochloride, 4874  
 Procainamide hydrochloride, 4902  
 Procarbazine hydrochloride, 4909  
 Propoxyphene hydrochloride, 4937  
 Propoxyphene hydrochloride, aspirin, and caffeine, 4939  
 Propranolol hydrochloride extended-release, 4946  
 Propranolol hydrochloride and hydrochlorothiazide extended-release, 4949  
 Pseudoephedrine hydrochloride extended-release, 4961  
 Pygeum, 1570  
 Quinidine sulfate, 4992  
 Quinine sulfate, 4996  
 Ramipril, 5006  
 Rifabutin, 5040  
 Rifampin, 5042  
 Rifampin and isoniazid, 5045  
 Rivastigmine tartrate, 5074  
 Salsalate, 5103  
 Saquinavir, 5106  
 Saw palmetto, 1591  
 Schizochytrium oil, 1595  
 Secobarbital sodium, 5117  
 Secobarbital sodium and amobarbital sodium, 5118  
 Simethicone, 5141  
 Soy isoflavones, 1601  
 Stavudine, 5195  
 Sulfapyrazone, 5235  
 Tacrine, 5253  
 Tacrolimus, 5257  
 Tamsulosin hydrochloride, 5270  
 Temazepam, 5306  
 Terazosin, 5308  
 Tetracycline hydrochloride, 5337  
 Tetracycline hydrochloride and nystatin, 5344  
 Thalidomide, 5347  
 Theophylline, 5350  
 Theophylline extended-release, 5350  
 Theophylline and guaifenesin, 5356  
 Thiothixene, 5380  
 Tolmetin sodium, 5426  
 Triamterene, 5465  
 Triamterene and hydrochlorothiazide, 5466  
 Trientine hydrochloride, 5476  
 Trihexyphenidyl hydrochloride extended-release, 5483  
 Trimethobenzamide hydrochloride, 5488  
 Troleandomycin, 5501  
 Ubidecarenone, 1614  
 Ursodiol, 5518  
 Valproic acid, 5534  
 Vancomycin hydrochloride, 5545  
 Venlafaxine hydrochloride extended-release, 5552  
 Verapamil hydrochloride extended-release, 5560  
 Vitamin A, 5576  
 Vitamin E, 5581  
 Vitamins, oil-soluble, 1622  
 Vitamins, oil- and water-soluble, 1664  
 Vitamins, water-soluble, 1775  
 Vitamins with minerals, oil- and water-soluble, 1710  
 Vitamins with minerals, water-soluble, 1799  
 Vitamins with minerals, oil-soluble, 1638  
 Zaleplon, 5610

**General chapters**

- Acetic acid in peptides (503), 208
- Acid-neutralizing capacity (301), 162
- Acoustic emission (1005), 449
- Aerosols, nasal sprays, metered-dose inhalers, and dry powder inhalers (601), 242
- Alcohol determination (611), 264
- Alginate assay (311), 163
- Alpha tocopherol assay (551), 216
- Alternative microbiological sampling methods for nonsterile inhaled and nasal products (610), 263
- Aluminum (206), 140
- Analysis of biological assays (1034), 521
- Analytical data—interpretation and treatment (1010), 452
- Analytical instrument qualification (1058), 650
- Ancillary materials for cell, gene, and tissue-engineered products (1043), 540
- Antibiotics—microbial assays (81), 76
- Antimicrobial agents—content (341), 164
- Antimicrobial effectiveness testing (51), 54
- Apparent intrinsic dissolution—dissolution testing procedures for rotating disk and stationary disk (1087), 717
- Applications of nuclear magnetic resonance spectroscopy (1761), 1066
- Application of water activity determination to nonsterile pharmaceutical products (1112), 779
- Arsenic (211), 145
- Articles of botanical origin (561), 216
- Assay for citric acid/citrate and phosphate (345), 166
- Assay for steroids (351), 167
- Assessment of drug product performance—bioavailability, bioequivalence, and dissolution (1090), 729
- Automated methods of analysis (16), 43
- Automated radiochemical synthesis apparatus (1015), 464
- Auxiliary packaging components (670), 291
- Bacterial endotoxins test (85), 90
- Barbiturate assay (361), 167
- The biocompatibility of materials used in drug containers, medical devices, and implants (1031), 487
- Biological assay validation (1033), 510
- Biological indicators—resistance performance tests (55), 56
- Biological indicators for sterilization (1035), 536
- Biological reactivity tests, in vitro (87), 94
- Biological reactivity tests, in vivo (88), 95
- Biologics (1041), 539
- Biotechnology-derived articles (1045), 547
- Biotechnology-derived articles—amino acid analysis (1052), 619
- Biotechnology-derived articles—capillary electrophoresis (1053), 629
- Biotechnology-derived articles—isolectric focusing (1054), 634
- Biotechnology-derived articles—peptide mapping (1055), 636
- Biotechnology-derived articles—polyacrylamide gel electrophoresis (1056), 641

- Biotechnology-derived articles—total protein assay (1057), 646
- Botanical extracts (565), 234
- Bovine serum (1024), 465
- Bulk density and tapped density (616), 265
- Bulk pharmaceutical excipients—certificate of analysis (1080), 700
- Bulk powder sampling procedures (1097), 741
- Calcium pantothenate assay (91), 102
- Cellular and tissue-based products (1046), 558
- Characterization of crystalline and partially crystalline solids by X-ray powder diffraction (XRPD) (941), 443
- Chloride and sulfate (221), 146
- Chromatography (621), 268
- Cleaning glass apparatus (1051), 619
- Cobalamin radiotracer assay (371), 167
- Color and achromicity (631), 275
- Color—instrumental measurement (1061), 664
- Completeness of solution (641), 276
- Congeeing temperature (651), 279
- Containers—glass (660), 282
- Containers—performance testing (671), 292

- Identification  
of articles of botanical origin (563), 226  
organic nitrogenous bases (181), 135  
test, thin-layer chromatographic (201), 139

Identification (*continued*)

tests—general (191), 136  
 tests, spectrophotometric (197), 139  
 tetracyclines (193), 138  
 Idoxuridine, 3882  
   ophthalmic ointment, 3882  
   ophthalmic solution, 3882  
 Ifosfamide, 3883  
   for injection, 3884  
 IgG-coated red cells, 1170  
 Imidazole, 1170  
 Imidurea, 2049  
 Imipenem, 3885  
   and cilastatin for injectable suspension, 3887  
   and cilastatin for injection, 3886  
 Imipramine hydrochloride, 3888  
   injection, 3889  
   tablets, 3889  
 Immunological test methods—surface plasmon resonance (1105), 765  
 Immunological test methods—enzyme-linked immunosorbent assay (ELISA) (1103), 757  
 Immunological test methods—general considerations (1102), 751  
 Impurities  
   in official articles (1086), 715  
   ordinary (466), 194  
 Impurities testing in medical gases (413), 182  
 Inamrinone, 3890  
   injection, 3890  
 Indapamide, 3892  
   tablets, 3893  
 Indene, 1170  
 Indicator and test papers, 1208  
 Indicators, 1206  
   indicator papers, 1208  
   reagents, and solutions, 1133  
   test papers, 1208  
 Indigo carmine, 1170  
   TS, 1214  
 Indigotindisulfonate sodium, 3893  
   injection, 3894  
 Indinavir sulfate, 3894  
 Indium In 111  
   capromab pendetide injection, 3896  
   chloride solution, 3897  
   ibritumomab tiuxetan injection, 3898  
   oxyquinoline solution, 3899  
   pentetate injection, 3899  
   pentetreotide injection, 3900  
   satumomab pendetide injection, 3901  
 Indocyanine green, 3901  
   for injection, 3902  
 Indole, 1170  
 Indole-3-carboxylic acid, 1170  
 Indomethacin, 3902  
   capsules, 3903  
   extended-release capsules, 3904  
   for injection, 3910  
   topical gel, 3906  
   oral suspension, 3907  
   sodium, 3908  
   suppositories, 3906  
 Indophenol-acetate TS, 1214  
 Inhalant  
   amyl nitrite, 2499  
   propylhexedrine, 4954

**Inhalation**

Acetylcysteine and isoproterenol hydrochloride solution, 2335  
 Cromolyn sodium powder, 3111  
 Cromolyn sodium solution, 3111  
 Dexamethasone sodium phosphate aerosol, 3181  
 Epinephrine aerosol, 3417  
 Epinephrine bitartrate aerosol, 3420  
 Epinephrine solution, 3418  
 Ergotamine tartrate aerosol, 3438  
 Isoetharine mesylate aerosol, 3979  
 Isoetharine solution, 3978  
 Isoproterenol hydrochloride aerosol, 3993  
 Isoproterenol hydrochloride and phenylephrine bitartrate aerosol, 3995  
 Isoproterenol solution, 3992  
 Isoproterenol sulfate aerosol, 3997  
 Isoproterenol sulfate solution, 3999  
 Levalbuterol solution, 4080  
 Metaproterenol sulfate aerosol, 4265  
 Metaproterenol sulfate solution, 4266  
 Racepinephrine solution, 4999  
 Ribavirin for solution, 5032  
 Sodium chloride, solution, 5159  
 Sterile water for, 5590  
 Terbutaline sulfate aerosol, 5319  
 Tobramycin solution, 5412

**Injection**

Acepromazine maleate, 2291  
 Acetazolamide for, 2327  
 Acyclovir for, 2340  
 Adenosine, 2347  
 Alcohol, dehydrated, 2360  
 Alcohol in dextrose, 2361  
 Alfentanil, 2365  
 Alprostadil, 2383  
 Alteplase for, 2386  
 Amifostine for, 2434  
 Amikacin sulfate, 2436  
 Aminocaproic acid, 2445  
 Aminohippurate sodium, 2449  
 Aminopentamide sulfate, 2449  
 Aminophylline, 2451  
 Amitriptyline hydrochloride, 2463  
 Ammonium chloride, 2469  
 Ammonium molybdate, 2472  
 Amobarbital sodium for, 2472  
 Amphotericin B for, 2488  
 Ampicillin for, 2492  
 Ampicillin and sulbactam for, 2496  
 Anileridine, 2505  
 Aprotinin, 2524  
 Arginine hydrochloride, 2526  
 Articaine hydrochloride and epinephrine, 2529  
 Ascorbic acid, 2531  
 Atenolol, 2550  
 Atracurium besylate, 2559  
 Atropine sulfate, 2561  
 Azaperone, 2567  
 Azathioprine sodium for, 2571  
 Azithromycin for, 2576  
 Aztreonam, 2584  
 Aztreonam for, 2584  
 Bacitracin for, 2588  
 Bacteriostatic sodium chloride, 5158  
 Bacteriostatic water for, 5590  
 Benztropine mesylate, 2628  
 Benzylpenicilloyl polylysine, 2632  
 Betamethasone sodium phosphate, 2646  
 Bethanechol chloride, 2653  
 Biperiden lactate, 2667  
 Bleomycin for, 2683  
 Bretylium tosylate, 2686  
 Bretylium tosylate in dextrose, 2687  
 Brompheniramine maleate, 2696  
 Bumetanide, 2700  
 Bupivacaine hydrochloride, 2703  
 Bupivacaine hydrochloride in dextrose, 2704  
 Bupivacaine hydrochloride and epinephrine, 2704  
 Butorphanol tartrate, 2726  
 C 11, flumazenil, 2798  
 C 11, mespiperone, 2799  
 C 11, methionine, 2800  
 C 11, raclopride, 2800  
 C 11, sodium acetate, 2801  
 Caffeine citrate, 2732  
 Caffeine and sodium benzoate, 2733  
 Calcitonin salmon, 2740  
 Calcitriol, 2742  
 Calcium chloride, 2756  
 Calcium gluceptate, 2758  
 Calcium gluconate, 2761  
 Calcium levulinate, 2766  
 Capreomycin for, 2779  
 Carbenicillin for, 2792  
 Carboplatin for, 2805  
 Carboprost tromethamine, 2807  
 Carmustine for, 2816  
 Cefamandole nafate for, 2842  
 Cefazolin, 2846  
 Cefazolin for, 2847  
 Cefepime for, 2857  
 Cefmenoxime for, 2862  
 Cefmetazole, 2863  
 Cefmetazole for, 2864  
 Cefonicid for, 2865  
 Cefoperazone, 2866  
 Cefoperazone for, 2867  
 Ceforanide for, 2868  
 Cefotaxime, 2870  
 Cefotaxime for, 2871  
 Cefotetan, 2872  
 Cefotetan for, 2873  
 Cefotiam for, 2875  
 Cefoxitin, 2877  
 Cefoxitin for, 2877  
 Cefpiramide for, 2879  
 Ceftazidime, 2887  
 Ceftazidime for, 2887  
 Ceftizoxime, 2890  
 Ceftizoxime for, 2890  
 Ceftriaxone, 2891  
 Ceftriaxone for, 2892  
 Cefuroxime, 2896  
 Cefuroxime for, 2896  
 Cephalothin, 2906  
 Cephalothin for, 2907  
 Cephapirin for, 2910  
 Cephadrine for, 2912  
 Chloramphenicol, 2927  
 Chloramphenicol sodium succinate for, 2934  
 Chlordiazepoxide hydrochloride for, 2939  
 Chloroprocaine hydrochloride, 2950

**Injection** (continued)

- Chloroquine hydrochloride, 2951
- Chlorothiazide sodium for, 2956
- Chlorpheniramine maleate, 2958
- Chlorpromazine hydrochloride, 2965
- Chorionic gonadotropin for, 3764
- Chromic chloride, 2978
- Chromium Cr 51 edetate, 2979
- Cimetidine, 2990
- Cimetidine in sodium chloride, 2991
- Ciprofloxacin, 2998
- Cisplatin for, 3004
- Clavulanic acid and ticarcillin, 5392
- Clindamycin, 3034
- Clindamycin for, 3035
- Cloprostenol, 3066
- Codeine phosphate, 3090
- Colchicine, 3095
- Colistimethate for, 3099
- Corticotropin, 3104
- Corticotropin for, 3105
- Corticotropin, repository, 3106
- Cr 51, sodium chromate, 2978
- Cupric chloride, 3114
- Cupric sulfate, 3116
- Cyanocobalamin, 3117
- Cyclophosphamide for, 3123
- Cyclosporine, 3129
- Cysteine hydrochloride, 3134
- Cytarabine for, 3135
- Dacarbazine for, 3137
- Dactinomycin for, 3139
- Dantrolene sodium for, 3144
- Daunorubicin hydrochloride for, 3148
- Deferoxamine mesylate for, 3150
- Dehydrated alcohol, 2360
- Deslanoside, 3163
- Desmopressin acetate, 3166
- Desoxycorticosterone acetate, 3171
- Dexamethasone, 3175
- Dexamethasone sodium phosphate, 3183
- Dextran 40 in dextrose, 3193
- Dextran 40 in sodium chloride, 3193
- Dextran 70 in dextrose, 3195
- Dextran 70 in sodium chloride, 3195
- Dextrose, 3201
- Dextrose and sodium chloride, 3201
- Diatrizoate meglumine, 3202
- Diatrizoate meglumine and diatrizoate sodium, 3203
- Diatrizoate sodium, 3205
- Diazepam, 3210
- Diazoxide, 3212
- Dibucaine hydrochloride, 3215
- Dicyclomine hydrochloride, 3227
- Diethylstilbestrol, 3238
- Digitoxin, 3245
- Digoxin, 3247
- Dihydroergotamine mesylate, 3251
- Dihydrostreptomycin, 3253
- Dimenhydrinate, 3265
- Dimercaprol, 3268
- Dinoprost tromethamine, 3272
- Diphenhydramine hydrochloride, 3276
- Dipyridamole, 3282
- Dobutamine, 3298
- Dobutamine for, 3299
- Dobutamine in dextrose, 3299
- Docetaxel, 3303
- Dolasetron mesylate, 3314
- Dopamine hydrochloride, 3322
- Dopamine hydrochloride and dextrose, 3323
- Doxapram hydrochloride, 3325
- Doxorubicin hydrochloride, 3332
- Doxorubicin hydrochloride for, 3332
- Doxycycline for, 3334
- Droperidol, 3348
- Dyphylline, 3360
- Edetate calcium disodium, 3369
- Edetate disodium, 3371
- Edrophonium chloride, 3371
- Electrolytes and dextrose type 1, multiple, 3380
- Electrolytes and dextrose type 2, multiple, 3382
- Electrolytes and dextrose type 3, multiple, 3384
- Electrolytes and dextrose type 4, multiple, 3385
- Electrolytes and invert sugar type 1, multiple, 3386
- Electrolytes and invert sugar type 2, 3387
- Electrolytes and invert sugar type 3, 3388
- Electrolytes type 1, multiple, 3377
- Electrolytes type 2, multiple, 3379
- Elements, trace, 3389
- Emetine hydrochloride, 3393
- Enalaprilat, 3400
- Enoxaparin sodium, 3406
- Ephedrine sulfate, 3415
- Epinephrine, 3418
- Ergonovine maleate, 3435
- Ergotamine tartrate, 3439
- Erythromycin, 3446
- Erythromycin ethylsuccinate, 3453
- Erythromycin lactobionate for, 3457
- Estradiol cypionate, 3480
- Estradiol valerate, 3484
- Ethacrynate sodium for, 3496
- Ethiodized oil, 3505
- Etomidate, 3521
- Etoposide, 3525
- Famotidine, 3529
- Fenoldopam mesylate, 3551
- Fentanyl citrate, 3556
- Ferumoxides, 3570
- Floxuridine for, 3591
- Fluconazole, 3594
- Fludarabine phosphate, 3602
- Fludarabine phosphate for, 3603
- Fludeoxyglucose F18, 3622
- Flumazenil, 3608
- Flunixin meglumine, 3613
- Fluorescein, 3620
- F 18, sodium fluoride, 3626
- F 18, fluorodopa, 3624
- Fluorouracil, 3631
- Fluphenazine decanoate, 3639
- Fluphenazine enanthate, 3641
- Fluphenazine hydrochloride, 3642
- Folic acid, 3667
- Fosphenytoin sodium, 3680
- Fructose, 3682
- Fructose and sodium chloride, 3682
- Furosemide, 3686
- Gadodiamide, 3696
- Gadopentetate dimeglumine, 3697
- Gadoteridol, 3701
- Gadoversetamide, 3704
- Gallamine triethiodide, 3711
- Gallium citrate Ga 67, 3712
- Ganciclovir for, 3713
- Gemcitabine for, 3718
- Gentamicin, 3722
- Glucagon for, 3741
- Glycopyrrolate, 3754
- Gold sodium thiomalate, 3757
- Gonadorelin for, 3761
- Gonadotropin, chorionic for, 3764
- Granisetron hydrochloride, 3772
- Guaifenesin for, 3780
- Haloperidol, 3796
- Heparin sodium, 3805
- Histamine phosphate, 3811
- Hyaluronidase, 3816
- Hyaluronidase for, 3817
- Hydralazine hydrochloride, 3819
- Hydrochloric acid, 3820
- Hydrocortisone sodium phosphate, 3843
- Hydrocortisone sodium succinate for, 3844
- Hydromorphone hydrochloride, 3851
- Hydroxocobalamin, 3856
- Hydroxyprogesterone caproate, 3860
- Hydroxyzine hydrochloride, 3863
- Hyoscyamine sulfate, 3870
- I 123, iobenguane, 3926
- I 123, iodohippurate sodium, 3928
- I 125, iothalamate sodium, 3930
- I 125 albumin, iodinated, 3930
- I 131, iobenguane, 3927
- I 131, iodohippurate sodium, 3932
- I 131, rose bengal sodium, 3932
- I 131 albumin, iodinated, 3931
- I 131 albumin aggregated, iodinated, 3931
- Idarubicin hydrochloride for, 3881
- Ilofamide for, 3884
- Imipenem and cilastatin for, 3886
- Imipramine hydrochloride, 3889
- Inamrinone, 3890
- Indigotindisulfonate sodium, 3894
- Indium In 111 capromab pendetide, 3896
- Indium In 111 ibritumomab tiuxetan, 3898
- Indium In 111 pentetate, 3899
- Indium In 111 pentetreotide, 3900
- Indium In 111 satumomab pendetide, 3901
- Indocyanine green for, 3902
- Indomethacin for, 3910
- Insulin, 3913
- Insulin human, 3914
- Human insulin and human insulin isophane suspension, 3915
- Insulin lispro, 3920
- Inulin in sodium chloride, 3924
- Invert sugar, 5207
- Iodipamide meglumine, 3935
- Iodixanol, 3939
- Iohexol, 3946
- Iopamidol, 3948
- Iophendylate, 3951
- Iopromide, 3953
- Iothalamate meglumine, 3954
- Iothalamate meglumine and iothalamate sodium, 3954
- Iothalamate sodium, 3955
- Ioversol, 3957
- Ioxaglate meglumine and ioxaglate sodium, 3958
- Ioxilan, 3961
- Iron dextran, 3974
- Iron sorbitex, 3975

**Injection** (*continued*)

- Iron sucrose, 3976
- Isoniazid, 3988
- Isoproterenol hydrochloride, 3994
- Isoxsuprine hydrochloride, 4015
- Ivermectin, 4022
- Ivermectin and clorsulon, 4026
- Kanamycin, 4033
- Ketamine hydrochloride, 4035
- Ketorolac tromethamine, 4041
- Labetalol hydrochloride, 4046
- Leucovorin calcium, 4075
- Levocarnitine, 4093
- Levorphanol tartrate, 4104
- Lidocaine hydrochloride, 4113
- Lidocaine hydrochloride and dextrose, 4114
- Lidocaine hydrochloride and epinephrine, 4114
- Lincomycin, 4119
- Lorazepam, 4150
- Magnesium sulfate, 4190
- Magnesium sulfate in dextrose, 4190
- Mangafodipir trisodium, 4195
- Manganese chloride, 4197
- Manganese sulfate, 4199
- Mannitol, 4200
- Mannitol in sodium chloride, 4201
- Mechlorethamine hydrochloride for, 4210
- Menadiol sodium diphosphate, 4233
- Menadione, 4235
- Menotropins for, 4237
- Meperidine hydrochloride, 4239
- Mezlocillin hydrochloride, 4243
- Mepivacaine hydrochloride and levonordefrin, 4244
- Meropenem for, 4253
- Mesoridazine besylate, 4261
- Metaraminol bitartrate, 4268
- Methadone hydrochloride, 4281
- Methocarbamol, 4295
- Methohexital sodium for, 4296
- Methotrexate, 4300
- Methotrexate for, 4300
- Methotrimeprazine, 4302
- Methyldopate hydrochloride, 4319
- Methylene blue, 4320
- Methylene blue, veterinary, 4321
- Methylergonovine maleate, 4322
- Methylprednisolone sodium succinate for, 4333
- Metoclopramide, 4338
- Metoprolol tartrate, 4346
- Metronidazole, 4355
- Mezlocillin for, 4361
- Miconazole, 4363
- Midazolam, 4367
- Minocycline for, 4375
- Mitomycin for, 4387
- Mitoxantrone, 4389
- Morphine sulfate, 4410
- Morrhuate sodium, 4412
- Mycophenolate mofetil for, 4423
- N 13, ammonia, 4522
- Nafcillin, 4434
- Nafcillin for, 4435
- Nalorphine hydrochloride, 4439
- Naloxone hydrochloride, 4440
- Nandrolone decanoate, 4444
- Nandrolone phenpropionate, 4445
- Neomycin for, 4464
- Neostigmine methylsulfate, 4490
- Netilmicin sulfate, 4492
- Niacin, 4497
- Niacinamide, 4500
- Nitroglycerin, 4524
- Norepinephrine bitartrate, 4532
- O 15, water, 4650
- Ondansetron, 4585
- Orphenadrine citrate, 4600
- Oxacillin, 4607
- Oxacillin for, 4608
- Oxaliplatin, 4613
- Oxaliplatin for, 4615
- Oxymorphone hydrochloride, 4654
- Oxytetracycline, 4656
- Oxytetracycline for, 4659
- Oxytocin, 4664
- Paclitaxel, 4667
- Pamidronate disodium for, 4672
- Papaverine hydrochloride, 4688
- Paricalcitol, 4692
- Particulate matter in injections (788), 350
- Penicillin G potassium, 4713
- Penicillin G potassium for, 4714
- Penicillin G sodium for, 4723
- Pentazocine, 4734
- Pentobarbital sodium, 4737
- Perphenazine, 4748
- Phenobarbital sodium, 4762
- Phentolamine mesylate for, 4770
- Phenylbutazone, 4773
- Phenylephrine hydrochloride, 4775
- Phenytoin sodium, 4790
- Physostigmine salicylate, 4792
- Phytonadione injectable emulsion, 4795
- Piperacillin for, 4811
- Piperacillin and tazobactam for, 4813
- Plicamycin for, 4821
- Polymyxin B for, 4827
- Potassium acetate, 4832
- Potassium chloride concentrate for, 4839
- Potassium chloride in dextrose, 4841
- Potassium chloride in dextrose and sodium chloride, 4842
- Potassium chloride in lactated Ringer's and dextrose, 4843
- Potassium chloride in sodium chloride, 4844
- Potassium phosphates, 4857
- Pralidoxime chloride for, 4863
- Prednisolone sodium phosphate, 4885
- Prednisolone sodium succinate for, 4886
- Prilocaine and epinephrine, 4891
- Prilocaine hydrochloride, 4891
- Procainamide hydrochloride, 4903
- Procaine hydrochloride, 4906
- Procaine hydrochloride and epinephrine, 4907
- Procaine and tetracaine hydrochlorides and levonordefrin, 4908
- Prochlorperazine edisylate, 4911
- Progesterone, 4914
- Promazine hydrochloride, 4921
- Promethazine hydrochloride, 4923
- Propofol injectable emulsion, 4932
- Propoxycaïne and procaine hydrochlorides and levonordefrin, 4834
- Propoxycaïne and procaine hydrochlorides and norepinephrine bitartrate, 4934
- Propranolol hydrochloride, 4948
- Protamine sulfate, 4958
- Protamine sulfate for, 4958
- Pyridostigmine bromide, 4974
- Pyridoxine hydrochloride, 4977
- Quinidine gluconate, 4989
- Ranitidine, 5010
- Ranitidine in sodium chloride, 5013
- Repository corticotropin, 3106
- Reserpine, 5021
- Riboflavin, 5036
- Rifampin for, 5043
- Ringer's, 5053
- Ringer's and dextrose, 5054
- Ringer's and dextrose, half-strength lactated, 5057
- Ringer's and dextrose, lactated, 5056
- Ringer's and dextrose, modified, lactated, 5058
- Ringer's, lactated, 5055
- Ritodrine hydrochloride, 5069
- Ropivacaine hydrochloride, 5084
- Rose bengal sodium I 131, 3932
- Rubidium chloride Rb 82, 5087
- Sargramostim for, 5109
- Scopolamine hydrobromide, 5113
- Secobarbital sodium, 5117
- Secobarbital sodium for, 5118
- Selenious acid, 5121
- Sisomicin sulfate, 5146
- Sm 153 lexidronam, samarium, 5105
- Sodium acetate, 5148
- Sodium bicarbonate, 5152
- Sodium bromide, veterinary, 5154
- Sodium chloride, 5157
- Sodium chloride, bacteriostatic, 5158
- Sodium chromate Cr 51, 2978
- Sodium lactate, 5167
- Sodium nitrite, 5170
- Sodium nitroprusside for, 5171
- Sodium phosphates, 5174
- Sodium sulfate, 5177
- Sodium thiosulfate, 5178
- Somatropin for, 5180
- Strontium chloride Sr 89, 5200
- Streptomycin, 5199

Naphazoline hydrochloride, 4446  
Oxymetazoline hydrochloride, 4651  
Oxytocin, 4664  
Phenylephrine hydrochloride, 4777  
Tetrahydrozoline hydrochloride, 5345  
Xylometazoline hydrochloride, 5602

Nasal spray  
desmopressin acetate, 3167  
fluticasone propionate, 3655  
Natamycin, 4457  
ophthalmic suspension, 4457  
Nateglinide, 4458  
tablets, 4460  
Near-infrared spectrophotometry (1119),  
801  
Nefazodone hydrochloride, 4461  
tablets, 4462  
Neomycin  
boluses, 4464  
and colistin sulfates and hydrocortisone  
acetate otic suspension, 3100  
for injection, 4464  
penicillin G, polymyxin B, hydrocortisone  
acetate, and hydrocortisone sodium  
succinate topical suspension, 4707  
and polymyxin B sulfates, bacitracin, and  
hydrocortisone acetate ointment, 4476  
and polymyxin B sulfates, bacitracin, and  
hydrocortisone acetate ophthalmic  
ointment, 4476  
and polymyxin B sulfates, bacitracin, and  
lidocaine ointment, 4476  
and polymyxin B sulfates and bacitracin  
ointment, 4475  
and polymyxin B sulfates and bacitracin  
ophthalmic ointment, 4475  
and polymyxin B sulfates, bacitracin zinc,  
and hydrocortisone ointment, 4478  
and polymyxin B sulfates, bacitracin zinc,  
and hydrocortisone ophthalmic  
ointment, 4478  
and polymyxin B sulfates, bacitracin zinc,  
and hydrocortisone acetate ophthalmic  
ointment, 4479  
and polymyxin B sulfates, bacitracin zinc,  
and lidocaine ointment, 4479

and polymyxin B sulfates and bacitracin zinc  
ointment, 4477  
and polymyxin B sulfates and bacitracin zinc  
ophthalmic ointment, 4477  
and polymyxin B sulfates cream, 4474  
and polymyxin B sulfates and  
dexamethasone ophthalmic ointment,  
4480  
and polymyxin B sulfates and  
dexamethasone ophthalmic suspension,  
4480  
and polymyxin B sulfates and gramicidin  
cream, 4481  
and polymyxin B sulfates, gramicidin, and  
hydrocortisone acetate cream, 4481  
and polymyxin B sulfates and gramicidin  
ophthalmic solution, 4481  
and polymyxin B sulfates and  
hydrocortisone ophthalmic suspension,  
4482  
and polymyxin B sulfates and  
hydrocortisone otic solution, 4482  
and polymyxin B sulfates and  
hydrocortisone otic suspension, 4483  
and polymyxin B sulfates and  
hydrocortisone acetate cream, 4483  
and polymyxin B sulfates and  
hydrocortisone acetate ophthalmic  
suspension, 4483  
and polymyxin B sulfates and lidocaine  
cream, 4484  
and polymyxin B sulfates ophthalmic  
ointment, 4475  
and polymyxin B sulfates ophthalmic  
solution, 4475  
and polymyxin B sulfates, penicillin G  
procaine, and hydrocortisone acetate  
topical suspension, 4722  
and polymyxin B sulfates and pramoxine  
hydrochloride cream, 4484  
and polymyxin B sulfates and prednisolone  
acetate ophthalmic suspension, 4485  
and polymyxin B sulfates solution for  
irrigation, 4474  
sulfate, 4463  
sulfate and bacitracin ointment, 4465  
sulfate and bacitracin zinc ointment, 4466  
sulfate cream, 4464  
sulfate and dexamethasone sodium  
phosphate cream, 4466  
sulfate and dexamethasone sodium  
phosphate ophthalmic ointment, 4466  
sulfate and dexamethasone sodium  
phosphate ophthalmic solution, 4467  
sulfate and fluocinolone acetonide cream,  
4468  
sulfate and fluorometholone ointment,  
4468  
sulfate and flurandrenolide cream, 4468  
sulfate and flurandrenolide lotion, 4468  
sulfate and flurandrenolide ointment, 4469  
sulfate and gramicidin ointment, 4469  
sulfate and hydrocortisone cream, 4469  
sulfate and hydrocortisone ointment, 4470  
sulfate and hydrocortisone otic suspension,  
4470  
sulfate and hydrocortisone acetate cream,  
4470  
sulfate and hydrocortisone acetate lotion,  
4471

Neomycin (*continued*)

sulfate and hydrocortisone acetate ointment, 4471  
 sulfate and hydrocortisone acetate ophthalmic ointment, 4471  
 sulfate and hydrocortisone acetate ophthalmic suspension, 4471  
 sulfate, isoflupredone acetate, and tetracaine hydrochloride ointment, 4472  
 sulfate, isoflupredone acetate, and tetracaine hydrochloride topical powder, 4473  
 sulfate and methylprednisolone acetate cream, 4474  
 sulfate, nystatin, gramicidin, and triamcinolone acetonide cream, 4552  
 sulfate, nystatin, gramicidin, and triamcinolone acetonide ointment, 4552  
 sulfate, nystatin, thiostrepton, and triamcinolone acetonide cream, 4553  
 sulfate, nystatin, thiostrepton, and triamcinolone acetonide ointment, 4553  
 sulfate ointment, 4465  
 sulfate ophthalmic ointment, 4465  
 sulfate and prednisolone acetate ointment, 4485  
 sulfate and prednisolone acetate ophthalmic ointment, 4486  
 sulfate and prednisolone acetate ophthalmic suspension, 4486  
 sulfate and prednisolone sodium phosphate ophthalmic ointment, 4487  
 sulfate oral solution, 4465  
 sulfate, sulfacetamide sodium, and prednisolone acetate ophthalmic ointment, 4488  
 sulfate tablets, 4465  
 sulfate and triamcinolone acetonide cream, 4488  
 sulfate and triamcinolone acetonide ophthalmic ointment, 4489

 Neomycin sulfate and dexamethasone sodium phosphate ophthalmic, 4466  
 Neomycin sulfate and fluorometholone, 4468  
 Neomycin sulfate and flurandrenolide, 4469  
 Neomycin sulfate and gramicidin, 4469  
 Neomycin sulfate and hydrocortisone, 4470  
 Neomycin sulfate and hydrocortisone acetate, 4471  
 Neomycin sulfate and hydrocortisone acetate ophthalmic, 4471  
 Neomycin sulfate, isoflupredone acetate, and tetracaine hydrochloride, 4472  
 Neomycin sulfate and prednisolone acetate, 4485  
 Neomycin sulfate and prednisolone acetate ophthalmic, 4486  
 Neomycin sulfate and prednisolone sodium phosphate ophthalmic, 4487  
 Neomycin sulfate, sulfacetamide sodium, and prednisolone acetate ophthalmic, 4488  
 Neomycin sulfate and triamcinolone acetonide ophthalmic, 4489  
 Neomycin sulfate ophthalmic, 4465  
 Nitrofurazone, 4521  
 Nitroglycerin, 4524  
 Nystatin, 4550  
 Nystatin, neomycin sulfate, gramicidin, and triamcinolone acetonide, 4552  
 Nystatin, neomycin sulfate, thiostrepton, and triamcinolone acetonide, 4553  
 Nystatin and triamcinolone acetonide, 4555  
 Oxytetracycline hydrochloride and hydrocortisone, 4661  
 Oxytetracycline hydrochloride and polymyxin B sulfate, 4661  
 Oxytetracycline hydrochloride and polymyxin B sulfate ophthalmic, 4661  
 Physostigmine sulfate ophthalmic, 4794  
 Polyethylene glycol, 2142  
 Povidone-iodine, 4862  
 Prednicarbate, 4877  
 Resorcinol ointment, compound, 5030

Rose water, 5085  
 Scopolamine hydrobromide ophthalmic, 5114  
 Sodium chloride ophthalmic, 5159  
 Sulfacetamide sodium ophthalmic, 5211  
 Sulfacetamide sodium and prednisolone acetate ophthalmic, 5212  
 Sulfur, 5239  
 Tetracaine, 5330  
 Tetracaine and menthol, 5331  
 Tetracaine ophthalmic, 5330  
 Tetracycline hydrochloride, 5339  
 Tetracycline hydrochloride ophthalmic, 5340  
 Tobramycin and dexamethasone ophthalmic, 5414  
 Tobramycin ophthalmic, 5412  
 Triamcinolone acetonide, 5459  
 Undecylenic acid, compound, 5516  
 Vidarabine ophthalmic, 5566  
 White, 4561  
 Yellow, 4561  
 Zinc oxide, 5626

**Ophthalmic solution**

Acetylcholine chloride for, 2333  
 Apraclonidine, 2521  
 Atropine sulfate, 2563  
 Benoxinate hydrochloride, 2613  
 Betaxolol, 2650  
 Carbachol, 2787  
 Carteolol hydrochloride, 2821  
 Cefazolin, 2847  
 Chloramphenicol, 2928  
 Chloramphenicol for, 2928  
 Chymotrypsin for, 2981  
 Ciprofloxacin, 3000

**Ophthalmic solution** (continued)

Cromolyn sodium, 3112  
 Cyclopentolate hydrochloride, 3121  
 Demecarium bromide, 3152  
 Dexamethasone sodium phosphate, 3184  
 Dipivefrin hydrochloride, 3281  
 Echothiophate iodide for, 3367  
 Emedastine, 3392  
 Epinephrine, 3419  
 Epinephrine bitartrate, 3421  
 Epinephrine bitartrate for, 3422  
 Epinephryl borate, 3422  
 Fluorescein sodium and benoxinate hydrochloride, 3621  
 Fluorescein sodium and proparacaine hydrochloride, 3622  
 Flurbiprofen sodium, 3650  
 Gentamicin sulfate, 3723  
 Gentamicin sulfate and betamethasone acetate, 3723  
 Glycerin, 3750  
 Homatropine hydrobromide, 3813  
 Hydroxyamphetamine hydrobromide, 3857  
 Hypromellose, 3873  
 Idoxuridine, 3882  
 Levobunolol hydrochloride, 4091  
 Methylcellulose, 4313  
 Moxifloxacin, 4414  
 Naphazoline hydrochloride, 4447  
 Naphazoline hydrochloride and pheniramine maleate, 4447  
 Neomycin and polymyxin B sulfates, 4475  
 Neomycin and polymyxin B sulfates and gramicidin, 4481  
 Neomycin sulfate and dexamethasone sodium phosphate, 4467  
 Norfloxacin, 4539  
 Ofloxacin, 4559  
 Opatadine hydrochloride, 4567  
 Oxymetazoline hydrochloride, 4652  
 Phenylephrine hydrochloride, 4777  
 Physostigmine salicylate, 4793  
 Pilocarpine hydrochloride, 4799  
 Pilocarpine nitrate, 4802  
 Polymyxin B sulfate and trimethoprim, 4829  
 Prednisolone sodium phosphate, 4885  
 Proparacaine hydrochloride, 4929  
 Scopolamine hydrobromide, 5114  
 Silver nitrate, 5139  
 Sodium chloride, 5159  
 Sulfacetamide sodium, 5211  
 Suprofen, 5249  
 Tetracaine hydrochloride, 5333  
 Tetrahydrozoline hydrochloride, 5346  
 Timolol maleate, 5401  
 Tobramycin, 5414  
 Travoprost, 5450  
 Tropicamide, 5502  
 Zinc sulfate, 5629

**Ophthalmic suspension**

Brinzolamide, 2689  
 Chloramphenicol and hydrocortisone acetate for, 2930  
 Dexamethasone, 3176  
 Fluorometholone, 3629

Gentamicin and prednisolone acetate, 3727  
 Hydrocortisone acetate, 3839  
 Natamycin, 4457  
 Neomycin and polymyxin B sulfates and dexamethasone, 4480  
 Neomycin and polymyxin B sulfates and hydrocortisone, 4482  
 Neomycin and polymyxin B sulfates and hydrocortisone acetate, 4483  
 Neomycin and polymyxin B sulfates and prednisolone acetate, 4485  
 Neomycin sulfate and hydrocortisone acetate, 4471  
 Neomycin sulfate and prednisolone acetate, 4486  
 Oxytetracycline hydrochloride and hydrocortisone acetate, 4660  
 Prednisolone acetate, 4882  
 Rimexolone, 5053  
 Sulfacetamide sodium and prednisolone acetate, 5213  
 Tetracycline hydrochloride, 5341  
 Tobramycin and dexamethasone, 5415  
 Tobramycin and fluorometholone acetate, 5416

Opium, 4591  
 powdered, 4592  
 tincture, 4592  
 Optical  
 microscopy (776), 343  
 rotation (781), 344  
 Oracet blue B, 1207  
 TS, 1216

**Oral powder**

Containing at least three of the following—  
 acetaminophen and (salts of)  
 chlorpheniramine, dextromethorphan,  
 and pseudoephedrine, 2308  
 Levothyroxine sodium, 4108  
 Sodium bicarbonate, 5153

**Oral solution**

Abacavir, 2284  
 Acacia syrup, 1865  
 Acetaminophen, 2293  
 Containing at least three of the following—  
 acetaminophen and (salts of)  
 chlorpheniramine, dextromethorphan,  
 and phenylpropanolamine, 2302  
 Containing at least three of the following—  
 acetaminophen and (salts of)  
 chlorpheniramine, dextromethorphan,  
 and pseudoephedrine, 2310  
 Acetaminophen and codeine phosphate, 2316  
 Acetaminophen, dextromethorphan hydrobromide, doxylamine succinate, and pseudoephedrine hydrochloride, 2319  
 Acetaminophen for effervescent, 2294  
 Amantadine hydrochloride, 2431  
 Aminobenzoate potassium for, 2442  
 Aminocaproic acid, 2446  
 Aminophylline, 2452  
 Amprolium, 2498

Aromatic elixir, 1888  
 Ascorbic acid, 2532  
 Aspirin effervescent tablets for, 2540  
 Atenolol, 2550  
 Benzaldehyde elixir, compound, 1898  
 Betamethasone, 2637  
 Bethanechol chloride, 2654  
 Bromodiphenhydramine hydrochloride, 2694  
 Bromodiphenhydramine hydrochloride and codeine phosphate, 2694  
 Brompheniramine maleate, 2696  
 Brompheniramine maleate and pseudoephedrine sulfate, 2697  
 Butabarbital sodium, 2715  
 Caffeine citrate, 2733  
 Calcium glubionate syrup, 2757  
 Captopril, 2783  
 C 13 for, urea, 2803  
 Cetirizine hydrochloride, 2916  
 Cherry syrup, 1958  
 Chloral hydrate, 2924  
 Chloramphenicol, 2929  
 Chlorpheniramine maleate, 2959  
 Chlorpheniramine maleate and pseudoephedrine hydrochloride, 2963  
 Chlorpromazine hydrochloride syrup, 2966  
 Chocolate syrup, 1964  
 Citalopram, 3007  
 Clindamycin hydrochloride, 3030  
 Clindamycin palmitate hydrochloride for, 3031  
 Cloxacillin sodium for, 3079  
 Cyanocobalamin Co 57, 3082  
 Codeine phosphate, 3090  
 Cyclosporine, 3130  
 Cyproheptadine hydrochloride, 3131  
 Dexamethasone, 3177  
 Dexamethasone elixir, 3174  
 Dexbrompheniramine maleate and pseudoephedrine sulfate, 3185  
 Dexchlorpheniramine maleate, 3186  
 Dextromethorphan hydrobromide, 3200  
 Dicyclomine hydrochloride, 3227  
 Didanosine for, 3231  
 Digoxin, 3248  
 Dihydrotachysterol, 3254  
 Diltiazem hydrochloride, 3263  
 Dimenhydrinate, 3266  
 Diphenhydramine hydrochloride, 3277  
 Diphenoxylate hydrochloride and atropine sulfate, 3279  
 Docusate sodium syrup, 3310  
 Dolasetron mesylate, 3314  
 Doxepin hydrochloride, 3330  
 Doxylamine succinate, 3344  
 Dyphylline, 3361  
 Dyphylline and guaifenesin, 3362  
 Ephedrine sulfate, 3416  
 Ergocalciferol, 3429  
 Ergoloid mesylates, 3433  
 Ethosuximide, 3509  
 Ferric ammonium citrate for, 2470  
 Ferrous gluconate, 3564  
 Ferrous sulfate, 3567  
 Ferrous sulfate syrup, 3568  
 Fluoxetine, 3635  
 Fluphenazine hydrochloride, 3642  
 Fluphenazine hydrochloride elixir, 3642

**Oral solution** (continued)

Furosemide, 3687  
 Glycerin, 3751  
 Guaifenesin, 3781  
 Guaifenesin and codeine phosphate, 3782  
 Haloperidol, 3796  
 Hydralazine hydrochloride, 3819  
 Hydromorphone hydrochloride, 3852  
 Hydroxyzine hydrochloride, 3863  
 Hyoscyamine sulfate, 3870  
 Hyoscyamine sulfate elixir, 3869  
 Ipecac, 3964  
 Isoniazid, 3988  
 Isosorbide, 4000  
 Levetiracetam, 4086  
 Levocarnitine, 4094  
 Levofloxacin, 4101  
 Lincomycin, 4119  
 Lithium, 4133  
 Loperamide hydrochloride, 4136  
 Loratadine, 4145  
 Magnesium carbonate, citric acid, and potassium citrate for, 4177  
 Magnesium carbonate and citric acid for, 4176  
 Manganese chloride for, 4197  
 Magnesium citrate, 4180  
 Magnesium citrate for, 4181  
 Meperidine hydrochloride, 4240  
 Mesoridazine besylate, 4261  
 Metaproterenol sulfate, 4266  
 Methadone hydrochloride, 4281  
 Methdilazine hydrochloride, 4286  
 Methenamine, 4288  
 Methenamine mandelate for, 4291  
 Methylcellulose, 4314  
 Metoclopramide, 4339  
 Metoprolol tartrate, 4346  
 Mibolerone, 4362  
 Nafcillin sodium for, 4435  
 Neomycin sulfate, 4465  
 Nortriptyline hydrochloride, 4547  
 Ondansetron, 4586  
 Orange syrup, 2118  
 Oxacillin sodium for, 4608  
 Oxtriphylline, 4630  
 Oxybutynin chloride, 4634  
 Oxycodone hydrochloride, 4640  
 Paromomycin, 4695  
 Penicillin G potassium for, 4714  
 Penicillin V potassium for, 4727  
 Perphenazine, 4749  
 Phenobarbital, 4760  
 Phenylpropanolamine hydrochloride, 4781  
 Piperazine citrate syrup, 4816  
 Polyethylene glycol 3350 and electrolytes for, 4825  
 Potassium bicarbonate effervescent tablets for, 4833  
 Potassium bicarbonate and potassium chloride for effervescent, 4834  
 Potassium bicarbonate and potassium chloride effervescent tablets for, 4834  
 Potassium bicarbonate, potassium chloride, and potassium citrate effervescent tablets for, 4843  
 Potassium bromide, veterinary, 4837  
 Potassium chloride, 4840  
 Potassium chloride for, 4840  
 Potassium citrate and citric acid, 4846  
 Potassium gluconate, 4848  
 Potassium gluconate and potassium chloride, 4849  
 Potassium gluconate and potassium chloride for, 4850  
 Potassium gluconate and potassium citrate, 4850  
 Potassium gluconate, potassium citrate, and ammonium chloride, 4851  
 Potassium iodide, 4852  
 Potassium and sodium bicarbonates and citric acid effervescent tablets for, 4835  
 Prednisolone, 4880  
 Prednisone, 4888  
 Prochlorperazine, 4909  
 Promazine hydrochloride, 4921  
 Promazine hydrochloride syrup, 4921  
 Promethazine hydrochloride, 4923  
 Pseudoephedrine hydrochloride, 4961  
 Pseudoephedrine hydrochloride, carbinoxamine maleate, and dextromethorphan hydrobromide, 4964  
 Pyridostigmine bromide, 4975  
 Ranitidine, 5011  
 Reserpine, 5022  
 Risperidone, 5064  
 Saccharin sodium, 5096  
 Senna, 5125  
 Sertraline hydrochloride, 5130  
 Sodium bromide, veterinary, 5154  
 Sodium citrate and citric acid, 5161

 Cefadroxil for, 2840  
 Cefdinir for, 2852  
 Cefixime for, 2860  
 Cefpodoxime proxetil for, 2881  
 Cefprozil for, 2883  
 Cefuroxime axetil for, 2893  
 Cellulose sodium phosphate for, 2901  
 Cephalixin for, 2904  
 Cephalixin tablets for, 2905  
 Cephadrine for, 2913  
 Chloramphenicol palmitate, 2933  
 Chloroquine phosphate, 2952  
 Chlorothiazide, 2955  
 Cholestyramine for, 2977  
 Clarithromycin for, 3018  
 Clavulanate potassium and amoxicillin for, 2479  
 Clonazepam, 3053  
 Colestipol hydrochloride for, 3097  
 Colistin sulfate for, 3100  
 Dapsone, 3146  
 Demeclocycline, 3154  
 Diazoxide, 3213  
 Dicloxacillin sodium for, 3225  
 Didanosine tablets for, 3232  
 Diltiazem hydrochloride, 3263  
 Dipyrindamole, 3283  
 Dolasetron mesylate, 3315  
 Doxycycline for, 3335  
 Doxycycline calcium, 3336  
 Enalapril maleate, 3395  
 Erythromycin estolate, 3450

**Oral suspension** (continued)

- Erythromycin estolate for, 3451  
 Erythromycin estolate and sulfisoxazole acetyl, 3451  
 Erythromycin ethylsuccinate, 3454  
 Erythromycin ethylsuccinate for, 3454  
 Erythromycin ethylsuccinate and sulfisoxazole acetyl for, 3456  
 Famotidine for, 3530  
 Felbamate, 3535  
 Ferumoxsil, 3572  
 Flecainide acetate, 3589  
 Flucytosine, 3599  
 Furazolidone, 3685  
 Ganciclovir, 3714  
 Granisetron hydrochloride, 3773  
 Griseofulvin, 3777  
 Hydroxyzine pamoate, 3866  
 Ibuprofen, 3876  
 Indomethacin, 3907  
 Isradipine, 4018  
 Ketoconazole, 4036  
 Labetalol hydrochloride, 4046  
 Lamotrigine tablets, 4058  
 Lisinopril, 4126  
 Loracarbef for, 4142  
 Magaldrate, 4171  
 Magaldrate and simethicone, 4172  
 Magnesium carbonate and sodium bicarbonate for, 4177  
 Mebendazole, 4205  
 Megestrol acetate, 4223  
 Meloxicam, 4228  
 Meprobamate, 4246  
 Methacycline hydrochloride, 4279  
 Methadone hydrochloride tablets for, 4282  
 Methenamine mandelate, 4291  
 Methylodopa, 4315  
 Metolazone, 4341  
 Metoprolol tartrate, 4347  
 Minocycline hydrochloride, 4376  
 Mycophenolate mofetil for, 4425  
 Nalidixic acid, 4438  
 Naproxen, 4449  
 Naratriptan hydrochloride, 4455  
 Nevirapine, 4493  
 Nitrofurantoin, 4518  
 Nystatin, 4551  
 Nystatin for, 4551  
 Omeprazole, 4579  
 Ondansetron hydrochloride, 4584  
 Oxcarbazepine, 4625  
 Oxfendazole, 4627  
 Oxytetracycline and nystatin for, 4657  
 Oxytetracycline calcium, 4658  
 Pantoprazole, 4679

 Bromodiphenhydramine hydrochloride and codeine phosphate oral, 2694  
 Bromodiphenhydramine hydrochloride oral, 2694  
 Brompheniramine maleate and pseudoephedrine sulfate oral, 2697  
 Brompheniramine maleate oral, 2696  
 Butabarbital sodium oral, 2715  
 Butorphanol tartrate nasal, 2727  
 Caffeine citrate oral, 2733  
 Calcitonin salmon nasal, 2741  
 Calcium glubionate syrup, 2757  
 Calcium hydroxide topical, 2762  
 Captopril oral, 2783  
 Carbachol intraocular, 2787  
 Carbachol ophthalmic, 2787  
 Carbamide peroxide topical, 2792  
 Carbol-fuchsin topical, 2796  
 C 13 for oral, urea, 2803  
 Carteolol hydrochloride ophthalmic, 2821  
 Cefazolin ophthalmic, 2847  
 Cetylpyridinium chloride topical, 2922  
 Cherry syrup, 1958  
 Chloral hydrate oral, 2924  
 Chloramphenicol for ophthalmic, 2928  
 Chloramphenicol ophthalmic, 2928  
 Chloramphenicol oral, 2929  
 Chloramphenicol otic, 2929  
 Chlorhexidine gluconate, 2943  
 Chlorpheniramine maleate and pseudoephedrine hydrochloride oral, 2963  
 Chlorpheniramine maleate oral, 2959  
 Chlorpromazine hydrochloride syrup, 2966  
 Chocolate syrup, 1964  
 Cholecalciferol, 2975  
 Chymotrypsin for ophthalmic, 2981  
 Ciprofloxacin ophthalmic, 3000  
 Clindamycin hydrochloride oral, 3030  
 Clindamycin palmitate hydrochloride for oral, 3031  
 Clindamycin phosphate topical, 3036  
 Clobetasol propionate topical, 3044  
 Clotrimazole topical, 3073  
 Cloxacillin sodium for oral, 3079  
 Coal tar topical, 3082  
 Cyanocobalamin Co 57 oral, 3082  
 Cocaine hydrochloride tablets for topical, 3085  
 Cocaine and tetracaine hydrochlorides and epinephrine topical, 3085

**Solution** (*continued*)

- Cromolyn sodium ophthalmic, 3112  
 Cupriethylenediamine hydroxide, 1.0 M, 1156  
 Cyclopentolate hydrochloride ophthalmic, 3121  
 Cyclosporine oral, 3130  
 Cyproheptadine hydrochloride oral, 3131  
 Demecarium bromide ophthalmic, 3152  
 Dexamethasone elixir, 3174  
 Dexamethasone oral, 3177  
 Dexamethasone sodium phosphate ophthalmic, 3184  
 Dexbrompheniramine maleate and pseudoephedrine sulfate oral, 3185  
 Dexchlorpheniramine maleate oral, 3186  
 Dextromethorphan hydrobromide oral, 3200  
 Diatrizoate meglumine and diatrizoate sodium, 3204  
 Diatrizoate sodium, 3206  
 Dichlorophenol–indophenol, standard, 1220  
 Dicyclomine hydrochloride oral, 3227  
 Didanosine for oral, 3231  
 Diethyltoluamide topical, 3239  
 Digoxin oral, 3248  
 Dihydratachysterol oral, 3254  
 Diltiazem hydrochloride oral, 3263  
 Dimenhydrinate oral, 3266  
 Dimethyl sulfoxide topical, 3270  
 Diphenhydramine hydrochloride oral, 3277  
 Diphenoxylate hydrochloride and atropine sulfate oral, 3279  
 Dipivefrin hydrochloride ophthalmic, 3281  
 Docusate sodium, 3310  
 Docusate sodium syrup, 3310  
 Dolasetron mesylate oral, 3314  
 Doxepin hydrochloride oral, 3330  
 Doxylamine succinate oral, 3344  
 Dyclonine hydrochloride topical, 3358  
 Dyphylline and guaifenesin oral, 3362  
 Dyphylline oral, 3361  
 Ecamsule, 3364  
 Echothiophate iodide for ophthalmic, 3367  
 Emedastine ophthalmic, 3392  
 Ephedrine sulfate oral, 3416  
 Epinephrine bitartrate for ophthalmic, 3422  
 Epinephrine bitartrate ophthalmic, 3421  
 Epinephrine ophthalmic, 3419  
 Epinephryl borate ophthalmic, 3422  
 Ergocalciferol oral, 3429  
 Ergolid mesylates oral, 3433  
 Erythromycin topical, 3448  
 Ethosuximide oral, 3509  
 Fehling's, 1213  
 Ferric ammonium citrate for oral, 2470  
 Ferric subsulfate, 3557  
 Ferrous gluconate oral, 3564  
 Ferrous sulfate oral, 3567  
 Ferrous sulfate syrup, 3568  
 Fluocinolone acetonide topical, 3616  
 Fluocinonide topical, 3618  
 Fluorescein sodium and benoxinate hydrochloride ophthalmic, 3621  
 Fluorescein sodium and proparacaine hydrochloride ophthalmic, 3622  
 Fluorouracil topical, 3631  
 Fluoxetine oral, 3635  
 Fluphenazine hydrochloride elixir, 3642  
 Fluphenazine hydrochloride oral, 3642  
 Flurbiprofen sodium ophthalmic, 3650  
 Formaldehyde, 1167, 3669  
 Furosemide oral, 3687  
 Gentamicin sulfate and betamethasone acetate ophthalmic, 3723  
 Gentamicin sulfate and betamethasone valerate otic, 3725  
 Gentamicin topical, 3725  
 Gentamicin sulfate ophthalmic, 3723  
 Gentian violet topical, 3729  
 Glutaral disinfectant, 2027  
 Glycerin ophthalmic, 3750  
 Glycerin oral, 3751  
 Guaifenesin and codeine phosphate oral, 3782  
 Guaifenesin oral, 3781  
 Halazone tablets for, 3792  
 Halcinonide topical, 3794  
 Haloperidol oral, 3796  
 Heparin lock flush, 3800  
 Homatropine hydrobromide ophthalmic, 3813  
 Hydralazine hydrochloride oral, 3819  
 Hydrocortisone and acetic acid otic, 3835  
 Hydrogen peroxide, 1169  
 Hydrogen peroxide topical, 3849  
 Hydroquinone topical, 3855  
 Hydroxyamphetamine hydrobromide ophthalmic, 3857  
 Hydroxyzine hydrochloride oral, 3863  
 Hyoscyamine sulfate elixir, 3869  
 Hyoscyamine sulfate oral, 3870  
 Hypromellose ophthalmic, 3873  
 Idoxuridine ophthalmic, 3882  
 Indium In 111 chloride, 3897  
 Indium In 111 oxyquinoline, 3899  
 Iodine, strong, 3925  
 Sodium iodide I 123, 3929  
 Sodium iodide I 131, 3934  
 Iodine topical, 3925  
 Ipecac oral, 3964  
 Isoniazid oral, 3988  
 Isosorbide oral, 4000  
 Ivermectin topical, 4025  
 Lactulose, 4050  
 Lead, standard, 1217  
 Levalbuterol inhalation, 4080  
 Levobunolol hydrochloride ophthalmic, 4091  
 Levocarnitine oral, 4094  
 Levofloxacin oral, 4101  
 Lidocaine hydrochloride topical, 4114  
 Lincomycin oral, 4119  
 Lithium oral, 4133  
 Locke–Ringer's, 1214  
 Loperamide hydrochloride oral, 4136  
 Loratadine oral, 4145  
 Mafenine acetate for topical, 4169  
 Magnesium carbonate and citric acid for oral, 4176  
 Magnesium carbonate, citric acid, and potassium citrate for oral, 4177  
 Manganese chloride for oral, 4197  
 Magnesium citrate for oral, 4181  
 Magnesium citrate oral, 4180  
 Maltitol, 2082  
 Meperidine hydrochloride oral, 4240  
 Mesoridazine besylate oral, 4261  
 Metaproterenol sulfate oral, 4266  
 Methadone hydrochloride oral, 4281  
 Methdilazine hydrochloride oral, 4286  
 Methenamine mandelate for oral, 4291  
 Methenamine oral, 4288  
 Methoxsalen topical, 4304  
 Methylcellulose ophthalmic, 4313  
 Methylcellulose oral, 4314  
 Metoclopramide oral, 4339  
 Metoprolol tartrate oral, 4346  
 Mibolerone oral, 4362  
 Minoxidil topical, 4379  
 Mometasone furoate topical, 4397  
 Moxifloxacin ophthalmic, 4414  
 Myrrh topical, 4429  
 Nafcillin sodium for oral, 4435  
 Naphazoline hydrochloride ophthalmic, 4447  
 Naphazoline hydrochloride and pheniramine maleate ophthalmic, 4447  
 Neomycin and polymyxin B sulfates and gramicidin ophthalmic, 4481  
 Neomycin and polymyxin B sulfates and hydrocortisone otic, 4482  
 Neomycin and polymyxin B sulfates for irrigation, 4474  
 Neomycin and polymyxin B sulfates ophthalmic, 4475  
 Neomycin sulfate and dexamethasone sodium phosphate ophthalmic, 4467  
 Neomycin sulfate oral, 4465  
 Nickel standard TS, 1215  
 Nitrofurazone topical, 4522  
 Nitromersol topical, 4526  
 Norfloxacin ophthalmic, 4539  
 Nortriptyline hydrochloride oral, 4547  
 Ofloxacin ophthalmic, 4559  
 Olopatadine hydrochloride ophthalmic, 4567  
 Ondansetron, oral, 4586  
 Oral, containing at least three of the following—acetaminophen and (salts of) chlorpheniramine, dextromethorphan, and phenylpropanolamine, 2302  
 Oral, containing at least three of the following—acetaminophen and (salts of) chlorpheniramine, dextromethorphan, and pseudoephedrine, 2310  
 Orange syrup, 2118  
 Oxacillin sodium for oral, 4608  
 Oxtriphylline oral, 4630  
 Oxybutynin chloride oral, 4634  
 Oxycodone hydrochloride oral, 4640  
 Oxymetazoline hydrochloride ophthalmic, 4652  
 Papain tablets for topical, 4687  
 Paromomycin oral, 4695  
 Penicillin G potassium for oral, 4714  
 Penicillin V potassium for oral, 4727  
 Perphenazine oral, 4749  
 Perphenazine syrup, 4749  
 Phenobarbital oral, 4760  
 Phenol, topical, camphorated, 4764  
 Phenylephrine hydrochloride ophthalmic, 4777  
 Phenylpropanolamine hydrochloride oral, 4781  
 Phosphate P 32, sodium, 4791  
 Physostigmine salicylate ophthalmic, 4793  
 Pilocarpine hydrochloride ophthalmic, 4799  
 Pilocarpine nitrate ophthalmic, 4802  
 Piperazine citrate syrup, 4816

**Solution** (*continued*)

- Podophyllum resin topical, 4823  
 Polyethylene glycol 3350 and electrolytes for oral, 4825  
 Polymyxin B sulfate and hydrocortisone otic, 4828  
 Polymyxin B sulfate and trimethoprim ophthalmic, 4829  
 Potassium bicarbonate effervescent tablets for oral, 4833  
 Potassium bicarbonate and potassium chloride for effervescent oral, 4834  
 Potassium bicarbonate and potassium chloride effervescent tablets for oral, 4834  
 Potassium bicarbonate, potassium chloride, and potassium citrate effervescent tablets for oral, 4843  
 Potassium bromide oral, veterinary, 4837  
 Potassium chloride for oral, 4840  
 Potassium chloride oral, 4840  
 Potassium citrate and citric acid oral, 4846  
 Potassium gluconate and potassium chloride for oral, 4850  
 Potassium gluconate and potassium chloride oral, 4849  
 Potassium gluconate, potassium citrate, and ammonium chloride oral, 4851  
 Potassium gluconate and potassium citrate oral, 4850  
 Potassium gluconate oral, 4848  
 Potassium iodide oral, 4852  
 Potassium nitrate, 4854  
 Potassium and sodium bicarbonates and citric acid effervescent tablets for oral, 4835  
 Povidone-iodine cleansing, 4862  
 Povidone-iodine topical, 4862  
 Prednisolone oral, 4880  
 Prednisolone sodium phosphate ophthalmic, 4885  
 Prednisone oral, 4888  
 Prochlorperazine oral, 4909  
 Promazine hydrochloride oral, 4921  
 Promazine hydrochloride syrup, 4921  
 Promethazine hydrochloride oral, 4923  
 Proparacaine hydrochloride ophthalmic, 4929  
 Protein standard (8 g/dL), 1186  
 Pseudoephedrine hydrochloride, carbinoxamine maleate, and dextromethorphan hydrobromide oral, 4964  
 Pseudoephedrine hydrochloride oral, 4961  
 Pyridostigmine bromide oral, 4975  
 Ranitidine oral, 5011  
 Reserpine oral, 5022  
 Risperidone oral, 5064  
 Saccharin sodium oral, 5096  
 Scopolamine hydrobromide ophthalmic, 5114  
 Senna oral, 5125  
 Silver nitrate ophthalmic, 5139  
 Sodium acetate, 5148  
 Sodium bromide oral, veterinary, 5154  
 Sodium chloride, isotonic, 1193  
 Sodium chloride ophthalmic, 5159  
 Sodium chloride tablets for, 5160  
 Sodium citrate and citric acid oral, 5161  
 Sodium fluoride and acidulated phosphate topical, 5164  
 Sodium fluoride oral, 5163  
 Sodium hypochlorite, 1194, 5166  
 Sodium hypochlorite topical, 5166  
 Sodium lactate, 5168  
 Sodium phosphate P 32, 4791  
 Sodium phosphates oral, 5174  
 Sodium phosphates rectal, 5174  
 Sorbitol, 5181  
 Sorbitol noncrystallizing, 2218  
 Sorbitol sorbitan, 2219  
 Stavudine for oral, 5196  
 Sulfacetamide sodium ophthalmic, 5211  
 Sulfaquinoxaline oral, 5232  
 Suprofen ophthalmic, 5249  
 Syrup, 2262  
 Terpin hydrate and codeine oral, 5323  
 Terpin hydrate oral, 5323  
 Tetracaine hydrochloride ophthalmic, 5333  
 Tetracaine hydrochloride topical, 5334  
 Tetracycline hydrochloride for topical, 5340  
 Tetrahydrozoline hydrochloride ophthalmic, 5346  
 Tetramethylammonium hydroxide, in methanol, 1200  
 Theophylline and guaifenesin oral, 5357  
 Theophylline oral, 5352  
 Theophylline sodium glycinate oral, 5358  
 Thiamine hydrochloride oral, 5363  
 Thiamine mononitrate oral, 5365  
 Thimerosal topical, 5370  
 Thioridazine hydrochloride oral, 5376  
 Thiothixene hydrochloride oral, 5382  
 Timolol maleate ophthalmic, 5401  
 Tobramycin ophthalmic, 5414  
 Tolnaftate topical, 5429  
 Tolu balsam syrup, 2265  
 Travoprost ophthalmic, 5450  
 Tretinoin topical, 5455  
 Triamcinolone diacetate oral, 5461  
 Tricitrates oral, 5472  
 Trifluoperazine oral, 5477  
 Trihexyphenidyl hydrochloride oral, 5483  
 Trikates oral, 5485  
 Trimeprazine oral, 5486  
 Triprolidine hydrochloride oral, 5495  
 Triprolidine and pseudoephedrine hydrochlorides oral, 5497  
 Tropicamide ophthalmic, 5502  
 Valproic acid oral, 5535  
 Valrubicin intravesical, 5537  
 Vancomycin hydrochloride for oral, 5547  
 Vehicle for oral, 2116  
 Vehicle for oral, sugar free, 2116  
 Verapamil hydrochloride oral, 5558  
 Vitamins with minerals, water-soluble oral, 1818  
 Vitamins, oil- and water-soluble oral, 1683  
 Vitamins with minerals, oil- and water-soluble oral, 1736

 Calcium carbonate oral, 2749  
 Calcium and magnesium carbonates oral,  
 2754  
 Captopril oral, 2783  
 Carbamazepine oral, 2788  
 Cefaclor for oral, 2837  
 Cefadroxil for oral, 2840  
 Cefdinir for oral, 2852  
 Cefixime for oral, 2860  
 Cefpodoxime proxetil for oral, 2881  
 Cefprozil for oral, 2883  
 Cefuroxime axetil for oral, 2893  
 Cellulose sodium phosphate for oral, 2901  
 Cephalixin for oral, 2904  
 Cephadrine for oral, 2913  
 Chloramphenicol and hydrocortisone  
 acetate for ophthalmic, 2930  
 Chloramphenicol palmitate oral, 2933  
 Chlorothiazide oral, 2955  
 Cholestyramine for oral, 2977  
 Chromic phosphate P 32, 4790  
 Ciclopirox olamine topical, 2985  
 Ciprofloxacin and dexamethasone otic,  
 2996  
 Clarithromycin for oral, 3018  
 Clavulanate potassium and amoxicillin for  
 oral, 2479  
 Clindamycin phosphate topical, 3036  
 Clonazepam oral, 3053  
 Colestipol hydrochloride for oral, 3097  
 Colistin and neomycin sulfates and  
 hydrocortisone acetate otic, 3100  
 Colistin sulfate for oral, 3100  
 Corticotropin zinc hydroxide injectable,  
 3106  
 Cortisone acetate injectable, 3108  
 Demeclocycline oral, 3154  
 Desoxycorticosterone pivalate injectable,  
 3173  
 Dexamethasone acetate injectable, 3179  
 Dexamethasone ophthalmic, 3176  
 Diazoxide oral, 3213  
 Dicloxacillin sodium for oral, 3225  
 Didanosine tablets for oral, 3232  
 Diltiazem hydrochloride oral, 3263  
 Dipyrindamole oral, 3283  
 Dolasetron mesylate oral, 3315  
 Doxycycline calcium oral, 3336  
 Doxycycline for oral, 3335  
 Erythromycin estolate for oral, 3451  
 Erythromycin estolate oral, 3450  
 Erythromycin estolate and sulfisoxazole  
 acetyl oral, 3451

Erythromycin ethylsuccinate for oral, 3454  
 Erythromycin ethylsuccinate oral, 3454  
 Erythromycin ethylsuccinate and  
 sulfisoxazole acetyl for oral, 3456  
 Estradiol injectable, 3475  
 Estrone injectable, 3493  
 Famotidine for oral, 3530  
 Ferumoxsil oral, 3572  
 Flucytosine oral, 3599  
 Fluorometholone ophthalmic, 3629  
 Furazolidone oral, 3685  
 Ganciclovir oral, 3714  
 Gentamicin and prednisolone acetate  
 ophthalmic, 3727  
 Griseofulvin oral, 3777  
 Hydrocortisone acetate injectable, 3838  
 Hydrocortisone acetate ophthalmic, 3839  
 Hydrocortisone injectable, 3833  
 Hydrocortisone rectal, 3834  
 Hydroxyzine pamoate oral, 3866  
 Ibuprofen oral, 3876  
 Imipenem and cilastatin for injectable,  
 3887  
 Indomethacin oral, 3907  
 Isophane insulin human, 3917  
 Human insulin isophane and human insulin  
 injection, 3915  
 Insulin human zinc, 3922  
 Insulin human zinc, extended, 3922  
 Isophane insulin, 3916  
 Insulin zinc, 3920  
 Insulin zinc, extended, 3921  
 Insulin zinc, prompt, 3921  
 Isoflupredone acetate injectable, 3981  
 Ketoconazole oral, 4036  
 Labetalol hydrochloride oral, 4046  
 Loracarbef for oral, 4142  
 Magaldrate and simethicone oral, 4172  
 Magaldrate oral, 4171  
 Magnesium carbonate and sodium  
 bicarbonate for oral, 4177  
 Mebendazole oral, 4205  
 Medroxyprogesterone acetate injectable,  
 4217  
 Megestrol acetate oral, 4223  
 Meloxicam oral, 4228  
 Meprobamate oral, 4246  
 Mesalamine rectal, 4256  
 Methacycline hydrochloride oral, 4279  
 Methadone hydrochloride tablets for oral,  
 4282  
 Methenamine mandelate oral, 4291  
 Methyldopa oral, 4315  
 Methylprednisolone acetate injectable,  
 4332  
 Metolazone oral, 4341  
 Metoprolol tartrate oral, 4347  
 Minocycline hydrochloride oral, 4376  
 Nalidixic acid oral, 4438  
 Naproxen oral, 4449  
 Natamycin ophthalmic, 4457  
 Neomycin and polymyxin B sulfates and  
 dexamethasone ophthalmic, 4480  
 Neomycin and polymyxin B sulfates and  
 hydrocortisone otic, 4483  
 Neomycin and polymyxin B sulfates and  
 hydrocortisone acetate ophthalmic, 4483  
 Neomycin and polymyxin B sulfates and  
 hydrocortisone ophthalmic, 4482

**Suspension** (*continued*)

Neomycin and polymyxin B sulfates and prednisolone acetate ophthalmic, 4485  
 Neomycin sulfate and hydrocortisone otic, 4470  
 Neomycin sulfate and hydrocortisone acetate ophthalmic, 4471  
 Neomycin sulfate and prednisolone acetate ophthalmic, 4486  
 Nevirapine oral, 4493  
 Nitrofurantoin oral, 4518  
 Nystatin for oral, 4551  
 Nystatin oral, 4551  
 Ondansetron hydrochloride oral, 4584  
 Oxfendazole oral, 4627  
 Oxytetracycline and nystatin for oral, 4657  
 Oxytetracycline calcium oral, 4658  
 Oxytetracycline hydrochloride and hydrocortisone acetate ophthalmic, 4660  
 Pantoprazole oral, 4679  
 Penicillin G benzathine injectable, 4709  
 Penicillin G benzathine and penicillin G procaine injectable, 4711  
 Penicillin G benzathine oral, 4710  
 Penicillin G, neomycin, polymyxin B, hydrocortisone acetate, and hydrocortisone sodium succinate topical, 4707  
 Penicillin G procaine, dihydrostreptomycin sulfate, chlorpheniramine maleate, and dexamethasone injectable, 4719  
 Penicillin G procaine and dihydrostreptomycin sulfate injectable, 4719  
 Penicillin G procaine, dihydrostreptomycin sulfate, and prednisolone injectable, 4721  
 Penicillin G procaine, neomycin and polymyxin B sulfates, and hydrocortisone acetate topical, 4722  
 Penicillin G procaine injectable, 4717  
 Penicillin G procaine for injectable, 4718

 Alprazolam extended-release, 2377  
 Alprazolam orally disintegrating, 2379  
 Alumina and magnesia, 2390  
 Alumina, magnesia, and calcium carbonate chewable, 2392  
 Alumina, magnesia, calcium carbonate, and simethicone chewable, 2392  
 Alumina, magnesia, and simethicone chewable, 2395  
 Alumina and magnesium carbonate, 2397  
 Alumina, magnesium carbonate, and magnesium oxide, 2398  
 Alumina and magnesium trisilicate, 2400  
 Aluminum hydroxide gel, dried, 2408  
 Aluminum sulfate and calcium acetate for topical solution, 2412  
 Amiloride hydrochloride, 2438  
 Amiloride hydrochloride and hydrochlorothiazide, 2438  
 Aminobenzoate potassium, 2442  
 Aminocaproic acid, 2446  
 Aminoglutethimide, 2448  
 Aminopentamide sulfate, 2450  
 Aminophylline, 2453  
 Aminophylline delayed-release, 2454

**Tablets** (continued)

- Aminosaliclate sodium, 2455
- Aminosaliclic acid, 2457
- Amitriptyline hydrochloride, 2464
- Amlodipine besylate, 2467
- Ammonium chloride delayed-release, 2469
- Amodiaquine hydrochloride, 2474
- Amoxapine, 2476
- Amoxicillin, 2483
- Amoxicillin and clavulanate potassium, 2480
- Amphetamine sulfate, 2487
- Ampicillin, 2494
- Anileridine hydrochloride, 2506
- Apomorphine hydrochloride, 2520
- Arginine, 1335
- Ascorbic acid, 2532
- Aspirin, 2538
- Aspirin, buffered, 2538
- Aspirin, alumina, and magnesia, 2542
- Aspirin, alumina, and magnesium oxide, 2543
- Aspirin and codeine phosphate, 2545
- Aspirin, codeine phosphate, alumina, and magnesia, 2547
- Aspirin delayed-release, 2539
- Aspirin effervescent for oral solution, 2540
- Aspirin extended-release, 2540
- Astemizole, 2549
- Atenolol, 2551
- Atenolol and chlorthalidone, 2552
- Atropine sulfate, 2564
- Azatadine maleate, 2568
- Azathioprine, 2570
- Azithromycin, 2580
- Bacampicillin hydrochloride, 2587
- Baclofen, 2594
- Barium sulfate, 2603
- Belladonna extract, 2607
- Benazepril hydrochloride, 2610
- Bendroflumethiazide, 2612
- Benzotropine mesylate, 2629
- Betamethasone, 2639
- Betaxolol, 2651
- Bethanechol chloride, 2655
- Bicalutamide, 2657
- Biperiden hydrochloride, 2666
- Bisacodyl delayed-release, 2669
- Bismuth subsalicylate, 2677
- Bisoprolol fumarate, 2680
- Bisoprolol fumarate and hydrochlorothiazide, 2681
- Black cohosh, 1359
- Bromocriptine mesylate, 2692
- Brompheniramine maleate, 2696
- Bumetanide, 2701
- Bupropion hydrochloride, 2708
- Bupropion hydrochloride extended-release, 2708
- Buspirone hydrochloride, 2713
- Busulfan, 2713
- Butabarbital sodium, 2716
- Butalbital, acetaminophen, and caffeine, 2718
- Butalbital and aspirin, 2719
- Butalbital, aspirin, and caffeine, 2721
- Cabergoline, 2730
- Calcium acetate, 2745
- Calcium carbonate, 2750
- Calcium carbonate, magnesia, and simethicone chewable, 2752
- Calcium citrate, 1369
- Calcium gluconate, 2761
- Calcium lactate, 2764
- Calcium and magnesium carbonates, 2754
- Calcium pantothenate, 2767
- Calcium phosphate, dibasic, 2771
- Calcium with vitamin D, 1372
- Calcium and vitamin D with minerals, 1373
- Capecitabine, 2777
- Captopril, 2784
- Captopril and hydrochlorothiazide, 2785
- Carbamazepine, 2789
- Carbamazepine extended-release, 2790
- Carbenicillin indanyl sodium, 2793
- Carbidopa and levodopa, 2795
- Carbinoxamine maleate, 2796
- Calcium carbonate and magnesia chewable, 2751
- Carboxymethylcellulose sodium, 2809
- Carisoprodol, 2810
- Carisoprodol, aspirin, and codeine phosphate, 2813
- Carisoprodol and aspirin, 2811
- Carprofen, 2818
- Carteolol hydrochloride, 2821
- Carvedilol, 2824
- Cascara, 2830
- Cat's claw, 1382
- Cefaclor chewable, 2837
- Cefaclor extended-release, 2838
- Cefadroxil, 2841
- Cefixime, 2860
- Cefpodoxime proxetil, 2882
- Cefprozil, 2884
- Cefuroxime axetil, 2894
- Cephalexin, 2904
- Cephalexin, for oral suspension, 2905
- Cephadrine, 2913
- Cetirizine hydrochloride, 2917
- Cetirizine hydrochloride and pseudoephedrine hydrochloride extended-release, 2918
- Chlorambucil, 2925
- Chloramphenicol, 2929
- Chlordiazepoxide, 2936
- Chlordiazepoxide and amitriptyline hydrochloride, 2936
- Chloroquine phosphate, 2953
- Chlorothiazide, 2955
- Chlorpheniramine maleate, 2959
- Chlorpheniramine maleate and phenylpropanolamine hydrochloride extended-release, 2961
- Chlorpromazine hydrochloride, 2967
- Chlorpropamide, 2968
- Chlortetracycline hydrochloride, 2971
- Chlorthalidone, 2972
- Chlorzoxazone, 2973
- Chondroitin sulfate sodium, 1401
- Chromium picolinate, 1403
- Cilostazol, 2987
- Cimetidine, 2989
- Ciprofloxacin, 3000
- Citalopram, 3008
- Clarithromycin, 3018
- Clarithromycin extended-release, 3019
- Clemastine fumarate, 3026
- Clomiphene citrate, 3050
- Clonazepam, 3054
- Clonazepam orally-disintegrating, 3055
- Clonidine hydrochloride, 3057
- Clonidine hydrochloride and chlorthalidone, 3058
- Clopidogrel, 3064
- Clorazepate dipotassium, 3068
- Clover, red, 1576
- Clozapine, 3080
- Cocaine hydrochloride, for topical solution, 3085
- Codeine phosphate, 3091
- Codeine sulfate, 3093
- Colchicine, 3095
- Colestipol hydrochloride, 3098
- Cortisone acetate, 3108
- Curcuminoids, 1415
- Cyclizine hydrochloride, 3119
- Cyclobenzaprine hydrochloride, 3119
- Cyclophosphamide, 3124
- Cyproheptadine hydrochloride, 3132
- Dapsone, 3146
- Dehydrocholic acid, 3151
- Demeclocycline hydrochloride, 3155
- Desipramine hydrochloride, 3162
- Desogestrel and ethinyl estradiol, 3167
- Dexamethasone, 3177
- Dexchlorpheniramine maleate, 3187
- Dextroamphetamine sulfate, 3197
- Diazepam, 3211
- Dichlorphenamide, 3217
- Diclofenac potassium, 3219
- Diclofenac sodium delayed-release, 3221
- Diclofenac sodium extended-release, 3222
- Dicyclomine hydrochloride, 3228
- Didanosine for oral suspension, 3232
- Diethylcarbamazine citrate, 3235
- Diethylpropion hydrochloride, 3236
- Diethylstilbestrol, 3238
- Diflunisal, 3241
- Digitalis, 3244
- Digitoxin, 3245
- Digoxin, 3248
- Dihydrotachysterol, 3254
- Dihydroxyaluminum sodium carbonate chewable, 3257
- Diltiazem hydrochloride, 3264
- Dimenhydrinate, 3266
- Diphenoxylate hydrochloride and atropine sulfate, 3279
- Dipyridamole, 3283
- Dirithromycin delayed-release, 3285
- Disulfiram, 3289
- Divalproex sodium delayed-release, 3292
- Divalproex sodium extended-release, 3293
- Docusate sodium, 3311
- Dolasetron mesylate, 3316
- Donepezil hydrochloride, 3318
- Donepezil hydrochloride orally disintegrating, 3320
- Doxazosin, 3328
- Doxycycline, 3335
- Doxycycline hyclate, 3343
- Doxycycline hyclate delayed-release, 3339
- Doxylamine succinate, 3345
- Drospirenone and ethinyl estradiol, 3351
- Dydrogesterone, 3360
- Dyphylline, 3361
- Dyphylline and guaifenesin, 3363
- Enalapril maleate, 3395
- Enalapril maleate and hydrochlorothiazide, 3397
- Entacapone, 3412

**Tablets** (continued)

- Ergocalciferol, 3430
- Ergoloid mesylates, 3433
- Ergoloid mesylates sublingual, 3434
- Ergonovine maleate, 3436
- Ergotamine tartrate, 3439
- Ergotamine tartrate and caffeine, 3442
- Ergotamine tartrate sublingual, 3440
- Erythromycin, 3448
- Erythromycin delayed-release, 3448
- Erythromycin estolate, 3451
- Erythromycin ethylsuccinate, 3455
- Erythromycin stearate, 3459
- Escitalopram, 3462
- Estazolam, 3469
- Estradiol, 3479
- Estradiol and norethindrone acetate, 3481
- Estrogens, conjugated, 3488
- Estrogens, esterified, 3491
- Estropipate, 3495
- Ethacrynic acid, 3497
- Ethambutol hydrochloride, 3499
- Ethinyl estradiol, 3503
- Ethionamide, 3506
- Ethotoin, 3511
- Ethinodiol diacetate and ethinyl estradiol, 3513
- Ethinodiol diacetate and mestranol, 3514
- Etidronate disodium, 3516
- Etodolac, 3518
- Etodolac extended-release, 3519
- Famotidine, 3532
- Felbamate, 3537
- Felodipine extended-release, 3539
- Fenofibrate, 3548
- Fenoprofen calcium, 3554
- Ferrous fumarate, 3560
- Ferrous fumarate and docusate sodium extended-release, 3561
- Ferrous gluconate, 3565
- Ferrous sulfate, 3568
- Fexofenadine hydrochloride, 3576
- Fexofenadine hydrochloride and pseudoephedrine hydrochloride extended-release, 3579
- Finasteride, 3585
- Flavoxate hydrochloride, 3587
- Flecainide acetate, 3590
- Fluconazole, 3597
- Fludrocortisone acetate, 3605
- Fluoxetine, 3636
- Fluoxymesterone, 3638
- Flurbiprofen, 3649
- Fluvoxamine maleate, 3664
- Folic acid, 3668
- Fosinopril sodium, 3676
- Fosinopril sodium and hydrochlorothiazide, 3677
- Furazolidone, 3685
- Furosemide, 3688
- Gabapentin, 3692
- Galantamine, 3708
- Garlic delayed-release, 1468
- Gemfibrozil, 3720
- Ginkgo, 1483
- Ginseng, American, 1324
- Ginseng, Asian, 1329
- Glimepiride, 3731
- Glipizide, 3735
- Glipizide and metformin hydrochloride, 3736
- Glucosamine, 1487
- Glucosamine and chondroitin sodium sulfate, 1485
- Glucosamine, chondroitin sulfate sodium, and methylsulfonylmethane tablets, 1491
- Glucosamine and methylsulfonylmethane, 1490
- Glyburide, 3745
- Glyburide and metformin hydrochloride, 3747
- Glycopyrrolate, 3754
- Granisetron hydrochloride, 3773
- Griseofulvin, 3778
- Griseofulvin, ultramicrosize, 3778
- Guaifenesin, 3781
- Guanabenz acetate, 3786
- Guanadrel sulfate, 3787
- Guanethidine monosulfate, 3789
- Guanfacine, 3791
- Guggul, 1505
- Halazone for solution, 3792
- Haloperidol, 3797
- Homatropine methylbromide, 3815
- Hydralazine hydrochloride, 3820
- Hydrochlorothiazide, 3824
- Hydrochlorothiazide and amiloride hydrochloride, 2438
- Hydrocodone bitartrate, 3825
- Hydrocodone bitartrate and acetaminophen, 3826
- Hydrocodone bitartrate and homatropine methylbromide, 3827
- Hydrocortisone, 3834
- Hydroflumethiazide, 3848
- Hydromorphone hydrochloride, 3853
- Hydroxychloroquine sulfate, 3858
- Hydroxyzine hydrochloride, 3864
- Hyoscyamine, 3867
- Hyoscyamine sulfate, 3871
- Ibuprofen, 3877
- Ibuprofen and pseudoephedrine hydrochloride, 3878
- Imipramine hydrochloride, 3889
- Indapamide, 3893
- Iodoquinol, 3943
- Iopanoic acid, 3950
- Irbesartan, 3968
- Irbesartan and hydrochlorothiazide, 3969
- Isoniazid, 3988
- Isopropamide iodide, 3989
- Isoproterenol hydrochloride, 3994
- Isosorbide dinitrate chewable, 4003
- Isosorbide dinitrate extended-release, 4003
- Isosorbide dinitrate sublingual, 4005
- Isosorbide mononitrate, 4007
- Isosorbide mononitrate extended-release, 4009
- Isoxsuprine hydrochloride, 4016
- Ivermectin, 4024
- Ivermectin and pyrantel pamoate, 4027
- Ketoconazole, 4037
- Ketorolac tromethamine, 4042
- Labetalol hydrochloride, 4047
- Lamivudine and zidovudine, 4052
- Lamotrigine, 4056
- Lamotrigine for oral suspension, 4058
- Leflunomide, 4070
- Letrozole, 4072
- Leucovorin calcium, 4075
- Levamisole hydrochloride, 4083
- Levetiracetam, 4088
- Levocarnitine, 4095
- Levodopa, 4097
- Levonorgestrel and ethinyl estradiol, 4103
- Levorphanol tartrate, 4105
- Levothyroxine sodium, 4109
- Liothyronine sodium, 4122
- Liotrix, 4123
- Lipoic acid, alpha, 1519
- Lisinopril, 4126
- Lisinopril and hydrochlorothiazide, 4128
- Lithium carbonate, 4131
- Lithium carbonate extended-release, 4131
- Loperamide hydrochloride, 4137
- Loratadine, 4148
- Loratadine orally disintegrating, 4146
- Lorazepam, 4153
- Losartan potassium, 4156
- Losartan potassium and hydrochlorothiazide, 4158
- Lovastatin, 4163
- Lysine hydrochloride, 1527
- Magaldrate, 4172
- Magaldrate and simethicone chewable, 4173
- Magnesia, 4175
- Magnesium gluconate, 4182
- Magnesium oxide, 4186
- Magnesium salicylate, 4188
- Magnesium trisilicate, 4191
- Maprotiline hydrochloride, 4202
- Mazindol, 4203
- Mebendazole, 4206
- Mecamylamine hydrochloride, 4209
- Mecizine hydrochloride, 4212
- Medroxyprogesterone acetate, 4218
- Mefloquine hydrochloride, 4221
- Megestrol acetate, 4224
- Melatonin, 1535
- Meloxicam, 4230
- Melphalan, 4232
- Menadiol sodium diphosphate, 4234
- Meperidine hydrochloride, 4240
- Mephénytoin, 4241
- Mephobarbital, 4242
- Meprobamate, 4246
- Mercaptopurine, 4249
- Mesalamine delayed-release, 4257
- Mesoridazine besylate, 4262
- Metaproterenol sulfate, 4267
- Metformin hydrochloride, 4269
- Metformin hydrochloride extended-release, 4271
- Methadone hydrochloride, 4282
- Methamphetamine hydrochloride, 4283
- Methazolamide, 4285
- Methdilazine hydrochloride, 4286
- Methenamine, 4288
- Methenamine hippurate, 4290
- Methenamine mandelate, 4292
- Methenamine mandelate delayed-release, 4292
- Methimazole, 4293
- Methocarbamol, 4295
- Methotrexate, 4301
- Methscopolamine bromide, 4306
- Methyclothiazide, 4309
- Methylcellulose, 4314
- Methyldopa, 4316
- Methyldopa and chlorothiazide, 4316

**Tablets** (continued)

- Methyldopa and hydrochlorothiazide, 4317  
 Methylergonovine maleate, 4323  
 Methylphenidate hydrochloride, 4326  
 Methylphenidate hydrochloride extended-release, 4327  
 Methylprednisolone, 4330  
 Methylsulfonylmethane, 1537  
 Methyltestosterone, 4336  
 Methysergide maleate, 4337  
 Metoclopramide, 4339  
 Metolazone, 4341  
 Metoprolol succinate extended-release, 4344  
 Metoprolol tartrate, 4348  
 Metoprolol tartrate and hydrochlorothiazide, 4348  
 Metronidazole, 4355  
 Metyrapone, 4357  
 Midodrine hydrochloride, 4370  
 Milk thistle, 1544  
 Minerals, 1553  
 Minocycline hydrochloride, 4378  
 Minoxidil, 4379  
 Mirtazapine, 4382  
 Mirtazapine orally disintegrating, 4383  
 Mitotane, 4388  
 Modafinil, 4391  
 Molindone hydrochloride, 4393  
 Moricizine hydrochloride, 4407  
 Mycophenolate mofetil, 4426  
 Nabumetone, 4431  
 Nadolol, 4432  
 Nadolol and bendroflumethiazide, 4433  
 Nafcillin sodium, 4436  
 Nalidixic acid, 4438  
 Naltrexone hydrochloride, 4443  
 Naproxen, 4449  
 Naproxen delayed-release, 4450  
 Naproxen sodium, 4451  
 Naratriptan, 4455  
 Nateglinide, 4460  
 Nefazodone hydrochloride, 4462  
 Neomycin sulfate, 4465  
 Neostigmine bromide, 4489  
 Nevirapine, 4495  
 Niacin, 4497  
 Niacinamide, 4501  
 Niacin extended-release, 4498  
 Nifedipine extended-release, 4509  
 Nitrofurantoin, 4519  
 Nitroglycerin, sublingual, 4524  
 Norethindrone, 4533  
 Norethindrone acetate, 4537  
 Norethindrone acetate and ethinyl estradiol, 4538  
 Norethindrone and ethinyl estradiol, 4534  
 Norethindrone and mestranol, 4535  
 Norfloxacin, 4540  
 Norgestimate and ethinyl estradiol, 4543  
 Norgestrel, 4545  
 Norgestrel and ethinyl estradiol, 4545  
 Nystatin, 4551  
 Ofloxacin, 4559  
 Olanzapine, 4562  
 Ondansetron, 4587  
 Ondansetron orally disintegrating, 4590  
 Orbifloxacin, 4594  
 Orphenadrine citrate extended-release, 4601  
 Oxandrolone, 4619  
 Oxaprozin, 4621  
 Oxazepam, 4624  
 Oxprenolol hydrochloride, 4628  
 Oxprenolol hydrochloride extended-release, 4629  
 Oxtriphylline, 4630  
 Oxtriphylline delayed-release, 4631  
 Oxtriphylline extended-release, 4632  
 Oxybutynin chloride, 4634  
 Oxybutynin chloride extended-release, 4635  
 Oxycodone and acetaminophen, 4645  
 Oxycodone and aspirin, 4646  
 Oxycodone hydrochloride, 4641  
 Oxycodone hydrochloride extended-release, 4642  
 Oxymetholone, 4652  
 Oxytetracycline, 4656  
 Pancreatin, 4674  
 Pancrelipase, 4677  
 Pantoprazole sodium delayed-release, 4682  
 Papain for topical solution, 4687  
 Papaverine hydrochloride, 4688  
 Paroxetine, 4698  
 Penbutolol sulfate, 4702  
 Penicillamine, 4706  
 Penicillin G benzathine, 4710  
 Penicillin G potassium, 4715  
 Penicillin V, 4725  
 Penicillin V potassium, 4728  
 Pentazocine and acetaminophen, 4730  
 Pentazocine and aspirin, 4731  
 Pentazocine and naloxone, 4733  
 Pentoxifylline extended-release, 4739  
 Pergolide, 4746  
 Perphenazine, 4750  
 Perphenazine and amitriptyline hydrochloride, 4750  
 Phenazopyridine hydrochloride, 4754  
 Phendimetrazine tartrate, 4756  
 Phenelzine sulfate, 4757  
 Phenmetrazine hydrochloride, 4759  
 Phenobarbital, 4761  
 Phentermine hydrochloride, 4768  
 Phenylbutazone, 4773  
 Phenylpropanolamine hydrochloride, 4781  
 Phenylpropanolamine hydrochloride extended-release, 4782  
 Phenytoin chewable, 4785  
 Phytonadione, 4796  
 Pilocarpine hydrochloride, 4800  
 Pimozide, 4802  
 Pindolol, 4804  
 Pioglitazone, 4807  
 Piperazine citrate, 4816  
 Potassium and sodium bicarbonates and citric acid effervescent, for oral solution, 4835  
 Potassium bicarbonate effervescent for oral solution, 4833  
 Potassium bicarbonate and potassium chloride effervescent, for oral solution, 4834  
 Potassium chloride extended-release, 4841  
 Potassium chloride, potassium bicarbonate, and potassium citrate effervescent, for oral solution, 4843  
 Potassium citrate, 1566  
 Potassium citrate extended-release, 4845  
 Potassium gluconate, 4848  
 Potassium iodide, 4853  
 Potassium iodide delayed-release, 4853  
 Pravastatin sodium, 4870  
 Praziquantel, 4872  
 Prednisolone, 4880  
 Prednisone, 4889  
 Primaquine phosphate, 4893  
 Primidone, 4896  
 Probenecid, 4898  
 Probenecid and colchicine, 4899  
 Probuco, 4901  
 Procainamide hydrochloride, 4903  
 Procainamide hydrochloride extended-release, 4904  
 Prochlorperazine maleate, 4912  
 Procydine hydrochloride, 4913  
 Promazine hydrochloride, 4922  
 Promethazine hydrochloride, 4924  
 Propantheline bromide, 4928  
 Propoxyphene hydrochloride and acetaminophen, 4938  
 Propoxyphene napsylate, 4942  
 Propoxyphene napsylate and acetaminophen, 4943  
 Propoxyphene napsylate and aspirin, 4944  
 Propranolol hydrochloride, 4948  
 Propranolol hydrochloride and hydrochlorothiazide, 4951  
 Propylthiouracil, 4957  
 Protriptyline hydrochloride, 4959  
 Pseudoephedrine hydrochloride, 4962  
 Pseudoephedrine hydrochloride extended-release, 4962  
 Pyrazinamide, 4973  
 Pyridostigmine bromide, 4975  
 Pyridoxine hydrochloride, 4977  
 Pyrilamine maleate, 4979  
 Pyrimethamine, 4981  
 Pyruvium pamoate, 4983  
 Quazepam, 4984  
 Quinapril, 4987  
 Quinidine gluconate extended-release, 4990  
 Quinidine sulfate, 4994

## Topical solution

Aluminum acetate, 2401  
 Aluminum subacetate, 2411  
 Aluminum sulfate and calcium acetate for, 2412  
 Aluminum sulfate and calcium acetate tablets for, 2412  
 Aminobenzoic acid, 2444  
 Benzethonium chloride, 2614  
 Benzocaine, 2619  
 Benzocaine, butamben, and tetracaine hydrochloride, 2620  
 Calcium hydroxide, 2762  
 Carbamide peroxide, 2792  
 Carbol-fuchsin, 2796  
 Cetylpyridinium chloride, 2922  
 Chlorhexidine acetate, 2942  
 Chlorhexidine gluconate, 2945  
 Ciclopirox, 2982  
 Clindamycin phosphate, 3036  
 Clobetasol propionate, 3044  
 Clotrimazole, 3073  
 Coal tar, 3082  
 Cocaine hydrochloride tablets for, 3085  
 Cocaine and tetracaine hydrochlorides and epinephrine, 3085  
 Diethyltoluamide, 3239  
 Dimethyl sulfoxide, 3270  
 Dyclonine hydrochloride, 3358  
 Erythromycin, 3448  
 Fluocinolone acetonide, 3616  
 Fluocinonide, 3618  
 Fluorouracil, 3631  
 Gentamicin sulfate and betamethasone valerate, 3725  
 Gentian violet, 3729  
 Halcinonide, 3794  
 Hydrogen peroxide, 3849  
 Hydroquinone, 3855  
 Iodine, 3925  
 Ivermectin, 4025  
 Lidocaine hydrochloride, 4114  
 Mafenide acetate for, 4169  
 Methoxsalen, 4304  
 Minoxidil, 4379  
 Mometasone furoate, 4397  
 Myrrh, 4429  
 Nitrofurazone, 4522  
 Nitromersol, 4526  
 Papain tablets for, 4687  
 Phenol, camphorated, 4764  
 Podophyllum resin, 4823  
 Povidone-iodine, 4862  
 Sodium fluoride and acidulated phosphate, 5164  
 Sodium hypochlorite, 5166  
 Tetracaine hydrochloride, 5334  
 Tetracycline hydrochloride for, 5340  
 Thimerosal, 5370  
 Tolnaftate, 5429  
 Tretinoin, 5455

## Topical suspension

Calamine, 2734  
 Calamine, phenolated, 2735  
 Ciclopirox olamine, 2985  
 Clindamycin phosphate, 3036  
 Penicillin G, neomycin, polymyxin B, hydrocortisone acetate, and hydrocortisone sodium succinate, 4707  
 Penicillin G procaine, neomycin and polymyxin B sulfates, and hydrocortisone acetate, 4722  
 Resorcinol and sulfur, 5031  
 Selenium sulfide, 5122  
 Sulfacetamide sodium, 5212  
 Zinc sulfide, 5631

---

Topiramate, 5429  
 tablets, 5431  
 Torsemide, 5434  
 Total organic carbon (643), 276  
 Tragacanth, 2266  
 Tramadol hydrochloride, 5435  
 and acetaminophen oral suspension, 5440  
 and acetaminophen tablets, 2324  
 oral suspension, 5436  
 tablets, 5437  
 extended-release tablets, 5438  
 Trandolapril, 5441  
 tablets, 5442  
 Tranexamic acid, 5444  
 Transdermal system  
 clonidine, 3059  
 nicotine, 4502  
 Transfer of analytical procedures (1224), 982  
 Transfusion and infusion assemblies and similar medical devices (161), 131  
 Tranlycypromine  
 sulfate, 5445  
 tablets, 5446  
 Travoprost, 5448  
 ophthalmic solution, 5450  
 Trazodone hydrochloride, 5451  
 tablets, 5452  
 Trehalose, 2266  
 Trenbolone acetate, 5452  
 Tretinoin, 5454  
 cream, 5454  
 gel, 5455  
 topical solution, 5455  
 Triacetin, 5456  
*n*-Triacotane, 1202  
 Triamcinolone, 5456  
 acetone, 5457  
 acetone cream, 5458  
 acetone dental paste, 5460  
 acetone injectable suspension, 5460  
 acetone topical aerosol, 5458  
 acetone lotion, 5459  
 acetone and neomycin sulfate cream, 4488  
 acetone and neomycin sulfate ophthalmic ointment, 4489  
 acetone and nystatin cream, 4554  
 acetone, nystatin, neomycin sulfate, and gramicidin cream, 4552  
 acetone, nystatin, neomycin sulfate, and gramicidin ointment, 4552

acetone, nystatin, neomycin sulfate and thiostrepton cream, 4553  
 acetone, nystatin, neomycin sulfate, and thiostrepton ointment, 4553  
 acetone and nystatin ointment, 4555  
 acetone ointment, 5459  
 diacetate, 5461  
 diacetate injectable suspension, 5462  
 diacetate oral solution, 5461  
 hexacetone, 5462  
 hexacetone injectable suspension, 5463  
 tablets, 5456  
 2,4,6-Triamino-5-nitrosopyrimidine, 1202  
 Triamterene, 5464  
 capsules, 5465  
 and hydrochlorothiazide capsules, 5466  
 and hydrochlorothiazide tablets, 5468
